KEY TO PRONUNCIATION

For a full explanation of the various sounds indicated, see the KEY TO PRONUNCIATION in Vol. I.

ā as in ale, fate
ā " " senate, chaotic.
ā " " glare, care, and as *e* in there.
ā " " am, at.
ā " " arm, father.
ā " " ant, and final *a* in America, armada, etc
ā " " final, regal, pleasant
ā " " all, fall.
ē " " eve.
ē " " elate, evade.
ē " " end, pet
ē " " fern, her, and as *i* in sir, etc.
ē " " agency, judgment.
i " " ice, quiet
i " " quiescent
i " " ill, fit
ō " " old, sober
ō " " obey, sobriety.
ō " " orb, nor
ō " " odd, forest, not.
o " " atom, carol.
oi " " oil, boil
ōō " " food, fool, and as *u* in rude, rule.
ou " " house, mouse.
ū " " use, mule.
ū " " unite.
ū " " cut, but.
u " " full, put, or as *oo* in foot, book.
ū " " urn, burn.
y " " yet, yield.
h " " Spanish Habana, Córdoba, where it is like English *v* but made with the lips alone.

ch as in chair, cheese.
d " " Spanish Almodovar, pulgada, where it is nearly like *th* in English then.
g " " go, get
g " " German Landtag = *ch* in Ger ach, etc.
h " " *j* in Spanish Jijona, *g* in Spanish gila; like English *h* in hue, but stronger.
hw " *wh* in which.
k " *ch* in German ich, Albrecht = *ch* in German Arensburg, Mecklenburg, etc.
ŋ " " in sinker, longer.
ng " " sing, long
n " " French bon, Bourbon, and *m* in the French Etampes, here it indicates nasalizing of the preceding vowel.
sh " " shine, shut
th " " thrust, thin.
th " " then, this
zh " *z* in azure, and *s* in pleasure.

An apostrophe [*ʼ*] is sometimes used as in tā'b'l (table), kāz'm (chasm), to indicate the elision of a vowel or its reduction to a mere murmur.

For foreign sounds, the nearest English equivalent is generally used. In any case where a special symbol, as *g*, *h*, *k*, *n*, is used, those unfamiliar with the foreign sound indicated may substitute the English sound ordinarily indicated by the letter. For a full description of all such sounds, see the article on PRONUNCIATION.

A PARTIAL LIST OF THE LEADING ARTICLES IN VOLUME XVI

- MISSISSIPPI.
Dr E N. Lowe, Honorable Henry Yeiger; Honorable J N Power, Honorable H E. Blakeslee, Mr Allen Leon Churchill; Mr Charles Vernon Katz; Professor Alvin Saunders Johnson
- MISSISSIPPI RIVER
Mr. John W. Woerman, Mr. W G Burroughs.

* Deceased.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

MISSISSIPPI, mis't-sip'i. One of the South Central States of the American Union. It takes its name from the river which forms its west boundary for a distance of about 300 miles and separates it from the States of Louisiana and Arkansas. It lies between Tennessee on the north and Louisiana on the south, being separated from the former by the thirty-fifth parallel of north latitude and from the latter by the thirty-first parallel from the Mississippi River to the Pearl River, a distance of 110 miles. Thence following the Pearl River southward the boundary line is completed on the south by the Gulf of Mexico. The Tennessee River cuts off a small portion from the northeast corner, but the east boundary separating the State from Alabama runs southward in a nearly straight line to the Gulf. Mississippi has an extreme length of 330 miles and an extreme width of 188 miles, and comprises an area of 46,665 square miles, of which 303 square miles is water. Mississippi includes, in addition to the mainland territory, the islands Ship, Horn, Cat, Petit Bois, and others, separated from the mainland by the Mississippi Sound.

Topography. The highest ridges in the northeast reach an altitude of about 700 feet. Throughout most of the State elevations range from 350 to 500 feet to about 150 feet a few miles from the Gulf. A moderate uplift of the region has allowed the rivers to carry the work of dissection to maturity, all gradients now being low, nearly or quite at base level. The streams have their lower courses in valleys opened wide, from a few hundred yards to several miles, and wandering in sinuous courses upon silted bottoms. These river bottoms cover a total of 7560 square miles, or over one-sixth of the entire State. Of this the Yazoo bottoms occupy the greater part. The flood plains of the Yazoo and Mississippi rivers are lined on the east by bluffs from 100 to 300 feet in height, caused by the lateral corrosion of the swinging meanders of the great river. These bluffs are capped throughout with a deposit of loess. Extending through the middle of the Yazoo bottoms is a flat ridge standing above flood level. This and the banks of the various streams are available for cultivation, being the best cotton land in the world. The bottom is being steadily reclaimed for plantations. The swamp and marsh area is occupied by cypress trees, very valuable as lumber, while

the drier lands are covered with cane brakes and rich forests of many species of timber trees.

Hydrography. The principal rivers are the Mississippi, flowing the entire length, the Tombigbee, Big Black, and Pearl. The Yazoo River is a distributary of the Mississippi and the whole area of its bottom is a mesh of interlacing streams, bayous, and oxbow lakes. About one-half the area of the State drains directly into the Mississippi. The Pascagoula drains most of the southeastern quarter. The bottom lands of the Mississippi and other rivers are liable to overflow when the rivers are flooded. To guard against this, levees, or artificial banks, are built to restrain them. See **LEVEE, MISSISSIPPI RIVER**.

Flora. The result of the rather large annual rainfall and of the equable distribution through the year is best seen in the luxuriant forests, largely of deciduous trees. Over 125 species of forest trees are known. There are 15 species of oak, including the live oak. Cypress predominates on the bottom and swamp lands. The long-leaved pine is the chief forest tree of the southern half of the State. Tupelo, sycamore, persimmon, magnolia, holly, cucumber tree, sweet gum, black walnut, and various species of hickory, elm, and maple are also present.

Climate. Mississippi lies in the warm temperate climatic belt and its climate is strongly influenced by reason of its proximity to the Gulf. The average January temperature is 55° F. in the islands off the coast, 50° F. in the southern part of the mainland, and 40° F. near the north boundary. The average July temperatures range from 80° F. to 87° F. The average maximum shade temperature is 100°, while occasional anticyclones of winter bring a minimum temperature of 10° F. to the southern portion and zero weather to the portions below the northern quarter. Such cold weather is, however, very infrequent. The frost-free growing season lasts seven months in the north and ten months in the south. This is of the very greatest importance to many of the crops, especially cotton. The average annual rainfall for the whole State is over 50 inches. The southern quarter has over 60 inches, this distribution being largely due to the prevailing southwest winds and to the influence of the Gulf. The heaviest rains occur in late winter or early spring, when the warm Gulf winds meet the cold winds, but on the whole the precipitation is quite evenly dis-

tributed through the year. There is a slight snowfall as far south as Natchez. The atmosphere is humid at all seasons, the average annual relative humidity being not far from 70 per cent in the northern half and from 70 to 75 per cent in the southern half. The average wind velocity for the whole year is seven miles per hour. The prevailing wind for January is north, while it is south for July. The cyclonic belt lies far to the north and generally does not touch the State.

Soils. The soils are pretty closely correlated with the geology. In the northeastern corner cherty and gravelly soils are common. The Selma Chalk or Rotten Limestone, the most extensive division of the Cretaceous, gives rise to a very fertile calcareous clayey soil, now mostly under cultivation. A narrow belt at the inland edge of the Tertiary formations, extending from the Tennessee line to the Alabama line, known as the post oak flatwoods, is characterized by stiff clay soils of very little agricultural value. In the eastern central part of the State reddish loams prevail. A little south of the centre there is another calcareous strip, formed by the Jackson and Vicksburg formations, and south of that sandy soils, rather poor, but easily tilled and responding generously to proper fertilization.

The brown loam and loess in the western half of the State, extending from about Holly Springs, Jackson, and Brookhaven to the river bluffs, make a very fertile soil, and the alluvium of the delta is one of the richest soils in the world. Much of the last is as yet too swampy for cultivation, but it is being gradually drained by levees and ditches. The loess is very easily eroded, and large areas of it have been so cut up by gullies since the country was first settled as to make the land almost worthless.

Geology. The Cumberland Ridge just reaches the northeast corner of the State with its outlying undulations, thus bringing a small outcrop of Devonian and Subcarboniferous rocks into its borders. From this corner as a focus the younger strata dip away gently to the west and south. Cretaceous beds cover a belt radiating about 25 miles west and 75 miles south of the northeast corner. The four prominent members of the Cretaceous outcrop, in series from the oldest up, are the Tuscaloosa, Eutaw, Selma Chalk, and Ripley. The total thickness of these beds is 2000 feet. At the close of Cretaceous time there was a deep gulf extending north to Cairo, Ill., which was slowly filled by fluvial and offshore deposits. These beds are the Eocene and Neocene outcrops, covering the greater part of the State and extending from the Cretaceous on the northeast to the Yazoo bottoms and almost to the Gulf on the south.

Mineral Products. The only activities of Mississippi as a mineral-producing State are the output of clay, sand, and gravel, and the production of mineral waters. Some iron ore and sand-lime brick have been worked, but are of no importance. The clay products in 1913 were valued at \$691,271. In the same year there were produced 1,891,063 short tons of sand and gravel, valued at \$430,401. The production of commercial mineral waters in 1913 was 346,652 gallons, valued at \$81,800. The total value of the mineral production in 1913 was \$1,143,472.

Agriculture. Mississippi is preëminently an agricultural State. Of the approximate land area of 29,671,680 acres, in 1910 there were 18,557,533 acres in farms, of which there num-

bered 274,382. Improved land in farms included 9,008,310 acres. The average number of acres per farm was 67.6 in 1910. The total value of farm property, including land, buildings, implements, machinery, domestic animals, and poultry, was, in 1910, \$426,314,634. There were, in 1910, 274,382 farm operators, of whom 92,891 were owners, 825 managers, and 181,491 tenants. The share of the farms operated by tenants increased from 43.8 per cent in 1880 to 66.1 per cent in 1910. The land in farms owned and operated by white farmers in 1910 was 12,100,106 acres, with 4,520,927 acres improved land, and by negroes 6,457,427 acres, with 4,487,383 acres improved. Acreage operated by white owners was 9,489,280 and by negro owners 21,227,194. The average acreage per farm operated by white farmers was 110.4 in 1910 and for negroes 39.2. More than three-fourths of all the farms were between 10 and 99 acres in size. The native white farmers in 1910 numbered 108,909 and foreign-born white farmers numbered 736. Negro and other nonwhite farmers numbered 164,737, or 60 per cent of the total number. The acreage, production, and value of crops shown in the following table are estimates for 1914 made by the United States Department of Agriculture.

PRODUCTS	Acreage	Prod bu	Value
Corn	3,150,000	58,275,000	\$42,541,000
Oats	160,000	3,680,000	2,392,000
Potatoes	12,000	960,000	912,000
Sweet potatoes	50,000	4,500,000	2,835,000
Hay	210,000	*304,000	3,648,000
Rice	1,000,000	30,000	26,000
Cotton	3,120,000	†1,275,000	41,512,000

* Tons

† Bales

The total value of crops in 1909 was \$147,316,000 and the acreage 6,158,719. The leading crops in the order of their importance are cotton, corn, cottonseed, hay and forage, and sweet potatoes and yams. The acreage of cotton in 1909 was 3,400,210. The production was 1,127,156 bales, valued at \$83,148,805. The chief acreage of cotton is found in that section described as the Yazoo delta or bottoms. In acreage of cotton Mississippi ranked fourth in 1914, being surpassed only by Texas, Georgia, and Alabama.

Corn is the leading cereal produced, its acreage in 1909 was 2,172,612. The production was 28,428,667 bushels, valued at \$26,030,376. Of the remaining cereals only oats are important. In 1909, 97,085 acres were harvested, producing 1,268,675 bushels, valued at \$822,932. The acreage of hay and forage in 1909 was 229,705, producing 279,236 tons, valued at \$3,363,647. The growing of peanuts is given considerable attention. The total acreage in 1909 was 13,997, and the production amounted to 284,791 bushels, valued at \$317,236. A small quantity of tobacco is grown, and this in 1909 amounted to 18,600 pounds, valued at \$3390. The total acreage of potatoes and other vegetables in 1909 was 125,610, and their value \$9,483,576. Excluding potatoes and sweet potatoes and yams, the acreage of vegetables was 61,223, and their value \$5,868,000. There were grown, in 1909, 1,634,305 bushels of orchard fruits, valued at \$1,325,506. Of these the most important in quantity and value were peaches. Second in product and value were apples; third, plums and prunes. There were also grown, in

1909, 760,563 pounds of grapes, valued at \$44,262. Of the small fruits grown the most important is the strawberry, of which 1,345,013 quarts, valued at \$101,882, were produced. Among tropical fruits, figs, oranges, and pomeloes are grown. The production in 1909 was 1,949,301 pounds, valued at \$107,609. Mississippi is one of the most important sugar-cane-producing States. There were grown, in 1909, 222,600 tons, from which were made 1665 pounds of sugar and 2,920,519 gallons of sirup, the latter valued at \$1,494,696.

Live Stock and Dairy Products. The total number of cattle of all kinds in 1910 was 1,012,632, with a value of \$15,269,264. On Jan. 1, 1915, the estimated number of cattle other than milch cows was 514,000, with a value of \$7,350,000, milch cows, 434,000, valued at \$15,190,000, horses, 241,000, valued at \$20,726,000; mules, 292,000, valued at \$31,536,000; sheep, 208,000, valued at \$458,000, swine, 1,540,000, valued at \$11,088,000. The total value of the milk, cream, and butter fat sold and butter and cheese made in 1909 was \$6,003,465. The milk produced amounted to 79,079,293 gallons, the butter made to 28,730,685 pounds, valued at \$5,571,011. Fowls of all kinds in 1909 numbered 5,070,000, valued at \$1,846,750. The production of eggs was 17,700,000 dozen, valued at \$3,151,000.

Fisheries. Biloxi is the centre of the wholesale fishing industry. It is the shipping point of large quantities of canned and prepared oysters and shrimps. Mollusks and crustaceans are the principal products of the fisheries, of which oysters are by far the most important. In the year 1908 the valuation of the fish caught was \$295,000. Buffalo fish, sea trout, white mullet, catfish, and paddlefish are, in the order named, the principal species. In that year there were 2037 persons engaged in fisheries, and the capital invested was \$522,000. The total production was valued at \$556,000. The industry seems to be declining in the number of persons engaged and the value of products. This is probably due to a decision of the United States Supreme Court transferring the jurisdiction of the Pear Island oyster and fishing grounds to Louisiana. The chief fishing grounds are the Gulf of Mexico and the Mississippi River.

Forest Products. In 1908, 17,500,000 acres, about 59 per cent of the total area, were covered by forests. As noted in the section on *Manufactures*, the lumber industry is the most important single manufacturing industry in the State. In the production of rough lumber, 2,610,581 M feet B. M., Mississippi ranked third among the States. By far the greatest percentage of the cut was yellow pine. The other principal varieties sawed, in the order of their importance, were oak, gum, cottonwood, cypress, poplar, hickory, ash, tupelo, and elm. There were manufactured, in 1909, 151,303 thousands of shingles and 90,926 thousands of lath. In the same year there were produced 1,589,000 gallons of turpentine valued at \$732,000, and 27,020 tons of resin valued at \$740,000. There were, in 1913, 908 active saw mills. The lumber produced in 1914 was valued at \$42,793,000. In addition to the figures of lumber given above, there were taken from the farms in 1909 forest products valued at \$6,602,943.

Manufactures. While Mississippi is not essentially a manufacturing State, its industrial importance has kept pace with its growth. In 1909 the gross value of products per capita

was \$45. The table on page 4 gives the most important figures relative to manufactures for 1909 and 1904. The most important single industry is that connected with lumber and timber products. This is treated in detail under *Forest Products*. The manufacture of cottonseed oil and cake ranks second in value of products. In 1909, 559,357 tons of cottonseed were crushed, and from it were manufactured 24,386,289 gallons of cottonseed oil, 244,738 tons of meal and cake, 181,797 tons of hulls, and 24,237,536 pounds of linters. Mississippi has shared in the remarkable development of cotton manufactures in the Southern States. The manufacture of cotton goods ranks fourth. The principal material used in these manufactures is domestic cotton, of which there were consumed, in 1909, 16,371,192 pounds. The principal product is bleached and unbleached sheetings and shirtings, the output of which amounted to 17,225,461 square yards in 1909. The number of producing spindles was 153,804 in 1909, and the number of looms, 4733. The manufacture of fertilizers is an important industry and ranks fifth. There were made, in 1909, 59,902 tons of superphosphates from minerals, bones, etc., 78,193 tons of complete fertilizers, and 1006 tons of other fertilizers. In addition to these a considerable quantity of fertilizers was produced by cottonseed-oil mills. In the production of turpentine and rosin Mississippi is one of the most important States, although this industry has shown a decline in recent years. Mississippi in 1909 ranked fourth among the States in the output of these products.

The total number of wage earners in 1909 was 50,384, and of these 47,898 were males. The wage earners of 16 years of age and under numbered 1058, of whom 611 were males. The prevailing hours of labor for nearly half the wage earners employed were 60 a week.

The State has five cities having a population of over 10,000—Hattiesburg, Jackson, Meridian, Natchez, and Vicksburg. These cities contained in 1910 only 4.9 per cent of the total population and produced 14.8 per cent of the total value of its manufactures. The most important manufacturing city is Meridian (q.v.), in which there were, in 1909, 1524 wage earners and which had a product valued at \$4,237,476. The cottonseed-oil industry is the most important, followed by the manufacture of fertilizers, steam-railroad repair shops, and lumber mills.

Transportation. Mississippi has excellent transportation facilities. It has direct connection with several large railroad systems of the South and Middle West and is bordered for practically its entire length by the Mississippi River. The proximity to the port of New Orleans by means of this river places it in a favorable position for domestic or foreign shipments. The total railway mileage on Oct. 30, 1913, was 4279. The principal railroads with their main-line mileage in 1913 were as follows: Illinois Central, 679; Yazoo and Mississippi Valley, 1144; Mobile and Ohio, 315; New Orleans, Mobile, and Chicago, 370; Southern Railway, 236; Mississippi Central, 164. The mileage of electric railways on Jan. 1, 1913, was 107. There were 12 companies operating such railways in that year. Pearl River is a customs district and has a small foreign trade.

Banking. The Bank of Mississippi at Natchez was chartered in 1809. In 1818 it was created a State bank, with a capital of \$3,000,-

000, the State participating in its management and pledging a monopoly of its banking business until 1840. In 1830, with the hope of getting more direct control of banking operations, the Legislature broke its pledge by establishing the Planters' Bank of Mississippi, with a capital of \$3,000,000, and making it the financial agent of the State. This forced the first bank into liquidation. For a few years the Planters' Bank had a practical monopoly of the banking, but from 1835 new banks followed in rapid succession. The most daring venture was the organization of the Mississippi Union Bank in 1838, with a capital of \$15,500,000, which made it the largest State bank in the United States at that time. These hold undertakings in the very midst

\$1,787,074; loans, \$33,453,505, and deposits, \$34,416,264. There were 22 loan and trust companies with an aggregate capital of \$1,803,150, and 17 savings banks with a combined capital of \$485,600.

Government. The present constitution was adopted in 1890, and it is the fourth instrument under which the State has been governed. The constitution of 1890 had for its special purpose the preservation of the supremacy of the white vote. (See *Suffrage and Elections* below.) The constitution may be amended by a two-thirds vote of both Houses indorsed by the vote of the people.

Executive.—The chief executive officer is the Governor, who holds office for four years and is

SUMMARY OF MANUFACTURES FOR 1909 AND 1904

THE STATE — TEN LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manufacture
			Total	Wage earners (average number)				
All industries	1909	2,598	56,761	50,384	\$72,393	\$18,768	\$80 555	\$43,629
	1904	1,520	42,966	38,690	50,256	14,819	57,451	31,650
Bread and other bakery products	1909	79	417	285	287	128	878	362
	1904	57	237	160	184	69	499	238
Cars and general shop construction and repairs by steam-railroad companies	1909	10	2,709	2,572	1,412	1,558	3,233	1,811
	1904	15	2,755	2,653	1,337	1,421	2,886	1,554
Cotton goods, including cotton small wares	1909	14	2,720	2,045	5,336	695	3,102	1,060
	1904	14	2,225	2,161	4,520	518	2,463	814
Fertilizers	1909	10	524	449	2,607	141	2,125	740
	1904	5	371	348	1,049	79	1,082	225
Foundry and machine-shop products	1909	50	711	583	1,682	295	1,088	616
	1904	35	622	516	875	260	920	564
Ice, manufactured	1909	51	477	341	1,851	189	866	653
	1904	37	376	274	1,266	119	603	458
Lumber and timber products	1909	1,647	37,118	33,397	39,455	12,583	42,793	28,586
	1904	664	24,415	22,431	24,819	9,242	26,162	19,157
Oil, cottonseed, and cake	1909	87	3,014	2,503	10,133	833	15,966	3,797
	1904	91	2,956	2,499	8,552	732	12,587	2,517
Printing and publishing	1909	225	1,132	736	1,173	387	1,308	1,008
	1904	211	861	549	733	254	916	721
Turpentine and rosin	1909	64	2,811	2,573	1,251	582	1,475	1,126
	1904	124	3,036	2,633	598	737	2,366	1,972

of a financial crisis could lead to only one result. In 1841 the repudiation of the charter granted to the Union Bank was the chief political issue in the State. The repudiators won, and the bonds were canceled in 1842. In 1853 the Planters' Bank bonds were also canceled. These acts were upheld by the constitution of 1890. There were numerous failures in 1838-45, in 1855 there was but one chartered bank. A revival came in the eighties, when national banks were introduced. Stringent banking laws have given to the State banks the confidence of the people, and their number has increased. On Sept. 12, 1914, there were 38 national banks with a combined capital of \$3,835,000; surplus, \$1,777,456; cash, etc., \$391,649; loans, \$14,897,834; and deposits, \$16,037,548. On June 30, 1914, there were 266 State banks with a total capital of \$8,604,330; surplus, \$2,003,081; cash, etc.,

not eligible for immediate reelection. Other executive officers are Lieutenant Governor, Secretary of State, Treasurer, Auditor, Attorney-General. The Treasurer and Auditor may not be candidates for two successive terms.

Legislative.—The Legislature includes the Senate and the House of Representatives. In 1912 the system of sessions once in four years, with a special session between, was changed to biennial sessions in even years. The Lower House includes (1915) 138 members and the Senate 45.

Judiciary.—The judiciary is the supreme or appellate court of the State, which, by constitutional amendment adopted in 1914, consists of six members, a chancery court of equity jurisdiction and a circuit court of common-law jurisdiction in each county. The chancery and circuit judges have heretofore been appointed by the Governor, but are now elective. The coun-

SCALE OF KILOMETERS

County Towns @

Railroads

ties are divided into chancery and circuit districts, a chancellor and a circuit judge being chosen for each district. There are in addition two or more justices of the peace elected for each of five districts in a county.

Suffrage and Elections.—Every male citizen 21 years of age who has resided in the State for two years, in the district in which he offers to vote for one year, who has registered and paid taxes for two preceding years, and who is able to read or understand the Constitution of the United States, is eligible to vote. The last qualification, which election officers are given discretion to interpret, was designed chiefly to eliminate a large portion of the negro vote. All voters must pay a poll tax of \$2 for the support of the common schools.

All nominations for the State, district, and county officers and United States Senators are made at primary elections. Each political party pays the expenses of its primaries, and the candidates may be assessed for expenses. General elections are held on the first Tuesday after the first Monday of November.

Local and Municipal Government.—Cities may adopt a commission form of government including the charter providing for the recall and initiative at an election held on petition by 10 per cent of the voters. Any city may vote to abandon its charter after six years under commission government. Each county is divided into five districts, in each of which a resident freeholder is selected as a member of the board of supervisors. The boards of supervisors regulate the fiscal affairs of the county, make all contracts, equalize assessments, levy the taxes, and have exclusive control of roads, ferries and bridges, etc.

Miscellaneous Constitutional and Statutory Provisions.—Women are placed on an equality with their husbands in acquiring and disposing of property and the making of contracts. A divorce may be granted only to one who has lived for one year at least in the State. A public-service corporation which may remove a suit from a State to a Federal court forfeits its right to carry on intrastate commerce in the State. Nine or more jurors may agree on a verdict in civil suits. Contributory negligence does not bar recovery for injuries or death. The giving of tips in hotels is forbidden. As a result of a statute passed in 1908, the State is under prohibition. The Legislature of 1914 passed a measure restricting the intrastate shipment of intoxicating liquors and prohibiting the keeping of liquor in any locker of any social club or any other organization. There are strict regulations for railroad companies delivering intoxicating liquors shipped from outside the State.

Finance. The early financial history of the State is closely connected with the organization of its banks. A large State debt of \$2,000,000 was created in 1830 in order to acquire shares in the Planters' Bank and, in 1838, \$5,000,000 for shares of the Union Bank of Mississippi. These banks were later brought to insolvency as a result of the financial crisis of the thirties. This involved the State in an enormous debt. In the floating of this debt infringements were made upon the constitution, and it was repudiated by a popular vote in 1852. The debt was finally disposed of by a clause in the constitution of 1875. The State was again involved in serious financial difficulties during and after the

Civil War. The "carpet-bag" régime greatly aggravated the situation. The expenditures increased from about \$500,000 in 1867-69 to more than \$1,500,000 in 1871-75, and the tax rate increased from 1 mill to 14 mills. The taxpayers organized a protest in 1874, and a gradual decrease of the State's debt, expenditures, and rate of taxation followed. The total debt in 1880 was \$3,324,084, of which \$530,615 was bonded debt. On Sept. 30, 1912, the total debt was \$4,460,519, of which \$1,506,899 was bonded debt. The funded debt consisted on that date of several series of bonds and of special debt obligations to public trust funds. The latter represent obligations to several educational funds, the principal of which, amounting to \$2,344,674, has been used by the State, for which it pays an annual interest of 6 per cent in perpetuity. The bonded debt on Sept. 30, 1913, was \$3,923,752. The per capita debt in 1912 was \$2.41. There is no sinking fund. The total receipts from all sources for the fiscal year 1913 amounted to \$4,501,447 and the disbursements to \$4,426,591. The balance at the beginning of the fiscal year was \$250,999 and at the end \$325,855. The chief sources of revenue are State taxes, and the chief expenditures are for educational and State institutions.

Militia. The males of militia age in the State in 1910 numbered 345,745. The organized militia consists of one brigade of infantry, comprising the second and third regiments, and a sanitary troop and a field hospital. The total strength of enlisted men in 1914 was 1116 and of officers 104.

Population. The following figures show the growth of the population at various periods: 1800, 8850; 1830, 136,621; 1850, 606,527; 1860, 791,305; 1870, 827,922; 1880, 1,131,597; 1890, 1,289,600; 1900, 1,551,270; 1910, 1,797,114. The estimated population on July 1, 1914, was 1,901,882. In 1910 Mississippi ranked twenty-first among the States. There is a very small foreign-born population, but it has a larger percentage of colored population than any other State. The white population in 1910 was 786,111, and the negro population was 1,009,487. The white population, however, is increasing at a faster rate than the negro. The foreign-born whites in 1910 numbered 9389. The urban (cities of 2500 or more) population is comparatively small. In 1910 this amounted to 207,311. The rural population in 1910 was 1,589,803. The negroes are most numerous in the western or Mississippi valley counties, in some of which they are five times as numerous as the whites. There are about 1250 Indians, who are descendants of the Choctaw tribes which inhabited the State at the time of its settlement. A large number of these Indians have removed to Oklahoma and have become members of the Choctaw nation. In the State in 1910 there were 905,760 males and 891,354 females. The males of voting age numbered 426,953. There were in 1910 only nine cities having a population of 8000 or over. The largest city, Meridian, had a population in 1910 of 23,285 and, in 1914, 21,806 (estimate). The other large cities with their populations in 1910 and as estimated for 1914 are as follows: Jackson, 21,262 and 26,990; Vicksburg, 20,814 and 22,090; Hattiesburg, 11,733 and 14,952; Greenville, 9610 and 10,448; Columbus, 8988 and 10,053; Biloxi, 8049 and 9147; Natchez, 11,791.

Education. Education in Mississippi is car-

ried on under some disadvantages, caused by the large and widely scattered rural population. This fact and a negro population that amounts to more than half of that of the State accounts for the large percentage of illiteracy. The total illiterates in 1910 numbered 290,235 (persons of 10 years and over), a percentage of 22.4 South Carolina and Alabama were the only States with higher percentages. Of the total illiterates the native whites numbered 28,344, or 5.3 per cent, and the negroes 259,438, or 35.6 per cent. Conditions, however, are greatly improving, and the percentage of illiterates is steadily decreasing. In 1910 the total school population was 644,805, of which 265,767 were native whites of native parentage and 372,331 were negro.

According to an enumeration made in 1912 the total number of children of school age in that year was 740,856; of these 311,389 were native white and 429,467 were negro. In addition there were 407 Indian children of school age. There is no compulsory-education law.

The administration of the schools is in the hands of the State Board of Education, composed of the Secretary of State, the Attorney-General, and the Superintendent of Education. The latter is the chief executive officer. There is a superintendent for each county, and there are separate districts for white and for negro children. The districts have the power to tax themselves for the support of the schools. The common-school fund amounts to about \$3,500,000. For a long time the legislatures were somewhat indifferent to the importance of improvement in educational matters, but beginning with 1910 several laws of great importance have been passed. These included a measure permitting the consolidation of two or more weak schools into one stronger school; the establishment of agricultural high schools; the creation of a textbook commission and of a supervisor of elementary rural schools. The Legislature of 1911-12 enacted several important measures which have had good results.

There is a normal school at Hattiesburg, established in 1911. The Shelby Normal Institute at Shelby is for colored students. The institutions of collegiate rank include the University of Mississippi at University, the Mississippi Agricultural and Mechanical College at Agricultural College, Mississippi College at Clinton, Millsaps College and Meridian Male College at Meridian. Colleges for women are Hillman College at Clinton, Mississippi Industrial Institute and College at Columbus, Grenada College at Grenada, Meridian Women's College at Meridian, and the Port Gibson Female College at Port Gibson. Rust University at Holly Springs is for colored students. Other colleges for colored students are the Alcorn Agricultural and Mechanical College at Alcorn, the Southern Christian Institute at Edward, the Mississippi Industrial College at Holly Springs, Campbell College at Jackson, Jackson College at Jackson, Kosciusko Industrial College at Kosciusko, Lincoln School at Meridian, Tougaloo University at Tougaloo, Utica Normal Industrial Institute at Utica, Vicksburg Industrial School at Vicksburg, and Granada-Seion College at Winona. There are also several normal schools for colored persons.

Charities and Corrections. The charitable and correction institutions under the control of the State include the State Charity Hospital

at Jackson, the State Charitable Hospital at Vicksburg, the State Charitable Hospital at Natchez, the Beauvoir Home at Beauvoir, the State Insane Asylum at Asylum, the Eastern Mississippi Insane Asylum at Meridian, the State Penitentiary at Jackson, the Deaf and Dumb Institution and the Institution for the Blind at Jackson. State convicts are employed on several State farms and plantations, white and negro convicts being assigned to different farms. These farm penitentiaries are controlled by a board of trustees elected by the people. The hiring out of prisoners by counties is prohibited. Public farms must be secured for them to work on by the county authorities or they must be employed on the public roads.

Religion. Over half of the Church population of the State belong to the Baptist church, and the majority of the remainder to the Methodist. Of the lesser denominations the more important are the Presbyterian, Roman Catholic, Christian, and Protestant Episcopal.

History. In 1539 Hernando de Soto, with a band of Spanish adventurers, crossed the northeastern part of what is now the State and in the early part of 1541 reached the Mississippi River, near the present site of Memphis, Tenn. In 1673 the French explorers Joliet and Marquette, passing down the Mississippi, sailed as far as the mouth of the Arkansas. In 1681-82 La Salle sailed down the river to its mouth and, taking formal possession for the King of France, Louis XIV, named the country Louisiana after him. The first attempt to found a colony was made in 1699 by Iberville, who brought 200 immigrants from France to Biloxi, on the east shore of the Bay of Biloxi. This was the germ of the subsequent settlement of New Orleans (1718). In 1716 Iberville and Bienville, with a large body of immigrants and a military force, ascended the Mississippi to the present site of Natchez, where they founded a settlement named Rosalie, in honor of the Countess of Pontchartrain. Attempts to plant colonies were soon after made at St. Peter's (on the Yazoo), at Pascagoula, and elsewhere. The small colonies in Mississippi, however, grew but slowly, New Orleans attracting many of the settlers. Under Bienville, who was Governor of Louisiana from 1718 to 1724, friendly relations with the Indians were preserved, but under his successor, Perrier, the hostility of the Natchez Indians was awakened. In 1729 a sudden assault was made on the line of French posts. At Fort Rosalie 200 persons were killed and more than 500 were taken prisoners. In the smaller settlements many of the inhabitants were butchered. Retribution followed swiftly. Aided by the Choctaw tribes, the French succeeded in defeating the Natchez, the greater part of whom fell in battle, while most of the survivors were sold as slaves. When Bienville became Governor again, in 1733, he found the colony at war with the Chickasaws, allies of the English, and the conflict continued for several years. There was a peace, followed in 1752 by another Indian war, instigated, it was said, by English adventurers. The French commander sought to retaliate, but without much success. Under French rule the country failed to prosper. In 1763 France ceded its possessions east of the Mississippi to Great Britain, which received also Florida from Spain. Immigrants flocked thither in considerable numbers from the English colonies on the Atlantic coast as well as from Scotland.

That part of the territory south of a line drawn through the mouth of the Yazoo River eastward to the Chattahoochee had been erected into the Province of West Florida soon after the establishment of English rule in 1763. In 1781 West Florida was conquered by Spain and passed under Spanish rule. By the Peace of Paris, in 1783, the thirty-first parallel of latitude was recognized as the southern boundary of the United States, and Spain was therefore considered as an intruder in that part of Mississippi to the north of the line. By the Treaty of 1795 between the United States and Spain, Spain ceded her claims to the disputed territory, but continued to occupy it until 1798. In 1798 the Territory of Mississippi was organized, and in 1804 it was extended to the present boundary of Tennessee. In 1813 the district south of 31° and east of the Pearl River, taken from Spain, was annexed. At first a Governor and three judges appointed by the President were the chief authorities for the government of the Territory, but in 1800 provision was made for a legislature, the Lower House consisting of nine members representing the three counties into which the Territory was then divided. In 1802 Washington became the capital of the Territory. In the Creek War Mississippi took a conspicuous part, several hundred inhabitants of the Territory being massacred at Fort Mims (q.v.). In the War of 1812 the Territory was well represented at the battle of New Orleans. In March, 1817, Congress passed an enabling Act for the admission of Mississippi to the Union, and the State was formally admitted Dec. 10, 1817. The most notable features of the first constitution of Mississippi were the high property qualifications for holding office, the short tenures of offices, and the large appointing power of the Governor and Legislature. The first Governor was David Holmes, and during his administration the capital was permanently located at Jackson, near the headwaters of the Pearl River.

By the treaties of 1830 and 1832, with the Choctaw and Chickasaw Indians, who inhabited all the northern part of the State, the lands occupied by those tribes were incorporated into the State, subjected to its jurisdiction, and thrown open to settlement by the whites. In 1832 a new constitution was adopted for the State. Its most notable features were the abolition of property qualifications for officeholding, the requirement that all officers, both State and county, including the judges, should be chosen by the people. It also created a high court of errors and appeals and abolished the office of Lieutenant Governor. During the "flush times" of this period Mississippi, like many other Southern and Western States, fell a victim to financial extravagance and speculation, one of the results of which was the repudiation by the State of \$5,000,000 in bonds which it had issued for the purpose of acquiring stock in the Union Bank. The supreme court of the State decided in favor of the liability of the State for the payment of the bonds, but the people, in an election in which this was the main issue, decided otherwise, and the Legislature refused to make any appropriation for the purpose. A little later \$2,000,000 of the Planters' Bank bonds were repudiated under similar circumstances. Upon the outbreak of the Mexican War Mississippi was called upon to furnish one regiment of volunteers, but more than enough men for two regiments responded. The first regiment was

commanded by Col. Jefferson Davis, who won great distinction at the battle of Buena Vista. In 1851 occurred the first important struggle in Mississippi over the slavery question, which had become serious on account of the enactment by Congress of the so-called Compromise Measures of 1850. The Democratic party in Mississippi adopted a platform favoring secession and nominated Jefferson Davis for Governor, while the Whigs declared their attachment to the Union and nominated United States Senator Foote as their standard bearer. The Union party won a substantial victory, and the slavery question rested until 1856, when the question of secession was again agitated on account of the fear that Fremont would be elected President. The news of John Brown's raid in 1859 led the Legislature to appropriate \$150,000 for the purchase of military supplies and for the organization of the militia. It was left, however, for the election of Lincoln to bring the secession movement to a head. An ordinance of secession was passed on Jan. 9, 1861, by a convention, by a vote of 84 to 15, and the State constitution was amended to bring it into conformity with the constitution of the Confederate States. During the Civil War the people of Mississippi suffered greatly, and in 1863 and 1864 especially a large part of the State was devastated by the contending armies. Almost all semblance of government had disappeared. (For the military operations in Mississippi, see CIVIL WAR, CORINTH; IUKA; VICKSBURG.) In June, 1865, Governor Clarke was removed, and a provisional Governor was appointed by President Johnson. On July 21 slavery was abolished by a State convention, and on the following day the ordinance of secession was repealed. In December the State government was given over into the hands of the duly elected officers, who proceeded to reorganize the State militia for the public defense, a course in which they were upheld by the President. Limited civil rights were conferred on the freedman, but the Fourteenth Amendment was rejected in January, 1867, and in March the State came under military government.

In January, 1868, a convention framed a new constitution, conferring the suffrage on negroes. The conservative element vehemently opposed the constitution because of the severe penalties it imposed on members of the government and armies of the Confederacy, and brought about its rejection at a popular election. Resubmitted in November, 1869, with the test oath and disfranchisement clauses to be voted on separately, the constitution was adopted almost unanimously, while the independent clauses were as unanimously rejected. In January, 1870, the Fourteenth and Fifteenth amendments were ratified, and on Feb. 17, 1870, the State was readmitted into the Union. The period before 1875 was marked by a spirit of bitter hatred between the old Democrats and the newly enfranchised negroes, together with their leaders, the white Republicans. The feeling of animosity was intensified by the unhappy financial condition of the State and by the dishonesty and incapacity of its officers, very many of whom were ignorant negroes, the tools of scheming politicians. Bloody collisions between whites and negroes were frequent in 1874 and 1875, in one of which, at Vicksburg, 29 negroes and several whites were killed. The desperate attempts of the "conservatives" to restore the supremacy of the white population proved finally successful

in 1875, when the Democratic party captured the Legislature. The Republican Governor and Lieutenant Governor and the Superintendent of Education were driven from office by impeachment or threats of impeachment, and since then the Democratic party has retained an overwhelming predominance. The 20 years after 1865 were a period of economic depression, the result of the havoc wrought by the war and of the difficulties encountered in readjusting production to the new conditions of labor, but later the rise of manufactures marked the beginning of a bright era. The racial problem assumed a momentous aspect in 1844, when a vast migration of colored men into the swamp lands of Mississippi seemed to threaten the rise of a negro State within the State of Mississippi. The policy of fortifying the white race in power was continued. By the constitution of 1890 the suffrage was restricted to those able to read a section of the Constitution or to interpret any passage if read aloud, a provision aimed against the negro voter and sufficiently successful in attaining its aim. (See *Government*, above.) In national elections Mississippi has been a Democratic State with the exception of the year 1840, when it voted for the Whig candidate, and of 1872, when its vote was given to Grant. In 1864 and 1868 its vote was not counted. While the Democratic party is practically the only political organization, there was from the first years of the twentieth century a condition of political turmoil which was hardly surpassed in other States where the great political parties have strong rival organizations. In 1904 James K. Vardaman was elected Governor. His chief political tenet was the disfranchisement of the negro, not only in the State but in the nation, by means of the repeal of the Fourteenth Amendment of the Constitution. During his term, 1907, it became necessary to elect a United States Senator for the term beginning March 4, 1911. In Mississippi the Senators take their seats four years after election. Governor Vardaman was a candidate for the Senate and was opposed by John Sharp Williams, then a Representative in Congress. The contest was one of great bitterness, and among its features was a series of joint debates between the two candidates. At the primary election held in August, 1907, Mr. Williams received a majority of about 1000 votes. On November 5 of that year E. F. Noel was elected Governor. The Legislature of 1908 passed a statutory prohibition bill which became operative on Jan. 1, 1909. An attempt made to pass a measure for constitutional prohibition was defeated. In the election for President in 1908 Bryan received 60,876 votes, Taft 4505, and Watson 1057. On Dec. 26, 1909, Senator A. J. McLaurin died, and Col. James Gordon, a Confederate veteran of the Civil War, was appointed by the Governor to fill the vacancy until a successor to Senator McLaurin could be chosen by the Legislature. This election by the Legislature in 1910 resulted in a fierce and prolonged factional battle. After the deadlock lasting seven weeks Le Roy T. Percy was elected. He was opposed by Mr. Vardaman, who, shortly after Senator Percy had taken his seat in the Senate, caused charges to be made that the latter's election had resulted from bribery and corruption. After an investigation Senator Percy was entirely exonerated. In 1911 another senatorial election was held for the term beginning March, 1913, when Senator Percy's

term expired. He was a candidate for reelection and was again opposed by Mr. Vardaman. In this election the latter was successful. Earl Brewer was chosen Governor. Mr. Vardaman was elected by the Legislature in 1912. On March 5 of that year the Legislature, which was controlled by friends of Mr. Vardaman, demanded the resignation of Senator Percy on the ground that he had promised to resign if he were defeated in the primaries for nomination, a procedure altogether unprecedented in the history of American politics. Senator Percy denied that such a pledge had been made and continued to serve out his term. In the presidential election of 1912 Wilson received 57,227 votes, Roosevelt 3645, Taft 1595, and Debs 2161. In 1912-13 the State suffered much from floods of the Mississippi River. In 1914 several amendments to the constitution were adopted. The number of supreme court judges was increased to six, and their term of office was made eight years. The Governors of Mississippi have been the following

TERRITORIAL

Winthrop Sargent	1798-1801
John Steele (acting Governor)	1801
William C. C. Claiborne	1801-03
Cate West (acting Governor and Governor ad int.)	1804

MISSISSIPPI, UNIVERSITY OF. A State university chartered in 1844 and opened in 1848, at Oxford, Miss., and maintained until 1880 by annual grants by the Legislature. From 1861 to 1865 exercises were suspended, owing to the resignation of the faculty. In 1870 the policy of separate schools, with optional studies and with courses leading to other degrees besides that of B.A., was adopted. There are seven undergraduate courses, partly elective, leading to the bachelor's degree in arts, science, pedagogy, philosophy, mining, and civil and electrical engineering. The university also maintains a law school, a medical department, and a summer school and confers the degrees of M.A. and Ph.D. In 1892 the preparatory education was discontinued at the university. The requirements for admission are those adopted by the Association of Colleges and Preparatory Schools of the Southern States, of which the university is one of the original members. Students from approved high schools are admitted without examination. Since 1882 women are admitted. The faculty consisted in 1915 of 35 instructors, and the students numbered 528. The library contained 25,000 volumes. The total endowment was about \$700,000, with a gross income of \$138,226. The buildings and grounds were valued at \$500,000, the total value of the property being \$1,300,000. The president in 1915 was Joseph N. Powers, LL.D.

MISSISSIPPI AGRICULTURAL AND MECHANICAL COLLEGE. An institution for agricultural and scientific education, established by an Act of the Legislature in 1878 at Agricultural College, Miss. The curriculum includes a two-year training course and four courses of instruction—agricultural, mechanical, industrial education, and general science—with provisions for graduate work and summer sessions. The degrees conferred are bachelor and master of science. There is also an honorary degree of master of progressive agriculture. The bona-fide residents of Mississippi receive free tuition; other students are required to pay a fee of \$50 per session. Instruction in military government is given by an officer of the United States army, and all students are required to wear a prescribed uniform within 5 miles of the college campus. During the regular sessions of the college the attendance of women is not permitted. The total enrollment in all depart-

ments in the session of 1914-15 was 1140. This does not include the Summer School. The faculty, teaching force, and officers of administration numbered 105. The value of the property at the end of the collegiate year 1913-14 was \$1,329,776; the income was \$537,580, of which \$246,008 was from State appropriations and \$80,817 from Federal appropriations. The library contains about 33,000 bound volumes and 65,000 unbound volumes. The president in 1915 was G. R. Hightower.

MISSISSIPPI BUBBLE. See MISSISSIPPI SCHEME.

MISSISSIPPIAN SERIES. A group of limestones outcropping in the upper Mississippi valley and also in Arkansas and Texas. It is the equivalent of the Lower Carboniferous in the Appalachian States. See CARBONIFEROUS SYSTEM.

MISSISSIPPI CATFISH. The largest of North American catfish (*Ameiurus lacustris*, or *Ictalurus ponderosus*), which may reach 150 pounds in weight, is sold in all the markets of its region and is regarded by many as good food. It inhabits the Great Lakes and all the larger waters of the Saskatchewan, Mississippi, and Missouri valleys. In color it is greenish slate, growing darker with age, the sides paler, without spots. (See CATFISH.) Among its many local names in the South are flannel mouth and mud cat.

MISSISSIPPI COLLEGE. An institution of learning at Clinton, Miss., founded in 1826. It has a preparatory and a collegiate department with an attendance in 1914 of 462 students and a faculty of 18 instructors. The library contained about 4000 volumes. The college buildings are valued at \$225,000, and the property of the institution at about \$700,000. The endowment is \$125,000, and the gross income \$25,000.

MISSISSIPPI RIVER (Algonquin, *Missi Sepe*, great river; lit., father of waters). The principal river of the North American continent, discovered by De Soto in 1541 (Map. United States, Eastern Part, H 4). In 1673 Marquette and Joliet descended it almost to its mouth, and in 1682 La Salle passed through it to the Gulf of Mexico and took possession of the country in the name of the King of France. Counting as a part of it the longest branch of the drainage system, the Missouri, which far overtops the central stem, it is the longest river in the world. The entire system lies within the United States, excepting the headwaters of a few tributaries of the upper Missouri, which extend a short distance beyond the northern boundary of Montana into Canada.

Location and Climate. The headwaters of the main north and south stem are in lat. 47° 09' N., long. 95° 13' W., and its central mouth in lat. 28° 59' N., long. 89° 08' W. Although well within the temperate zone, there is a wide range in climate, particularly in winter temperatures. In northern Minnesota the extreme range in temperature is from -50° F. to +100° F., while at New Orleans it varies from +20° F. to +100° F. These temperatures do not occur every year, but are likely to occur three years out of ten. The mean annual temperature at Duluth is 39° F.; at New Orleans, 69° F. The principal cities situated on the banks of the river are Minneapolis, St. Paul, La Crosse, Dubuque, Moline, Davenport, Rock Island, Burlington, Quincy, St. Louis, East St.

Louis, Cairo, Memphis, Vicksburg, Natchez, Baton Rouge, and New Orleans. The chief agricultural products in the north are wheat, barley, and potatoes; in the central States corn, oats, and rye; and in the south cotton, sugar cane, and tobacco. Fruits are grown throughout the valley, apples better in the north, and peaches more successfully in the south.

Source. Popularly Lake Itasca, since its discovery by Schoolcraft in 1832, has been considered the source of the Mississippi, and this is not far from being precise. Later explorers announced Nicollet Creek, Elk or Glazier Lake, Gagwa Dosh or Deer Creek, and Hernando de Soto Lake as the headwaters. According to an accurate contour map of Itasca State Park, issued by the Mississippi River Commission about 1910, Little Elk Lake is the ultimate source. It empties into Lake Itasca through Elk (or Excelsior) Creek and Elk Lake. Lake Itasca is surrounded by such an intricate network of smaller glacial lakes, more or less obscured by reeds and water grass, that it is easy to understand why this question was a matter of so much controversy until the whole Itasca basin was covered by a careful geodetic survey. Lake Itasca at its outlet is 2459 miles from the Gulf of Mexico, and Little Elk Lake about 7 miles farther. Lake Itasca is about 4 miles long, 30 feet deep, and about 1470 feet above sea level. Little Elk Lake is about half a mile long, 600 feet wide, and about 100 feet higher than Lake Itasca.

General Description. The Mississippi as it flows from the north end of Lake Itasca is ordinarily less than 20 feet wide and 2 feet deep. It flows swiftly over shoals and boulders in a northwesterly direction for a distance of 62 miles by river, or 32 along the axis of the valley, to Lac Travers or Lake Bemidji, covering about 20 square miles, surrounded by forested hills. The Mississippi as it flows from the east side of Lake Bemidji is at the most northern point of its course. Seventeen miles farther on it enters Cass Lake, and 12 miles beyond Cass Lake it enters Lake Winnibigoshish. From Lake Winnibigoshish the river flows southeastward for 24 miles and unites with Leech Lake River, which is nearly as large as the Mississippi and furnishes the outlet for Leech Lake, which covers about 250 square miles and is the largest of the lakes constituting the headwaters of the Mississippi. Forty miles farther is found the first rock in place, a bed of sandstone, where the Falls of Pokegama have been submerged by two dams. Eighty miles below Pokegama the waters of Sandy Lake empty into the Mississippi through a storage dam, and 82 miles below Sandy Lake enters Pine River, which is dammed a short distance above its mouth to regulate the outflow from Whitefish Lake. Twenty-two miles below Pine River is located the town of Brainerd (q.v.), with a water-power dam with a 15-foot head. Between Brainerd and Minneapolis occurs a series of dams and rapids having a total fall, with the Brainerd Dam, of 444 feet. The Crow Wing River, which is nearly as large as the Mississippi, enters 11 miles below Brainerd. At the Sauk Rapids, 60 miles below the Crow Wing and at the entrance of Sauk River, begin the first rocky banks of Potsdam sandstone, which are in frequent evidence from this point down to the head of the Rock Island Rapids, 350 miles below St. Paul.

The entire drainage basin of the Mississippi

above Minneapolis is covered with a blanket of glacial drift, 100 to 300 feet thick, consisting of a mixture of clay and gravel. Its surface is very irregular and is broken by thousands of glacial pot holes, resulting in a vast multitude of lakes and swamps, estimated by some at 5000 to 6000 in number. At the Falls of St. Anthony, in Minneapolis, the river pitches down a vertical falls and rapids amounting to 80 feet in half a mile, leaving the clay banks for a channel that lies between vertical bluffs of sandstone, gradually increasing to a height of 300 to 500 feet as the bed sinks below the general level of the prairie. Below St. Paul the distance between the bluffs rapidly increases, so that from St. Paul to Rock Island the usual distance between bluffs is 2 to 3 miles, except at the head of the Rock Island Rapids, where they are only 1 mile apart. Their height varies from 200 to 600 feet. The debris from centuries of degradation has built up slopes at the foot of the bluffs and on all projecting ledges which are now covered with grass and trees. For more than 200 miles below St. Paul the oaks, elms, beeches, and maples are interspersed with cedars and pines. This fact, together with the greater height of the bluffs, makes this section even more beautiful than the bluffs farther south. The river flows first against one bluff and then the other in its meanderings back and forth across the valley.

Seventy-seven miles below St. Paul the vast quantities of sand brought down by the Chipewewa River have choked the valley so that the river fills the entire space from bluff to bluff, forming Lake Pepin, which is approximately 25 miles long and 2 to 3 miles wide. At the Rock Island Rapids the bed of the river consists of stratified limestone in a series of folds or steps, creating 11 chains or rapids with a total fall of 21 feet in 15 miles. From this point down to Cape Girardeau, 132 miles below St. Louis and 460 miles from Rock Island, the formation is Carboniferous and the river winds back and forth between picturesque rocky bluffs 100 to 400 feet high and from 3 to 8 miles apart. The bluffs are usually partially covered with grass and trees, as above Rock Island, but from Grafton to Alton, a distance of 18 miles, and for shorter distances below St. Louis, the bluffs rise vertically from the river, forming palisades of rugged beauty. From Cape Girardeau down to Grays Point, a distance of 5 miles, the river passes the low land which constitutes the head of the St. Francis basin, through which the flood waters of the Mississippi formerly escaped in great volumes. From Grays Point to Commerce, a distance of 7 miles, the river flows through a gorge, where the water is closely confined between vertical bluffs one-half to three-fourths of a mile apart. This geological landmark is said to be a spur of the Ozark Mountains, which cross the southern part of Missouri.

The rock bluffs between which the river meanders for more than 1000 miles and the vast northern upland, mainly elevated rock with a moderate covering of soil, both terminate at Commerce, 144 miles below St. Louis and 38 miles above the mouth of the Ohio. The vast alluvial valley of great fertility extending from Commerce to the Gulf, about 1100 miles by river or 600 miles in a direct line, has been created from the river's own silt. Commerce is at the head of an ancient arm of the ocean into

which the silt-laden river poured its deposits as the present river does into the Gulf, leaving a valley as fertile as that of the Nile in its palmiest days and four times as large.

From Cairo to the Gulf the surface of the river is normally above the lands lying back from the river. The ground slopes away from the river with a gradient of about 7 feet in the first mile, decreasing gradually to 6 inches per mile at the outer edge, where the overflow from the Mississippi naturally drained away towards the Gulf through numerous bayous running parallel to the main river.

Between Cairo and Memphis, 230 miles, the river does not get far from the low bluffs on the east side of the valley and at several points impinges upon them. The river then zigzags diagonally across the wide valley and strikes the west bluff at Helena, 306 miles below Cairo. The St. Francis basin, which is 45 miles wide just below Cairo and 35 miles wide at Memphis, tapers out at Helena, where the St. Francis empties into the Mississippi. The Yazoo basin, which starts at Memphis on the east side of the river, increases in width as the St. Francis decreases, having a width of 22 miles at Helena and 60 miles opposite the mouth of the Arkansas River, which is 402 miles below Cairo. At Arkansas City, 438 miles below Cairo, the Yazoo basin reaches its maximum width, 65 miles, and the Tensas basin begins on the west bank. The Yazoo basin terminates in a wedge at Vicksburg, 600 miles below Cairo, where the Yazoo enters the Mississippi, and the latter again strikes the east bluffs, which at this point are about 200 feet high. The Tensas basin, which is from 20 to 35 miles in width, terminates at the mouth of the Red, of which the Tensas is a tributary. There is no diminution in the width of the basin, however, only a change in the name, which from this point to the Gulf is known as the Atchafalaya basin, after the Atchafalaya River, which not only carries the discharge of the Red River, but also at flood times an immense volume from the Mississippi. A narrower basin on the New Orleans side is known as the Pontchartrain basin.

Islands, Lakes, and Tributaries. Between St. Paul and the mouth of the Missouri, 658 miles, there are about 540 islands of sufficient size to be dignified with a name or number. They occur singly, in pairs, and in chains, the lower ones covered with willows, and the higher ones with cottonwoods, maples, and oaks or else cleared for cultivation. Between the mouth of the Missouri and the Ohio there are, or were, about 60 islands large enough to be designated by name. Most of them are from 2 to 3 miles long. Nearly all of these 600 islands have been connected with the mainland by wing dams or hurdles, and the channels or chutes behind them have become silted up, so that they no longer appear as islands during low water. This is particularly true below St. Louis, where most of the islands have already lost their identity except to those familiar with the river. Between Cairo and the mouth of Red River, a distance of 765 miles, there are 147 islands, usually 2 to 4 miles in length. From this point to the Gulf, 309 miles, there are only three islands, and except at these points the river sweeps along majestically in a single deep channel.

A great number of large horseshoe lakes lie adjacent to the river, particularly from Mem-

phis to the mouth of Red River, where, in a distance of 534 miles, there are 31 of these crescent-shaped lakes, most of them from 5 to 10 miles long. These are former channels of the river which were abandoned as the result of cut-offs, described in a later paragraph. The number of tributaries, and tributaries of tributaries, which are shown in ordinary atlases aggregates about 250, of which more than 50 are navigable. The more important of the tributaries in the order of their entry, proceeding downstream from Minneapolis, are the Minnesota, St. Croix, Chippewa, Black, Wisconsin, Galena, Rock, Iowa, Des Moines, Salt, Illinois, Missouri, Kaskaskia, Ohio, St. Francis, Arkansas, Yazoo, Big Black, and Red.

Floods. The Mississippi valley receives little rain from either the Atlantic or the Pacific coast. A small percentage comes from the Great Lakes, but the heavy rains which produce great floods come from the Gulf of Mexico. In winter and spring the surface of the ground is cooler than the waters of the Gulf, and as the moisture-laden winds sweep northward they become cooled and create snow and rain. A wind from the southwest will sweep across the Ohio valley, one from the south up the Mississippi; one from the southeast across the valleys of the Red, the Arkansas, and the Missouri; but in all cases the greatest rainfall will occur near the Gulf and gradually decrease as the winds travel inland. Floods do not arise from mean conditions, but from heavy rainfalls of long duration; if the ground is frozen or saturated, the run-off is proportionately greater. The maximum discharge of the upper Mississippi is 450,000 cubic feet per second, the Missouri, on account of its great length, 900,000; the Ohio, 1,400,000, the Arkansas, 450,000, and the Red, 220,000. There is also a large discharge from the St. Francis, Yazoo, White, and Tensas. Below Cairo the river overflows its banks when the discharge exceeds 1,000,000 cubic feet per second. The flood of 1912 was the greatest below Cairo of which we have definite knowledge and amounted to about 2,000,000 cubic feet per second at Cairo and 2,300,000 flowing into the Gulf. This flood was due to the coincidence of moderately high floods from the Missouri, upper Mississippi, Ohio, Wabash, Tennessee, and Cumberland rivers, supplemented by excessive rains covering the alluvial valley and the watersheds of the southern tributaries.

The alluvial valley having been built up by floods, it follows that they must have always occurred. Naturally only the more disastrous floods are remembered and recorded, and the older ones are gradually forgotten as those of more recent date attract the attention. The floods of 1785, 1828, and 1844 were of abnormal height and did great damage, and stirred the people in the valley to renewed efforts at levee construction. Then came the great floods of 1851 and 1858. The latter was regarded as the greatest which had ever come down the river and overtopped practically all of the levees in existence at that time. Active repair work and extensions were followed by other great floods in 1862, 1865, and 1867, which supplemented the havoc of the war and did millions of dollars' worth of damage. Active reconstruction was followed by the great flood of 1874, which in many parts of the valley proved to be the most disastrous of all. Then in 1882, 1883, and 1884 the valley was visited for the first time by three

excessive floods in three successive years. In 1882 there were 284 crevasses; in 1883, 224; in 1884, 204; 712 crevasses in three years! A large part of the lands reverted to the States on account of the inability of the owners to pay the heavy levee taxes, and in 1882 the Federal government came to the rescue and began its cooperation with State and local organizations, as stated in the section on *Levees*. The greatest activity ever witnessed on the levees followed, and the results were most encouraging.

Floods of greater volume than that of 1874 also occurred in 1886, 1887, 1892, and 1893, but, on account of the greatly improved levee system, these were all safely passed without material damage except that due to erosion. But in 1897 came another of unusual severity, causing 47 crevasses and flooding 20,000 square miles. This was followed by even greater activity in levee construction, and after the flood of the following year the Mississippi River Commission reported "This is the first time in the history of the river since the commencement of the continuous levee system that a flood reaching the height of 49.8 feet on the gauge at Cairo has been carried to the Gulf without a single break in the levee." For five years the levees successfully held back the floods, but in 1903 another great flood came, and the levees were again breached, doing enormous damage. In 1907 the flood was only a trifle lower than that of 1903. The next year was remarkable for four moderate floods in succession, beginning in February and ending in June, followed by another in 1909. The latter was about as large as that of 1874, but all were carried through to the Gulf without any break in the levees.

In 1912 came the greatest flood on record (as measured by the volume of water) causing 14 crevasses below Cairo and a loss in property estimated at \$42,000,000. There was some loss of human life, but the number of lives lost was never ascertained. The army officers reported that 272,000 people were furnished food and shelter.

In 1913 two distinct and excessive floods passed Cairo, the first in January and the second in April. The second exceeded in height all previous records for nearly the entire distance from Cairo to the Gulf. Like that of the preceding year it was caused by excessive rains throughout the valley. The precipitation at a number of Weather Bureau stations in Ohio exceeded all previous records for a like period of time. At Cincinnati the Ohio rose 21 feet in one day. The flood of January was kept within the levees except at Beulah, where a break of the previous year had not yet been completely closed. This crevasse attained a width of 1000 feet and overflowed about 2100 square miles. During February and March it was closed successfully at great cost by means of a trestle, using 1374 cars of rock and 145,000 cubic yards of earth. During the April flood six crevasses occurred, overflowing 2568 square miles, but in addition 6756 square miles were overflowed by water coming through various unleveed sections.

An important contributory cause of repeated failures after so many years of levee building is the fact that, as the areas formerly subject to overflow are more and more protected from overflow, the channel left for the flood waters has become more and more restricted and the water

surface has steadily risen. The former flood width of 20 to 80 miles by 1915 had been reduced to about 5 miles and the flood height increased about 10 feet. This was anticipated and correctly computed 20 years previously, but the funds available were not sufficient to enlarge the levees to the full cross section required. The waters of the upper Mississippi, Missouri, and Ohio having been combined at Cairo, the gauge at that point is an accurate index of the relative volumes of different years, particularly since it is not so much affected by breaks or extensions in the levee system as the gauges farther down. However, two floods passing Cairo at the same stage do not always remain of the same proportions throughout the lower valley, as they are affected to some extent by the discharge from the tributaries below Cairo.

FLOOD HEIGHTS ON THE CAIRO GAUGE*

Year	Day	Feet
1858	June 21	49.53
1859	May 7	46.49
1862	May 2	50.76
1865	March 19	47.90
1867	March 21	50.97
1874	April 26	47.37
1876	April 6	46.38
1882	February 26	51.87
1883	February 27	52.17
1884	February 22	51.79
1886	April 19	51.02
1887	March 9	48.50
1892	April 28	48.29
1893	May 9	49.33
1897	March 25	51.72
1898	April 6	49.78
1899	April 2	46.24
1903	March 16	50.57

Watershed. The area drained by the Mississippi River and its tributaries extends from the Alleghany Mountains to the Rocky Mountains and from the St. Lawrence basin to the Gulf of Mexico—1,240,050 square miles, or 41 per cent of the mainland of the United States, exclusive of Alaska. The areas of the principal river basins which form this immense watershed are as follows:

DESIGNATION	Area, sq miles	Percentage of whole
Missouri	527,150	43
Upper Mississippi	165,900	13
Ohio	201,700	16
Middle and lower Mississippi	69,000	6
Arkansas	186,300	15
Red	90,000	7
Total	1,240,051	100

Divisions and Length. For purposes of investigation and improvement the Mississippi River is divided by the government engineers as shown in the districts tabulated on page 13. These distances are measured along a line midway between the banks. Distances measured along the steamboat channel are more than 10 per cent greater. In volume of sediment and

other characteristics the Missouri River is the main stream and should have been named the Mississippi. Measuring from the headwaters of the Missouri River to the Gulf, it has a total length of 4200 miles, the longest river in the world

Slopes, Water Power, Locks, and Dams. From Lake Itasca, which is 1472 feet above sea level, to Bemidji there is a fall of 130 feet in 32 miles. At Bemidji there is a power dam with a head of 22 feet. From this point to Brainerd, a distance of 300 miles, the river flows through

DISTRICT	Length miles
Little Elk Lake to St. Paul	534
St. Paul to mouth of Missouri River (upper Mississippi)	658
Mouth of Missouri River to mouth of Ohio River (middle Mississippi)	200
Mouth of Ohio River to head of passes (lower Mississippi)	1,060
South Pass	14
Total	2,466

Reservoirs and Capacities. Near the headwaters of the Mississippi a series of lakes have been dammed by the government in order to create a system of storage reservoirs for increasing the low-water flow and depth of navigable channel of the upper river. The capacities of these reservoirs are given in the accompanying table, together they constitute the largest reservoir system in the world

NAME	Storage capacity, cu. ft.
Lake Winnibigoshish and Cass Lake	13,992,000,000
Leech Lake	33,094,300,000
Pokegama Lake	5,260,000,000
Sandy Lake	3,157,900,000
Pine River	7,732,900,000
Gull Lake	4,910,100,000

Widths, Natural and Artificial. From Lake Itasca to Minneapolis the width of the river increases gradually from less than 50 to more than 400 feet at ordinary stages. Under the adopted project for the deepening of the river the low-water width is contracted to 300 feet at St. Paul. As the volume is increased by various tributaries this width is increased by degrees to 600, 700, 900, 1000, 1200, and 1400 feet, the latter width being for the reach between the mouths of the Illinois and Missouri. On the Rock Island Rapids the width between contraction works is 250 to 400 feet. Where the Des Moines Rapids formerly existed there is now a beautiful artificial lake about a mile wide and 50 to 60 miles long, created by the new concrete power dam at Keokuk. The natural width from St. Paul to the mouth of the Missouri is from two to three times these project widths, except in Lake Pepin, where the natural width of 2 miles has not been disturbed.

From the mouth of the Missouri to the mouth of the Ohio the project width is 2500 feet, although the widths in the unimproved sections vary from 800 to 5000 feet. The widths in this reach at a bank-full stage vary from 1600 to 7000 feet. The flood width, before the construction of levees, extended from bluff to bluff, an average distance of 5 miles.

Below Cairo the project width is 3000 feet, the natural low-water width 1000 to 7500 feet, and the bank-full width 2000 to 10,500 feet. Previous to the construction of levees the area subject to overflow had an average width of 40 miles. In 1915 the average restricted flood width was 5 to 10 miles, decreasing to about 1 mile below Baton Rouge.

a country which is largely swampy, but the flat slopes of the river are interrupted by the storage dams at Lake Winnibigoshish and Pokegama Lake, by a power dam at Grand Rapids, and by several smaller rapids farther downstream. The crest of the Brainerd power dam is 1172 feet above sea level. From this point to Minneapolis, a distance of 150 miles, there is a fall of 444 feet, 80 of which is in the falls and rapids of St. Anthony. About 135 feet of this 444 is utilized by six power dams, the remainder is wasted.

Between Minneapolis and St. Paul the United States government in 1915 completed a large lock and power dam, with a lift of 30 feet, which permits the packets from St. Louis to reach Minneapolis. From this point to Le Claire, at the head of the Rock Island Rapids, the average slope is about 0.4 foot per mile, except in Lake Pepin, where the river has a fall of less than 0.2 foot in 24 miles. At the Rock Island Rapids there is a fall of 21 feet in 15 miles. From this point to the head of Cooper Lake at Burlington, a distance of 84 miles, there is an average slope of 0.35 foot per mile.

Cooper Lake, named after the civil engineer who designed and built the hydroelectric power plant at Keokuk, is 50 to 60 miles long and nearly level. The head on the dam and the lift in the new government lock will vary from 30 to 40 feet, according to the amount of water stored in the pool. From Keokuk to Grafton, at the mouth of the Illinois River, a distance of 150 miles, there is a slope of 0.5 foot per mile, from Grafton to the Eads Bridge at St. Louis, 0.66 per mile, although the maximum at the Chain of Rocks above St. Louis is 1.3 and the minimum, in the St. Louis harbor, 0.2 per mile. Low water at this point is 378 feet above Gulf level.

From the Eads Bridge to Cairo the average slope is 0.6 foot per mile; from Cairo to Vicksburg, 600 miles by river, 0.38 per mile, from Vicksburg to the mouth of Red River, 154 miles, 0.24 per mile. This point is over 300 miles from the Gulf and only 3 feet above Gulf level. Practically all of this head is used up in the next 70 miles, so that at Baton Rouge, 240 miles from the Gulf, low water is only 0.2 foot above mean Gulf level. Although the tides at the mouth of the river amount to only 1 to 2 feet, their effect extends up the river to Baton Rouge, and below this point there is a slight negative slope during high tide. In other words, contrary to popular opinion, water does run "up hill" under certain conditions.

Depths, Prior and Subsequent to Improvement. Between St. Paul and St. Louis, prior

to improvement, the depths on the bars or crossings at low water did not exceed 2 to 2.5 feet, especially in the upper sections and on the Rock Island and Des Moines Rapids. About two-thirds of this division has now been improved to a low-water depth of 6 feet. Where the improvements have not been completed, depths of not less than 4 feet are maintained by dredging. From St. Louis to Cairo the minimum depths, previous to improvement, did not exceed 3.5 to 4 feet at low water. At present, by means of improvement works and dredging, a depth of 8

above St. Louis are all frozen over, the discharge at and above St. Louis may be 25 per cent less than is shown in the table. Since the opening of the Chicago Drainage Canal in January, 1900, about 5000 cubic feet per second have been taken from Lake Michigan through the Chicago River, the Chicago Drainage Canal, the Des Plaines and Illinois rivers and discharged into the Mississippi at Grafton. At and below Grafton, therefore, the present low-water discharge is 5000 cubic feet per second greater than the natural discharge shown in the table

NATURAL DISCHARGE OF MISSISSIPPI RIVER

NAME OF STATION	Distance from Gulf, miles	Ordinary low-water discharge, cubic feet per second	Maximum flood discharge, cubic feet per second
Above Cass Lake	2,370	100	2,000
Grand Rapids, Minn.	2,278	500	10,000
Brainerd, Minn.	2,107	1,500	40,000
St. Paul, Minn.	1,934	3,000	110,000
Winona, Minn.	1,814	6,000	130,000
Clayton, Iowa	1,711	12,000	200,000
Keokuk, Iowa	1,447	18,000	372,000
Grafton, Ill.	1,295	20,000	425,000
St. Louis, Mo.	1,257	35,000	1,116,000
Columbus, Ky.	1,052	70,000	2,015,000
Helena, Ark.	768	77,000	2,041,000
Arkansas City, Ark.	636	92,000	2,007,000
Vicksburg, Miss.	475	97,000	1,783,000
Red River Landing, La.	309	94,000	1,595,000
New Orleans, La.	110	94,000	1,358,000
Mississippi + Atchafalaya + crevasses		100,000	2,300,000

feet is maintained. From Cairo to the Gulf the minimum depths, prior to improvement, did not exceed 4.5 to 6 feet at low water. At the present time, by means of improvement works and dredging, primarily the latter, a minimum depth of 9 feet is maintained from Cairo to Vicksburg. Below Vicksburg no dredging is required, the least depths being 11 feet from Vicksburg to Baton Rouge, 35 feet from Baton Rouge to New Orleans, 62 feet from New Orleans to Quarantine Station, and 30 feet to the Gulf through either the South Pass or the Southwest Pass.

Velocity of Current. The velocity of the current is a function of the depth as well as of the slope. It varies greatly, therefore, between low and high water at every point on the river. The velocity at low water, however, does not differ greatly on the upper and lower river, as the greater depths on the lower river are largely counterbalanced by the flatter slopes. Roughly speaking, the velocity at low water, from St. Paul to St. Louis, except on the rapids, varies from 1 to 2 feet per second, and from St. Louis to New Orleans from 1 to 2.5 feet, while the high-water velocities vary from 3 to 6 feet on the upper river and from 6 to 8 feet on the lower river. The greatest velocity that has been noted on the river occurred under the Merchants Bridge at St. Louis during the flood of 1892, when a mean velocity of 12.2 feet per second was measured. The excessive contraction of the waterway under the bridge caused the bottom to scour out to a depth of 86 feet on this occasion. To obtain the velocities in miles per hour multiply the preceding figures by 0.7.

Discharge. The ordinary or normal low-water discharge and the maximum flood discharge of the river at typical points are shown in the accompanying table. By ordinary or normal low water is meant the lowest stage which occurs during the navigation season. Occasionally in midwinter, when the tributaries

These low-water discharges do not occur every summer, but only once in five to ten years. The low-water discharge shown for St. Louis corresponds to a zero stage on the St. Louis gauge, while "standard low water," which is approximately the average annual low water during the navigation season, corresponds to a discharge of 63,000 cubic feet per second.

Just above Red River Landing is the mouth of the Red River, which also serves as the mouth, or rather as the headwaters, of the Atchafalaya River, because ordinarily the latter takes all of the discharge from the Red River and also some from the Mississippi River, as indicated in the table. The reduction in flood discharge below Helena is due to crevasses or breaks in the levees, as described further on under **LEVEES**.

Caving Banks. In the volume of its caving banks the Mississippi probably surpasses every other river that man has yet attempted to improve. In the superficial area of its caving banks it is exceeded by the Missouri, but on account of the higher banks and greater depths of water on the Mississippi the volume of earth falling into the river is greater along the latter. Previous to revetment some caving occurred on the upper Mississippi as far north as Keokuk, but caving on a large scale really begins at the mouth of the Missouri River and increases in extent downstream, reaching a maximum in the vicinity of Vicksburg. Below the mouth of Red River the caving gradually diminishes until at Donaldsonville it practically ceases.

From Cairo to Red River the extent of the caving banks was measured in 1907 and 1908, and it was found that 411 miles of bank were caving at low water and 708 miles at high water, or, deducting for the banks which were caving at both low and high water, a total of 749 miles in 754 miles of river. In other words, caving is taking place on one bank or the other or on some island practically the entire distance. A

similar survey in 1892, before much revetment work had been done, showed 921 miles of caving banks in the 885 miles from Cairo to Donaldsonville. The same survey showed that the average annual caving in this distance amounted to 38,991,000 square yards, or 12.6 square miles in area by 66 feet in depth, or more than 1,000,000 cubic yards per mile of river. Similar measurements between Cairo and St. Louis show that from 1879 to 1889 the average annual amount of caving was 64,000,000 cubic yards, while from 1889 to 1907 the average annual amount was 48,000,000, the diminution being due to the extensive revetment work executed in the meantime.

Caving banks have been classified as eroding banks, slumping banks, sinking banks, and sliding or slipping banks. As most of the damage is done by the first method, no further reference will be made to the others. A typical eroding bank is one whose soil is not cohesive enough to withstand the scouring and dissolving action of the ordinary river currents. As the velocity of the current increases with the stage, the erosion increases correspondingly, provided the direction of the current remains the same. As the direction of the current is frequently different at high water, caving, while much more extensive, does not always occur at the same places. In erosion the bank is undercut or undermined below the water surface until the weight of the portion above the water causes it to break away and fall into the river. A recession in the shore line of 300 to 600 feet in a single season is a common occurrence.

Sinuosities. Experiments on a large scale show that a running stream in an alluvial bed will not remain straight. Owing to variations in the cohesive strength of the soil, irregularities begin to develop, and the resulting curves are gradually enlarged by the centrifugal action of the currents thereby inaugurated. The resulting radius of curvature is determined largely by the volume of discharge. For example, below St. Paul the radius of curvature is 1600 to 4500 feet, while in the bends below Arkansas City it is from 8000 to 15,000 feet. When the river changes from its low-water flow to a flood discharge, it attempts to adjust its sinuosities to its increased flow. In other words, at a flood stage the current does not follow the deep bends in which it flowed during low water, but tends to flow in flatter curves, thereby shortening and changing its main channel to the confusion of the navigator.

The greatest danger to the regimen of a river occurs, however, when the erosion in one bend approaches the cutting bank in the second bend below. If left to itself, the peninsula or narrow neck of land will be eventually cut through, thereby forming a cut-off. As this disturbs the regimen of the river for many miles above and below, it is always prevented by bank revetment. If not prevented, it may require 20 to 25 years before this reach becomes as stable as it was before the cut-off took place. The last cut-off occurred in 1884, before improvement work was well organized, at Waterproof, 20 miles above Natchez, shortening the river about 12 miles.

Erosion in the bends does not widen the river because the convex bank is built out as rapidly as the other caves away, but it takes many years before the new accretion becomes high enough and fertile enough to be valuable for agricultural purposes.

The Movement of Sediment. Material is carried down the river in three ways, viz., in solution, in suspension, and by rolling along the bottom. The second is by far the greatest in volume. The material carried in suspension by the Mississippi is received almost entirely from the Missouri River. At low water the proportion of sediment in the Missouri River is about 1 part in 1000, by weight, while at a flood stage it amounts to 10 parts in 1000, or 1 per cent of the weight of water. This means that a flood of 500,000 cubic feet per second carries with it into the Mississippi about 120 cubic yards of sediment per second, or more than 10,000,000 cubic yards per day. It is estimated that 400,000,000 cubic yards per annum are carried into the Mississippi from the Missouri, and approximately the same amount passes out into the Gulf. A volume, therefore, equal to that produced by the river's own caving banks is deposited as accretions along the banks of the river and on the areas subject to overflow. A deposit or accretion occurs whenever the velocity of the current is checked, as, e.g., below a hurdle or permeable dike, where the fill frequently amounts to 10 feet during a single flood. One case is on record of a maximum deposit of 64 feet in a single year.

The movement of sand along the river bottom results in the formation of sand waves, a phenomenon similar to the formation and movement of sand dunes or snowdrifts by the wind. Sand waves on the lower river vary from 400 to 1000 feet in length, from 8 to 22 feet in height, and have a daily movement of 20 to 40 feet. They have the least dimensions and slowest rate of travel during low water and the greatest during high water.

Bars and Crossings. Concurrently with the erosion and accretion in each bend occurs another process which is equally typical of all alluvial streams, viz., the formation of a bar or submerged dam across the channel at the lower end of each bend. These do not lie normal to the banks, but extend diagonally across the river, having a length at least double the width of the river. In this way the deep water in the upper pool usually extends downstream past the head of the next pool, and the main body of water, in passing from one pool into the next, passes over this bar or natural weir in a comparatively thin sheet of water. The deepest water in a bend is always found near the concave bank, and the pilot of a vessel, in passing from the deep water in one pool to the deep water in the pool below, must make a crossing in a diagonal course from one side of the river to the other.

One of the most interesting characteristics of these bars, and a most troublesome one to the navigator, is the fact that the top or crest rises and falls with the water surface. Repeated measurements show that below St. Louis the available depth across a bar increases only about one-half foot for every foot rise in the water surface.

After a high stage, if the river falls slowly, say 0.2 or 0.3 foot per day, the current will have time to cut down the bars fast enough to maintain a good channel, but if the river falls rapidly, the result is most disastrous, as there will be bad water on the crossings until the current has time to cut them down or the hydraulic dredges to dredge a channel through them. For the guidance of the pilots the cross-

ings are indicated by lights and day marks maintained by the Lighthouse Service

Bank Revetment. When the permanent improvement or regulation of a river like the Mississippi is undertaken, the first work necessary is the revetment or protection of its caving banks, giving the channel a fixed location and incidentally conserving the fertile bottom lands along the river and reducing the amount of sediment to be disposed of by the stream. This can be accomplished the most economically by the use of brush and stone revetment, constructed during the low-water season. Below the water the sloping bank is covered with a mattress or carpet of willow brush, covered with a single layer of rubble stone, while above the water level, where the willows would soon rot, stone alone is used in a heavier layer. The width of the mattress varies with the depth of the river and the friability of the soil. On the upper river the width varies from 25 to 35 feet, between St. Louis and Cairo the standard width is 125 feet; and below Cairo, 250 to 400 feet. On the upper and lower river the mattress is made up of fascines, or bundles of willows, fastened together with poles and wire cables, while on the middle Mississippi the mattress is made by weaving light willows under and over heavier poles, placed about 6 feet apart, parallel to the bank. The willows are 20 to 30 feet long and from 2 to 4 inches thick at the butt, except the poles, which are longer and heavier. The mattresses are made on skids supported on barges, the barges being gradually withdrawn downstream as the mattress is formed, leaving a continuous floating mattress, which is then sunk from the upstream end by loading it with stone.

Above the water level the bank is first graded by a hydraulic grader to a slope of 1, vertical, to 2 1/2 or 3, horizontal, and covered with rubble stone placed by hand. Where stone must be transported long distances, as on the lower Mississippi, it has been found more economical to use concrete, provided gravel may be found within a reasonable distance. The height of the banks above standard low water varies from 10 to 20 feet on the upper river, from 20 to 30 feet on the middle Mississippi, and from 40 to 60 feet on the lower river.

Contraction Works. As indicated by the name, these are built for the purpose of contracting the cross section of the river where its natural width, at low water, is too great and its depth too shallow to afford a good navigable channel. The widths to which the river is being contracted are given in the section on *Widths, Natural and Artificial*. The contraction of the entire flow within a restricted width results in scouring out the bottom to the required depth. On the upper river, where these works are called wing dams, they are built up of alternate layers of brush and stone—about two-thirds brush and one-third stone—to a height of 6 feet above mean low water. The first or lowest course projects downstream about 10 feet beyond the others so as to protect the dam from underscour.

On the middle Mississippi the contraction works consist of permeable pile dikes, locally called hurdles, the piles being driven through a brush mattress having a width of 60 to 100 feet to protect it from underscour. The piles are driven in clusters of three to four each, and each hurdle consists of two to three rows of clusters. The rows are about 3 feet apart, and the

clusters 8 to 10 feet apart in the rows and staggered with those in adjoining rows. Long slender piles are then laid horizontally between rows, thereby bracing the upper row against the adjoining row. The tops of the piles are left 15 to 20 feet above low water at the channel end and 20 to 25 feet at the bank end. The piles vary from 30 to 60 feet in length, according to the depth of the water, and have a penetration of about one-third their length. On the lower river no contraction works are being built as the funds appropriated are needed more urgently for levees, bank revetment, and dredging.

Dredging and Snagging. Dredging is carried on extensively to maintain the project depth where improvement works have not yet been constructed and to supplement the scouring action of the contraction works when the river falls rapidly after a high stage. Most of this work is done by hydraulic or suction dredges, of which in 1915 there were eight on the upper river, four on the middle division, and nine on the lower river. The size of the discharge pipe is 12 to 18 inches in diameter, 28 to 32 inches, and 32 to 36 inches respectively on the three divisions of the river. The largest suction dredges have a capacity of 1000 to 2000 cubic yards of sand per hour, and the cost varies from five to ten cents per cubic yard. In addition to the suction dredges, seven dipper dredges are in use on the upper Mississippi excavating rock and other hard material, principally on the Rock Island Rapids. See DREDGE.

One snagboat above and two below the mouth of the Missouri patrol the river during the navigation season to remove snags and other obstructions which are a menace to navigation. To dispose of a snag it is hoisted on deck with machinery, the portions which will float away are sawed off in short lengths, and the heavy mass of roots is dropped in a deep pool, deposited below a wing dam, or hauled out on the bank.

Levees. The main area originally subject to overflow, amounting to 29,790 square miles, begins at Cairo on the left bank and at Cape Girardeau, 51 miles above Cairo, on the right bank. The entire levee system includes about 1570 miles of levee, of which all but 70 miles were under construction in 1915, affording protection during moderate floods to 26,570 square miles. Between Cape Girardeau and Rock Island there are additional levee lines aggregating 337 miles in length, but the area protected probably does not exceed 1000 square miles. The following remarks refer to the main area below Cairo.

The first levee was built at New Orleans about the beginning of the eighteenth century. In 1828 the State of Louisiana took up the matter quite actively and up to the time of the Civil War had expended about \$18,000,000, while Mississippi was a close second with \$14,000,000. The total expenditure by individuals, parishes, and States up to that time is estimated by C. G. Forshey, of New Orleans, at over \$41,000,000. During the war and the years immediately following many breaks occurred, many miles fell into the river, and the remainder became badly deteriorated. Work was gradually resumed, but was not pushed actively until the United States began its coöperation in 1882. The volume in place at that time is estimated at 32,000,000 cubic yards. The total volume in the projected

system is estimated at 434,000,000 cubic yards, and the total volume in place in 1915 about 290,000,000 cubic yards, leaving a balance of about 144,000,000 cubic yards to be completed. In 1915 about 20 to 25 million cubic yards of new work were being added each year, and from 3 to 5 million cubic yards of old work lost by caving banks.

The standard levee cross section has a top width of 8 feet and side slopes of 1, vertical, to 3, horizontal. All levees over 12 feet in height are reinforced by a banquet, the top of which is 8 feet below the top of the main levee. The width of the banquet varies from 20 feet for a levee 12 feet high to 40 feet for a levee 20 feet high. The height of the levees, as a rule, varies from 15 to 25 feet, decreasing to 10 feet near the Gulf and increasing frequently to 30 feet where they cross old sloughs. The total amount expended on levees by the United States up to 1915 was about \$35,000,000, and by State and local organizations about \$100,000,000, or a total of about \$135,000,000. The amount of money necessary to complete the system was estimated at \$60,000,000 to \$75,000,000.

Passes and Jetties. At the head of the passes, 96 miles below New Orleans, the river divides into three main outlets. Pass à l'Ouvre, which takes about 50 per cent of the discharge and subdivides into three smaller passes, Southwest Pass, which takes about 40 per cent of the discharge; and South Pass, which receives only about 10 per cent. Much work was done on the bars at the mouths of these passes in attempting to maintain ship channels across them. From 1836 to 1878 about \$2,500,000 were expended on various unsuccessful devices and plans. In 1875 Congress authorized James B. Eads to construct jetties and auxiliary works to develop a deep channel in the South Pass. He secured a 30-foot channel and was paid the contract price of \$5,250,000 and \$100,000 per annum for maintaining it from 1881 to 1900 inclusive. These are described and illustrated under JETTY.

The dredged channel in 1915 was about 75 per cent completed, about 25,000,000 cubic yards having been removed, giving a minimum width of 130 feet and a depth on the bar of 30 feet where there was originally only 9 feet. The length of the jetties is 4.5 miles, and the total length of the Southwest Pass, 19.5 miles.

Cost of Improvement. The total expenditures by the United States to June 30, 1914, on the improvement of the Mississippi River, including construction, maintenance, and operation of reservoirs, locks, and dams, are approximately as follows:

Snagging, St. Paul to New Orleans	\$4,400,000
Improvement works and dredging	
Above St. Paul	4,300,000
St. Paul to mouth of Missouri River	21,100,000
Mouth of Missouri River to Cairo	16,200,000
Cairo to head of passes	46,700,000
Passes	20,300,000
Levees	33,500,000
Total	\$146,500,000

The amounts expended by the several States and local interests are not so well known, but are roughly estimated at about \$100,000,000 for levees and \$10,000,000 for docks and revetment works at the larger cities. The hydroelectric-power development at Keokuk represents an investment of \$25,000,000. Smaller water-power plants at Rock Island, St. Paul, and points farther upstream have cost many millions more.

Commerce. On account of the hard labor involved in paddling, poling, warping, or cordeling against the current, the commerce downstream, at first carried in flatboat, pirogue, Mackinaw boat, keel boat, and barge, was always greatly in excess of that upstream. Cheap boats were built on the upper waters of every large river, floated downstream with their produce, and then sold with their cargoes or abandoned. Previous to the year 1817 the whole commerce from New Orleans to the upper country was carried in about 20 barges, averaging 100 tons each and making but one trip in each year.

The first steamboat built in the Mississippi valley was the *New Orleans*, built at Pittsburgh in 1811. She was 138 feet long, had a capacity of 300 or 400 tons, and cost \$38,000. The sixth boat, the *Zebulon M. Pike*, built in 1815, was the first to ascend the Mississippi above the mouth of the Ohio and the first to touch at St. Louis (1817). By 1819, 63 boats had been built, and this indicates the rapidity with which the new form of navigation was being developed. The boats varied in size from 25 to 700 tons, but most of them ranged from 80 to 300 tons, the most popular size being 150 tons. The Cincinnati and Louisville Mail line, the first line of steamboats organized in the Mississippi valley, was established in 1818. Details of the first 63 boats built on the Mississippi and its tributaries are given in Scharf's *History of St. Louis* (Philadelphia, 1887).

On Jan. 1, 1834, an official list gave the total number of steamboats as 230, with an aggregate tonnage of 39,000. The capital invested was estimated at \$3,000,000. Of this number, 36 steamboats of over 200 tons plied between New Orleans and Ohio River points with an aggregate tonnage of 12,686.4 in the St. Louis trade with an aggregate tonnage of 1002.7 in the cotton trade with an aggregate tonnage of 2016; 57 boats, not in established trades, from 120 to 200 tons, aggregated 8641 tons, 126, under 120 tons, in various trades, aggregated 14,655 tons; grand total, 39,000 tons. Besides the steamboats it was estimated that 4000 flatboats annually descended the river, having an aggregate tonnage of 160,000. The total number of steamboats built from 1811 to Jan. 1, 1834, was 573; the difference between that number and the 230 in service represents the number worn out and lost, principally the latter.

In 1842 the number of steamboats employed in navigating the Mississippi and its tributaries was estimated at 450 with an average capacity of 200 tons each, making an aggregate of 90,000 tons. The cost of these boats was estimated at \$7,000,000, and the number of men operating them at 35,000. The first company organized to operate a line of steamboats on the upper Mississippi was established that year. The number of steamboat arrivals at St. Louis during the year 1842 was 2412, with 467,824 tons, besides 801 flatboats and exclusive of the daily packets to Alton. At New Orleans the number of arrivals was smaller, but the tonnage was larger—550,500 tons, valued at \$50,000,000. The number of steamboats lost each year was surprisingly large. In 1846, 36 vessels were lost, of which 24 were sunk by snags and submerged rocks and the remainder by fire, explosion, and collision. During the same year 108 new boats were built with a tonnage of 51,660 at a cost of \$1,450,000.

The transportation of coal down the Ohio and

Mississippi, which was destined to develop into such large proportions, began in a small way in the early forties. In 1844 it amounted to 737,000 bushels; in 1845, 4,605,000, in 1850, 12,298,000; in 1860, 37,948,000; in 1870, 57,596,000; in 1880, 84,048,000; in 1886, 109,895,000.

The official returns of St. Louis for the year ending June 30, 1853, show 3307 arrivals with a tonnage of 45,401. This was exceeded only by the tonnage of New Orleans and New York. In consequence of an unusual low-water season in 1860, freight rates on the upper Mississippi, Missouri, and Illinois ruled very high, and the number of marine disasters reached the astounding total of 299. This was followed by a general paralysis of all industries and commerce during the next four years, so that after the Civil War it was necessary to start all over again. In this rebuilding most of the steamboats and barges were built of larger proportions than before the war.

The rise and decline in river traffic is well shown in the accompanying extracts from the annual reports of the Merchants Exchange of St. Louis

river terminals maintained by the municipalities for the use of all boats, (2) the operation in each line of a large number of boats by companies with ample capital working in cooperation with the railroads; (3) the separation of freight and passenger traffic, using fast steel packets with modern accommodations for passenger service and powerful and efficient towboats with covered steel barges for freight traffic.

* Approximate.

There was a decline in river commerce from 1870 to 1877, followed by a revival for a few years, since which there has been a steady decline. The decline on the Ohio and lower Mississippi has also been quite marked, but not to so large a degree as at St. Louis. The freight delivered at New Orleans by river in 1909, expressed in tons, was as follows: coal, 740,000; lumber, 110,000; gravel, 150,000; cotton, 60,000; oil, 40,000; provisions, 38,000; iron and steel, 15,000; passengers, 5000.

The cause of the decline in river commerce is a mooted question. Primarily it has been due to the more efficient service rendered by the railroads, combined with rate cutting by the railroads in favor of river towns. The latter practice was stopped by the Interstate Commerce Commission, but the damage was already done. To the above must be added (1) uncertainty and irregularity of service, (2) instability of rates; (3) short life of the individual steamboat; (4) lack of effective line organization, (5) extravagance engendered by early prosperity. The likelihood of a revival of river commerce is also a mooted question. If it is accomplished, as many hope and believe it will be, it will no doubt be along the lines successfully adopted in Europe: (1) ample and efficient

MISSISSIPPI SCHEME. A gigantic banking and commercial scheme projected in France by the celebrated Scottish financier John Law (q.v.), at the beginning of the reign of Louis XV. The primary object of the scheme was to resuscitate the French finances by removing some of the debt and disorder which had followed on the wars of Louis XIV. Money was to flow into France by developing the resources of the Province of Louisiana and the country bordering on the Mississippi—a tract at that time believed to abound in the precious metals. The company was incorporated in 1717, under the designation of the *Compagnie d'Occident*, and started with a capital of 100,000,000 livres. Two hundred thousand shares were placed on the market and eagerly bought up. The company obtained exclusive privileges of trading to the Mississippi for 25 years, of farming the taxes, and of coining money. In 1718 the company changed its name to the *Banque Royale*, and the King guaranteed the notes. In 1719 it obtained a monopoly of trading to the East Indies, China, the South Seas, and all the possessions of the French East India Company, and the brilliant vision opened up to the public gaze was irresistible. The *Compagnie des Indes*, as it was now called, created 50,000 additional shares, but there were at least 300,000 applicants for these, and consequently shares rose to an enormous premium. The public enthusiasm became absolute frenzy, and while confidence lasted, a fictitious impulse was given to trade in Paris, the value of manufactures was increased fourfold, and the demand far exceeded the supply. The population of Paris is said to have been increased by hundreds of thousands, many of whom were glad to take shelter in garrets, kitchens, and stables. But the Regent Orléans had meanwhile caused the paper circulation of the national bank to be increased as the Mississippi scheme stock rose in value, and paper currency to the face value of 2,700,000,000 livres flooded the country. The result was that many wary speculators, foreseeing a crisis, secretly converted their paper and shares into gold, which they transmitted to England or Belgium for security. The increasing scarcity of gold and silver in France becoming felt, a general run

was made on the national bank, which in February, 1720, had been incorporated with the *Compagnie des Indes*. On May 21 the government issued an edict which reduced the value of bank notes and of shares in the company by one-half. Law was now Comptroller General of the Finances, and he made several unavailing attempts to mend matters. Those suspected of having more than a limited amount (fixed by a law passed at the time) of gold and silver in their possession, or of having removed it from the country, were punished with the utmost vigor. The final crisis came in July, 1720, when the bank stopped payment, and Law was compelled to flee the country. A share in the Mississippi scheme now with difficulty brought 24 livres. An examination into the state of the accounts of the company was ordered by the government, much of the paper in circulation was canceled, and the rest was converted into stock.

MISSISSIPPI SOUND. A lagoon-like strait, 5 to 10 miles wide, washing the coasts of Alabama and Mississippi from Mobile Bay to the entrance of Lake Borgne, a distance of about 70 miles (Map Mississippi, H 10). It is formed and separated from the Gulf of Mexico by several long and narrow islands or sand bars, one of which is fortified. It is generally tranquil, has a depth of from 6 to 10 feet, and is navigated chiefly by the steamers and coasting vessels running between Mobile and New Orleans by way of Lake Pontchartrain.

MISSOLOGHI, mī'sō-lōy'gē, or MESOLOGHI. One of the principal towns of western Greece, the capital of the Nomarchy of Aetolia and Etolia (Map Greece, C 5). It is situated on the north shore of the Gulf of Patras, in a marshy and unhealthy locality. The harbor is shallow and inaccessible for large vessels. The town is the seat of an Archbishop. It has a statue of Lord Byron, who died here in 1824, and a mausoleum which contains the heart of the poet. The town is famous as the chief western stronghold of the Greek patriots during the war of liberation (1822-26). Under Markos Bozzaris it withstood a siege by the Turks in 1822, and again from 1825 until April, 1826, when the survivors of the garrison destroyed the town and cut their way through the Turkish lines. Outside the gates stands the *Heroon*, or burial place of those who died during the defense. In May, 1829, the town was evacuated by the Turks and restored to Greece. Pop., 1896, 8394; 1907, 10,702.

MISSOULA, mī-sōō'la. A city and the county seat of Missoula Co., Mont., 125 miles by rail west by north of Helena, on the Missoula River and on the Northern Pacific and the Chicago, Milwaukee, and St. Paul railroads (Map Montana, C 3). It is the seat of the State University, contains Fort Missoula, and has a Carnegie library, attractive Federal building, high school, and two hospitals, one maintained by the Northern Pacific Railroad. The city is in a farming and fruit-growing, lumbering, and mining region, for which it is an important distributing centre, and controls a considerable trade in grain, fruit, and produce. There are large lumber mills, a brewery and bottling works, and railroad shops of the Northern Pacific. Founded in 1804, Missoula was first incorporated in 1887, and has adopted the commission form of government. Pop., 1900, 4366; 1910, 12,869; 1914 (U. S. est.), 16,492.

MISSOURI, mī-sōō'ri or mī-sōō'ri; locally

often mī-zōō'rū. A State of the American Union occupying a central position in the great interior lowland drained by the Mississippi and its tributaries. It lies a little to the east of the geographic centre of the country. It is separated from Iowa on the north by the parallel of 40° 30' N. and from Arkansas on the south by that of 36° 30' N. Its most easterly point lies in long. 89° 53' W. Its east boundary is an irregular line marking the middle of the Mississippi River channel as it was at the time the boundary was defined, even though this is not in all cases the middle of the channel at the present time. This boundary separates the State from Illinois, Kentucky, and Tennessee. North of Kansas City the west boundary is formed by the Missouri River channel, with exceptions as just noted along the east boundary, and south of that point by the meridian of 94° 43' W. This line separates the State from Kansas and Oklahoma. Its land area is 68,727 square miles.

Topography. The area of the State includes portions of three of the great topographic provinces of the United States, which may be designated as the prairie plains, the Ozark region (Appalachian province), and the coastal plain. These provinces are differentiated on the basis of existing topography and of history of natural evolution. The prairie plains occupy all of the northern part of the State except a narrow belt along the Missouri River east of Glasgow and one along the Mississippi in Marion, Pike, and Lincoln counties. They occupy the western part of the State west of a line running approximately from Glasgow through eastern Pettis, western Cedar, the southeastern corner of Barton, and the middle of the west boundary of Jasper counties.

Along their eastern border their upland surface lies at elevations ranging from 750 to 900 feet. Westward, leaving out of consideration the valleys, the elevation across the northern tier of counties increases gradually to about 1100 feet in Mercer County, west of which there is a very gradual decline to about 950 feet along the Missouri River bluffs. Westward along the southern counties, however, the elevation remains constant to a north-south line through Richmond, Braymer, Trenton, and Ravanna, along which there is an abrupt rise of about 100 feet. West of this there is a slight decline to the Missouri River bluffs. Along the Mississippi there is a narrow belt of sharply dissected country, best described as hilly. West of this and east of the Wabash Railway through Moberly, Macon, and Kirksville the topography consists of rather broad flat or undulating plains on the watersheds with belts of low hills bordering the valleys. West of the Wabash Railway all of the northern part of the State is essentially a rolling to undulating plain. Areas of flat upland are few and small. South of the Missouri River the prairie plains consist of a smooth to undulating eastern belt and a rolling western belt. The boundary between them runs approximately from Lexington through Odessa and Pleasant Hill and across the northwest corner of Bates County. Along this line there is a rise of about 150 feet from the lower eastern to the higher western belt. North of the Missouri River the surface of the prairie plains has a thin veneer of glacial material which does not occur south of the river. It does not, however, change the essential features of the topog-

raphy from what they would be if the veneer were removed. The Ozark region occupies all that part of the State not occupied by the prairie plains except the area south of Cape Girardeau and Poplar Bluff. It is essentially a plateau which slopes gently and almost imperceptibly to the surrounding country. Its upland surface ranges in elevation, except around the border, from about 1200 feet in the eastern and central part to 1700 feet in the southwestern part. Its typical plateau surface is interrupted in iron and adjoining counties by a number of low blunt peaks and short rounded ridges of hard igneous rocks known as the St. Francis Mountains. The plateau surface would be smooth but for the great number of valleys that traverse it. These have made of it a hilly country as a whole. The portions with the greatest number of, the deepest and most sharply cut, valleys are the White and Current River basins, the lower Niangua, and the Central Osage and Gasconade basins. The valleys reach a maximum depth of about 500 feet in the White and part of the Niangua basins and 350 feet or more in the others. In other basins besides those mentioned the valley depths are less, but usually the valley borders are very hilly. There are several rather small areas, however, that are not yet invaded by valley-making forces. The most important of these are the Salem-Rolla, the Lebanon, the Eldon, the Owensville, and the Springfield areas. The coastal plain in Missouri lies in the extreme southeastern part. It barely exists as a true coastal-plain area, most of it having been converted long ago into broad, level river valleys. The true coastal plain exists only in a narrow ridge broken into two parts known as Crowley and Benton ridges. The former runs southward through Stoddard and Dunklin counties, the latter lies in Scott County. The coastal-plain ridges are less than 150 feet high and have a rolling upland surface. The rest of the area in the State south and east of the Ozark boundary, running through Cape Girardeau, Mingo, Poplar Bluff, and Naylor, is flat alluvial land. From the foregoing it will be seen that the topography of the State, leaving the valleys out of consideration, is of plains varying in elevation. Their original surfaces have been almost completely destroyed by the cutting of valleys in them. The later, except the short ravines, are almost invariably flat-bottomed and floored with alluvial deposits. They are broadest in the coastal-plain region, reaching a maximum width of about 40 miles. In the Ozark region they are rarely more than half a mile wide, and in the prairie region they range up to a maximum, along the large rivers, of about 5 miles.

Hydrography. The State is drained by streams flowing eastward into the Mississippi River either directly or through the Missouri and Arkansas. The river systems are well developed and reach effectively practically all the upland area of the State. Swamps due to imperfectly developed river systems like those in the recently glaciated areas of the Northern States do not exist. The nearest approach to such conditions occurs on the nearly flat watershed ridges, or plains remnants, in the northeastern part of the State. They are not swampy, however.

Geology. In age the consolidated rocks underlying the area of the State are Archean, Paleozoic, and Cenozoic. In mineralogical character

they have a relatively wide range. The rocks of the Ozark region are predominantly limestones. The small area of the St. Francis Mountains is underlaid by igneous rocks consisting of granites and fine-grained eruptives mainly acidic. At one point, the extreme summit of Pilot Knob in Iron County, there is an area of slates, conglomerates, and iron ores that may be Algonkian in age. At a few points and in small areas sandstones occur among the predominant limestones in the Ozark plateau. The Ozark limestones are almost invariably cherty. The rocks underlying the prairie region are predominantly shales, interbedded with limestone and sandstone beds, all of Paleozoic age. The coastal-plain rocks, only partially consolidated, consist of shales, clays, and sands, presumably of Tertiary age. The unconsolidated rock material of the State is of Glacial age north of the Missouri River, of recent but undetermined age south of the same stream, and of recent age in the valleys. The glacial material is predominantly a sandy clay with a layer of silty material overlying it, the origin of which is yet undetermined. The unconsolidated material in the prairie region south of the Missouri consists mainly of clays and silts derived from the decay of rock in places similar to those on which it lies. In the Ozark region it consists mainly of red clay and silt filled with fragments of stone, mainly chert. The alluvial material ranges from clay to sand.

Climate. Missouri lies in the milder half of the warm temperate zone. Being far inland, the State is subject to the extremes of a continental climate, which are all the more accentuated by the fact that it is in the path of frequent cyclonic storms. The average January temperature ranges from 35° F. in the southeastern to 20° F. in the northwest corner. For July the temperature is 80° F. in the extreme south and 75° F. in the extreme north. The average date of the last killing frost in spring is about the middle of April, though it may occur as late as the middle of May. The average date of the first killing frost in the fall is about the middle of October, though it may occur as early as September 25. The average length of the growing season is about 180 days, with a minimum of about 130 days. The different parts of the State do not differ widely in these respects, though the southeastern lowlands are considerably milder than the rest of the State. In summer the mercury sometimes rises to 105° F., while the anticyclones of winter carry the minimum of 10° below to the southern border and 20° below to St. Louis, thus giving that city an annual range of 125°. The southeastern extremity of the State has not a day in the year with the average temperature below freezing, but the record rises rapidly northward, there being 30 such days in Springfield, 60 at Jefferson City, and 90 at Rockport. The summers are pleasantly tempered in the Ozark plateau.

The rainfall ranges from 35 inches per year in the north to 50 inches at the Arkansas line. While this is well distributed through the year, there is a marked minimum in the winter season and maximum in the summer season. Droughts lasting 30 days sometimes occur. Snow falls on the average to the depth of 20 inches in the latitude of St. Louis and less than 10 inches at the Arkansas line, though it rapidly disappears and seldom covers the ground many days. The average relative humidity for the

year is less than 70 per cent over the whole State. The prevailing winds are west and northwest in January and south in July. There are on the average 30 thunderstorms in the year, with a maximum frequency in June.

Soils. The soils vary with the underlying character of the rock, the topography, and the drainage. In the Ozark region they are gray, brown, or red in color, rarely black, and are well drained in both soil and subsoil. The texture of the fine material is usually fine grained, silt loams predominating in the soils and silty clays in the subsoil. They are rather stony, and occur, as a rule, on a rolling to rather rough topography, the stone content being predominantly chert. The gray soils are usually deficient in lime while the red soils and the subsoils carry a fair amount. In the prairie region the soils are rather light in color in the eastern part, becoming darker westward and northward. They are, as a rule, somewhat heavier than the Ozark soils, are practically stone free, have good surface drainage except on flat areas, and have a moderate lime content except the soils on the flat areas in the eastern part. The subsoils, except the Missouri River belt, are heavier than the soils. In most of the prairie region the soils are dark enough to be called black. In the southern part, the soils are mostly alluvial and, like these soils in all other parts, are fertile. They are predominately brown in color and range from clays to sands in texture.

Large areas need artificial drainage, and this is rapidly being furnished. The soils in Crowley and Benton ridges are brown silt and clay loams, much like the river bluff soils farther north.

Vegetation. See *Forest Products*, below.

Mining. The principal mineral products of Missouri are spelter (zinc) and lead, in which it ranks first among the States. It leads in the production of barytes and tripoli and ranks second in the production of mineral paints. The combined value of spelter and lead represents about 60 per cent of the entire mineral output of the State. From 40 to 45 per cent of both the spelter and the lead produced in the United States comes from Missouri. The lead ores of Missouri carry very little silver, and the lead produced is known as "soft lead." The principal lead-producing counties are St. Francois and Madison. The southeast Missouri lead region has made the greatest gains in production of all the lead-producing districts of the United States and since 1908 has annually exceeded the production of the Cœur d'Alene region in Idaho, which formerly held first rank. The ore of the southeast Missouri region is almost wholly lead ore, although, particularly in the southern portion, there are in many places considerable copper, nickel, and cobalt mixed with the lead. The total output of lead concentrates in 1913 was 255,723 short tons, valued at \$11,444,935. The recoverable lead content of Missouri ores amounted to 176,110 short tons, valued at \$15,498,208. Nearly all the production of sphalerite ores is in the Joplin district, in southwestern Missouri. The recoverable zinc content of the ores produced in 1913 amounted to 124,963 short tons of metal, valued at \$13,995,856. The mining of coal ranks third among the mineral industries. Missouri was the first State west of the Mississippi River to enter this field, and in 1840 produced 9772 short tons.

The industry, however, has shown little progress as compared with neighboring States, owing to the competition of the oil and gas fields of Kansas and Oklahoma and the more cheaply mined coal of Illinois and other States. The coal-producing area lies entirely north and west of a line drawn from the northeastern to the southwestern corner. The coal production in 1913 was 4,318,125 short tons, valued at \$7,468,308. The occurrence of coal in Missouri appears to have been known as early as 1806, when it was noted by Zebulon M. Pike on the banks of the Osage River. Clay products are fourth in value of the mining industries. While ranking seventh among the States in the total value of its clay products, it ranks second in the manufacture of fire brick. The chief centre of this industry is the immediate vicinity of St. Louis. The refractory brick made in Missouri are of especially high grade, and the average price of its fire brick is higher than that of any other State with the exception of New Jersey. The total value of clay products in 1913 was \$6,602,076. Portland cement is another of Missouri's important mineral products. In 1913 the production amounted to 4,485,820 barrels, valued at \$4,556,822. Cement plants are located near St. Louis and Kansas City and also at Hannibal and Cape Girardeau. The quarry products, chiefly limestone, were valued at about \$2,538,699. A comparatively large quantity of lime is produced. This in 1913 amounted to 161,770 short tons, valued at \$734,009. Sand and gravel are also important mineral products. Other mineral products are copper, occasional gems, iron ore, mineral waters, natural gas, pyrite, and silver. The total value of the mineral products in 1913 was \$54,001,088.

Agriculture. Of an approximate land area of 43,985,280 acres in 1910, 34,591,248 acres were in farms, of which there numbered 277,244. The improved land in farms amounted to 24,581,186 acres, or 56 per cent of the total area. The average acres per farm were 1248 in 1910, and the total value of farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$2,052,917,488. The average value of all farm property was \$7405 in 1910, and the average value of land per acre \$41.80, an increase per farm of \$21.34 over 1900. Of the total number of farms in 1910, 194,286 were operated by owners and managers. There were, in 1910, 259,111 native white farmers, 14,467 foreign-born white, and 3666 negro and other nonwhite. Of the foreign-born white farmers 8453 were born in Germany.

The following table shows the acreage, production, and value of some of the principal crops in 1914. The figures are estimates of the United States Department of Agriculture.

PRODUCTS	Acreage	Prod bu	Value
Corn	7,200,000	158,400,000	\$107,712,000
Wheat	2,549,000	43,333,000	42,466,000
Oats	1,200,000	25,800,000	11,352,000
Rye	17,000	238,000	207,000
Potatoes	87,000	3,915,000	2,858,000
Hay	2,600,000	*1,820,000	24,752,000
Tobacco	4,100	†4,920,000	640,000
Cotton	122,000	‡75,000	2,336,000
*Tons †Pounds ‡Bales			

The total value of crops in 1909 was \$220,664,000 and the combined acreage was 14,335,588,

representing 58.3 per cent of the total improved land in farms. The general character of agriculture is indicated by the fact that about two-thirds of the total value of crops in 1909 was contributed by cereals and 15.3 per cent by hay and forage. The remainder consisted chiefly of potatoes and other vegetables, forest products, and fruits and nuts. The leading crops in 1909 in order of their importance as judged by value were corn, hay and forage, wheat, oats, potatoes, and cotton. Corn, the most important crop, had an acreage of 7,113,953 in 1909. The production was 191,427,007 bushels, valued at \$107,347,033. Hay and forage had an output valued at \$33,845,000, the acreage being 3,628,348. In that year wheat, the third important crop, had an acreage of 2,017,128 and an output valued at \$29,926,000. The acreage of cotton in 1909 was 96,527, from which were produced 54,498 bales, valued at \$3,392,440. The total acreage of potatoes and other vegetables in 1909 was 233,767 and their value \$13,305,829. Excluding potatoes and sweet potatoes and yams, the acreage of vegetables was 129,570 and their value \$8,268,000.

The production of orchard fruits, chiefly of apples, is an important agricultural industry. The total quantity grown in 1909 was 11,957,399 bushels, valued at \$6,582,578. Of the total production apples contributed 9,968,977 bushels, with a value of \$4,885,544. Other important orchard fruits are peaches and nectarines, pears, plums, prunes, and cherries. The production of grapes in 1909 was 17,871,816 pounds, valued at \$488,765. Of small fruits the most important is the strawberry, of which 15,171,034 quarts, valued at \$1,122,784, were grown in 1909. The total production of small fruits was 23,696,221 quarts, valued at \$1,761,409. Sorghum cane is produced in important quantities. This in 1909 amounted to 201,206 tons, and from it were made 1,788,391 gallons of sirup, valued at \$876,970. Tobacco is an important product in some portions of the State. In 1909, 5433 acres were planted to tobacco, and the production was 5,372,738 pounds, valued at \$636,479.

Live Stock and Dairy Products.—The total value of domestic animals of all kinds on the farms in 1909 was \$273,366,662. Missouri has always been noted for the quantity and value of its mules. On Jan. 1, 1915, it was estimated that there were 1,414,000 cattle other than milch cows, valued at \$53,591,000; milch cows numbered 747,000, valued at \$43,436,000; horses, 1,095,000, valued at \$96,360,000; mules, 329,000, valued at \$32,242,000; sheep, 1,490,000, valued at \$7,450,000; swine, 4,250,000, valued at \$34,425,000. The total value of milk, cream, and butter fat sold and butter and cheese made in 1909 was \$13,685,318. There were sold 15,733,185 gallons of milk and 14,646,771 pounds of butter. The total number of fowls of all kinds in 1910 was 20,897,208, valued at \$11,870,972.

Forest Products. The timber lands north of the Missouri River are restricted mostly to the river valleys, while the Ozark region south is normally a forest area of largely mixed hardwoods, thinning out westward. The forest area in 1908 was 28,600 square miles, or 42 per cent of the total. The logging and milling operations are confined largely to the wooded Ozark region of southern Missouri, while many of the planing mills and box factories are located in the larger cities. With the exception of the boot and shoe factories the

lumber industry gives employment to more persons than any other industry. The fertility of the soil gives the hardwoods a decided advantage over evergreens in most parts of the State. There is only one pine (short-leaf, *Pinus*

facilities, are factors favorable to the growth of their manufacturing industries.

The table below gives the most important figures relative to the 10 leading industries in 1909 and 1904.

SUMMARY OF MANUFACTURES FOR 1909 AND 1904

THE STATE — TEN LEADING INDUSTRIES

INDUSTRY	Census	Number of estab-lish-ments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manufac-ture
			Total	Wage earners (average number)				
All industries	1909	8,375	185,705	152,993	\$444,343	\$80,843	\$574,111	\$219,700
	1904	6,464	156,585	133,167	379,369	66,641	439,549	187,291
Boots and shoes, including cut stock and findings	1909	59	18,665	17,396	15,838	8,164	48,751	14,211
	1904	37	10,949	10,451	8,290	4,349	23,541	8,588
Bread and other bakery products	1909	954	6,797	4,743	17,043	2,487	18,524	7,695
	1904	614	4,962	3,761	7,416	1,816	12,672	5,391
Clothing, men's, including shirts	1909	84	8,667	7,994	8,109	2,994	15,407	6,336
	1904	73	6,500	6,070	5,037	2,098	10,329	4,786
Coffee and spice, roasting and grinding	1909	40	1,376	730	5,273	342	12,062	2,870
	1904	26	960	554	3,129	268	7,264	2,119
Flour-mill and gristmill products	1909	680	3,602	2,198	17,066	1,040	44,508	5,682
	1904	582	3,555	2,345	14,834	1,091	38,026	5,098
Foundry and machine-shop prod-ucts	1909	329	9,051	7,443	20,870	4,860	19,975	10,819
	1904	256	8,331	7,155	14,102	4,274	14,692	8,619
Liquors, malt	1909	31	6,348	5,616	44,662	3,908	27,447	19,870
	1904	50	6,202	5,568	43,620	3,408	24,154	17,902
Lumber and timber products	1909	1,098	15,814	13,522	18,930	5,897	23,261	12,647
	1904	495	14,057	12,664	13,688	5,512	18,319	11,932
Printing and publishing	1909	1,322	15,792	10,790	21,998	6,610	29,651	21,024
	1904	1,253	13,912	9,757	16,358	5,330	21,412	17,611
Slaughtering and meat packing	1909	45	5,529	4,671	18,787	2,673	79,581	7,383
	1904	38	4,862	4,236	16,449	2,381	60,110	6,011

echinata), and that is chiefly confined to the Ozark region. One other evergreen, the cedar, is widely distributed over the State, but not very abundant, and cypress, a deciduous conifer, is found in considerable quantities in the alluvial bottoms in the southeast. The remainder of the forest is made up of hardwoods. The thirteenth census reports 2076 saw mills in Missouri, with the following production of lumber, lath, and shingles for 1909, in M feet, B. M.: *Conifers*—pine, 142,271; cypress, 32,891. cedar, 2984. *Hardwoods*—oak, 271,623. red gum, 83,905. hickory, 33,259; elm, 27,913. cottonwood, 17,987. ash, 12,685. sycamore, 10,526. maple, 10,376. tupelo gum, 4351. walnut, 4314. yellow poplar, 1791. birch, 1115. basswood, 1990. all others, 1078. Total, 660,159 M feet, valued at \$10,041,472. The total value of manufactured products in 1909 was \$23,261,000. In addition to the figures above there were produced on the farms of the State in 1909 forest products valued at \$8,406,823.

Manufactures. Missouri's prominent industrial position is due largely to the activity of the industries of St. Louis and Kansas City. It ranked well in manufactures as early as 1849, in which year it was tenth in value of products. In 1909 it held the same relative position. In that year the gross value of products per capita was \$174. Its abundant mineral supply has resulted in the development of such industries as smelting and refining copper, lead, and zinc, marble and stone work, iron and steel blast furnaces, kaolin and ground earths, glass, and paints. Extensive timber areas have provided abundant material for the development of the lumber and timber industries. The location of the cities in the midst of a great agricultural region and their proximity and access to raw materials, as well as their excellent shipping

The most important industry is that connected with slaughtering and meat packing. Missouri is located in the centre of a hog-raising area, it is one of the great corn-growing States and has extensive feeding and grazing areas for cattle in the prairies of the north and for sheep in the Ozarks of the south. These features have been very important factors in the development of this industry. The total number of hogs slaughtered in 1909 was 2,471,658, valued at \$36,911,941. In addition there were 530,356 beefs slaughtered, valued at \$24,332,919. 81,551 calves, valued at \$821,829, and 546,649 sheep, valued at \$2,659,215. The manufacture of boots and shoes, which was second in importance in 1909, measured by value of product, has shown a remarkable development. As a result of this pronounced growth Missouri became second in the industry in 1909. The industry gave employment to more wage earners than any other in 1909, and is not confined to the larger cities, but exists in many small cities and towns. In 1909, 24,657,160 pairs of boots and shoes were made. The manufacture of flour-mill and gristmill products occupied third place in value of products in 1909. Most of the mills are small and are located in the rural districts, but there are several very large mills in the cities. There were produced, in 1909, 5,661,379 barrels of white flour, valued at \$29,995,104. The manufactures of graham flour, corn meal and corn flour, and feed are also important. One of the distinctive industries of the State is the manufacture of smoking pipes. The world's supply of corn-cob pipes is manufactured largely in Missouri.

There was in 1909 an average of 152,993 wage earners, of whom 122,266 were males. The wage earners 16 years of age and under numbered 3818, of whom 2280 were males. For

nearly three-fourths of the wage earners employed the prevailing hours of labor range from 54 to 60 a week. The most important manufacturing city is St. Louis. There were in this city, in 1909, 87,371 wage earners, and the value of its manufactured products was \$328,495,313. St. Louis (q.v.) held in 1909 fourth place in the value of manufactured products among the cities of the United States and third place in the manufacture of boots and shoes. All of the tanneries, the baking-powder establishments, and practically all of the soap works of the State are located here. There were in Kansas City (q.v.), in 1909, 14,643 wage earners, and the value of its manufactured products was \$54,704,510. St. Joseph (q.v.), the third city in manufacturing rank, had, in 1909, 5390 wage earners and a product valued at \$17,625,682.

Transportation. Missouri is one of the leading States in mileage of navigable rivers. It is also well equipped with transportation facilities by land. The northern half is covered by a network of railroads. In the southern half, however, the mileage is small and a number of counties have no railroad communication. The northern half has the advantage of lying in the course of some of the great transcontinental lines and is less broken than the southern part. St. Louis, Kansas City, and St. Joseph on the western border are large railroad centers. The railway mileage was 8153 in 1913. The chief lines are the Missouri Pacific, the Atchison, Topeka, and Santa Fe, the St. Louis and San Francisco, the Kansas City Southern, the Chicago, Burlington, and Quincy, the Chicago and Alton, the Wabash, and the Missouri, Kansas, and Texas. Railroad rates are in charge of the Board of Railroad Commissioners, who hear and determine complaints against the railroads, but their decision is subject to revision by the courts. There is a large amount of water traffic between St. Louis, the terminal for the larger steamers, and the Gulf. Competition of the railroads, however, is tending to decrease this. The grain and animal produce of the West reaches its market in great part by way of Missouri. The mileage of electric railways in 1912 was 852. The total number of companies operating electric roads in that year was 19.

Banks. The Bank of St. Louis, chartered in 1813 and opened in 1816, was the first in the State. It went into liquidation in 1819. Next came the Bank of Missouri, which opened in St. Louis in 1817 and failed in 1822. This left the State without any chartered banks until 1829, when the United States Bank opened a branch in St. Louis. The branch was discontinued in 1833. The Bank of the State of Missouri, chartered in 1837, was a large institution with five branches in the State and was a bank both of issue and of discount. For 20 years it had almost a monopoly of the banking business, but its circulation was insufficient and in 1857 seven more banks of issue were chartered. Many more followed. All were forced to conform to the law which allowed the issue of only three dollars for every dollar specie. The law of 1857 provided also for a bank commissioner, who should visit and examine the various institutions. This office was soon abolished and there sprang up a number of small speculative banks, all of which collapsed in the panic of 1873. The system of national banking extended

very slowly, but the largest institutions sooner or later became the national banks. In 1868 the St. Louis Clearing House Association was organized with 35 members. Trust companies were first formed in 1889 and became very popular. There always have been many banks bearing the word "savings" in their titles, but none of them conformed to the general plan of a savings bank. In September, 1914, there were 130 national banks, with an aggregate capital of \$35,570,000. Their combined surplus was \$15,986,118; cash, etc., \$7,832,484; loans, \$306,486,630; and deposits, \$143,165,947. The State banks on June 30, 1914, numbered 1250. Their combined capital was \$34,845,350; surplus, \$18,552,198; cash, etc., \$11,245,644; loans, \$208,877,432; and deposits, \$207,570,909. Bank clearings at St. Louis in 1914 amounted to \$4,051,000,000 and at Kansas City to \$3,015,810,567. In 1914 Federal Reserve Banks were located at these cities.

Government. The present constitution, which has been amended in important details, was adopted in 1875. Amendments must be passed by a majority of the members of each House of the General Assembly, after which they are submitted separately to the people at the next general election. The General Assembly may also at any time authorize a vote of the people to be taken upon the question whether a constitutional convention shall be held.

Legislative.—The legislative power is vested in a Senate and a House of Representatives, called the General Assembly. The House of Representatives consists of members chosen every second year, who are apportioned according to the population of the counties. A representative must have attained the age of 24 years and have been a qualified voter for at least two years. The Senate consists of 34 members, chosen from districts of approximately equal population. Senators must be at least 30 years of age and qualified voters for three years. The initiative and referendum were adopted by a constitutional amendment in 1908.

Executive.—The executive department consists of a Governor, Lieutenant Governor, Secretary of State, State Treasurer, State Auditor, Attorney-General, and Superintendent of Public Schools, all of whom, except the Lieutenant Governor, must reside at the seat of government during their term of office. The supreme executive power is vested in the Governor. He must be at least 35 years of age at the time of his election, have been a citizen of the United States 10 years and a resident of the State seven years next before his election. The Governor and Treasurer are ineligible for reelection. The term of all the executive officers is four years.

Judiciary.—The judicial power is vested in a supreme court, courts of appeals, circuit courts, and others of minor importance. The supreme court consists of seven judges and is divided into two divisions. The courts of appeals consist each of three judges who are elected by the qualified voters of the appellate district for a term of four years. Separate and district courts exist in each county, presided over by a circuit judge, although his circuits may comprise several counties. Judges of the circuit court are elected and hold offices for terms of six years. Each county has a probate court and a county court.

Suffrage and Elections.—Persons qualified to vote are males over 21 years of age who are

citizens of the United States or who have declared their intention of becoming such not less than one year nor more than five years preceding the election and who have resided in the county 60 days immediately previous to the day of election. General elections in the State are held biennially on the Tuesday next following the first Monday in November, dating from 1876. All elections must be by ballot. The Legislature of 1913 made important changes in the general election and primary laws. These amendments were embraced in 10 separate acts, the most important relating to primary elections. There is a stringent corrupt-practices act.

Local and Municipal Government.—The General Assembly has no power to establish any new county with a territory of less than 410 square miles. Municipalities are not permitted to subscribe to the capital stock nor aid corporations or institutions. Townships may be organized whenever a majority of the legal voters of the county shall so determine. Cities having a population of more than 100,000 may form a charter for their own government. These charters must provide for a mayor or chief magistrate, and two houses of legislation, one of which at least shall be elected by a general ticket. Provision is also made for adoption by cities and towns of a commission form of government.

Other Constitutional and Statutory Provisions.—Imprisonment for debt is not permitted. Corporations cannot be created by special laws. Railroad companies may not charge for the transportation of freight or passengers a greater amount for a less distance than the amount charged for any greater distance. There is a blue-sky law, patterned after the Kansas statute. There is a white-slave act, conforming in its essential features to the Mann Act. The State is under local-option law, which permits the liquor question to be settled by a vote of the people in each county, excepting only from its operation cities containing a population of 2500 or more and permitting these to vote as separate units.

Finance. Missouri's first public debt was acquired in 1835, when it bought stock in the banks of the State. This amounted to \$1,397,000. Quite unlike many other States, it was not involved in financial difficulties due to its banking enterprises and was free from extensive debt up to 1850. Then began the era of speculative railroad construction, and within the next eight years many railroads were chartered, receiving from the State loans in the shape of guaranteed bonds amounting to about \$24,000,000. The railroads failed to pay the interest, and the State had to assume the entire debt, which amounted to \$27,370,000 in 1862. The debt remained above \$20,000,000 until 1880, but has been reduced, and in 1915 it was \$7,308,339. This is divided among the State school fund (\$3,159,000), the State seminary fund (\$1,239,839), and the capitol building fund (\$2,909,500). For the year ending Dec 31, 1914, the total receipts were \$10,540,264, the disbursements were \$9,618,813, and the balance in the Treasury was \$4,942,011.

Militia. The males of militia age in the State in 1910 numbered 721,866. The organized militia in 1914 consisted of a division of infantry, including the first, second and third, fourth and sixth regiments, a cavalry troop, two field artillery troops, a signal troop, and sanitary troop.

The strength of enlisted men was 3320 and of officers 256.

Population. The population at different periods is as follows: 1810, 20,845; 1820, 66,586; 1840, 383,702; 1850, 682,044; 1860, 1,182,012; 1870, 1,721,205; 1880, 2,168,380; 1890, 2,679,184; 1900, 3,106,665; 1910, 3,293,335. The estimated population on July 1, 1914, was 3,372,886. In 1910 Missouri ranked seventh in population. The white population was 3,134,932 in 1910. The foreign-born white population was 228,896, and the negro population, which is confined largely to the Missouri and Mississippi River counties, was 157,452. Of the foreign-born white the most numerous are Germans, followed by Irish, Russians, Italians, and Austrians. St. Louis was an early centre of German immigration, and the Germans still constitute over one-half of the total foreign-born population of that city.

Of the total population in 1910, 67.4 per cent were born in the State. Of the remainder 5.6 per cent were born in Illinois, 2.3 per cent in Kentucky, 2 per cent in Kansas, 2 per cent in Ohio, 1.9 per cent in Indiana, 1.8 per cent in Tennessee, 1.7 per cent in Iowa, nearly 1 per cent in Pennsylvania, less than 1 per cent in each of the other States, and 6.9 per cent in foreign countries. The population in places of 2500 or more in 1910 was 1,398,817. The rural population was 1,894,513. In 1910 there was an average of 47.9 persons per square mile, a greater density than is shown in any other State west of the Mississippi. There were, in 1910, 15 cities with a population of 8000 or over. The largest city, St. Louis, had in 1910 a population of 687,029 and in 1914 an estimated population of 734,667. Kansas City had in 1910 a population of 248,381 and in 1914 an estimated population of 281,911. Other large cities with their populations in 1910 are: St. Joseph, 77,403; Springfield, 35,201; Joplin, 32,073; Hannibal, 18,341.

Education. Educational problems of Missouri are in general those of other Southern States which have a large rural population. Persistent efforts have resulted in material improvement of conditions. The percentage of illiteracy among all classes was 4.3 in 1910, the number of illiterate persons of 10 years of age or over being 111,116. The percentage of illiteracy among native whites of native parentage was 3.4, among native whites of foreign or mixed parentage 1.2, among foreign-born whites 10.1, and among negroes 17.4. The improved condition of the colored population as regards illiteracy is particularly encouraging. In 1890, 41.7 per cent of the colored population was illiterate. According to the thirteenth census the total school population, ages 6 to 20 years, in 1910 was 993,998. Of these, 646,868 attended school in that year. The total school population of native parentage was 798,833, and the negro school population was 41,682. According to the report of the State Superintendent of Education the total school population in 1913 was 954,699, the total enrollment 690,484, and the average daily attendance 494,309. Female teachers numbered 14,148 and male 4706. The average salary of male teachers was \$497.60 per year and of female teachers \$484.44. On June 1, 1914, there were 165 first-class high schools, 55 second-class, and 141 third-class, making a total of 361 approved schools.

The General Assembly of 1909 provided county supervision of schools and a compulsory eight months' term in each school district. In 1911 a

teachers' certificate law was passed and provisions made for the transportation of pupils.

Agriculture is taught in the high schools. The total enrollment in the high schools in 1913 was 42,266. The average length of the school term in 1913 was 160 days. The estimated value of the school property for sites and buildings was \$41,829,767 and for school equipment \$3,605,681. The total expenditure for educational purposes in 1913 was \$16,402,780. There are normal schools at Cape Girardeau, Kirksville, Warrensburg, Springfield, and Maryville. Washington University is at St. Louis, the University of Missouri at Columbia, Missouri Wesleyan College at Cameron, Christian University at Canton, Central College at Fayette, Pritchett College at Glasgow, Missouri Valley College at Marshall, Scarritt-Morrisville College at Morrisville, Park College at Parkville, Drury College at Springfield, Tarkio College at Tarkio, and Central Wesleyan College at Warrenton. These are all coeducational. Colleges for men exclusively are Westminster College at Fulton, William Jewell College at Liberty, St. Louis University at St. Louis, and Christian Brothers College at St. Louis. The last two are Roman Catholic institutions. Colleges for women are Stephens College at Columbia, Howard-Payne College at Fayette, Synodical College at Fulton, Central College for Women at Lexington, Lexington College for Young Women at Lexington, Hardin College at Mexico, Cotter College at Nevada, Lindenwood Female College at St. Charles, and Forest Park University at St. Louis. Special schools include the State School for the Deaf at Fulton, Missouri School for the Blind at St. Louis, Missouri Training School for Boys at Boonville, and Missouri Training School for Girls at Chillicothe.

Charities and Corrections. The charitable and correctional institutions are under the control of the State Board of Charities and Corrections. This board, in addition to its other duties, serves as a bureau of information for those seeking knowledge of social questions. It employs a secretary, who devotes all his time to the study of social work and acts as an official agent for the board. The charitable and correctional institutions under the supervision of this board include hospitals at Fulton, St. Joseph, Nevada, and Farmington, the Industrial School for Girls at Chillicothe, Training School for Boys at Boonville, Colony for Feeble-Minded and Epileptic at Marshall, Missouri School for the Deaf at Fulton, Missouri School for the Blind at St. Louis, Federal Soldiers Home at St. James, Confederate Soldiers Home at Higginsville, State Sanatorium at Mount Vernon, and State Penitentiary at Jefferson City. Prior to 1911 convicts were employed under contract, although their work was confined to the prisons. In some of the counties male prisoners within the county jails were worked on the public roads or at quarrying stone. In the year mentioned a measure was passed forbidding the farming out or selling of convict labor. Convicts are allowed to work in the binding-twine plant and in manufacturing supplies for State institutions. These cannot be purchased elsewhere if they can be supplied by convict labor. The same Legislature passed a measure permitting counties with a population of 250,000 to 500,000 which have a juvenile court to appropriate not more than \$12,000 a year for the support of mothers of children under 14, who are widows or whose

husbands are prisoners and who would otherwise have to work away from their children. The only city to which this applies is Kansas City. Cities of 500,000 or more inhabitants are permitted to create a board of children's guardians to manage public institutions of the city for delinquent, dependent, or defective children. In counties with a population of 50,000 or more juvenile courts for children under 17 are established.

Religion. The two leading denominations, the Methodist and the Baptist, are of almost equal strength. The Roman Catholics also have a strong representation. Probably the most rapidly developing denomination is that of the Disciples of Christ. It ranks third among Protestant denominations. The largest of the remaining denominations are the Presbyterians, Lutherans, Protestant Episcopalians, and Congregationalists.

History. Missouri was part of the vast area of Louisiana claimed by the French on the ground of the discoveries of La Salle, who descended the Mississippi to its mouth in 1681-82. A few years before La Salle, in 1673, Marquette and Joliet had sailed down the river as far as the mouth of the Arkansas. The territory included within the present State was traversed before 1720 by parties of French explorers in search of mines of lead and silver, and in 1723 a certain Lieutenant Renaud received the grant of a large tract of land in that region. The foundation of St. Genevieve is sometimes placed in the year 1735. The second settlement within the State was St. Louis, established as a trading post in 1764, a year after the cession of Louisiana to Spain by the Peace of Paris. Many French residents removed from the villages east of the Mississippi to St. Louis, which became, under the French and the Spanish, a prosperous little capital. The colonization of the region was greatly accelerated by the Ordinance of 1787, which, in excluding slavery from the Northwest Territory, diverted the stream of southern immigration to Missouri. The Spaniards also encouraged immigration by the offer of liberal bounties to settlers. In 1800 Louisiana was retroceded to France, which, however, retained it only three years. After the acquisition of Louisiana by the United States, in 1803, the entire territory was divided in two by the line of the thirty-third parallel of latitude, the northern part being known as the District and Territory of Louisiana till 1812, and subsequently as the Territory of Missouri. At that time the population was over 20,000, and the chief occupations of the inhabitants were agriculture, fur trading, and mining. The mass of the people were sturdy and unrefined, the rough backwoodsman and the fighting Mississippi River boatman were picturesque types of the society of the period. After 1815 immigration increased markedly. In 1820 there were 66,000 inhabitants within the present limits of the State, of whom about 10,000 were slaves. The Indian titles to the land were extinguished rapidly. Between 1800 and 1824 the Osages and Sacs and Foxes ceded almost all their lands, though it was not till 1837 that the area of the State was rounded out by the so-called Platte Purchase.

In 1817 the Territorial Legislature applied to Congress for permission to prepare a State constitution. (For the struggle in Congress concerning Missouri, see UNITED STATES and

MISSOURI COMPROMISE.) In June, 1820, a convention framed a constitution which sanctioned slavery and forbade any free negro or mulatto to take up his residence in the State; but Missouri was admitted (Aug. 10, 1821) only after the Legislature had taken a pledge that the antifreedmen clause should never be enforced. The period after 1820 was one of rapid, if not entirely sound, development. An era of wild speculation in lands set in, accompanied by the usual inflation of the currency (the Bank of St. Louis had been established in 1816) and the inception of an elaborate system of internal improvements. Within 20 years after 1835 the State pledged its credit for \$28,000,000 to various railroad companies and found itself saddled with a debt of over \$20,000,000. The system of public education was quite inefficient before the Civil War, though St. Louis University had been incorporated in 1832 and the State University at Columbia eight years later. Respect for the law was often sadly wanting in the western part of the State, as was shown in the history of the Mormons. They had settled at Independence in Jackson County and had made the beginning of a prosperous community, when they were driven out by mob violence, for which it is probable they were less responsible than their enemies. They established themselves anew in Caldwell County; but there, too, they came into conflict with the authorities and the inhabitants, who forced them to depart once more in a destitute condition, leaving valuable farms and other property behind them. See **MORMONS.**

In the first half of the nineteenth century Missouri, though a slave State, was not an ardent defender of slavery, and a very large proportion of its citizens were interested in movements looking towards the gradual emancipation of the slaves. With the rise of the Abolitionists, however, Missouri became decidedly a proslavery State. It favored the annexation of Texas in 1845 and took a very prominent share in the Mexican War, General Kearny's army of invasion consisting largely of Missourians. In 1849 the Legislature adopted the so-called Jackson resolutions, in which the right of Congress to regulate slavery in the Territories was trenchantly denied, and the principle of squatter sovereignty was asserted. The Jackson resolutions, however, did not represent the unanimous feeling in the State when they covertly threatened secession. In the election of 1860 the vote in the State for Douglas and for Bell was nearly equal, while Breckenridge and Lincoln received a far smaller vote than the others. The Legislature thereupon issued a call for a convention to consider the relation of the State to the Union. In the elections for the convention the secessionist delegates were defeated by a popular majority of 80,000, and when the convention met—February to April, 1861—it declared that it could find no cause to dissolve the connection between the State and the Federal Union, and expressed the hope that some compromise might be effected between the North and the South. In reply to President Lincoln's call for troops, Governor Jackson, who, with the rest of the State government, was in favor of secession, refused to participate in the "unholy crusade" and summoned the State militia to arms. Between the State militia and the Federal troops, under Colonel Lyon, aided by the volunteer

bands which the loyalists of St. Louis had organized, civil war ensued. The Governor, together with a majority of the Legislature, fled to the southern part of the State, and the supreme power was assumed by the convention which declared all the offices vacant and proceeded to install a provisional government. The fugitive Legislature responded by declaring Missouri a member of the Southern Confederacy. (For military operations in Missouri, see **CIVIL WAR IN AMERICA.**) In 1863 the convention passed an ordinance of emancipation of doubtful legality, to go into effect in 1870. With the fall of the Confederate power in Missouri the regular State government was reorganized (1864), and in January, 1865, a constitutional convention controlled by the radical union party assembled in St. Louis. The new constitution provided for the immediate emancipation of the slaves and imposed severe political disabilities on all who had participated in the Rebellion, all teachers, physicians, lawyers, and ministers were required to take a searching oath of loyalty. The qualifications for the franchise deprived a vast proportion of the citizens of the right to vote and continued in force till 1871, when a more liberal registration law was adopted. A third constitution went into effect in 1875.

From 1824 to the Civil War Missouri was always Democratic. From 1864 to 1872 the Republicans were in power, but the defection of a large body of Liberal Republicans who were opposed to the policy pursued against those who had participated in the Rebellion led to the reestablishment of Democratic supremacy. In 1894, however, the Republicans secured a majority in the Legislature and the congressional delegation. In 1904 Roosevelt carried the State. In 1905 Joseph W. Folk (Democrat), who had become a national figure, from his successful exposure and conviction of corrupt city officials in St. Louis, was elected Governor, although in the same year the Republican national ticket carried the State by 25,000 plurality. The Legislature of 1907 passed many severe measures for the regulation of railroads and corporations; these resulted in much litigation in the succeeding years. (See **RAILWAYS** and **STATE RIGHTS**.) In 1908, as a result of a suit brought by Attorney-General Herbert S. Hadley, the Standard Oil Company of Indiana and the Republic Oil Company of New York were forbidden to do business in the State. In the elections of that year Mr. Hadley defeated the Democratic candidate, William H. Cowherd, for Governor, and William J. Stone was nominated for the United States Senate. The carrying of the State by the Republicans in the presidential election was one of the surprises of the campaign of 1908. Taft received 347,202 votes, Bryan 246,574. In January, 1909, the United States Supreme Court upheld the decision of the State courts against the Standard Oil Company of Indiana and its subsidiary companies. Missouri took a conspicuous part in the political campaign of 1912. The leading candidate for the Democratic nomination put at the head of the national convention was Champ Clark, one of the State's Representatives in Congress and Speaker of the House. Governor Hadley was one of the foremost Progressive leaders in the Republican pre-convention campaign and was one of the seven governors who signed a letter urging Mr. Roosevelt to be a candidate during

the first days of the convention. He was leader of the Republican forces. With the nomination of Mr. Taft, however, Governor Hadley did not join the movement for a new party, but gave his support to President Taft. At the election on November 5, Wilson received 339,497 votes, Taft 207,491, and Roosevelt 123,111. Elliott W. Major, Democrat, was elected Governor. A senatorial election was held in 1914 in which Senator Stone was reelected. The most notable feature of this election was the falling off of the Progressive vote, which was reduced from 327,371 in 1912 to 27,614 in 1914. The following is a list of the Governors of the State with their party affiliations:

Alexander McNair	Democrat	1820-24
Frederick Bates	"	1824-25
Abraham J. Williams (acting)	"	1825
John Miller	"	1825-32
Daniel Dunklin	"	1832-36
Lilburn W. Boggs	"	1836-40
Thomas Reynolds	"	1840-44
M. M. Marmaduke (acting)	"	1844
John C. Edwards	"	1844-48
Austin A. King	"	1848-52
Sterling Price	"	1852-56
Trusten Polk	"	1856-57
Hancock Jackson	"	1857
Robert M. Stewart	"	1857-61
Claiborne F. Jackson	"	1861
Hamilton R. Gamble	(Provisional)	1861-64
Willard P. Hall (acting)	"	1864-65
Thomas C. Fletcher	Republican	1865-69
Joseph W. McClurg	"	1869-71
B. Gratz Brown	Liberal Republican and Democrat	1871-73
Silas Woodson	"	1873-75
Charles H. Hardin	Democrat	1875-77
John S. Phelps	"	1877-81
Thomas T. Crittenden	"	1881-85
John S. Marmaduke	"	1885-87
A. P. Morehouse	"	1887-89
David R. Francis	"	1889-93
William J. Stone	"	1893-97
Lon V. Stephens	"	1897-1901
Alexander M. Dockery	"	1901-05
Joseph W. Folk	"	1905-09
Herbert S. Hadley	Republican	1909-13
Elliott W. Major	Democrat	1913-

MISSOURI, mī-sŭŭrĭ or mī-zŭŭrĭ. A small tribe of Siouan stock. When first known to the whites they occupied the territory about Grand River, a northern affluent of the Missouri, in what is now the State of Missouri, and contiguous to the Iowa and Oto (q.v.) on the north and west, all three tribes speaking the same language. Their popular name is of Algonquian origin, and is said to mean "great muddy," referring to the Missouri River. They call themselves *Niutachi* or *Nudacha*, "those who come to the mouth" (of the river). The Missouri are named upon Marquette's map of 1673, and some years afterward a French fort was established in their territory. In 1725 a number of their

chiefs visited France and attracted much attention. At one time in the eighteenth century they were estimated at from 1000 to 1200; but, after being greatly reduced by smallpox, they were attacked by the Sauk, who compelled them to abandon their territory about 1798 and take refuge west of the Missouri. In 1805 they were living near the mouth of the Platte River and numbered about 300. In 1823 they were again so decimated by smallpox that the remnant, about 80 persons, incorporated with the kindred Oto.

MISSOURI, UNIVERSITY OF. A State institution for higher education, founded in 1839 at Columbia, Mo. It is coeducational. The university in 1915 was organized into 11 divisions: the colleges of arts and sciences, and agriculture, including an experiment station; schools of commerce, education, engineering, including an experiment station, journalism, law, medicine, mines and metallurgy; graduate school, and the extension division. The school of journalism was founded in 1906 and the school of commerce in 1914. These divisions, with the exception of the school of mines and metallurgy, which is located at Rolla, are at Columbia. For admission to the division of arts and agriculture four years' high-school work is required, while for admission to professional schools there are required two years of college work or its equivalent. The master's degree is conferred in the graduate school and the bachelor's degrees in the colleges of arts and sciences and agriculture, schools of commerce, education, journalism, law, and mines and metallurgy; the degrees of M.E. in mines and metallurgy, and C.E., E.E., M.E., and Ch.E. in engineering. The honorary degree of doctor of laws is also conferred. The enrollment in all the departments in 1914-15 was 3816. This includes the enrollment in the summer schools. The faculty numbered 186, including 84 assistants. The campus at Columbia contained about 70 acres, and the university owns a farm containing nearly 800 acres. The campus at Rolla contains 27 acres. The total value of the grounds, buildings, and equipment at the end of the collegiate year 1913-14 was \$3,646,010. The endowment was \$1,505,339. The university is supported largely by State and Federal appropriations. The library contains nearly 200,000 volumes and 100,000 pamphlets. The president in 1915 was Albert R. Hill, LL.D.

MISSOURI COMPROMISE. In American history, an arrangement between the free and slave States, embodied chiefly in an Act of Congress approved March 6, 1820, which provided for the admission of the State of Missouri into the Union with a constitution which allowed slavery, but which forever prohibited slavery in all the rest of the Louisiana territory lying north of lat. 36° 30' N., that being the southern boundary line of Missouri. To balance the admission of Missouri as a slave State, Maine was admitted as a free State at the same time. In February, 1819, in the debate in Congress on the bill to admit Missouri into the Union, James W. Tallmadge, of New York, moved to amend the Missouri bill to the effect "that the further introduction of slavery or involuntary servitude be prohibited, and that all children of slaves born within the State after the admission thereof in the Union shall be free at the age of 25." The admission of Alabama in the same year without any prohibition against slavery made

the number of "slave" States and of "free" States equal. The admission of Missouri as a "free" State, therefore, would disturb the equilibrium. The bill with the Tallmadge amendment passed the House Feb. 7, 1819, by a vote of 87 to 76. On March 2 the Senate passed the bill without the Tallmadge amendment. Two days later Congress adjourned and the question of Missouri went over to the next session. In December, 1819, another bill for the admission of Missouri was introduced, whereupon John W. Taylor, of New York, on Jan. 26, 1820, offered an amendment in the House which provided that as a condition of admission the State should be required to adopt a constitution forever prohibiting slavery within its limits. This gave rise to a prolonged and vigorous debate on the power of Congress to impose conditions upon the admission of a State into the Union. Those who upheld the power of Congress in the premises based their argument on the provision of the Constitution which empowers Congress to admit new States, the implication being that it may admit under any conditions which it may see fit to impose. Their opponents relied chiefly upon the doctrine of the equality of the States in the Federal system, and declared that Congress had no constitutional power to destroy that equality by attaching onerous conditions to admission of the new States. Meantime the situation was complicated by the application of Maine to be admitted with a constitution prohibiting slavery. The House of Representatives promptly passed a bill for this purpose, and when this bill came up for discussion in the Senate in January, 1820, the friends of slavery in Missouri, who were in a majority in the Senate, coupled the Maine bill with the bill to admit Missouri with slavery, and the Senate steadily refused to disconnect the two measures. In this situation the substance of the compromise was proposed by Senator Thomas, of Illinois, in an amendment which provided that Missouri should be admitted with a constitution allowing slavery, but that in all the rest of the Louisiana territory north of lat 36° 30' N. slavery or involuntary servitude should be forever prohibited. The bill with this amendment finally passed the Senate, Feb. 18, 1820, by a vote of 34 to 10. The bill thus amended was coupled with the bill to admit Maine, and in this shape was sent to the House for concurrence. The House refused to agree to the combination, and the matter was then referred to a conference committee of the two Houses, which recommended that the Maine bill be passed separately, and that the Missouri bill should be passed with the Thomas amendment. To this report the House agreed. The separation of bills as distinct subjects was thus secured, and recognition was given to the claim of the Southerners that Congress had no power to impose such limitations as it saw fit upon any State as a condition of its admission to the Union. President Monroe approved the Maine bill on March 3, and the Missouri bill on March 6, 1820. Henry Clay, who was Speaker of the House, exerted his influence to bring about this result, and for his work in these compromises was called the "Pacifier." In the next session the constitution of Missouri, including a paragraph making it the duty of the Legislature to prevent the immigration of free negroes into the State, was presented to Congress for approval. This provoked a heated debate concern-

ing the duty of the Federal government to protect the citizens of each State in the exercise of their civil rights of citizenship in every other State. After protracted negotiation, a bill was finally introduced providing that Missouri should be considered admitted as a State only after its Legislature had declared that no law would ever be passed, nor any construction placed upon the obnoxious paragraph which would justify any law which might abridge within Missouri the rights guaranteed to all citizens by the Federal Constitution. The bill involving this second compromise was approved March 2, 1821, and in accordance with its terms Missouri became a Commonwealth. The compromise of 1820 was important as the first precedent for the congressional exclusion of slavery from public territory, and also as a clear recognition that Congress had no right to impose upon a State asking for admission into the Union conditions which do not apply to those States already in the Union. "The Missouri Compromise was the work of moderate men, chiefly those who lived in the Middle States and in the northern tier of Southern States." The Missouri Compromise was specifically repealed by the Kansas-Nebraska Bill of 1854, and was pronounced unconstitutional and void by the famous Dred Scott decision.

MISSOURI RIVER. The principal affluent of the Mississippi and the longest river of the United States (Map: United States, G 2). It is formed in southwest Montana by the confluence of the Jefferson, Madison, and Gallatin rivers, which unite at Gallatin City, Mont., at an elevation of 4032 feet above sea level. The longest branch, the Jefferson, has its farthest source in Red Rock Creek, which rises on the slopes of the Red Rock Range of the Rocky Mountains, on the border between Montana and Idaho, west of the central portion of Yellowstone Park. The Madison and Gallatin rivers rise within the Yellowstone Park near the source of the Yellowstone River. From the junction of the three forks the Missouri flows north and east across Montana into North Dakota. Here it is joined by its largest affluent, the Yellowstone River, which at the point it empties into the Missouri is about 800 yards wide. From this place the Missouri describes a long curve towards the southeast and then crosses the whole width of South Dakota. After reaching the Nebraska boundary it divides this State from Iowa and Missouri, forms the northeast boundary of Kansas, and finally takes an easterly course across Missouri, joining the Mississippi River 3 miles below Alton, Ill., and 20 miles above St. Louis. Its length to the source of the Jefferson is about 2950 miles and to the source of the Madison about 2910 miles. With the lower Mississippi the river has a total length

of about 4200 miles, which is equaled by no other river in the world. The Missouri is a swift and turbid stream, navigable only by flat-bottomed steamboats. In the flood period in early summer it can be ascended nearly to Great Falls, Mont., about 2300 miles from the mouth, but during low water, which occurs in summer and early autumn, navigation is suspended above the junction of the Yellowstone. At Great Falls the Missouri passes over a series of cataracts, descending a vertical distance of 350 feet in 16 miles. The highest falls are 87 feet. About 145 miles above this point is the Gate of the Rocky Mountains, a narrow rock gorge 5 miles in length, whose perpendicular walls rise 1200 feet above the river. The lower course of the Missouri, lying within the great plains, has been graded so as to offer no interruptions. In this part it is often a mile or more wide. The chief tributaries are the Milk and Yellowstone, in Montana, Little Missouri, in North Dakota; Cheyenne, James, White, and Big Sioux, in South Dakota; Niobrara and Platte, in Nebraska; Kansas and Osage, in Kansas and Missouri. It drains the greater part of the territory between the Mississippi and the summits of the Rocky Mountains. The Arkansas and Red rivers are the only other large streams in this region that contribute their waters directly to the Mississippi. The area of the basin drained by the Missouri is about 600,000 square miles, and the average quantity of water discharged by the Missouri in a second is about 120,000 cubic feet. A number of thriving cities are located on the Missouri, including Kansas City, Leavenworth, Atchison, Omaha, Sioux City, Pierre, Bismarck, and Great Falls, the last being the centre of a great copper-smelting industry which utilizes the power of the falls.

MISSOURI SUCKER, or GOUBSEED. See BLACK HORSE, and Plate of SUCKERS.

MISSOURI VALLEY. A city in Harrison Co., Iowa, 21 miles north of Council Bluffs, on the Chicago and Northwestern Railroad (Map Iowa, B 3). It has a Carnegie library, and the fair grounds of the county agricultural society. The industrial interests are represented by extensive railroad machine shops, stockyards, grain elevators, and manufactories of flour, machine-shop products, bricks, tiles, cement blocks, and creamery products. Fruit growing and stock raising are carried on in the vicinity. The water works are owned and operated by the municipality. Pop., 1900, 4010, 1910, 3187.

MIST. See FOG, HAZE.

MISTAKE. In law, an erroneous mental conception affecting the will or intention and hence leading to an unintended act or preventing a contemplated result. The importance of the mistake in legal contemplation is its effect upon the act. In general a mistake of law produces no legal effect upon an act influenced or induced by it. Thus, one is without remedy who has entered into a contract without knowing or understanding its legal effect, or who has voluntarily and with full knowledge of the facts paid a claim not well founded in law. The full acceptance of the doctrine is due to a misapplication of the maxim, *Ignorantia juris non excusat* (Ignorance of the law is no excuse), which is applicable only in the criminal law or under statutes imposing quasi-criminal penalties where sound policy requires that ignorance of law should not excuse one charged with a crime. (See INTENT.) Mistake of fact has a direct

legal effect on many acts, and the law in many cases affords a remedy to one who has done a prejudicial act induced by mistake of fact.

The effect of mutual mistake as to a material term of a contract is to prevent the meeting of the minds and thus prevent the formation of a contract (q.v.). The effect of mutual mistake of fact in case of sale is to prevent passing of title, and one who has given up the possession of personal property under mistake, preventing the passing of title, may recover the specific property by an appropriate action, or its value in an action of trover. In general, whenever money or property is delivered to another under material mistake of fact, its value may be recovered in an action based on the theory of quasi contract (q.v.).

In the law of tort the effect of mistake of fact varies considerably with the different branches of the subject. In the law of trespass one is required to know his own, and he interferes with the property of another at his peril.

Equity has jurisdiction to relieve one from the consequences of his mistake of fact, by compelling a re-formation or rescission of a contract.

Consult Kerr, *A Treatise on the Law of Fraud and Mistake* (3d ed., London, 1902).

MISTASSINI, mis'tās-sē'né. A large lake near the north boundary of the Province of Quebec, lat. 50° N., long. 72° to 74° W. (Map Canada, Q 6). In 1672 French Jesuit missionaries visited it. The Indians claimed an extravagant length for the lake, saying that three days were employed in crossing the narrowest part from island to island, but an estimate based on surveys gives the length at 120 miles and the actual width at 20 miles in the widest parts. From the northeast and southeast it receives the drainage of a chain of smaller lakes, and discharges its own surplus into James Bay, the southern arm of Hudson Bay, by the Rupert River, 120 miles long. The Hudson's Bay Company has a post on Lake Mistassini, 333 miles north of Montreal. The lake is of great depth and abounds in fish; the surrounding country is level and well fitted for agriculture, while the woods are full of game. The winters are clear and cold and the summers warm and short.

MISTEC. See MIXTEC.

MISTELI, mis-tā'le, FRANZ JOSEF (1841-1903). A Swiss philologist. He was born at Solothurn, studied at Zurich and Bonn, taught at Saint-Gall and Solothurn; and in 1874 became professor of comparative linguistics at Basel. A follower of Steinthal, whose *Charakteristik der hauptsächlichsten Typen des Sprachbaus* he re-edited in 1893, Misteli contributed to Kuhn's *Zeitschrift* and to the *Zeitschrift für Volkspsychologie*, and wrote *Ueber griechische Betonung* (1875) and *Erläuterungen zur allgemeinen Theorie der griechischen Betonung* (1875). He was an authority on the dialects of the Ural and Altai.

MISTLE (mis'l) THRUSH, or MISSEL THRUSH. One of the most familiar and admired of European thrushes (*Turdus viscivorus*), named from its fondness for mistletoe berries, which are rejected by the majority of small birds. It is the largest and one of the most numerous of British thrushes, and is also well known throughout the Mediterranean region and western and northern Asia. Everywhere it is migratory, and is noted for its loud and pleasant song, which begins first of all bird notes in the spring and lasts far into the sum-

mer, its habit of cheerfully singing on cold or rainy days, when most other birds are quiet, has given it the sobriquet "stormcock." Its plumage is soft grayish brown above and white below, the breast and abdomen thickly and sharply spotted. See THRUSH.

MISTLETOE, mis'tl-tō (AS. *misteltān*, *mistiltān*, Icel. *mistilteinn*, from AS. *mistel*, bird-lime, mistletoe, basil, Icel. OHG *mistil*, Ger. *Mistel*, mistletoe + AS. *tān*, twig). A genus (*Viscum*) of small shrubs of the family Loranthaceæ. This family contains more than 500 known species, mostly tropical and parasitic. The leaves are entire, almost nerveless, thick, fleshy, and without stipules. The flowers of many species are showy. The European mistletoe (*Viscum album*), a native of the greater part of Europe, grows on many kinds of trees, particu-

VISNUM ALBUM

larly on the apple, and its close relatives, the service and hawthorn, sometimes, also, on sycamores, limes, poplars, locust trees, and firs, but rarely on oaks (contrary to the common belief). It is very plentiful in some parts of the south of England, its evergreen leaves giving a peculiar appearance to the orchards in winter, when the clusters of mistletoe are very conspicuous among the naked branches of the trees. The stems divide by forking, the leaves are opposite, of a yellowish-green color, obovate-lanceolate, obtuse. The flowers are inconspicuous, and grow in small heads at the ends and in the divisions of the branches, the male and female flowers on separate plants. The berries are about the size of currants, white, translucent, and full of a very viscid juice, which serves to attach the seeds to branches, where they germinate, and take root, the radicle always turning towards the branch, whether on its upper or under side. The mistletoe derives its nourishment only partly from the juices of the tree on which it grows, and from which it seems to spring as if it were one of its own branches. The green coloring matter, chlorophyll, permits the parasite to elaborate its food. The mistletoe was intimately connected with many of the superstitions of the ancient Germans and the British Druids. In the northern mythology, Balder is said to have been slain with a spear of mistletoe. Among the Celts the mistletoe which grew on the oak was in peculiar esteem for magical virtues. Traces of the ancient regard for the mistletoe still remain in some old English and German customs, as kissing under the mistletoe at Christmas. The

mistletoe was at one time in high repute as a remedy for epilepsy and convulsions, but it seems to possess no decided medicinal properties. *Loranthus europæus*, a shrub very similar to the mistletoe, but with flowers in racemes, is plentiful in some parts of the south of Europe, and very frequently grows on oaks. *Loranthus odoratus*, a Nepalese species, has very fragrant flowers. In the United States the mistletoe is *Phoradendron*, a genus of plants closely allied to and greatly resembling *Viscum*. The common species in the Eastern States is *Phoradendron flavescens*. It occurs upon various species of hardwood trees from New Jersey to Missouri and southward and is used for Christmas decorations like the European one. In the southwestern part of the United States and in California are still other species. *Arceuthobium pusillum*, or *Razoumofskyia pusilla* is a leafless mistletoe about an inch long, parasitic on spruce and tamarack trees from Maine to Michigan. A larger species of the same genus grows in the Northwest. See Colored Plate of PARASITIC PLANTS.

MISTLETOE BOUGH, THE. A pathetic song by Thomas Haynes Bayly, based on a legend connected with various localities.

MISTRAL, mé'stral', or **MAESTRAL**, má'stral' (Prov., master wind). The Provençal name for the cold northwest wind on the southern coast of France and in other parts of the Mediterranean coast region. This wind is identical in origin with the bora (q.v.) of the Caspian Sea and of Austria, Turkey, and southern Russia. It is also perfectly analogous to the strong northwest winds of the United States. In both cases the atmosphere over a great extent of country is circulating about a region of low pressure or a so-called storm centre, moving along over the surface of the earth usually towards the east or northeast. When such a storm centre passes over southern Europe, the cold winds from Russia sweep southward with great force towards it. The warm southerly siroccos give place to cold northerly boras and mistrials, which are very dry, the cloudy hazy skies are replaced by cloudless transparent air. During the first few hours the wind seems to come in descending and violent gusts; afterward it becomes more moderate, but is still very strong. When it descends over mountain slopes upon the water, as it does along the coast of France, Italy, and Austria, it makes navigation difficult and even dangerous to small craft.

MISTRAL, FRÉDÉRIC (1830-1914). A French poet, the leader of the modern Provençal revival in southern France. He was born at Maillane, Bouches-du-Rhône, Sept. 8, 1830, and went to school in Avignon. Here he came under the influence of Joseph Roumanille (q.v.), who had already conceived the idea of raising the native speech to higher uses. Roumanille's Provençal poem *Li Margardeto* fired the youth's enthusiasm, and when he returned to Maillane, at the end of his school days, he wrote a poem in four cantos, *Li Meissoun*, the best parts of which he has preserved by insertion into his riper works. His father, seeing his intellectual superiority, had him study law at Aix. Mistral, however, did not practice law, but gave himself up heart and soul to the work of creating a literature in Provençal. With six friends he founded the society of the *Félibres* in 1854 and contributed to their annual organ *L'Aïman Prouvençau*. The publication in 1859 of *Mirèio* is the most important

event in Mistral's life and in the history of the movement. It was a revelation to the *Félibres*, and through the enthusiastic praise of Lamartine it obtained a national success. *Mirèio* is a narrative pastoral poem in twelve cantos, a wonderful expression of what is most characteristic and best in the rural life of Provence. The language is the dialect of Saint-Remy, raised to the dignity of a literary language by a process of purification and enrichment strictly in accord with its genius. At this time also Mistral published some of his best lyrical poems, notably one called *The Countess*, a vigorous protest against the centralization prevailing in France. In 1867 he published a second long poem, *Calendau* (French, *Calendal*); it treats of mediæval legends and traditions, and abounds in symbolism. In 1875 appeared his only volume of lyrics, *Las Isclo d'or*. In 1876 the *Félibrige* (q.v.) was formally organized into a great association with Mistral as *Capoulé* or chief. He next published *Nerto*, a fantastical tale in verse. Later he brought out his monumental dictionary of all the dialects of the *Langue d'oc*, *Lou tresor dou Félibrige*. In 1890 appeared *La Rèno Jano* (Queen Joanna), which he called a Provençal tragedy. It is brilliant in language, but of little dramatic power. In the same year he founded the quarterly *L'Aiòls*. In 1897 appeared a third long narrative poem, *Lou pouèmo dou rose*, his best work after *Mirèio*. It is a felicitous combination of fanciful legends and realism. In 1904, with Echegaray, Mistral was awarded the Nobel prize for literature. He published in 1906 *Mes origines, mémoires et récits*, in 1910 he made a Provençal translation of Genesis, *La Genèsi traduchò en provençal*, and in 1913 appeared his *Oulivado*, a collection of lyric poetry written at different times in his life. The best English translation of *Mirèio* is that of Harriet Preston (Boston, 1872); it appears also in Warner's *Library of the World's Best Literature*. There are prose translations in French by Mistral of all his works. He died March 25, 1914. Consult: Gaston Paris, *Penseurs et poètes* (Paris, 1896); Welter, *Frédéric Mistral, der Dichter der Provence* (Marburg, 1899); C. A. Downer, *Frédéric Mistral, Poet and Leader in Provence* (New York, 1901); *Memoirs of Mistral*, rendered into English by C. E. Maud. Lyrics from the Provençal by Alma Strettel (London, 1907).

MISTRETTA, mè-strét'ta. A town in the Province of Messina, Sicily, 50 miles northwest of Catania (Map Italy, E 6). It is situated in one of the most fertile sections of the island, 3200 feet above the sea and but a short distance from it. The chief industries are farming and cattle raising. Lignite is mined in the vicinity. Pop. (commune), 1901, 13,481; 1911, 13,608.

MISTRIAL. In law, an invalid or illegal trial of an action, the result of which is without legal effect on the cause of action, and which leaves the parties in the same position as if there had been no trial of the case. A mistrial may result from a variety of causes, as a defective plea, the failure of the parties to form a triable issue, the incompetence of the judge to act in a given case, the drawing of a jury from the wrong county, the withdrawal or death of a juror, or any other event which affects the legal validity of the proceedings. Where the prosecution of a person charged with a crime results in a mistrial the accused may be again tried, and cannot plead the constitutional defense that he has been twice in jeopardy, as that plea is valid

only where the proceedings are legal and the issue is tried to a conclusion. See NONSUIT, TRIAL.

MITANI, mè-tā'né. See AMARNA LETTERS; CUNEIFORM INSCRIPTIONS.

MITANNIANS. The name of a people living in Mesopotamia in the second millennium B.C. Our knowledge concerning them is derived chiefly from the Tel el Amarna and Boghaz Keui tablets. The Mitannians seem to have belonged to the Hittites in the wider sense of this term, but were apparently distinct from the Hatti, or Hittites, whose capital was at Boghaz Keui in the days of Subbiluliuma and his successors. (See HITTITES.) Among the leading kings of the Mitannians who are known to us were Saushshatar, Artatama I, Sutarna I, Tushratta, Artatama II, Artashshumara, Mattuaza, and Sutarna II. Tushratta was a contemporary of Subbiluliuma, and father-in-law of Amenhotep III of Egypt (1411-1389 B.C.). His three predecessors consequently reigned during the fifteenth century. This dynasty, however, does not seem to have belonged to the native Mitannian race, but to the Harri, an Aryan people, as their worship of Mitia, Varuna, Indra, and the Nashatya indicates. Winckler has suggested that these Harri first took possession of Armenia and then imposed their authority on the Mitannians. The Mitannians themselves may have been the Hittites (Hatti) who in 1932 B.C. made an end to the Amorite dynasty of Babylon. (See BABYLONIA.) In the weakness of Assyria following Samsi Adad II (c.1870-1840) they established themselves in Mesopotamia, and the new dynasty of the Harri was able to take possession of Assyria itself, or at any rate the territory around Nineveh, so that Tushratta could send Ishtar of Nineveh to Amenhotep III in his last illness. It was evidently by an alliance with Egypt that Tushratta was able to maintain his independence of the great King of Hatti, while it is not improbable that another independent Harrian kingdom existed north of his realm adjoining the Arzawa in Armenia. As to the ethnic relations of the native Mitannians, their language seems to point to a kinship, not only with the Hittites in Asia Minor, but also with other Asianic and Caucasian peoples. Among the letters of Tushratta in the Tel el Amarna collection one is written in the Mitannian language, though in cuneiform characters. It is a square tablet whose longest side is 3 feet in length, containing two columns of text on each side, each of which has 100 lines. This letter is now in Berlin, and it was first published by Winckler in *Mitteilungen aus den k. Museen zu Berlin* (Berlin, 1890). Attempts at interpreting it were made by Brünnow, Sayce, Jensen, and Messerschmidt, but the most exhaustive study of its language has been made by Bork, who compares it throughout with the Georgian, Mingrelian, and other Caucasian tongues, and also with the Chaldian (see CHALDIANS) and the Elamitish (see ELAM), finding no similarities between it and the Aryan, Semitic, or Uralo-Altaic languages. It has been plausibly conjectured that the name Mitani occurs in the bilingual inscription on the so-called Tarkondemos boss, showing that both Hittite hieroglyphics and cuneiform script were used among the Mitannians. In the religion of this people Teshub, Nergal as sun god, and Ishara, corresponding to Ishtar, seem to have been the chief deities. Aryan divinities, possibly at that time

Iranian, were introduced by the Harri, and the worship of Akkadian, Assyrian, and Amoritic gods no doubt flourished among the Mitannians.

Bibliography. The editions of the Tel el Amarna tablets by Winckler and Knudtzon; Brönnow, Sayce, and Jensen in *Zeitschrift für Assyriologie* (Leipzig, 1890-91); Messerschmidt, "Hettiter," in *Der alte Orient* (ib, 1903); Ferdinand Bork, "Mitanninamen aus Nippur," in *Orientalistische Literatur-Zeitung* (Berlin, 1906); Winckler, in *Mitteilungen der deutschen Orientgesellschaft* (ib, 1907); M. A. S. Oppenheim, "Der Tell Halaf und die verschleierte Götter," in *Der alte Orient* (Leipzig, 1908); Ferdinand Bork, *Die Mitannisprache* (Berlin, 1909); Winckler, *Vorderasien im zweiten Jahrtausend* (Leipzig, 1913).

MITAU, mé'tou. The capital of the Government of Courland, Russia, situated in a flat and fertile district on the left bank of the navigable Semgaller Aa, 25 miles southwest of Riga (Map-Russia, B 3). It has an immense palace erected by Biron in 1738 on the site of an older ducal palace, used as a government building. Two Gymnasias, a provincial museum with a library, and a theatre are the principal educational establishments of the town. The industries of Mitau are unimportant, the chief manufactures are flour, chocolate, oilcloth, ink, and iron products. The trade in grain and lumber is rather extensive. Pop., 1897, 35,011; 1913, 39,200, consisting of Germans (95,000), Jews (6500), Letts (6000), Russians, and Poles. The majority of the inhabitants are Protestants, and the town is the seat of a General Superintendent of the Lutheran church. The castle of Mitau was founded by the Knights Sword Bearers in the second half of the thirteenth century, and became a city in 1435. In 1561 it became the capital of the Duchy of Courland and in 1795 it was annexed to Russia. In 1812 it was occupied by the French and Prussians.

MITCHAM. An important railway junction and suburb of London, England, on the river Wandle, in Surrey, 4 miles northwest of Croydon (Map London, G 6). It is noted for its extensive gardens, the soil of which is especially adapted for the cultivation of roses, lavender, peppermint, and other medicinal herbs, from which an excellent quality of essential oil is extracted. Mitcham Common, covering 480 acres, is a favorite recreation ground for golfers. Pop., 1901, 14,904; 1911, 29,606.

MITCHEL, JOHN (1815-75). An Irish Nationalist agitator. He was born at Camnash, County Londonderry, Ireland, was educated at Trinity College, Dublin, and studied and practiced law. Through his *Life of Hugh O'Neil, Prince of Ulster* (1845), he gained a reputation as a writer and a Nationalist. He became a contributor to the *Irish Nation*, and, after the death of Thomas Osborne Davis, was its chief editor. He withdrew from the *Nation* in 1848 and established the *United Irishman*. In the same year he was arrested under the Treason-Felony Act, was convicted and sentenced to transportation for 14 years, and was sent to Bermuda for one year and then to Tasmania. Escaping from the convict colony in 1853, he came to the United States, and in the following year established at New York the *Citizen*. He removed to Knoxville, Tenn., in 1857, started the *Southern Citizen*, and advocated in it the revival of the African slave trade. He lived in Paris in 1860-62, then returned to America, and for a

time edited the *Richmond Enquirer*, a semi-official organ of the Confederate government. He afterward went back to New York and in 1867 started the *Irish Citizen*, which had only a short career, being discontinued in 1872. He visited Ireland in 1872, and in 1875 he was elected to Parliament from Tipperary, but was declared ineligible and denied his seat on the ground that he was a convicted felon. He was elected a second time, but died before his case could be tested. His three sons were all in the Confederate army in the American Civil War. Besides the work already mentioned he published *The Last Conquest of Ireland* (perhaps) (1860) and *History of Ireland from the Treaty of Limerick* (1868), and edited *The Poems of Thomas Osborne Davis* (1856) and of *James C. Mangan* (1850), with biographies. Consult W. Dillon, *John Mitchel* (London, 1888).

MITCHEL, JOHN PURROY (1879-). An American mayor, born at Fordham, N. Y. He studied in St. John's College, graduated from Columbia University in 1899 and from the New York Law School in 1901. Admitted to the bar in the latter year, he was special counsel for the city of New York in 1906-07. His rapid rise in politics was due to his success as an investigator and prosecutor of grafters while commissioner of accounts of New York in 1907-09. To this office he had been appointed by his friend, Mayor McClellan. The trial and conviction of the grafters gave Mitchel standing with the good-government advocates of New York, and he was elected on a fusion ticket as president of the board of aldermen for the term 1909-13. Mitchel was acting mayor and demonstrated ability as an executive officer. A Democrat in politics, he was appointed collector of the port of New York by President Wilson in 1913. In that year, also, he became a candidate for the nomination for mayor on the fusion ticket, contesting for the place with District Attorney Whitman. The citizens' committee gave him the nomination, and in the regular election he defeated the Tammany ticket headed by Edward F. McCall. The issue most prominent was Tammany control, which had been sharply criticized because of alleged graft and the Sulzer impeachment. His administration was characterized by careful economies in expenditures, by the establishment of municipal markets, and by his attempts to relieve the unemployment situation in 1914-15.

MITCHEL, ORMSBY MCKNIGHT (1810-62). An American astronomer, educator, and soldier. He was born in Union Co., Ky., was a clerk for some time in a country store, and graduated at West Point in 1829. From 1829 to 1831 he was assistant professor of mathematics at West Point and in 1832 he resigned from the service. He practiced law in Cincinnati from 1832 to 1834 and for the next 10 years was professor of mathematics, philosophy, and astronomy in the Cincinnati College. In 1836-37 he was chief engineer of the Little Miami Railroad and was consulting engineer to the Ohio and Mississippi Railroad in 1848-53. He was adjutant general of Ohio in 1847. He was an enthusiastic student of astronomy and took an important part in procuring the erection of an observatory in Cincinnati, of which, when it was completed, he became the director, combining with this position in 1859 the directorship of the Dudley Observatory in Albany. On the outbreak of the Civil War he entered the Federal army, was com-

missioned a brigadier general of volunteers in August, 1861, and from September 19 to November 15 commanded the Department of the Ohio. In April, 1862, he was promoted to a major-generalship of volunteers in recognition of a brilliant movement into northern Alabama whereby he secured the control of 120 miles of railway. On Sept. 17, 1862, he was placed in command of the Department of the South, but before he had time to begin active operations he was attacked by yellow fever and died at Beaufort, S. C. He made several important astronomical discoveries, including, with exactness, that of the period of rotation of the planet Mars. He edited the *Sidereal Messenger*, which he founded, from 1846 to 1848, and published a number of works on astronomical subjects, including *The Planetary and Stellar Worlds* (1848), *The Orbs of Heaven* (1851); *Popular Astronomy* (1860), which, with *The Orbs of Heaven*, was reissued at London in 1892. *The Astronomy of the Bible* was published posthumously in 1863. Consult the biography by F. A. Mitchel (Boston, 1887).

MITCHELL. A city in Lawrence Co., Ind., 61 miles northwest of New Albany, on the Baltimore and Ohio Southwestern and the Chicago, Indianapolis, and Louisville railroads (Map: Indiana, E 7). Fruit growing and the manufacture of Portland cement are the chief industries. Of interest in the vicinity are numerous caves, notably Donaldson and Hamer's. The electric-light plant is owned by the city. Pop., 1900, 1772; 1910, 3,438.

MITCHELL. A city and the county seat of Davison Co., S. Dak., 72 miles west by north of Sioux Falls, on the Chicago and Northwestern and the Chicago, Milwaukee, and St. Paul railroads and on the James River (Map: South Dakota, F 4). It has Dakota University (Methodist Episcopal), established in 1888, a Carnegie library, city hall, opera house, and St. Joseph Hospital. The city maintains a beautiful corn palace, where a splendid exposition, attracting a large number of visitors, is given each year. The centre of a fertile agricultural region, Mitchell exports grain and live stock; it has a creamery, railroad and machine shops, cigar and candy factories, grain elevators, brick and lumber yards, wholesale fruit houses, etc. Settled in 1879, Mitchell was incorporated in 1883 and is governed under a charter, secured by general legislative act of 1890, which provides for a mayor, elected every two years, and a city council of which the executive is a member. The water works are owned by the municipality. Pop., 1900, 4,055; 1910, 6,515.

MITCHELL, ALEXANDER (1817-87). An American financier and railroad president, born near Ellon, Aberdeenshire, Scotland. In 1839 he came to the United States at the request of George Smith, a Scotchman who was interested in the development of the West, and was made president of the Wisconsin Marine and Fire Insurance Company, at the new town of Milwaukee. Mitchell settled in Milwaukee, and his name is inseparably connected with the development of that city and region. In 1861, appointed head of the Milwaukee debt commission, he labored effectively to restore the city's impaired credit. In 1864 Mitchell effected a combination of several roads into the Chicago, Milwaukee, and St. Paul Railroad Company, of which he was president from its organization until his death. He was a Republican until after the war, but left the party on the reconstruction issue, in 1868

was elected to Congress as a Democrat, and served until 1875.

MITCHELL, ALEXANDER FERRIER (1822-99). A Scottish divine and scholar, the historian of the Westminster Assembly. He was born at Brechin in Forfarshire, Sept. 10, 1822, and after graduating from the University of St. Andrews he became minister at Dunnichen (1847-48). He resigned to accept the professorship of Hebrew in the University of St. Andrews. In 1868 he was transferred to the chair of ecclesiastical history and divinity. He held some of the highest offices in the Church of Scotland and was an active member of the Scottish Text and History societies. Among his publications are: *The Westminster Confession of Faith* (1866), *Minutes of the General Assembly 1644-49* (1874), *The Westminster Assembly. Its History and Standards* (1883; new ed., 1895), *Catechisms of the Second Reformation* (1886); *Reprint, with Introduction, of the First Protestant Treatise in Scottish Dialect* (1888). He died March 22, 1899.

MITCHELL, DONALD GRANT (1822-1908). An American author, well known by his pseudonym Ik Marvel. Born in Norwich, Conn., he graduated from Yale College (1841), and for three years worked on a farm near his native town. In 1844 he went to Europe, living for ten years on the island of Jersey, and bringing out on his return *French Glacings, or a New Sheaf from the Old Fields of Continental Europe* (1847) and in 1849 *The Battle Summer*, sketches reminiscent of the outbreak in Paris two years before. In 1850 he produced *The Lorgnette, or Studies of the Town*, a series of mildly satirical papers in the manner of Irving's *Salmagundi*. The same year and the following year he wrote the books most popularly associated with his pseudonym, *A Bachelor's Reveries* (more recently renamed *Reveries of a Bachelor*) and *Dream Life*. These gained him admission to the American Academy of Arts and Letters. In 1853 Mitchell was appointed United States Consul at Venice. On his return, in 1855, he bought a farm (known as "Edgewood") near New Haven, Conn. There he wrote books dealing in an agreeable mixture of philosophy, farming, and anecdote, with the joys of country life: *My Farm of Edgewood* (1863); *Wet Days at Edgewood* (1865); *Dr. Johns* (1866), a novel of religious type, *Rural Studies, with Hints for Country Places* (1867), and several books of travel and sketches, such as *Seven Stories, with Basement and Attic* (1864), *English Lands, Letters, and Kings* (4 vols., 1889), *American Lands and Letters* (2 vols., 1898-99). Consult P. E. More, *Shelburne Essays* (5th series, New York, 1908).

MITCHELL, EDWARD PAGE (1852-). An American newspaper editor. He was born at Bath, Me., and in 1871 graduated from Bowdoin College, which conferred on him the honorary degree of Litt.D. in 1907. He joined the staff of the *Boston Advertiser* in 1871, but after 1875 was on the editorial staff of the *New York Sun*, of which he became editor in 1911. In 1913 he was a special lecturer at the Columbia School of Journalism. In 1909-11 he was president, and thereafter was vice president, of the Sun Printing and Publishing Company. Mitchell's writing gave the *Sun's* editorial page the reputation of being one of the most brilliant in the country. He contributed stories and sketches to the magazines.

MITCHELL, ELISHA (1793-1857). An American scientist, born at Washington, Conn. He graduated at Yale in 1813 and was ordained into the Presbyterian ministry in 1821. After teaching in Yale he became professor of mathematics and natural philosophy at the University of North Carolina in 1817, and in 1825 professor of chemistry, mineralogy, and geology at the same institution. In the capacity of State surveyor he ascended a number of the North Carolina mountains, and was finally killed by a fall from a precipice on a mountain which he had just ascertained to be the highest in the United States east of the Rockies. On this summit, called Mount Mitchell (see BLACK MOUNTAINS), the discoverer's body is buried. His works include a series of reports on the geology of North Carolina (1826-27), *Elements of Geology, with an Outline of the Geology of North Carolina* (1842); and various articles which he contributed to scientific publications.

MITCHELL, HENRY (1830-1902). An American hydraulic engineer, brother of Maria Mitchell. He was born in Nantucket, was educated in private schools, and early devoted himself to the study of tides and river currents, being first employed by the United States Coast Survey to report on the waters about Nantucket and Marthas Vineyard. After assisting the commissioners on harbor encroachments in New York City and discovering the underflow of the Hudson (1859), Mitchell was consulting engineer to the United States Commission on Boston Harbor (1860-67) and member of the commission; in 1867 was sent to study the decline of Greytown harbor, Nicaragua, and in 1874 was appointed a member of the board of engineers to improve the mouth of the Mississippi. In 1879 he visited the Suez Canal and reported on it. Mitchell was elected to the National Academy of Sciences in 1885 and in 1888 retired from active business. His papers on physical hydrology mostly appeared in the United States Coast Survey Reports.

MITCHELL, HINCKLEY GILBERT (1846-). An American theologian, born at Lee, N. Y. He graduated at Wesleyan University (1873) and at the Divinity School of Boston University (1876), and after studying at Leipzig, preached in the Methodist Episcopal church at Fayette, N. Y. (1879-80); taught at Wesleyan (1880-83), and thereafter until 1905 was professor of Hebrew and Old Testament exegesis at Boston University. For denying the historicity of the early chapters of Genesis he was refused confirmation by the Board of Bishops of the Methodist Episcopal Church in 1905. From 1906 to 1910 he was engaged in exegetical studies, and then became professor of Hebrew and Old Testament exegesis at Tufts College. He was director of the American School for Oriental Study and Research in Palestine in 1901-02. His publications include: *Hebrew Lessons* (1884, 1897); *Amos* (1893), a translation of Piepenbring's *Theology of the Old Testament* (1893); *Isaiah: A Study of Chapters i-xii* (1897); *Genesis* (1909); *Ethics of the Old Testament* (1912).

MITCHELL, JOHN (?-1768). An Anglo-American botanist and geographer, a physician by profession. He settled at Urbana, Va., about 1700. It was after him that the *Mitchella repens* was named by Linnaeus. He wrote *Nova Plantarum Genera* (1741) and an *Essay on the Causes of Different Colors of People in Different*

Climates (1744); but his name is best known in connection with *A Map of the British and French Dominions in North America* (1755).

MITCHELL, JOHN (1870-). An American labor leader, born at Braidwood, Ill. He attended night schools as a boy and later studied law for a year. Afterward he made a private study of economics. He became a coal miner in 1882; worked and traveled in the West from 1885 to 1890, was made a subdistrict secretary and treasurer of the United Mine Workers of America in 1895, and from 1899 to 1908 was president of the organization. During his administration the union was substantially enlarged, and he effectively gave his influence and efforts to securing increase of wages and an extension of the benefits of the eight-hour law. Mitchell served as fourth vice president of the American Federation of Labor in 1898-1900 and as second vice president from 1900 to 1914. He directed the successful strikes of the anthracite miners in 1900 and 1902, the latter was brought to a close largely as a result of Mitchell's offer as the representative of the miners to accept the decision of a commission of arbitration to be appointed by the President of the United States (Roosevelt). From the first he exerted his influence in behalf of good faith on the part of labor unions in all dealings with employers. From 1908 to 1911 he was chairman of the Trade Agreement Department of the National Civic Federation, and thereafter was a member of numerous industrial commissions in New York State. Mitchell, in company with Gompers and Morrison (qqv), was involved in the famous Buck Stove case. The American Federation of Labor had been publishing a list of manufacturers whom they regarded as unfair in their dealings with organized labor, and advised that the organization boycott their production. Among these names was that of the Buck Stove and Range Company. In 1907 this company secured, in the court of the District of Columbia, an injunction against the officers of the federation. The publication of the name on the black list continued, however, and Mitchell and his colleagues were, in 1908, adjudged in contempt of court and sentenced to a term of imprisonment. Although the case was later dismissed on technical grounds by the Supreme Court, it was important in that it gave much impetus to the movement against injunctions in labor questions—a movement which secured prohibition of such use in the Clayton Antitrust Act of 1914. In 1914 Mitchell was appointed by Governor Glynn of New York to the State Workmen's Compensation Board for a four-year term, and when, in 1915, a new Industrial Commission took over the functions of the Board, he became a member of this. He is author of *Organized Labor: Its Problems, Purposes, and Ideals* (1903) and *The Wage Earner and his Problem* (1913). Consult H. W. Laidler, *Boycotts and the Labor Struggle* (New York, 1914). See INJUNCTION.

MITCHELL, JOHN AMES (1845-). American editor and author, born in New York City and educated at Exeter, N. H., and at the Lawrence Scientific School, Harvard, after which he studied architecture (1867-70) in Boston and at the Ecole des Beaux-Arts, Paris. He returned to practice for six years in Boston, but in 1876 went again to Paris, this time to study drawing and painting. From 1880 to 1883 he was active in New York as an artist,

illustrator, and writer. In 1883 he founded the comic weekly *Life*, perhaps the best periodical of its kind in the United States—an American *Punch* or *Fliegende Blätter*. From the time of its founding Mitchell gave the periodical his closest attention both as to general policy and as to detail. In addition to his work as artist and editor he published: *Croquis de l'Exposition* (Paris, 1879); *The Summer School of Philosophy at Mount Desert* (1881); *The Romance of the Moon* (1886); *The Last American* (1889); *"Life's" Fairy Tales* (1893); *Amos Judd* (1895); *That First Affair* (1896); *Gloria Victis* (1897); *The Pines of Lory* (1901); *The Villa Claudia* (1904); *The Silent War* (1906); *Dr Thorne's Idea* (1910); *Pandora's Box* (1911).

MITCHELL, JOHN KEARSLEY (1798–1858). An American physician, born in Shepherdstown, Va. He graduated at the Medical College of the University of Pennsylvania in 1819. Before he went to Philadelphia in 1822 to practice his profession he made three voyages to the Far East as ship's surgeon. In 1826 he became professor of medicine and physiology at the Philadelphia Medical Institute and in 1833 professor of chemistry at the Franklin Institute. From 1841 to 1858 he was professor of the theory and practice of medicine in Jefferson Medical College. His works include: *St. Helena* (1821), a poem, *On the Wisdom, Goodness, and Power of God as Illustrated in the Properties of Water* (1834); *Indecision, a Tale of the Far West, and Other Poems* (1839); *On the Cryptogamous Origin of Malarious and Epidemic Fevers* (1849); the posthumous *Five Essays on Various Chemical and Medical Subjects* (1858), brought out by his son, S. Weir Mitchell (q.v.).

MITCHELL, LANGDON ELWYN (1862–). An American playwright, son of S. Weir Mitchell. Born in Philadelphia, he studied in Dresden and Paris, attended the Harvard and Columbia law schools, and was admitted to the New York bar in 1886. He wrote under the pen name of John Philip Varley, and his plays include *In the Season*, produced in London, 1893; *Becky Sharp*, produced in 1899, a dramatization of Thackeray's *Vanity Fair*; *A Kentucky Belle*; *Step by Step*; *The New Marriage*; *The New York Idea*, produced in London, 1907; *The Kreutzer Sonata*, adapted from the Yiddish of Jacob Gordin (1907). He is also author of *Sylvan and Other Poems* (1884); *Poems* (1894); *Love in the Backwoods* (1896). Mitchell became a member of the National Institute of Arts and Letters.

MITCHELL, MARGARET JULIA (popularly known as **MAGGIE MITCHELL**) (1832–). An American actress, born in New York. She made her first regular appearance as Julia in *The Soldier's Daughter* at the Chambers Street Theatre, New York, in 1851. The parts in which she was best liked were Jane Eyre, Mignon, Little Barefoot, and Fanchon the Cricket. She was married first to Henry Paddock, her manager, in 1868, and later to Charles Abbott, and retired from the stage to live in New York.

MITCHELL, MARIA (1818–89). An American astronomer, born Aug. 1, 1818, at Nantucket, Mass. She was of Quaker ancestry. Her father, William Mitchell, a teacher and then a bank cashier, gave much attention to astronomy as an avocation and made meteorological observations for the government; her brother was the hydraulic engineer Henry Mitchell (q.v.). Miss Mitchell early became greatly interested in

using her father's observatory, poorly equipped though it was, and devoted herself especially to the study of nebulae and comets. During this period she was also librarian of the Nantucket Athenæum library, where before 1855 she had introduced a system of card indexing. After 1847, when she announced the discovery of a new telescopic comet and was awarded therefor a gold medal by the King of Denmark, Maria Mitchell's position was recognized throughout the scientific world. From 1849 to 1868 she was one of the computers for the *Nautical Almanac*. During her travels in Europe in 1857–58 she was the guest of noted foreign astronomers, and soon after her return the women of America presented to her a large equatorial telescope. At Lynn, Mass., whither she and her father removed, she built an observatory and continued her investigations until 1865, when, on the establishment of Vassar College, she was called to the chair of astronomy. This position Miss Mitchell held until ill health forced her retirement in 1888. Her resignation was not accepted, but she was granted an indefinite leave on full salary. A member and later a fellow of the American Association for the Advancement of Science and a fellow of the American Academy of Arts and Sciences, she was the first woman to be admitted to the latter body. Columbia gave her the degree of LL.D. in 1887. Her later studies were of the sun and of Jupiter and Saturn. Miss Mitchell died at Lynn, June 28, 1889. An observatory in her memory was dedicated at Nantucket in 1908. Her numerous scientific papers have not been published in collected form. Consult: M. W. Whitney (associate and successor of Miss Mitchell at Vassar), *In Memoriam* (Poughkeepsie, N. Y., 1889); Henry Mitchell, in the *Proceedings of the American Academy of Arts and Sciences*, vol. xxv (Boston, 1889–90); P. M. Kendall, *Life, Letters, and Journals of Maria Mitchell* (Boston, 1896); M. K. Babbitt, *Maria Mitchell as her Students Knew her* (Poughkeepsie, N. Y., 1912).

MITCHELL, MOUNT. See **BLACK MOUNTAINS**.

MITCHELL, PETER (1824–1899). A Canadian statesman. He was born in Newcastle, New Brunswick, was educated there, and in 1848 was called to the bar. He was a Liberal member of the New Brunswick Legislative Assembly in 1856–60 and in 1860 was appointed a member of the Provincial Legislative Council. In 1858 he became a member of the New Brunswick administration, firmly supported responsible government, and in 1865 suffered defeat with his government on the question of a federal union of all British North America, which he strongly favored and worked for. He was Premier of New Brunswick in 1865–67, taking office in order to test the opinion of the province on the question of confederation. When the vote was taken, confederation was carried by 33 to 8. He was a delegate to the Charlottetown and Quebec conferences on confederation in 1864 and a delegate to London in 1866 to consult in that behalf with the British government. In 1867 he was appointed Senator, but in 1874 resigned. He was Minister of Marine and Fisheries in the coalition cabinet of the Dominion government in 1867–73, was the original organizer of that department, and in 1882 was elected to the Dominion Parliament for Northumberland County, New Brunswick. In 1885 he purchased the *Montreal Herald* and for some years was

its editor. He was in 1897 appointed inspector of fisheries for the Atlantic provinces. His publications include *A Review of President Grant's Recent Message to the United States Congress, Relative to the Canadian Fisheries and the Navigation of the St. Lawrence River* (1870) and *Notes of a Holiday Trip* (1880).

MITCHELL, PETER CHALMERS (1864-). A British zoologist. He was born in Dunfermline, Scotland, the son of a clergyman, was educated at Aberdeen and at Christ Church, Oxford, and was assistant in zoology at Oxford in 1888-91. He lectured on biology at Charing Cross Hospital in 1892-94 and in 1903 became examiner in zoology to the University of London and secretary to the Zoological Society of London. Besides contributions to technical periodicals he wrote *Outlines of Biology* (1894); an excellent critical sketch of Huxley (1900); *The Childhood of Animals* (1912).

MITCHELL, SAMUEL ALFRED (1874-). An American astronomer. He was born at Kingston, Ontario, where he graduated M.A. at Queen's University in 1894. In 1898 he took his Ph.D. at Johns Hopkins. At Columbia he was tutor in astronomy (1899-1905), instructor (1905-08), and adjunct professor (1908-13), and at the Yerkes Observatory (Williams Bay, Wis.) research associate in the summers of 1907 and 1909-11. In 1913 he became professor of astronomy and director of McCormick Observatory at the University of Virginia. He was a member of the United States eclipse expeditions to Georgia in 1900, to Sumatra in 1901, and to Spain in 1905.

MITCHELL, SAMUEL AUGUSTUS (1792-1868). An American geographer. He was born in Bristol, Conn., but removed to Philadelphia. He prepared textbooks of geography for the use of schools, as well as maps and treatises. His books had a very extensive sale. His publications included *American Traveler* (1843), *General View of the World* (1846), *Geographical Reader* (1849); *Traveler's Guide through the United States* (1850), *Universal Atlas* (1851), and many other works.

MITCHELL, S(ILAS) WEIR (1829-1914). A distinguished American neurologist and man of letters. He was born in Philadelphia, Feb. 15, 1829, the son of John Kearsley Mitchell (q.v.). Although ill health prevented graduation with his class at the University of Pennsylvania, he later entered Jefferson Medical College, Philadelphia, and took his degree in 1850. After a few years spent in general practice, Mitchell turned his attention almost entirely to diseases of the nervous system, a field in which he early achieved eminence. His special title to fame is derived from his elaboration of the system of rest treatment which has borne his name for many years and has been adopted, with modifications, the world over. His earliest work of importance consisted of researches upon the chemical composition and physiological action of the venom of snakes, in 1866 and later. He was assistant surgeon to the United States Hospital for Nervous Diseases during the Civil War and thereafter was a prolific contributor to medical literature. Besides scores of essays and monographs upon toxicology, comparative physiology, and clinical medicine, his publications include the following books or pamphlets on medical subjects: "Researches upon the Venom of the Rattlesnake," in *Smithsonian Contributions to Knowledge* (1860), *Injuries of Nerves and*

their Consequences (1864); *Wear and Tear, or Hints for the Overworked* (1873); *Rest in the Treatment of Disease* (1875), *Fat and Blood, and how to Make them* (1877); *Doctor and Patient* (1888), *Clinical Lessons on Nervous Diseases* (1895). Among his later papers may be mentioned *A Clinical Examination of the Motor Symptoms of Chorea* (1898) and *The Medical Department in the Civil War* (1914).

Dr. Mitchell first turned his attention to fiction and general literature during the Civil War, when he wrote *The Children's Hour*, to be sold during the great fair of the Sanitary Commission in Philadelphia. Among other pieces of juvenile fiction was *The Wonderful Stories of Fuz-buz, the Fly, and Mother Grabem, the Spider* (1867). His first novels were *Hephzibah Guinness, Thee and Thou*, and *A Draft on the Bank of Spain* (all published in 1880). Other books followed, including: *In War Time* (1882), *Roland Blake* (1884); *Characteristics* (1892), *Collected Poems* (1896); *Hugh Wynne, Free Quaker* (1898), a story of the American Revolution which ranks among the best of American historical novels; *The Adventures of François* (1898), *Dr. North and his Friends* (1900); *Circumstances* (1901); *The Youth of Washington* (1904), *Constance Trescott* (1905), *A Diplomatic Adventure* (1906), *The Red City* (1908), *John Sherwood, Ironmaster* (1911), *Westways* (1913), *Complete Poems* (1914).

Dr. Mitchell's eminence in science and letters was recognized by honorary degrees conferred upon him by several universities at home and abroad and by membership, honorary or active, in many American and foreign learned societies. In 1887 he was president of the Association of American Physicians and in 1908-09 president of the American Neurological Association. He died Jan. 4, 1914. Consult, for bibliography of Dr. Mitchell up to 1894, *A Catalogue of the Scientific and Literary Work of S. Weir Mitchell* (Philadelphia, 1894). Critical and biographical matter of interest will be found in the following: Talcott Williams, "Dr. S. Weir Mitchell," in the *Century Magazine*, vol. lvi (New York, 1898), in several articles in the *Book News Monthly*, vol. xxvi (Philadelphia, 1907). E. P. Oberholtzer, "Personal Memories of Weir Mitchell," in the *Bookman*, vol. xxxix (New York, 1914); B. R. Tucker, *S. Weir Mitchell* (Boston, 1914).

MITCHELL, SIR THOMAS LIVINGSTONE (1792-1855). A Scottish explorer. He was born in Stirling-shire, Scotland, began his service in the British army in the Peninsular campaign of 1808, and in 1826 was promoted to be major. He was then sent to make surveys and plans of the Peninsular battlefields. In 1827 he published *Outlines of a System of Surveying for Geographical and Military Purposes* and was made Deputy Surveyor-General of New South Wales in 1828. Besides attending to the routine work of this office he led four exploring expeditions into the interior of Australia. In 1835 he traced the course of the river Darling, which he followed, in 1836, as far as the Murray River, with which it unites. In the same expedition he followed the Glenelg River to the ocean. He gave the world the results of his explorations in his *Three Expeditions into the Interior of Eastern Australia* (2 vols., 1838). He went to England in 1839, and on his return to Australia in 1840 conducted a fourth exploring expedition, which is described in his *Journal of an Expedition*

into the Interior of Tropical Australia in Search of a Route from Sydney to the Gulf of Carpentaria (1848). In addition he published *Australian Geography* (1850) and *The Lusiad of Camoens* (loosely Translated) (1854).

MITCHELLA. See PARTRIDGE BERRY.

MITCH'ILL, SAMUEL LATHAM (1764-1831).

An American scientist, born at North Hempstead, Long Island, N. Y. He graduated in medicine at the University of Edinburgh in 1786 and from 1792 to 1801 was professor of chemistry, natural history, and philosophy in Columbia College. In 1796 he made a geological and mineralogical tour of the State of New York, and his report thereon gave him an international reputation in scientific circles. Jointly with Dr. Edward Miller and Elisha H. Smith he established the quarterly *Medical Repository*, of which he was for 18 years the editor. He several times represented his district in the State Legislature and in Congress, and in 1804 was elected a Democratic United States Senator. In 1808-20 he was professor of natural history and in 1820-26 professor of botany and materia medica in the College of Physicians and Surgeons. In 1818 he was appointed surgeon-general of the New York State militia. He was called the "Nestor of American science." His researches embrace a wide variety of scientific and philosophical subjects, and he published a large number of papers and several larger works. Consult "Memorable Events and Occurrences in the Life of Samuel L. Mitchell, of New York, from the Year 1786 to 1827," by himself and Dr. Francis, contained in S. D. Gross, *Lives of Eminent American Physicians and Surgeons of the Nineteenth Century* (Philadelphia, 1861).

MITE, mite, (AS *mite*, OHG. *miza*, *mizza*, Ger. *Miete*; probably connected with Goth. *maitan*, OHG. *meizan*, to cut). Any one of the Acarina, an order in the class Arachnida. They may be distinguished from other arachnids by their small size, by the unsegmented body, without a constriction between the anterior portion or cephalothorax and the posterior portion or abdomen; and by the lack of median eyes. There are exceptions, however, to all these characteristics, and certain forms have been misplaced even by naturalists. The mouth segments have become united to form a beak or rostrum, but this character is not easily recognized. The young mite, on hatching from the egg, is not provided with eight legs as are other arachnids, but with only four or six, except in the case of *Pteroptus*. In size mites vary from tiny creatures, invisible to the naked eye, to certain tropical forms fully half an inch long.

Typically, mites have four pairs of legs, arranged more or less definitely in two groups. The two hinder pairs are apparently attached to the abdomen, while the anterior pairs are close to the mouth parts, which consist of mandibles of varied character, palpi, and maxillæ. The mandibles are typically chelate, but in several families they are reduced to needle-like piercing organs. In the case of certain gamasid mites the mandibles are nearly as long as the entire animal, and can be wholly retracted within the body, or suddenly extruded to seize the prey. The palpi are of four kinds. Simple, filiform palpi, which have a tactile function, are found in many families. In some parasitic forms the palpi are reduced in size and united to the rostrum. In many predatory mites the palpi are modified for raptorial organs. In

some of the water mites the palpi have become organs for holding the mite to other objects. The legs of mites are composed of from five to seven segments, and commonly terminate in from one to three claws. In many genera a

A MITE OR RED SPIDER (*Tetranychus bimaculatus*).

cup-shaped sucking disk or ambulaerum is attached to the tarsus or last segment. The reproductive organs, as in other arachnids, open on the underside of the abdomen near its base. The body and legs are more or less thickly clothed with bristles, hairs, or scales, which are of characteristic nature and arrangement in each species. In many of the soft-bodied species there are chitinous plates or shields, sometimes so large or numerous as almost completely to cover the mite. In the ticks the body is flat and of a tough, leathery consistency.

The sense organs are few and of simple nature. Many mites have no eyes, but in some there are one or two ocelli-like spots on each side of the cephalothorax. A few families have what are considered organs of hearing. With the ticks this organ is a membrane-covered pit in the anterior tarsi, in the beetle mites it is a pore on the posterior margin of the cephalothorax, from which arises a bristle. The sense of touch is supposed to reside in some of the hairs of the body or legs. In many mites there is a considerable difference in appearance between the two sexes, although there is not often much difference in size.

Centralization is the peculiar characteristic of the anatomy of mites. The various organs are more crowded together than in other arachnids. The digestive system, when complete, consists of the pharynx or sucking organ, the œsophagus, the ventriculus or stomach, with its ceca, the hind-gut, and the Malpighian vessels. The œsophagus is a long, simple tube extending through the centre of the brain. The stomach is of varied size, according to food habits; in some forms it is very small, while the ceca are numerous and long. The hind-gut or intestine is a short tube ending in the rectum. The Malpighian vessels, when present, are two in number and enter the intestine near its end. In some mites there is a well-developed dorsal pulsating organ or heart, but in others it is not present. The nervous system consists of one ganglionic mass surrounding the œsophagus, from which all the principal nerves arise. Many mites have an elaborate system of tracheæ by which they breathe and which open in various parts of the body, in many common species near the mandibles, but in the ticks and gamasids they open by stigmata near the hind legs. A great number of mites, however, have no internal respiratory system whatever. In these the skin is soft and they absorb oxygen by osmosis.

Life History. Nearly all mites deposit eggs, frequently of large size. In a few forms the larvæ issue from the parent, but in some cases it is rather from the egg within the body of the dead mite. In many cases the hard external skin or chorion of the egg splits into halves and

exposes the lining vitelline membrane; this permits the maturing egg to increase in size, which is then called a deutovum. The young larvae on hatching commonly have six legs, but the gall mites have but four. During the nymphal stage the mite feeds until it attains adult size. In many cases the nymph molts directly into the adult mite, but in several families the nymph often transforms into a creature entirely different from both the nymph and the adult—the hypopus stage, or hypopus, long supposed to be a distinct genus of mites. On its ventral or under surface is an area of sucking disks, by which the hypopus attaches itself to an insect or small mammal and is transported to some new and suitable locality, where it falls from its carrier, molts into an octopod nymph, begins feeding, and in due time becomes an adult mite. The hypopus is, therefore, not a parasite, but a commensal, making use of the carrier only for transportation, and in certain gamasids (*Uropoda*) the mite in this migratorial stage is attached by a thread of hardened excrement to its host.

In some families (as the Trombididae) the larval and nymphal stages are attached to various insects and feed thereon, while the adult is free. In some of the beetle mites the nymph carries on its back old molted skins, eggshells, and other debris. In these mites there is a considerable resting period while the nymph is changing to the adult, a period when much of the internal anatomy is entirely changed, and it has been observed that when the adult emerges its legs are not withdrawn from the legs of the nymph but from beneath the body. In the bird mites there is a transition form between the nymph and the adult female, known as the nymphal female. The adult male mates with this nymphal form, and when the real adult emerges, an egg, already of considerable size, is seen in her body. Parthenogenesis has been observed in a number of mites. As a rule, mites possess no special accessory sexual organs, comparable to those of spiders, but in some male gamasids the mandibles carry the globule of sperm cells and insert it in the female vulva. In many species the males have one pair of legs enlarged and modified to act as claspers for holding the female. The eggs are usually deposited singly, but many gall mites and harvest mites place them in clusters.

Habits. The habits of mites are very diverse. Most mites ordinarily move quite slowly and deliberately; very few mites are fitted for leaping. The spinning mites, or "little red spiders" (*Tetranychus*), produce a tiny thread wherever they go, the accumulated threads of many individuals making a whitish mesh or web. More than one-half of the known mites are parasitic, at least during part of their life. The ticks are well known to infest various mammals, birds, and even snakes and turtles. They have mouth parts especially fitted for cutting into the skin of the host and sucking up the blood. (See TICK.) One group of the gamasids is parasitic on bats, birds, and small mammals. The bird mites live upon the skin and feathers of birds, but as they feed upon epidermal scales and loose bits of feathers, they do not injure their hosts, but are rather of service in keeping the skin and feathers clean. The itch mites burrow within the skin of man and other mammals. Other species live in the cellular tissue of birds. A few occur in the tracheal passages of seals, and

one has been found living in the lung of a monkey. Many species feed on living plants, and the gall mites produce deformations on the leaves and twigs of plants. Since these gall mites are invisible to the unaided eye, the deformations were formerly supposed to be fungi. Many of the beetle mites feed on fungi, lichens, and other low vegetation. A large number of mites are predacious and attack other mites and small insects. There is a large family, the water mites, living in fresh water, sometimes as commensals within the gills of bivalve mollusks; another group lives in the ocean, even at a considerable depth. In recent years investigators have found a number of mites associated with ants.

Injuries. The injuries caused by mites are arranged in two classes—injuries to man and domestic animals and injuries to cultivated plants and stored food. The most notable of the former class are the ticks. The famous miana bug of Persia is a tick of the genus *Argas*, which inhabits houses, and the early travelers in those regions declared that its bite or puncture would produce convulsions, delirium, and even death. Specimens kept in Europe, however, have proved to be comparatively harmless. The moubata bug of Africa is a similar tick with a similar reputation. An allied species, the chicken tick (*Argas miniata*), does considerable damage to poultry in the Southern States. The cattle tick (*Boophilus bovis*) is the most injurious of all mites, as it occurs in nearly all warm countries and is the means of spreading the Texas or Southern cattle fever. The itch mites, that cause a disgusting scaling of the skin, were formerly not uncommon, but modern cleanliness has largely abolished them in the case of man. A species known as the sheep scab mite (*Psoroptes communis*) is the cause of much injury to sheep, both in flesh and wool. The red

CLOVER MITE (*Bryobia pratensis*)

spider (*Tetranychus*) is a perennial source of trouble to greenhouse and outdoor plants, while the clover mite is a pest of fruit trees in the West, and a related form (*Stigmaeus*) injures pineapples in Florida. To the family of cheese or flour mites (*Tyroglyphidae*) belong a number of injurious species. The true cheese or flour mites (*Tyroglyphus* and *Aleurobius*) feed on a great variety of stored products—cheese, flour, hams, cereals, drugs, seeds, and dried fruits. Although they are very small, they multiply so rapidly that attacked materials are completely overrun with them in a few days. Some species infest mushrooms and are a serious hindrance to their cultivation. The bulb mite or eucharis mite (*Rhizoglyphus*) burrows within bulbs and the roots of plants, thereby giving entrance to destructive fungi; the bulbs of lilies and orchids are particularly subject to their ravages. A few species of gall mites are of great economic

importance, especially the pearleaf blister mite (*Eriophyes pyri*), which is a notorious enemy of pear culture in the United States. Certain species of Tarsonemidæ, living in enormous numbers in the heads of grasses, are known to cause a whitening of the grass, called silvertop.

Comparatively few mites are beneficial to man. One of the harvest mites is known to destroy the eggs of grasshoppers, and various species of *Cheyletus* prey on the flour mites and other injurious forms. Several species have been found feeding on scale insects.

Classification. The mites, formerly all kept in one family, have, in recent years, been divided into from 10 to 30 families, according to the author. The leading families are the following

Trombididæ and Rhyncholophidæ, or harvest mites, many of large size and bright-red color

Eupodidæ, consisting of many small, soft-bodied species that occur on moist soil.

Tetranychidæ, spinning mites, red spiders, and clover mites

Bdellidæ, or snouted mites, from the long, projecting mandibles, predacious.

Cheyletidæ, mites with stout, spiny palpi, predacious or parasitic.

Oribatidæ, or beetle mites; so called from their hard and often shining bodies, very numerous, but of little economic importance

Gamasidæ, many predacious and lurking commonly under fallen leaves and in moist places.

Ixodidæ, or ticks, all parasitic.

Tarsonemidæ, soft-bodied and of curious structure

Tyroglyphidæ, cheese and flour mites, soft-bodied forms, in which the hypopus stage is very common

Hydrachnidæ, or fresh-water mites, and Halacaridæ, or marine mites

Sarcoptidæ, or itch mites; and Analgesidæ, or bird mites.

Eriophyidæ, or gall mites, remarkable for their minute size, tapering, annulate body, and possessing only four legs. See CHIGOË, 2

MITFORD, JOHN (1781-1859). An English author and divine, born at Richmond in Surrey, Aug. 13, 1781. He graduated B.A. from Oriel College, Oxford, in 1804. Five years later he took orders in the English church, and in 1810 he received from Lord Redesdale the vicarage of Benhall in Suffolk. A few years later he obtained two other livings in the same shire. At Benhall he built a parsonage, collected a choice library, and amused himself in gardening. He took permanent lodging in London, where as time went on he came to live for most of the year. He was an intimate friend of Samuel Rogers, of Charles Lamb, and of other literary men. From 1834 to 1850 he edited the *Gentleman's Magazine*, to which he contributed largely. He died at Benhall, April 27, 1859. His *Miscellaneous Poems* appeared in 1858. For the Aldine edition of the English poets he contributed 11 memoirs. His best critical work was on Gray, found in *The Works of Thomas Gray* (1814) and in the Aldine edition (5 vols., 1835-43). His researches have been very freely used by succeeding editors. Mitford left three volumes of manuscript on Gray and a large mass of other manuscript, much of which is now in the South Kensington Museum and the library of the British Museum.

MITFORD, MARY RUSSELL (1787-1855). An English authoress, born at Alresford, Hampshire, Dec. 16, 1787. In 1797 she drew £20,000

in a lottery, with a part of which her father built a house at Reading. She was sent to a good London school for a short time (1798-1802) and then returned to her father's house. At this time she was reading extensively. In 1810 she published *Miscellaneous Poems*, which were immediately followed by other volumes (1811, 1812, 1813). The family, reduced to poverty as a result of the father's improvidence, moved in 1820 to a laborer's cottage at Three Mile Cross, a village near Reading. For a living she now began writing for the magazines and the stage. Among her plays (tragedies), which were moderately successful, are *Julian* (1823), *Foscari* (1826), and *Rienzi* (1828). In the meantime she had taken to writing sketches of village life as she had observed it. They were published (5 vols., 1824-32) in installments, under the title *Our Village*. These descriptive pieces possess charm, grace, and humor akin to Jane Austen's. They were followed by the more regular novel of country life, *Belford Regis* (1835), and, after a long interval, by *Atherton and Other Tales* (1854). In 1851 Miss Mitford removed to a near-by cottage at Swallowfield, where she died, Jan. 10, 1855. Consult: A. G. K. L'Estrange, *Life of Mary Russell Mitford* (London, 1870); id., *The Friendships of Mary Russell Mitford as Recorded in Letters from her Literary Correspondents* (2 vols., ib., 1882); J. T. Fields, *Yesterdays with Authors* (Boston, 1899); W. J. Roberts, *Mary Russell Mitford: The Tragedy of a Blue Stocking* (London, 1913); *Correspondence of Mary Russell Mitford with Charles Boner and John Ruskin*, edited by Elizabeth Lee (New York, 1915).

MITFORD, WILLIAM (1744-1827). An English historian, born in London. He studied at Queen's College, Oxford, and in 1769 became a captain in the South Hampshire militia. He made the acquaintance of Gibbon, then a fellow officer, by whose advice and encouragement he was induced to undertake his celebrated *History of Greece*. The first volume of this work appeared in 1784, and the fifth and last in 1810; it was supreme in European literature till Grote's *History of Greece* appeared. He was three times elected to Parliament, and was professor of ancient history at the Royal Academy. He also wrote *An Essay on the Harmony of Language* (1774) and several minor works.

MITH'AN. The name of the gayal (qv.), among the Indo-Chinese tribes west of the Bay of Bengal.

MITHRADATES. See MITHRIDATES.

MITH'RAS (Gk. *Mithras*, OPers. *Mithra* Skt. *Mitra*, friend). One of the chief deities of the ancient Persian religion. The god seems to have been known to the Indo-Iranians before their separation, as he appears in both the Avesta and the Veda. He is a god of light, invoked in company with the heaven (Ahura and Varuna), and is the guardian of truth and the enemy of all falsehood. In India this deity seems to have been early superseded, but in Persia he retained his place as one of the chief gods. It may be considered very doubtful whether the god was borrowed from the early Babylonians at a date long before our knowledge begins, more especially as in the earlier texts Mithras is not the sun but the light of heaven. In the Zoroastrian religion he is one of the Yazata, or spirits of the second rank, though even here he occupies a high position, seeing and knowing everything, a being whom it is impossible to deceive and in constancy

conflict with the powers of darkness, so that he becomes a warrior god, who is the chief helper of Ahura-Mazda in his struggle with Ahriman (see ZOROASTER; ZOROASTRIANISM) and, by a natural development, of truth and loyalty. In the Old Persian inscriptions, it should be said, he is invoked by the Achæmenidæ along with Ahura-Mazda and Anahita, and his festival (on the sixteenth day of the seventh month) was one of the solemn functions of the state religion. Honored by the numerous princes who built up small principalities throughout western Asia after the division of Alexander's kingdom, the god was a prominent divinity in Cilicia, Cappadocia, and Commagene, though practically unknown in the Greek world. From these regions his worship came to the West to the Romans, through the Cilician pirates conquered by Pompey. It is not mentioned, however, by contemporary Roman writers till the first century of our era, and the earliest Latin inscriptions that name Mithras belong to the early second century. The cult with its mysteries was popular in the army and quickly spread over the whole Roman world, as its monuments in all the frontier provinces plainly show, and became the chief opponent of Christianity. The nature of the religion is obscure, as the sacred writings have perished and information must be drawn either from the writings of Christian adversaries or from the representations in the numerous places of worship. It seems clear that the basis of the cult was derived from the Mazdean worship, but with a considerable mixture of Chaldean worship of the heavenly bodies. Mithras seems to have owed his prominence to the belief that he was the source of all life and could also redeem the souls of the dead and bring them into the better world. This worship was celebrated in underground chambers of small size, to which only those who belonged to the higher degrees were admitted, and was probably conducted according to elaborate ritual prescriptions (For such a Mithraeum at Rome, consult W. Dennison, "The Newly Discovered Mithraeum at the Baths of Caracalla," in the *Classical Weekly*, vii, 151-152, New York, 1915.) The ceremonies included a sort of baptism to remove sins, anointing, and a sacred meal of bread and water, while a consecrated wine believed to possess wonderful power played a prominent part. With the cult of Mithras went a belief in the immortality of the soul and in the resurrection of the dead; it was this belief in particular that brought the followers of Mithras and the Christians into collision. The mysteries contained seven degrees, of which the first three seem to have been probationary and not to have admitted to the sacred ceremonies. The degrees are given in this order: (1) *Corax* or Raven; (2) *Gryphus* or Griffin, (3) *Miles* or Soldier; (4) *Leo* or Lion; (5) *Perses* or Persian; (6) *Heliodromos* or Courier of the Sun; (7) *Patres* or Fathers, who were at the head of the cult, and whose chief was the *pater patrum*. The other initiates called themselves brethren (*fratres*). Women seem to have been excluded from the rites proper of Mithras, but in the western part of the world those rites were brought in close alliance with the worship of the Great Mother of the Gods (q.v.), which was open to women as freely as to men. The nature of the initiation is not known. The undoubted similarity in much of this worship to the new religion of Christianity seems only to have made the battle

between the rivals bitterer, and with the triumph of Christianity and the loss of the eastern provinces of the Roman Empire began the destruction of the Mithras worship, and by the end of the fourth century it seems to have been practically extinct in the West. Robinson, "A Study of the Social Position of the Devotees of the Oriental Cults in the Western World, Based on the Inscriptions," in the *Transactions of the American Philological Association*, vol. xlv (ib., 1913).

MITHRIDATES, mīth'ri-dā'tēz, or **MITHRADATES** (gift of Mithras, from OPers *Mithra*, the sun god + *dāta*, given, p p of the root *da*, to give) An old Persian name, common throughout the East, borne by several kings of Pontus. The most celebrated of them and the greatest of the rulers of Pontus was Mithridates VI, surnamed *Eupator* and *Dionysus*, but commonly called Mithridates the Great. He was born at Sinope about 134 B.C. and succeeded his father, Mithridates V, about 121 B.C. For a time, however, his mother was too strong for him, so that he withdrew to the mountains and lived there as a hunter. But at the age of about 20 he took the reins of government into his own hands. Little that is certain is known of the early part of his reign. He soon subdued the tribes along the northern coast of the Euxine as far as the Tauric Chersonese and set his son, Mithares, on the throne of the Kingdom of Bosphorus (q.v.). he then prepared to extend his conquests south of the Euxine and invaded Cappadocia and Bithynia. Here he encountered the Romans, who restored the kings of Bithynia and Cappadocia to power. Mithridates waged three wars with the Romans, known as the First, Second, and Third Mithridatic wars—the First, 88-84 B.C.; the Second, 83-82 B.C.; the Third, 74-65 B.C. The immediate cause of the First Mithridatic War was the invasion of the territories of Mithridates by Nicomedes, King of Bithynia, at the instigation of the Romans. Mithridates quickly compelled Nicomedes to withdraw, but was in the end defeated by the Roman general Flavius Fimbria, while his general Archelaus was defeated in Greece by Sulla. It was in the course of this war that Mithridates issued an order to all the cities of Asia to put to death, on the same day, all the Roman and Italian citizens who were to be found within their walls. Eighty thousand Romans and Italians are said to have perished in this massacre. As a result of the First Mithridatic War Mithridates consented to abandon all his conquests in Asia, to pay a sum of 2000 talents, and to surrender to the Romans a fleet of 70 ships. The Second Mithridatic War was due to the invasion of Mithridates' dominions by the Roman general Murena. The war was in the main favorable to Mithridates, but was short-lived, Murena being soon ordered by Sulla to withdraw. In 74 B.C. Nicomedes

III, King of Bithynia, died, leaving his dominions by will to the Romans. Mithridates claimed that Nicomedes had left a legitimate son and at once prepared to assert the latter's right. The Third Mithridatic War ensued. At first alone, and then supported by his son-in-law, Tigranes, King of Armenia, Mithridates successfully opposed the Roman forces, but in 66 B.C. the conduct of the war was intrusted to Pompey. (See LUCULLUS, LUCIUS LICINIUS.) Mithridates was then obliged to retreat beyond the Euxine, where, besieged by his son, Pharnaces, who had rebelled against him and had been proclaimed King, he took his own life at Panticapaeum in 63 B.C. Mithridates was a specimen of the true Eastern despot, but he possessed great ability and extraordinary energy and perseverance. His want of success was owing, not to his defects as a general, but to the impossibility of raising and training an army capable of coping with the Roman legions. He had received a Greek education at Sinope, could speak more than 20 different languages, and had a taste for art and science and appreciation of them. He owned a magnificent collection of pictures, statues, and engraved gems. In the estimation of the Romans he was the most formidable opponent they had ever encountered. Consult Theodor Reinach, *Mithridate Eupator* (Paris, 1890), translated into German, with corrections and additions by Reinach, by A. Goetz (Leipzig, 1895), and the article "Mithridates, G," in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

MITLA, mē'tlā, or **MICTLAN**, mēk'tlān' A famous ruin 30 miles east of Oaxaca City in southern Mexico. The name is Aztec and means 'the place of the dead.' In the centre of a wide, fertile valley surrounded by mountains are five clusters of stone buildings built around paved courts. Long stone lintels are used over the wide doorways. The walls of heavy concrete are veneered with cut stone and the façades are ornamented with sunken panels containing mosaics of finely-carved stones in geometrical patterns. Traces of mural paintings are still visible. Cruciform tombs are located under some of the buildings. Little is known concerning the history of this remarkable site except that it was a centre of late Zapotecan culture captured about 1495 by the Aztecs.

The five clusters of stone buildings have been named (1) group of the Curacy; (2) the Columns; (3) the Arroyo, (4) the Adobe; (5) the South Side. Other foundations exist and a mile or so distant, on an isolated hill, are the remains of a fort.

The buildings, which are worthy of the name of temples or palaces, are massive, rectangular structures of dressed stone, set on platforms and erected with surprising accuracy. The stones are laid with such precision that the joints are scarcely discernible, and for this reason little mortar was required. The ground plan is simple and the rooms are, as a rule, long and narrow, while the walls are but one story in height. The grouping of the buildings is in the form of quadrangles.

The walls are faced with dressed stone or plaster. Mosaic stonework is used lavishly, the designs being frets and other geometric designs. The exterior walls have no openings, but the single or triple doorways that open on the courts are imposing in their massive treatment with monolithic lintels. The rooms were ceiled with

beams of wood or slabs of stone. In case the room was wide two sets of beams were used, supported on a row of large stone columns, some of which are 16 feet high and 36 inches in diameter. The roofs were massive and flat, and probably constructed of beams, cross poles, and filling material of brush, capped with rammed clay, similar to the method employed by the Pueblo Indians of the southwestern United States. The floors were made of a durable cement. On the whole, the Mitla buildings, while formal in plan and profile, show perfect and charming mosaic surface decoration, arranged in panels which exhibit great fertility of geometric design, as well as skill in execution. In the Curacy and Arroyo groups mural paintings resembling the pictographs of the codices were employed on the lintels. A noteworthy feature is that realistic sculpture is almost lacking in these buildings.

Two of the palaces have a basement chamber in the form of a cross. Several of these cruciform structures have been discovered in and near Mitla, but nowhere else in Mexico have they been observed, except at Chila in Puebla. It is surmised that they were sepulchres of important personages. The character of the Mitla masonry is also seen in the interesting fortified hill situated about 1 mile west of the village. In location, massiveness of construction, and skill in plan it ranks with the ancient fortifications of Peru. Piles of rounded stones on the walls indicate that the fort was defended by slingers. The quarries from which the ancient Mitlans secured their materials have been discovered. The blocks were obtained by channeling with stone picks and hammers the full length of the stones and across the ends, then channels were cut down the sides and under the blocks until they could be broken off. Enormous stones in all stages of the work still remain in the quarry. Pottery of excellent design and finish has been found. Painted pottery is uncommon here. Fan-shaped implements, a few celts of copper, and gold bells and beads have been found in the tombs. A remarkable cruciform tomb was found by Saville 5 miles from Mitla. These ruins are mainly of stone, but there are evidences of adobe buildings, and some mounds probably supported wooden structures. The large buildings were probably for religious purposes, but their exact use has not been determined by the researches yet made.

Holmes, "Archæological Studies among the Ancient Cities of Mexico," in *Field Museum of Natural History, Anthropological Series* (Chicago, 1895-97); M. H. Saville, "Cruciform Structures Near Mitla," in *American Museum of Natural History, Bulletin*, vol. xiii (New York, 1900); Eduard Seler, "Wall Paintings at Mitla," in *Bureau of American Ethnology, Bulletin* 28 (Washington, 1904).

MITO, mē'tō, or **MYTHO**. A town of Cochinchina, situated on an arm of the Mekong, about 45 miles southwest of Saigon, with which it is connected by rail (Map: French Indo-China, E 4). It has a college and a hospital and is on the trade route between Cambodia and Annam. Pop., 30,000.

MITO'SIS (Neo-Lat., from Gk. *mitros*, *mitos*, thread). The phenomena accompanying the division of the nucleus of cells, a term proposed by

Fleming in 1882 and superseding "karyokinesis." In cell division the seat of the changes is the nucleus, in which portion of the cell the processes of cell division originate. After the nucleus subdivides the entire cell divides into halves, forming two new cells. Mitosis occurs not only in the division of cells during growth, but the nucleus subdivides, forming the first steps in reproduction or fertilization of all organisms. When the nucleus is about to divide, the chromatic granules forming part of the nuclear substance, and previously scattered throughout the central mass of the nucleus, become arranged in a row, forming a long thread,

STAGES IN MITOSIS

1, preparatory to division, 2, early stage in separation of chromosomes, 3, later state in separation, 4, formation of daughter nuclei at poles, and of wall at equator of spindle

which extends through the nucleus in an irregular spiral (spireme) and then divides into portions (chromosomes) of fairly equal length. The chromosomes are shaped like long loops, which afterward become shortened, thus giving rise to short loops, straight rods, or rounded granules. As a rule the number of chromosomes is constant for each species of plant or animal and also for successive series of cells during growth. By the time the process has reached this stage a special mechanism appears, which has till now remained concealed in the cell substance. This serves to divide the chromatin elements into two equal parts, to separate the resulting halves from one another, and to arrange them in a regular manner. At the opposite poles of the longitudinal axis of the nucleus two clear bodies—the centrosomes, each surrounded by a clear zone, the so-called sphere of attraction—now become visible. These were first discovered by Fol, by Van Beneden, and also by Boveri, who recognized their importance. They appear to possess a great power of attraction over the vital particles of the cell, so that these become arranged around them like a series of rays. At a certain stage in the preparation for division the substance of the cell body and of the nucleus gives rise to delicate fibres or threads; these fibres are motile and, after the disappearance of the nuclear membrane, seize the chromosomes with wonderful certainty and regularity, and in such a way that each element is held on either side by several

threads from each pole. The chromatin elements thus immediately become arranged in a fixed and regular manner, so as to lie in the equatorial plane of the nucleus. The centrosomes and threads or astral fibres (*aster*), called the spindle, together form the amphiaster. The chromatin elements next split longitudinally, thus becoming doubled, as discovered by Fleming. This splitting is completed by the two halves being gradually drawn farther apart towards the opposite poles of the nuclear spindle, until they finally approach the centre of attraction or centrosome, which has now fulfilled its object for the present and retires into the obscurity of the cell substance, only to become active again at the next cell division. Each separate half of the nucleus now constitutes a daughter nucleus in which the chromatin breaks up and is scattered in minute granules in the nuclear network. The body of the cell then divides, showing two new cells. Roux has pointed out that the whole complex but wonderfully exact apparatus for the division of the nucleus exists for the purpose of dividing the chromatin substance in a fixed and regular manner, not merely quantitatively, but also in respect of the different qualities which must be contained in it. It will be remembered that the chromatin particles or chromosomes are believed to be bearers of heredity. The mechanism of mitosis is thus far unknown. The problem may be solved, as Wilson states, through chemical research.

Amitosis. Mitosis is the indirect division of the nucleus where the nucleus elongates and directly divides through its total mass the process is called amitosis. This appears to occur exceptionally, but is known to take place in amoeba, in leucocytes, and has been observed in the sperm cells and eggs of batrachians and some insects, but more commonly in pathological tissues.

MITRA, mē'tra (Skt. friend). A Vedic Hindu god of light. He is mentioned most frequently, in company with Varuna (q.v.), with whom in the Veda his attributes blend. Although he seems to have been a god of importance in the Indo-Iranian religion, he lost his rank early in the Indian period and was not recognized after the Vedic age. His Iranian counterpart, Mithras (q.v.), however, was one of the chief deities of the pre-Zoroastrian religion, where he represented the sun. Consult Hillebrandt, *Vedische Mythologie*, vol. III (Breslau, 1902).

MITRA, RAJENDRALALA (1824-91). An Indian Orientalist, born in Calcutta. He belonged to the Kulin-Kayasth caste and was to a great extent self-educated. In 1846 he was appointed librarian of the Asiatic Society in Calcutta, and later philological secretary and vice president of the same organization. In 1885 he was elected president of the society, being the first native to attain that honor. He made

numerous contributions to the *Journal* of the society as well as to the series *Bibliotheca Indica*, editing more than 80 texts, at times with English translations. He was granted the title of Companion of the Indian Empire after the establishment of that Order in 1878 and was made a rajah 10 years later. The most important of his works are: *The Antiquities of Orissa* (2 vols., 1875, 1880); *Buddha Gaya, the Hermitage of Sakya Muni* (1878); *Catalogue of Sanskrit Manuscripts in the Library of the Mahārājā of Bikaner* (1880); *Indo-Aryans: Contributions towards the Elucidation of their Ancient and Medieval History* (2 vols., 1881); *The Sanskrit Buddhist Literature of Nepal* (1882); *History of the Asiatic Society of Bengal*, in the centenary review of the society (1885); and a translation of the *Twelve Principal Upanishads* (1891).

MITRAILLEUSE, mē'trā'yēz' (Fr., mitraille firer, from *mitraille*, to fire mitraille, from *mitraille*, bits of grapeshot, from OF. *mitaille*, fragments, from *mite*, small bit; ultimately connected with Goth. *maitan*, to cut). A machine gun, in which is combined a number of rifle barrels, with breech-action mechanism, and designed to discharge small missiles with great rapidity. It was invented in Belgium, and adopted by the French a little before the war with Germany in 1870. Its official name is *canon à balles* (bullet cannon). The name *mitrailleuse* is now given to any machine gun whatever. See MACHINE GUN.

MITRAL VALVE. See HEART; CIRCULATION.

MITRE (OF., Fr. *mitre*, from Lat. *mitra*, from Gk. *μίτρα*, *mitra*, fillet, belt; probably ultimately of Oriental origin). The headdress worn in solemn functions by bishops and some abbots. The ornament is probably of Eastern origin, although the headdress of Eastern prelates at the present day is quite different, being a large round cap something like a crown. The Western mitre is a tall, tongue-shaped cap, terminating in a two-fold point, supposed to symbolize the "cloven tongues as of fire" in which the Holy Spirit descended upon the Apostles; two flaps or streamers fall from it behind over the shoulders. Opinion is much divided as to the date at which the mitre first came into use. Eusebius, Gregory of Nazianzus, Epiphanius, and others speak of an ornamented headdress worn in the Church; but there is no very early pictorial representation which exhibits any head covering at all resembling the modern mitre. From the tenth century, however, it is undoubtedly found in use, although not at first universally. At the Reformation the mitre was practically discarded as a part of the episcopal costume in England, though there are traces of its survival in isolated instances; and the first Bishop of the Episcopal church in America, Seabury, occasionally wore one. In the last half of the nineteenth century the practice was revived with increasing frequency in the Anglican communion. In the Roman Catholic ritual three kinds of mitres are distinguished: *mitra pretiosa*, richly ornamented with jewels, gold, and silver; *mitra auriphygiata*, made up of gold brocade with embroidery, and *mitra simplex*, formed of white silk or linen damask, with scarcely any decoration, which is worn when black vestments are used. See COSTUME, ECCLESIASTICAL, and Plate.

MITRE, mē'trā, BARTOLOMÉ (1821-1906)

An Argentine statesman, soldier, and author, born at Buenos Aires. While a mere boy he went to Uruguay with his father and there in 1838 began his literary career as a contributor to *El Iniciador* of Montevideo. He continued to contribute to *El Nacional* and other periodicals during his residence in Montevideo. In 1839 he began his military career and in 1842 played an important part in the defense of Montevideo against the siege by Oribe. He was a member of the secret society, *Asociación Nacional*, which exerted a large influence on the government, and of the Assembly of Notables, which acted in place of a legislative body. A revolt, directed by the Porteños, caused Mitre to flee to Bolivia, where President Ballivian placed him in charge of the Military College. He was the President's chief of staff during a revolution and was decorated by the Bolivian government for his services. Upon the overthrow of Ballivian Mitre was exiled, going first to Peru and then to Chile, where he edited *El Comercio* at Valparaíso and *El Progreso* at Santiago. For attacking the corruption of the government his presses were confiscated and he was arrested and banished to Peru. In 1851 he returned to Argentina and joined Urquiza in the uprising against Rosas. He was in command of a battery of artillery in the battle of Monte Caseros (Feb. 3, 1852), in which Rosas was overthrown. Elected deputy of the Province of Buenos Aires, he openly attacked Urquiza, who was hostile to the Province of Buenos Aires, and assailed the *Acuerdo de San Nicolás*, which gave Urquiza unlimited powers. For this he was banished, but returned (September, 1852) and became a leading figure in the independent Province of Buenos Aires. He served the province as commander of its army, Minister of War (1855), and Minister of Government and Foreign Relations (1857). In 1859 Mitre was defeated by Urquiza at Cépeda, but he refused to surrender unconditionally and accept the constitution formed on the basis of the *Acuerdo de San Nicolás*. Instead he opened a campaign in favor of a revision of the constitution which would save the rights of Buenos Aires and give the country a national organization on a solid and popular basis. In November, 1859, an agreement was made between the Confederation and Buenos Aires, by which the latter rejoined the Confederacy. The next year a Constitutional Convention formed a new constitution (September, 1860), to which Mitre swore as Governor of Buenos Aires and as an Argentine citizen (October 21). The abuses committed by the national government caused Buenos Aires to take up arms in defense of the constitution in 1861. Mitre led the provincial forces and defeated Urquiza in the battle of Pavón (q.v.)—the triumph of the party of Argentine liberty. This is considered Mitre's greatest service to his country. From March to October, 1862, he was *encargado* of the national power, in which position he assembled the Congress which completed the unification of the Argentine nation. In the latter month he was unanimously elected President. He carried out the constitutional reorganization of the country, fostered internal improvement, and encouraged foreign immigration. He failed, however, to secure the federalization of the city of Buenos Aires. Upon the outbreak, in 1865, of the war of Paraguay with Argentina, Brazil, and Uruguay, Mitre joined in a coalition against the Paraguayan dictator

Francisco López (q.v.) and was in command of the allied forces until 1867. Defeated for reelection, he founded and edited for many years *La Nación*, a leading newspaper of Buenos Aires. He was elected Senator and in this position displayed remarkable powers of oratory. Having been defeated by corrupt methods in the presidential election in 1874, he led an ineffectual revolt, for which he was court-martialed and exiled, but he received an amnesty the following year. From 1878 to 1880 he served as deputy in the national Congress and in the latter year led the defense of Buenos Aires in a minor revolt. He actively opposed the administration of President Celman (1886-90) and was popularly acclaimed candidate for the canvass of 1892, but withdrew and joined Ex-President Roca in the support of Luis Sáenz Peña, who was selected. He was again candidate for the presidency in 1898, but withdrew, and afterward was elected to the Senate, of which body he served as president. During his active career he devoted much time to literature, indeed, he ranks as one of Argentina's greatest writers. His *Historia de Belgrano y de la independencia argentina* (1857; 5th ed., 4 vols., 1902) and *Historia de San Martín y de la emancipación sud-americana* (1869; 3d ed., 6 vols., 1907) are the best accounts of the South American wars of independence. There is an abridged translation in English of the *Historia de San Martín*, entitled *The Emancipation of South America* (London, 1893), by W. Pilling. Mitre's speeches were collected as *Arengas* (3d ed., 3 vols., 1902). He also published *Rimas* (new ed., 1890), *Uldrich Schmidel, primer historiador del Río de la Plata* (1890); and many other works. Consult J. J. Biedma, *El Temente General Bartolomé Mitre*, in Bartolomé Mitre, *Arengas*, vol. iii (Buenos Aires, 1902).

MITRE, THE. A former London tavern, the favorite meeting place of Dr. Samuel Johnson, Boswell, and other celebrities. It stood on Fleet Street, and other well-known taverns of the same name were situated on Wood Street and Fenchurch Street, both destroyed in the great fire of 1666.

MITRE SHELL. A gastropod of the genus *Mitra*, family Mitridæ. The shells are very beautiful and much prized by collectors, the favorite being the bishop's mitre (*Mitra episcopalis*). The shell is turreted, smooth, white, spotted with bright red, pillar four-plaited, outer lip denticulated at its lower part; epidermis thin. It is found in East Indian seas. In this genus the shell is fusiform, thick, spire elevated, acute; aperture small, notched in front; columella obliquely plaited, operculum very small. The animal has a very long proboscis, and when irritated emits a purple liquid having a very offensive smell. Over 400 recent and 100 fossil species have been described. These mollusks are found at depths varying from the surface to 17 fathoms, on reefs, sandy mud, and sands. All are inhabitants of warm countries, notably the East Indian and Philippine regions.

MITROWITZ, mî'trô-vîts, or MITROVICZA, mē'trô-vê-chô. A town of south Hungary, in the County of Szerem, on the Save, 43 miles west of Belgrade (Map, Hungary, F 4). On the opposite shore is the Servian town of Mitrovica. The chief industries are tanning leather and silk-worm culture. It has a considerable trade in grain, fruit, and wine, and contains ruins of the

old Roman city of Sirmium. Pop., 1900, 11,518. 1910, 12,909.

MITSCHERLICH, mîch'ér-lik, EILHARDT (1794-1863). A German chemist, born at Neuende, near Jever. In 1811 he proceeded to the University of Heidelberg, where he devoted himself to history and philology and especially to the study of Persian. In 1814 he published a work on Persian history. In the same year he decided to take up the study of the medical sciences, and while working in chemistry under Link at Berlin he first observed the similarity in the crystalline form of phosphates and arsenates of similar chemical composition. He then set to work measuring crystals of a large number of substances, and was able to establish, in 1819, the principle of *isomorphism* (See ATOMIC WEIGHTS.) The importance of the discovery was fully recognized by Berzelius, on whose invitation Mitscherlich went to Stockholm, remaining there until 1821. In the following year he was made professor extraordinary, and in 1825 full professor, in the University of Berlin. One of his earliest discoveries after his appointment was that of the occurrence of sulphur in two different crystalline forms—the first observed case of "dimorphism." He further discovered selenic and permanganic acids and nitrobenzene, and studied the formation of ethers, the phenomena of fermentation, etc. His principal work is his *Lehrbuch der Chemie* (1829-35; 4th ed., 1840-48). His papers on various scientific topics appeared in Poggendorff's *Annalen*, in the *Annales de chimie et de physique*, and in the *Abhandlungen* of the Academy of Berlin. A complete edition of his works was published at Berlin in 1896. Mitscherlich was an honorary member of almost all the great scientific societies and received the gold medal from the Royal Society of London for his discovery of the law of isomorphism. Consult Rose, *Eilhardt Mitscherlich* (Berlin, 1864). See CHEMISTRY, section on History, paragraph General Chemistry.

MITSUKURI, KAKACHI (1857-1909). A Japanese zoologist, born at Edo. In 1873 he came to the United States, where he received the Ph.D. degree from Yale in 1879 and from Johns Hopkins in 1883. He was appointed professor in the science department of the Imperial University of Tokyo in 1882 and counselor of the university in 1893. In 1896 he was made head of the fur-seal commission and signed, on behalf of Japan, a treaty with the United States and Great Britain. In 1901 he became dean of the College of Science of the Tokyo University and in 1907 was decorated with the Order of the Sacred Treasure in recognition of public service. In later life his time was largely occupied with administrative duties. He was regarded not only as one of the leading zoologists of Japan, but also as most influential in public life. His most important zoological publications, a series of papers on the embryology of the turtles, appeared at intervals from 1886 to 1896.

MITTAG-LEFFLER, mî'täg-lëf'lër, MAGNUS GUSTAF, BARON VON (1846-). A Swedish mathematician, born at Stockholm. He studied mathematics at Upsala and later in Paris under Weierstrass and in Berlin. He began his teaching as docent at Upsala in 1872, after having obtained the doctorate there the same year, and five years later became professor of mathematics at Helsingfors. In 1881 he was made

professor of mathematics at the University of Stockholm and subsequently was several times its rector. He was made a member of the Academy of Sciences of Sweden in 1883. His mathematical contributions are connected chiefly with the theory of functions. In 1882, under the patronage of King Oscar, he founded the *Acta Mathematica*, at present one of the leading mathematical journals of the world. The historical part of this journal has since 1887 been published separately by Eneström as the *Bibliotheca Mathematica*. It was Mittag-Leffler's appreciation of Sonja Kovalevsky's (q.v.) work that took her to Stockholm.

MITTERMAIER, mīt'ēr-mī'ēr, KARL JOSEPH ANTON (1787-1867). A German jurist, born in Munich and educated at the universities of Landeshut and Heidelberg. He was a professor at Bonn for two years (1819-21), but the rest of his life was passed as professor of law and jurisprudence at Heidelberg. For many years he was a member of the Baden Legislature, and in 1848 he was President of the Frankfurt Vorparlament, serving afterward as representative of the city of Baden in the German National Assembly. His greatest claim to distinction lies in his extensive writings on jurisprudence, among which is a complete manual of criminal law, *Das deutsche Strafrecht*, and he was an earnest advocate of reform in the German criminal procedure and in prison discipline. The number of his published writings is very large, including many treatises on branches of law, discussions on all the important questions of his time connected with jurisprudence, and especially on trial by jury and the penal code. His principal works have been translated into many languages. He himself translated Francis Lieber's *Letter on Anglian and Gallian Liberty*, and edited the German translation of the same author's *Civil Liberty*.

MITTERMAIER, (GEORG GOTTFRIED) WOLFGANG (1867-). A German legal scholar and criminologist, the grandson of K. J. A. Mittermaier. He was born in Heidelberg and was educated there and in Berlin, and traveled in the United States, England, France, and Austria. He lectured on criminal law at Heidelberg in 1896 and became professor there in 1899, at Bern in 1900, and at Giessen in 1903. Among his published works are: *Die Militärstrafgerichtsordnung* (1899); *Amerikanische Reformatorien* (1901), based on his own observation. *Kritische Beiträge zur Lehre von der Strafrechtsschuld* (1909); *Wie studiert man Rechtswissenschaft?* (1910).

MITTERWURZER, mīt'ēr-vurts'ēr, ANTON (1818-76). A German opera singer, one of the greatest barytone interpreters of the works of Gluck, Marschner, and Wagner. He was born at Sterzing in the Tirol, made his first theatrical appearance at Innsbruck, and at 21 was engaged at Dresden, where he stayed for 30 years and greatly influenced operatic methods. Mitterwurzer was at his best in such Wagnerian rôles as Wolfram, Telramund, and Hans Sachs.

MITTIMUS (Lat., we send). A written warrant or mandate issued by a competent judicial officer, directing a proper officer to convey safely the body of a prisoner to some jail or place of confinement and commanding the warden to receive and keep the prisoner for a certain time, or until released by due process of law. The act of sending the prisoner to prison is termed the commitment, and this latter term

is now commonly employed to describe the warrant also. Any officer who disobeys such a command is guilty of contempt of court. See COMMITMENT, ARREST.

MITTU, mīt'tōō. An agricultural Negro tribe, akin to the Bongo and living on the upper Nile in southern Sudan between lat. 5° and 6° N. In addition to the Mittu proper the term is also applied to a number of neighboring groups allied in speech and customs though politically independent. Of these the Madi, Madi-Kaya, Abbakah, and Loobah are mentioned by Schweinfurth. They are of earthy red-brown color and below the middle stature, but muscular. The hair is short and crisp. The lighter color of the skin would indicate a type of Hamite blood; but they are all pagans, like the other negroes about them, and little affected by Mohammedanism. Goats, fowls, and dogs are their domestic animals. At certain seasons of the year they are engaged in hunting and fishing. The costume of the Mittu consists only of a fringed apron, but they are fond of decorating their hair and parts of the body, such as the neck, arms, and lips, with ornaments. Their weapons are bows and arrows, with jagged, murderous points. Culturally they are most closely related to the Bongo and seem to form an intermediate link between them and the Azande (Niam-num). They are markedly musical, with a considerable sense for melody; among their instruments are the lyre, flute, and trumpet. Consult Georg Schweinfurth, *The Heart of Africa* (2 vols., New York, 1874).

MITTWEIDA, mīt'vi'dā. An industrial town of Saxony, Germany, situated on the Zschopau, about 30 miles west-southwest of Dresden (Map: Germany, E 3). It has important manufactures of cotton and woolen goods, cigars, cement, machinery, and furniture. Its institutions include a Realschule and a technical school. Pop. (including Rossgen), 1900, 16,119, 1910, 17,800, chiefly Protestants.

MITYLENE, mīt'i-le'nē. An island of the Ægean. See LESSOS, MYILENE.

MIVART, mī'vart, ST. GEORGE JACKSON (1827-1900). An English zoologist, born in London, Nov. 30, 1827. He was educated at Harrow, at King's College, London, and then, having become a Catholic in 1844, at St. Mary's College, Oscott. He was called to the bar at Lincoln's Inn in 1851, but in 1862 became lecturer on comparative anatomy and zoology at St. Mary's Hospital, London. From 1890 to 1893 he held the chair of the philosophy of natural history at the University of Louvain, Belgium. In 1879 he was president of the biological section of the British Association. A most careful and competent anatomist and zoologist, he wrote a large number of very important memoirs, especially upon the morphology and classification of vertebrates, and contributed largely to the discussion of the question of evolution. He was probably the most learned and powerful critic of Darwin and Huxley in minimizing the effect of natural selection as a factor of evolution and in insisting upon the existence of the guiding action of divine power, especially in the development of man's intellect and spiritual instinct. He distinguished, however, between absolute and derivative creation, maintaining that evolution operated only by means of the latter. His strength lay in natural science, and in this department he held a position of unquestioned eminence.

His efforts to reconcile the facts of science with the doctrines of religion aroused widespread attention. In the field of philosophy he published a number of works, such as *Lessons from Nature as Manifested in Mind and Matter* (1876); *Nature and Thought* (1882); *On Truth* (1889); *The Groundwork of Science. A Study of Epistemology* (1898). He claimed an increasing freedom of thought, which ultimately took him beyond what were considered in the Church the bounds of permissible speculation. After a series of magazine articles (1885-1900) dealing with the relations between science and faith, he was finally excommunicated by Cardinal Vaughan in January, 1900. He died April 1 of the same year in London. His more important works in natural science are: *The Genesis of Species* (1871), *Man and Apes* (1873); *The Common Frog* (1874); *The Cat* (1881), *Dogs, Jackals, Wolves, and Foxes* (1890), *American Types of Animal Life* (1894) His *Essays and Criticisms* (2 vols.) appeared in 1892.

MIWOK STOCK, or MOQUELUMNAN. A linguistic family of Indians in California consisting of the Miwok, Marin, and Middle Town tribes, now numbering 700. Consult A. L. Kroeber, in *American Anthropologist*, vol. viii (Lancaster, Pa., 1906), and S. A. Barrett, *Geography and Dialects of Miwok Indians* (Berkeley, Cal., 1908).

MIXED CADENCE, IN MUSIC. See HARMONY, *Cadences*.

MIXED RACES. Races which are blends of various other races. Of the factors which have been most potent in producing the varieties of man which we find on earth to-day, probably environment and crossbreeding must be assigned the first place. Unfortunately, neither one has been investigated with sufficient care to allow an accurate estimate of its specific influence. Further, the lack of any agreement among anthropologists as to a classification of human races complicates the problem, and until that agreement is reached confusion in the discussion is inevitable.

Certain general observations may, however, be permitted. With regard to crossbreeding it is undoubted that extensive migrations, with consequent blood mixtures, have been going on for an indefinite period. Accurate observation of anatomical and physiological characteristics of certain rather restricted groups, as in Europe, reveals a variability in these characters which has led some observers to conclude that a pure race does not exist at the present time. Recognizing these disturbing facts, however, any one will admit that there are certain types which are relatively permanent. We regard the fair white European as differing permanently from the negro, and both of these equally permanently from the typical Mongol. It is also a matter of common observation that mixture of any two of these types will produce a third, less distinctive, of course, but not to be included in either parent type. The real problem of hybridity as applied to man then arises. Are these subtypes permanent and fertile, or do they tend to revert to either one or the other of the parent types? It is here that the lack of accurate knowledge referred to above prevents positive statement. Early reports as to lack of fertility of certain half-breeds, as in the case of English and Australians, have been shown upon examination to be erroneous or the apparent sterility due to

nonessential factors; and recent observations on half-breed American Indians actually show an increase rather than a decrease in fertility. Looking at the question broadly, it would seem that the evidence, while extremely scanty, points towards the view that any two races (however defined) can unite to form a third; and this in turn with others, until we have a confusion of strains and types in which the originals are indistinguishable, wholly or partly, which is apparently precisely the condition which we find to-day in various regions of the world. An authoritative catalogue of the existing mixed races of the world is therefore impossible. The most notable are probably the well-known mulatto, or cross between European and negro; the mestizo, so called, or cross between European and American Indian, and the complex mixtures which we find in the East Indian Archipelago, where Chinese and Malayan traits predominate.

The social significance of race mixture is of course very great, but the complicating factors in this aspect of the question are even greater than on the physical side. We find here two schools ardently advocating diametrically opposed views both as to the advantages or disadvantages of racial mixtures as well as to the mode of transmission of the characteristics of the parent stocks. The whole problem is involved in the general zoological problem of evolution and heredity, and unassailable ground as to the points involved cannot be assumed until a much wider range of facts is at our disposal and the disputed questions of inheritance in general have more nearly approached solution.

Prof. Eugen Fischer has recently studied the Hottentot-Boer breeds of German Southwest Africa and arrives at a relatively favorable interpretation of this hybrid race, both as to vitality and social characteristics. In America an optimistic view as to miscegenation is held by Prof. Franz Boas. Consult Franz Boas, *The Mind of Primitive Man* (New York, 1911), and Fischer, *Die rehobother Bastards und das Bastardierungsproblem beim Menschen* (Jena, 1913). See CROSS BREEDING IN MAN.

MIXES. See ZOOGE.

MIXOG'AMY (from Gk *μῖξο-*, *mixo-*, mixed, from *μῖγναι*, *miḡnnai*, to mix + *γάμος*, *gamos*, marriage). A term describing the breeding habits of most fishes, where the males and females congregate on the spawning beds and the number of the former sex is greatly in excess. The same habit has been observed in gars (*Lepidosteus*). On the other hand, the stickleback (*Gasterosteus*) is truly polygamous, several females depositing their eggs in the same nest, guarded by one male only. Some bony fishes (*Ophiocephalus*, and probably all chondropterygians) are monogamous, as probably are all the viviparous fishes. Consult Albert Gunther, *An Introduction to the Study of Fishes* (London, 1850).

MIXOPHYTE. A term applied to plants of such a plastic nature that they are able to live either independently as autophytes or dependently upon dead organic matter as saprophytes. See AUTOPHYTE, SAPROPHYTE.

MIXTEC, or MISTEC, mē-stēk' An important Mexican tribe of high culture occupying eastern Guerrero and northwestern Oaxaca. In culture they resembled their southern neighbors, the Zapotec. Like them they were skilled in agriculture, pottery, and weaving, built temples

of hewn stone, kept hieroglyphic records, and had a calendar system. They still keep themselves apart from the political affairs of Mexico and maintain some of their old arts. The population is well over 200,000 and the language is believed to constitute a distinct stock, although often grouped with the Zapotec. The name is Aztec and means 'cloud people.'

MIXTURE (OF., Fr. *mixture*, from Lat. *mis-tura*, mixture, from *miscere*, to mix). An aqueous preparation of an insoluble substance held in suspension by a suitable vehicle. Among the mixtures used in medicine are those of chalk, of rhubarb and soda, and the compound mixtures of iron and of glycyrrhiza (licorice).

MIXTURE. An organ stop, consisting of from three to six ranks of small metallic pipes. It is generally found in large organs, and resembles the sesquialtera and furniture stops, except that it is much higher and shriller. Like other compound stops, the two smaller ranks of the mixture stop change on the upper part of the organ scale into an octave lower. This is necessitated from the fact that the pipes in their upper ranks would produce too small a volume of sound. The mixture can be used only in forte and fortissimo passages, as otherwise the harmonics would be heard too prominently.

MIYA, *mē'ya* (Jap., august house). A term sometimes applied to the mansions of Japanese princes, but more commonly denoting the shrines of the Shinto religion. These buildings represent the ancient cabins of the primitive Japanese modified by the progress of civilization and by Buddhist influence. The earth floor of the hut is replaced by wooden flooring raised 2 or 3 feet from the ground, necessitating steps at the entrance. A veranda going completely round the edifice has been added. The sides of the hut were made of mats, but the shrine has walls of wood. The roofs were originally thatched, but are now covered with shingles, tiles, or even copper. In many shrines Buddhist influence has led to much decoration, but the characteristic of the true miya is extreme simplicity. It contains neither picture, image, nor altar, but only a mirror, or in some instances a pillow for the god. Before the shrines is the *torii* (supposed to signify 'bird rest'), which is sometimes taken for a gateway by tourists. Often many of them are placed before a single shrine. From a cord which hangs above the entrance are suspended *go-hei*, paper cuttings, representative of the offerings of cloth which were made in ancient times. Services are infrequent, usually not oftener than once or twice a year, and in some shrines there are no ceremonies. In 1908 there were 130,258 miya in existence, most of them tiny constructions and only a few of wide reputation. The shrines are divided into four classes—national, provincial, prefectural, and local—and a few are supported in meagre fashion by funds from the Imperial treasury.

MIYADZŪ, *mē-yād'zū*. The most important town of the Japanese Province of Tango in San-in-do (Hondo), 87 miles northwest of Kyoto (Map: Japan, D 6). It was the residence in feudal times of Matsudaira, one of the three daimyos who ruled the province. Pop., about 10,000. In the vicinity, near Ama-no-hashidate (heaven's bridge) is a narrow tongue of land which juts out into the sea in a way much admired by the Japanese.

MIYAJIMA, *mē'yá-jé'má* (temple island), sometimes called ITSUKUSHIMA. A small, beau-

tifully wooded island in the Bay of Hiroshima, Japan, celebrated as the site of one of the most ancient Shinto shrines of the country. The temple is dedicated to the goddess Benten, worshipped by women for attractiveness and easy childbirth and by men for wealth. It was built in the year 527. The island is also notable for its deer and the absence of dogs. Priests, image carvers, fishermen, and innkeepers make up the population.

MIYAKO, *mē'yā'kō*. Another name for Kyoto, a city of Japan.

MIZON, *mē'zōn'*, LOUIS ALEXANDRE ANTOINE (1853-99). A French naval officer and explorer in Africa. He was born in Paris, studied at the Naval School (1869-72), and in 1877 was sent out to accompany Brazza on his expedition to the region of the Ogowai River in the Congo region. He was stationed at Franceville for six years, and in 1886 he published charts of the Ogowai. Four years afterward he was sent to Adamawa, where he promoted French commercial interests in the Niger country and greatly irritated Great Britain. The latter power in 1893, after Mizon had made a treaty with the Sultan of Hamarua, declared Hamarua a British protectorate and forced Mizon's recall. In 1895 he was made French Resident at Majunga in Madagascar. He died when on his way to take up the duties of Governor of the colony at Jibuti in French Somaliland.

MIZPAH, or **MIZ'PEH** (Heb., watch, outlook). The name of several places in Palestine, of which the most important are. 1. The heap of stones and pillar set up by Jacob and his brethren as a witness of the covenant between Jacob and Laban. It was also called Galeed by Jacob and Jegar-sahadutha, by Laban (Gen. xxxi. 44-49), the latter being the western Aramaic rendering of the Hebrew *gal-ed* (heap of testimony). The narrative points to the existence of a sanctuary in Galeed which was known as Mizpah. The pillar and the heap of stones are to be regarded as objects for the cult—the former a Baal symbol, the latter a boundary stone, serving also as an altar. It was at this sanctuary that Israel was encamped before the conflict with the Ammonites (Judg. x. 17), which, as Gen. xxxi. 25 informs us, lay in Gilead (upon which Galeed represents a play). The indications in the Old Testament are insufficient for determining the site of the place with certainty. It lay north of the Jabbok, and perhaps near the modern Jerash, which answers the conditions involved. 2. The place in the territory of Benjamin where Israel gathered before punishing the tribe of Benjamin for their outrage on the concubine of the Levite at Gibeah (Judg. xix-xx), and probably also the place where Samuel assembled Israel to resist the Philistines and subsequently to present Saul as King (1 Sam. x. 17 et seq.), though it is also possible that the two places may be distinct. The location is not certain. It may be a point on the mountain ridge north of Shafat. These gatherings again indicate the presence of a sanctuary at Mizpah, and the continued importance of the place is made manifest by its choice as a seat of government under Gedaliah (2 Kings xxv. 23; Jer. xl. 6). In postexilic times we meet with references to Mizpah, and it is of special interest to note that in the days of the Hasmonæans Mizpah again becomes a gathering place for the Jews (1 Macc. iii. 46). Besides these two Mizpahs there are references

in the Old Testament (*a*) to the land of Mizpah (Josh. xi. 3) and the valley of Mizpah (ib., xi. 8), which are identical. This Mizpah is mentioned in connection with the battle of Merom (*q.v.*), and may be located near Hermon. A fourth Mizpah was situated in the "lowland" of Judæa (Josh. xv. 38), and a fifth in Moab (1 Sam. xxii. 3). The use of Mizpah as an inscription for memorial rings is based upon the words occurring in connection with the setting up of the "heap" of stones by Jacob and his brethren "The Lord watch between me and thee" (Gen. xxxi. 49).

MIZ'ZEN, or **MIZ'EN**. See **MAST**.

MJÖSEN, myé'zen. The largest lake in Norway, situated in one of the most fertile valleys of the country, 36 miles northeast of Christiania (Map: Norway, D 6). Its length is 62 miles, its width averages only 2 and nowhere exceeds 10 miles. It receives the Laugen River at Lillehammer and empties its waters through the Vormen and the Glommen into Skager Rack. Its depth is remarkable, reaching in the southern part 1460 feet, its bottom being here 1050 feet below sea level. The vicinity of the lake is very popular as a summer resort, and steamers ply on it regularly during the ice-free season, which in the southern part, on account of its great depth, sometimes lasts throughout the year.

MLAWA, m'li'va (Russ. *Млава*). A district town in the Government of Plozk, 46 miles northeast of Plozk (Map: Russia, B 4). It is at the junction of the Marienburg-Mlawá and Kowel-Mlawá railways. It has five churches, a sixteenth-century town hall, a first-class custom-house, and is an important trade centre. Mlawá was founded in 1429 as an Imperial city, but declined rapidly after the wars with Sweden. Pop. 1910, 18,652. It was the centre of extremely heavy fighting during the European War which began in 1914. In the early part of the war it was captured by the Germans. They strongly intrenched their position, and several Russian attempts to recapture it were unsuccessful, although combined land and aerial attacks were resorted to. See **WAR IN EUROPE**.

MLYNARSKI, mlé-nár'ské, EMIL (1870-) A Polish composer, born at Kibarty in Suwalki. He received his musical education at the St. Petersburg Conservatory, where Leopold Auer (*q.v.*) was his violin teacher. In 1889 he joined the orchestra of the Russian Imperial Musical Society at St. Petersburg and a few years later became instructor of violin at its Odessa branch. In 1890-93 he toured England and Germany as violin virtuoso. In 1898 he was appointed conductor of the Warsaw Opera House, from 1901 to 1905 was conductor of the Warsaw Philharmonic concerts, and in 1904-07 was director of the local conservatory. In 1908 he moved to London. He wrote violin music, pieces for the piano, songs, and operas. His violin concerto won the Paderewski prize at Leipzig in 1898.

MNA. See **MINA**.

MNEMONICS, nê-môn'iks. See **MEMORY**.

MNEMOSYNE, nê-môs'î-nê (Lat., from Gk. *Μνημοσύνη*). In classical mythology, the goddess of memory, daughter of Uranus and Gaia. By Zeus she became the mother of the Muses (*q.v.*).

MNESICLES, nês'î-klêz (Lat., from Gk. *Μνησικλῆς*, *Μνήσικλῆς*). A Greek architect, who built the Propylæa (*q.v.*) of the Acropolis at Athens. His name was found on an inscription

in its ruins, and Plutarch mentions him as its architect.

MNESTRA. See **ERYSICHTHON**.

MO'A (Maori name). A general name for a family (*Dinornithidæ*) of extinct ratite birds of New Zealand, some of which were of gigantic proportions. The existence of their remains and of legends among the Maoris relating to them was first published in 1838. The exploration of New Zealand revealed bones of these birds in great profusion, on the surface, in peat bogs, in seaside sand dunes, and in certain caves where the dry air had in some cases preserved not only the ligaments binding skeletal parts together but even pieces of dried skin and feathers, which still retained their chestnut and white colors, while footprints and broken eggshells have also been found. Prehistoric camping grounds furnish charred bones and fragments of eggshells.

The moas form a family more nearly associated in structure with the emus, cassowaries, and apteryx than with the ostriches. They were in organization nearest to the kiwis (*Apteryx*), but distinguished by their short beaks and by having after-shafts upon the feathers. They attained not only to great numbers and size in the isolation of New Zealand, but to a remarkable variety, some 20 species being now recognizable. Some were not larger than turkeys, and these perhaps may have had some vestiges of wing bones; but the longer moas were not only wingless but entirely destitute of any shoulder girdle whatever. In Canterbury College, Christchurch, South Island, New Zealand, the museum contains a moa room in which stand two splendid specimens of the *Dinornis maximus*, 12 feet, 3 inches high, as well as other specimens ranging from the size of a small emu to that of a guanaco. That the moa, although now extinct, existed at one time in very considerable numbers may be inferred from the fact that a search expedition by Dr. von Haast in the year 1866 obtained enough bones of this gigantic bird to fill an immense wagon. For a long time—indeed until very recently—it was believed that living specimens of the moa might still be discovered in that almost inaccessible mountainous region on the southwest and westernmost coasts of Otago, where even the Maori, in all probability, never penetrated. The expedition of Herr Reischek, the Austrian naturalist, who spent several months of the years 1887 and 1888 in that solitary country, pretty well dissipated this hope. In the genus *Pachyornis* the leg bones were short, massive, and extremely powerful, so that these are called the "elephant-footed" moas. Consult Owens, *Extinct Birds of New Zealand* (London, 1879); Alfred Newton, *Dictionary of Birds* (New York, 1893-96); Walter Rothschild, *Extinct Birds* (London, 1907); F. A. Lucas, "Animals of the Past," in *American Museum of Natural History, Handbook Series*, No. 4 (New York, 1913). See **APYORNIS**; **EXTINCT ANIMALS**; **EXTINCTION OF SPECIES**.

MO'AB. The name given to a people occupying the high table-land east of the Dead Sea and the southern section of the Jordan (Map: Palestine, E 5). The southern boundary was Edom; the eastern, Ammon and the desert, the northern shifted from time to time, but in general was marked by a line some miles beyond the northern extremity of the Dead Sea. This land of Moab is a plateau from 3000 to 4000 feet above the Mediterranean Sea. The western slopes are gen-

erally steep and the aspect of the Moabite Mountains rising to the plateau is barren. It has streams in abundance; besides the Arnon, which divides the plateau, springs and brooks intersect the country. Numerous ruins testify to the former prosperity of the district, while the hundreds of rude stone monuments (stone circles, dolmens, cairns) show that it was densely settled in very early days. According to the biblical account, Moab, the eponymous ancestor of the Moabites, was a son of Lot by one of his daughters (Gen. xix. 37). This story, which traces both Moab and Ammon to an incestuous connection, may be a bit of tribal slander by Hebrew writers to throw discredit on their hated rivals and foes. (See LOT.) The close affiliation, however, between Hebrews and Moabites, which is indicated by the story, is correct. Not only was the language of Moab practically identical with Hebrew, but Moabites and Hebrews belong to the same branch of the Semitic stock, and for an indefinite period Hebrew and Moabitish history form an inseparable unit. The story of the separation of Abraham and Lot embodies a reminiscence of a union once existing between Hebrew and Moabitish clans which was dissolved by a quarrel over land. The land of Moab was included in the Egyptian supremacy over western Asia in the period from the seventeenth to the thirteenth century B.C., and the name Moab occurs in a list of conquests inscribed by Rameses II (1310-1244 B.C.) on one of his monuments at Luxor. The relations between Moab and Israel during the portion of Hebrew history known to us were generally hostile, and this hostility is traced back by tradition to the days of the Exodus (cf. Deut. xxiii. 4-5), but the oldest document we have regarding Moab is a fragment of a song (Num. xxi. 21-30) recalling a victory of the Amorites over Moab and the subsequent defeat of the Amorites by the Hebrews. The song, which bears marks of antiquity, may date from the early struggles of the Hebrews, anterior to the attempts of the latter to conquer Canaan to the west of the Jordan. On the other hand, the story of the endeavor of Balak, King of Moab, to secure the services of Balaam to curse Israel (Num. xxii-xxiv) is looked upon by many scholars as later than this invasion of Canaan, based upon the persistent hostility between Israel and Moab, and illustrating the invincible character of the former; while the apparent allusions to David and his conquests seem to indicate the age which produced the famous oracles. (See BALAAM.) After the conquest of Canaan the Hebrews were frequently at the mercy of the Moabites, as well as of Ammonites and Amalekites. We learn of a King Eglon of Moab, who held the Hebrews in subjection for 18 years (Judg. iii), from which they were freed by Ehud, a Benjaminite. Saul appears to have held the Moabites in check, while under David they actually became tributary to the Hebrews. It is not known whether Moab used the opportunity furnished by Jeroboam's revolt to secure its independence, or paid tribute to Israel after its separation from Judah. But from Mesha's inscription (see MOABITE STONE) we learn that Moab was oppressed by Israel for 40 years in the reigns of Omri and his son, and that in the middle of Ahab's reign the yoke of Israel was thrown off (c. 860 B.C.). From that time on Moab seems to have maintained its independence of Israel, and had its own kings.

Salmanu paid tribute to Tiglath-pileser IV in 733; Moab took part in the revolt of Ashdod against Sargon II in 711, Kamoshnadab paid tribute to Sennacherib in 701, and Muzura to Esarhaddon and Assurbanipal. Subsequently Moab became tributary to Babylonia. In post-exilic sections of the books of Isaiah and Jeremiah we find references to Moab which point to the continued existence and, in a measure, prosperity of the country, but otherwise throw no light upon its history. The name lingered on into the Christian era. During the Roman occupancy of Palestine the land of Moab was still densely inhabited, as the Roman and Greek remains show, but gradually the Arabs of the desert overran it, and what culture once existed there came to an end. It remained for modern travelers like Seetzen and Burckhardt to rediscover it. The chief god of the Moabites was Chemosh (qv), and their religion, so far as we know it, bore the characteristic marks of early Semitic cults.

MO'ABITE STONE, THE. A stone bearing an inscription of 34 lines in the Moabitish language, discovered in 1868 by the German missionary F. Klein at Diban in Moab. He took no copy of the inscription and gave no description of its contents. The negotiations set on foot for the purchase of the stone by Clermont-Ganneau, attaché of the French consulate at Jerusalem, who had also learned of the existence of the stone, led to quarrels among the Arab tribes claiming an interest in it, and the monument was unfortunately broken to pieces. The fragments, however, were with great difficulty collected, and are now preserved in the Louvre. Prior to the destruction of the stone squeezes had been obtained by Clermont-Ganneau. Some of these were very imperfect, but one was good. From a study of the fragments and the squeezes Clermont-Ganneau was able to publish the text and the first translation. As the result of numerous researches by French, German, and English scholars, the decipherment may now be said to be complete. The characters on the Moabite stone are those of the North Semitic alphabet (see ALPHABET), and the language is so closely allied to Hebrew that the conclusion is justified which makes Hebrew and Moabitish practically identical, though with dialectical differences. The inscription itself refers to the deeds of Mesha, King of Moab, who is mentioned in the very first line, and the interest of the stone is greatly enhanced by the circumstance that he is identical with the Mesha (qv) spoken of in 2 Kings iii. 4. Mesha begins in his inscription by referring to the affliction which Moab endured under Omri, King of Israel, and the latter's son (i.e., Ahab, who, however, is not mentioned by name). We know from the biblical narrative that Moab was tributary to Israel during the reigns of Omri and Ahab. This is the "affliction" referred to and is attributed by Mesha to the anger of his deity Chemosh. Thanks, however, to Chemosh, who turned with favor to

Mesha, the latter regained the cities which Israel had captured. Mesha adds in an exaggerated manner that "Israel perished with an everlasting destruction." But while in 2 Kings iii. 5 the revolt of Moab is said to have taken place after the death of Ahab, line 8 of the inscription makes it clear that the 40-year period of Israelitish oppression ended in the middle of the reign of Ahab. Since Mesha knew the length of Ahab's reign, the stone must have been erected after Ahab's death (c 851 B.C.), probably in 849 B.C. The rest of the inscription is taken up with details of the conflict and with building operations undertaken by Mesha. Besides its historical significance the inscription is of geographical importance because of the many names of sites in Moab which it contains. As one of the oldest inscriptions in the North Semitic alphabet the Moabite stone has also great epigraphical value.

MOALLAKAT, mō'al-la-kat' (Ar. *Mu'allakat*, the exalted ones). A *duan*, or collection, of seven poems, made by Hammad, surnamed *al rawi'a*, "the reciter." It consisted of what he considered the best poem of each of the following seven bards: 'Amru'l Kais, Tarafa, Zuhair, Labid, Antara ibn Shaddad, 'Amr ibn Kulthum, and Harith ibn Hilliza. Hammad lived in the first half of the eighth century. Ibn Abd Rabbih (died 940) and Nahhas (died 949) both give the same list of the seven poets. But Ibn Kuteiba (ninth century) mentions also a poem of 'Abid among the Muallakat. Nabigha and A'sha enjoyed a reputation as poets quite equal to any of the seven, and later scholars, like 'Ibrihi (died 1109), therefore included in the list these two and 'Abid. Ibn Khaldun (died 1406) included also Al Kama, evidently confusing the Muallakat with the *duan* of Al Alam, which contained a poem of each of the following six: 'Amru'l Kais, Zuhair, Tarafa, Nabigha, A'sha, and Al Kama. As for the title, Ibn Abd Rabbih seems to have been the first to understand it literally of poems that were "suspended." Against this his contemporary, Nahhas, entered a protest, maintaining that the poems were so called because they were "lifted up," "exalted," "excellent." This view has been accepted in modern times by Hengstenberg, Sprenger, Noldeke, Ahlwardt, and practically every Arabist, in place of the legend that the poems were hung up in the Kaaba, which is presented in its fullest form by Ibn Khaldun. The text has been published by Lyall, with the commentary of 'Ibrihi (Calcutta, 1894); Tarafa by Geiger in *Wiener Zeitschrift für die Kunde des Morgenlandes*,

xix (Vienna, 1905), and Antara, with the commentary of Ibn al Anbari by Roscher in *Revista degli studi orientali* (Rome, iv, 1911; vi, 1913). Five of the poems were translated and interpreted by Theodor Noldeke in *Sitzungsberichte der königlichen Akademie der Wissenschaften*, vols. cxi-cxlv (Vienna, 1900). Sir William Jones published the first English translation, *The Moallakat* (London, 1782); the most recent are those by F. E. Johnson, *Seven Arabic Poems* (ib., 1897), and Kennedy, *Pre-Islamic Poetry* (ib., 1908). See AMRU'L KAIS; AMR IBN KULTHUM; ANTAR, HARITH IBN HILLIZA; LABID; TARAF: and ZUHAIR.

MOAT, môt, (OF. *mote*, embankment, from ML *mota*, mound, embankment, ditch, castle; probably connected ultimately with Bavarian *mott*, peat, Swiss *mutte*, turf). The ditch round the ramparts of a fortress, often filled with water as an obstacle against attack. See FORTIFICATION. CASTLE.

MOAWIYAH, mō'a-wē'yā (Ar. *Mu'awiyah*) (c 610-680). Caliph and founder of the Omriad dynasty. He was born at Mecca, the son of Abu Sufian, the bitter enemy of Mohammed. He was made Governor of Syria by the Caliph Othman, and during his term of office conquered the island of Rhodes, but lost Cyprus. On the proclamation of Ali as the successor of Othman in 656 Moawiyah revolted and with the aid of the gifted Amr ibn al As attempted to make himself Caliph. He was defeated in several battles by Ali, who, however, was prevented by domestic rebellion and foreign war from completely crushing his rival. Moawiyah was proclaimed Caliph at Damascus, 666, and after the assassination of Ali in 661 he succeeded in speedily reducing the rest of the Empire to submission. His army, after making extensive conquests, was unable, after a long siege and repeated assaults, to capture Constantinople, and in 678 he entered into a treaty of peace with the Byzantine Emperor. Moawiyah not only exerted absolute control over the Moslem Empire, but succeeded in having the caliphate declared hereditary in his family.

MOB. See CROWN.

MOBERLY. A city in Randolph Co., Mo., 129 miles east by north of Kansas City, on the Missouri, Kansas, and Texas and the Wabash railroads (Map: Missouri, D 2). It has the division headquarters and machine shops of the Wabash Railroad, brickyards, flouring and planing mills, foundries and machine shops, ice, shoe, wagon, glove, furniture, and frame factories, culvert works, cement works, and a large grain elevator. There are valuable deposits of coal and fire clay in the vicinity. An extensive trade is carried on in agricultural and dairy products, lumber, live stock, poultry, hides, wool, tobacco, and, of the city's manufactured products, flour and bricks. Moberly has a Carnegie library, two fine parks, an attractive Federal building, two hospitals, and a convent school. The water works are owned by the city. Pop., 1900, 8012; 1910, 10,923; 1914 (U. S. est.), 12,162.

MOBERLY, GEORGE (1803-85). An English

prelate, Bishop of Salisbury. He was born in St. Petersburg (now Petrograd), Russia, and was educated at Winchester and Oxford. In 1826 he took the Oxford chancellor's prize for the best English essay. After connection with Balliol College as tutor and fellow he was in 1835-66 head master of Winchester. He was then presented to the living of Brightstone in the Isle of Wight and in 1868 became a canon of Chester Cathedral. In 1869 he was consecrated Bishop of Salisbury. Although he belonged to the High Church party, in 1872 he urged omission of the damnable sections of the Athanasian Creed (q v). Of his numerous published works the most important are: *A Few Remarks on the Proposed Admission of Dissenters to the University of Oxford* (1834); *Sermons Preached at Winchester College* (1844); *Sermons on the Beatitudes* (1860, 3d ed., 1870). In 1868 he delivered the Bampton lectures, which appeared under the title of *The Administration of the Holy Spirit in the Body of Christ*.

MOBERLY, ROBERT CAMPBELL (1845-1903). An English theologian. He was educated at Winchester and at New College, Oxford; was senior student of Christ Church in 1867-80; and was ordained a priest of the Established church in 1870. He was head of St. Stephen's House, Oxford, in 1876-78; served in 1878-80 as principal of the Diocesan Theological College at Salisbury, where he was also chaplain to his father, George Moberly, Bishop of Salisbury; and became vicar of Great Budworth, Cheshire, in 1880. He was appointed professor of pastoral theology at Oxford in 1892 and was chaplain in ordinary to Edward VII in 1901. His writings include an important paper on "The Incarnation as the Basis of Dogma" (1889) in *Lux Mundi: Sorrow, Sin, and Beauty* (1889, 2d ed., 1903), *Ministerial Priesthood* (1897, 2d ed., 1899), his chief work, *Atonement and Personality* (1901), *Christ our Life* (1902); *Problems and Principles* (1904).

MOBILE, mò-bèl'. The county seat of Mobile County, the only seaport of Alabama, 140 miles east by north of New Orleans (Map: Alabama, A 5). It lies where the delta of Mobile River (the Mobile, Spanish, Raft, Tensaw, and Apalachee rivers) empties into Mobile Bay, 26 miles north of the Gulf of Mexico, and is served by five railroads—the Louisville and Nashville, Southern, Mobile and Ohio, New Orleans, Mobile, and Chicago, and the Alabama, Tennessee, and Northern. Its total area of 17.51 square miles extends from the west bank of Mobile River westward to the last foothills of the Appalachian chain at Spring Hill. To the north are large gum and cypress swamps, barely at sea level, while land towards the gulf is generally low. The city's streets are laid out at right angles, and many are lined with beautiful white Colonial residences. In the business district are the new United States government building, the Mobile and Ohio station, the Battle House, the City Bank and Trust Company building, the Van Antwerp office building, the County Court House, and the City Hall, which was remodeled from an old Spanish market; also the Providence Infirmary, United States Marine Hospital, Mobile Infirmary, and Southern Infirmary. The cathedral of the Immaculate Conception, a good example of Gothic architecture dating from the French occupation in 1720, is the seat of the Bishop of Mobile. Christ Episcopal Church, with a severe Greek exterior, was built in 1835. Mo-

bile still retains a large number of the philanthropic institutions for which it was famed before the Civil War, when it was the premier cotton-shipping port of the South. Chief among them are the Medical School of the University of Alabama and Spring Hill College, the latter a Jesuit institution of excellent repute, founded in 1830; while McGill Institute, the Convent of the Academy of Visitation, and Barton Academy (the city high school) are worthy of mention. It has three small libraries. Along the bay shore south of the city is Monroe Park; the other chief recreation centres are Washington Square, Lyons Park, and Bienville Square. Across the bay on the east shore are beautiful summer homes, a colony of the advocates of the Henry George single-tax system at Fairhope, while on the west shore are the summer resorts of Coden and Bayou le Batre.

Mobile thrives principally as a port from which the cotton, lumber, and naval stores of the surrounding country are shipped to Cuba, Europe, South and Central America. It has regular sailings to New York, Cuba, Porto Rico, Central America, South America, and Europe. A 27-foot channel leads from the mouth of the bay to the city docks. From 1911 to 1914 the city made many improvements along the water front, and in the creation of municipal docks which cover 1500 feet of water front. The magnificent Turner-Hartwell docks with double slips extend 1600 feet into Mobile Bay, and the city acquired a vast new frontage of dredged land when the channel of the bay was straightened in 1913. Its exports, chiefly logs, hewn timber, shingles, pine lumber, rosin, cotton, and cotton products, amounted in 1913 to \$28,823,873. Imports, chiefly bananas, pineapples, sisal grass, asphalt, potash, and sulphur ore, totaled \$3,675,180. It has several large cotton compresses, a number of large saw mills which turn out pine, gum and cigar-box lumber, and several very important machine shops and a shipbuilding yard. There are also a brewery, sash and blind factories, veneering plants, cotton mills, an agricultural chemical plant, and in the suburb are the main repair shops of the Mobile and Ohio Railroad. In 1910 Mobile as the second manufacturing city of Alabama had invested in her enterprises \$5,250,000, which produced \$5,429,000 of finished goods, or an increase of about 10 per cent in the decade. The farming in the vicinity is much diversified, ranging from cotton to corn, pecans, Satsuma oranges, cabbages and staple vegetables, which are raised in large quantities. Mobile is the centre of an important Gulf fish and oyster industry.

The budget of the city in 1914 was \$494,080, the principal expenditures being \$170,000 for interest on bonds, police, \$76,500; fire, \$68,000, streets, \$82,000. The city owns the water works. Pop., 1860, 29,258. 1900, 38,649. 1910, 51,521, of which 22,763, or 44 per cent, were negroes or of negro descent.

Mobile was founded in 1702 by Bienville and d'Iberville at a point on the Mobile River north of the present city and known as Twenty-seven Mile Bluff. After experiencing the violent annual spring freshets in 1710 the city was moved to its present site in 1711. It was the capital of the French Province of Louisiana until 1720. In 1763 it was ceded to the English as part of Florida, but in 1780 the Spanish under Galvez captured it, and in 1783 the possession of Spain was confirmed by treaty. It became the property

of the United States under the Louisiana Purchase, and was captured in 1813 by Gen. James Wilkinson. It was the headquarters of Gen. Andrew Jackson in 1814. It was granted a city charter in 1819. It was an important point during the Civil War, and on Aug 5, 1864, Admiral Farragut bombarded Forts Morgan and Gaines, defending the mouth of the bay, and, after sinking the Confederate ram *Tennessee*, attacked and destroyed the main body of the Confederate fleet under Admiral Franklin Buchanan. (See MOBILE BAY, BATTLE OF.) In the spring of 1865 the Union general Canby defeated forces under Gen. R. C. Gibson, and the Federals took possession of it April 12. After the Reconstruction period it was placed in bankruptcy in 1879 as the Port of Mobile. It received a new charter in 1887. In 1906 a severe southeast gale caused the inundation of lower parts of the city by water backed up in the bay. There were many lives lost and much property destroyed at Coden, Cedar Point, and along the south shore of the county. In 1911 a commission form of government under three commissioners was adopted.

Mobile claims the distinction of being the home of the Mardi-gras celebration in the United States. As Mother of Mystics a masked society known as the Cowbellian de Rakin Society was formed in 1830. This was succeeded by the Order of Myths and the Infant Mystics, which still continue with several other organizations their yearly balls and elaborate street parades. It was the home of Raphael Semmes, the famous Confederate captain, Augusta Evans Wilson, writer, and Father Ryan, the poet priest.

Consult: "Mobile," in L. P. Powell (ed.), *Historic Towns of the Southern States* (New York, 1900); P. J. Hamilton, *Colonial Mobile* (Boston, 1910), id., *Founding of Mobile, 1702-1718* (Mobile, 1911).

MOBILE BAY. The estuary of the Alabama and Tombigbee rivers (whose waters after their junction form the Mobile and Tensaw rivers), running into the Gulf of Mexico, through the southwest portion of the State of Alabama (Map. Alabama, B 5). It is about 27 miles long and has an average width of about 8 miles. The southern part of the bay, stretching about 14 miles eastward from the entrance, is known as Bon Secours Bay, this is shallow, with an average depth of 7 to 15 feet. The entrance to the bay proper, between Mobile Point and the east end of Dauphin Island, is about 2¾ miles wide, but is obstructed by a number of islands and shoals. The main channel is about ½ mile wide, and 26 feet deep. Depths within the bay range from five to eleven fathoms. The entrance is defended by Forts Morgan and Gaines, and on Mobile Point is a lighthouse with a revolving light. The bay has also an outlet on the southwest through Grant's Pass, communicating with Mississippi Sound, used by steamers of light draft, and the regular course of the Mobile and New Orleans steamers. See MOBILE BAY, BATTLE OF.

MOBILE BAY, BATTLE OF. A battle of the Civil War in America, fought Aug. 5, 1864, between a Federal fleet under Rear Admiral Farragut and the Confederate ram *Tennessee* aided by three auxiliary gunboats and the guns of Fort Morgan. When Farragut was ordered to the Gulf of Mexico in January, 1864, he wished to attack Mobile and effectually put an end to blockade running, but not until late in July was he assured of the support of a land force and of

ironclads, without which the attack was likely to prove a failure. The city, 30 miles above the Gulf, was protected by Fort Morgan and Fort Gaines, respectively on the eastern and western sides of the entrance to the bay. The channel was closed by piles and torpedoes except for a narrow space under the guns of Fort Morgan. At seven o'clock on the morning of August 5 the four monitors *Tecumseh*, *Manhattan*, *Winnebago*, and *Chickasaw* began to fire upon the fort as they steamed past. They were followed by the wooden sloops *Brooklyn*, *Hartford* (flagship), *Richmond*, *Lackawanna*, *Monongahela*, *Osteepe*, and *Oneida*, to each of which was lashed a gunboat, to prevent it from drifting if disabled. When the *Brooklyn* was almost abreast of the torpedoes she stopped and began to back. The captain of the *Tecumseh* disobeyed orders, steering to the west of the open channel, and his vessel was blown up. As the *Brooklyn* turned across the channel, to prevent fouling, Admiral Farragut ordered the course directly across the torpedoes. Though the torpedoes were felt to strike the bottoms of the vessels, none exploded. Little damage was done by the guns of the fort and the Federal gunboats were released. Soon they sank the *Selma*, drove the *Gaines* aground and the *Morgan* under the guns of the fort, and the fleet prepared to anchor. The ram *Tennessee* coming out from the shelter of the fort attacked the entire Federal fleet. Though hit many times, and rammed by the *Hartford*, the *Monongahela*, and the *Lackawanna*, her armor suffered little damage, but her smokestack was shot away, her steering gear disabled, and her commander had his leg broken by a splinter. Her port shutters were so jammed that it was impossible to use her guns successfully and at ten o'clock she surrendered. General Granger had invested Fort Gaines, August 3, and on August 7 that fort surrendered. Fort Morgan was immediately invested and surrendered on August 23. No attempt was made to take the city at this time on account of the shoal water, but the port was effectually closed. The Confederate losses amounted to 12 killed, 20 wounded, and 280 taken prisoners. The Federals lost 52 killed, 170 wounded. To this should be added from the crew of the *Tecumseh* 93 drowned and 4 captured. Consult: Loyall Farragut, *Life of David Glasgow Farragut* (New York, 1892), and A. T. Mahan, *Admiral Farragut*, in "The Great Commanders Series" (ib., 1892).

MOBILE POINT. A name applied to the end of a long, narrow strip of sand which stretches between Navy Cove and the Bay of Bon Secours to the north and the Gulf of Mexico to the south, at the eastern extremity of the entrance to Mobile Bay. Fort Morgan is situated here, on the ground once occupied by Fort Bowyer (q.v.). Andrew Jackson repaired Fort Bowyer, on Mobile Point, and garrisoned it just in time for it to resist attack by the British on September 15, 1814. On Feb 11, 1815, 34 days after the battle of New Orleans, a British force captured Fort Bowyer, but withdrew on April 1.

MOBILE RIVER. The west branch of the system of channels through which the united Alabama and Tombigbee rivers discharge into the head of Mobile Bay near the west shore. It is about 38 miles long, and communicates at several points with the Tensaw, or eastern branch of the system.

MOBILES, mó'bél' (Fr. *garde nationale mobile*, usually called *garde mobile*). A body of

French troops created by law in 1868 and suppressed in 1872. It was composed of young men not included in the class with the colors; men exempt from these classes; men who had procured substitutes; and men who had served but who wanted to enlist anew.

MOBILIAN TRADE LANGUAGE. An Indian trade jargon formerly serving the same purpose of intertribal and trade communication in the Gulf States that is still served by the Chinook jargon (qv) along the Columbia and the northwest coast, by the *lingua geral* in Brazil, and to a certain extent by the sign language (qv.) of the plains. It was based upon Choctaw, with additions from all the neighboring dialects and from the more northern Algonquian languages, and was the common medium of communication among all the tribes of the Gulf region, from the Atlantic coast of Florida probably as far west as Matagorda Bay in Texas and northward along both banks of the Mississippi to the Algonquian frontier about the entrance of the Ohio. It was called *Moblienne* by the French, from Mobile, the great trading centre of the Gulf region. Along the Mississippi it was sometimes known as the Chickasaw trade language. In an official report upon the Texas tribes in 1805 Sibley stated that the Mobilian was spoken in addition to their native language by all the Indians who had come from the east side of the Mississippi. It was still spoken in Louisiana 70 years ago, but has since died out with the general decay of the Indian life.

MOBILIER, mò'bè'yâ', CRÉDIT, krá'dé'. See CRÉDIT MOBILIER.

MOBILIZA'TION (Fr. *mobilisation*, from *mobiliser*, to mobilize, from *mobile*, Lat. *mobilis*, movable, from *movere*, to move, Skt. *mv*, to push). The expansion, equipment, and concentration of the national military assets and the organization of the same into the larger tactical units prepared for immediate war service. The term is used to express the general preparation of both the army and the navy, but is more commonly employed with respect to the assembling of armies. For the navy mobilization includes placing in commission all ships held in reserve; receiving, equipping, and assigning the naval reservists, organizing the ships into divisions, squadrons, and fleets, supplying these with the necessary ammunition, coal, and with supply, repair, and hospital ships, etc., providing in general for creating and maintaining "fleets in being."

In continental Europe the national army in war is the "nation in arms," i.e., it is composed practically of the entire able-bodied male population, usually between the ages of 18 and 48. Since it is neither necessary nor possible, for economic reasons, to maintain permanently in peace the great forces that may be temporarily required in war, these Powers have adopted the system of a relatively small peace establishment capable of enormous expansion and rapid concentration when war is imminent. This expansion in size and concentration at threatened points is mobilization. The rapidity of mobilization is one measure of military efficiency, and an important one, for the reason that it affords the opportunity of securing the strategical and tactical advantages of the offensive. The number of trained soldiers and the rapidity of mobilization in any theatre of war are dependent on the form of government, whether centralized or decentralized; on population; on the national

genius for military organization; on the general political policies with respect to neighboring nations; on geographical location, on the local terrain and number of roads and railroads to the theatre of war; on economic conditions, on the system of service in time of peace, compulsory or volunteer, employed in training men for war. All great nations except England and the United States have adopted the compulsory system of training in peace, so that in war such nations, without delay, can embody in a great war army civilians previously trained as soldiers. In England and the United States, where the volunteer system is used, there is no such large body of trained reservists. In order to meet any great national emergency they must depend upon the slow process of volunteer recruiting and training such recruits after war has been declared.

It is true that England, in the special and army reserve class, had trained volunteer reservists, but their number was insignificant compared with the numbers of conscript reservists available for the continental armies when the European War of 1914 began. Mobilization as technically understood in compulsory-service armies has no application in volunteer systems like that of England and the United States, for the reason that there is little or nothing in the way of trained reservists to mobilize, or put "in being." The word mobilization when used with respect to the American or English system would be understood as meaning rather a system of recruiting volunteer civilians and their assemblage in camps for equipment and training. In the Spanish-American War of 1898 it required nearly two months to mobilize and transport to Santiago the insignificant force of about 15,000 men. In the European War of 1914 England was able to mobilize for immediate use in France not more than four divisions, about 80,000 men, and at the end of six months about 720,000 men, of which about half were trained troops, the rest partially trained colonial and Indian contingents and volunteers recruited after the war began. In strong contrast were the wonderful systems of France and Germany. At the end of two weeks France had an active field army of at least 1,380,000 men; Germany an army of 1,850,000 at the end of six days. These were only the initial mobilizations. Later there followed other classes of reservists, until the number of trained or partly trained men totaled an estimated number of 4,400,000 for France and 5,300,000 for Germany. Owing to the extent of territory over which her reservists are scattered and the lack of railways to the German and Austrian frontiers Russian mobilization on those frontiers was much slower than that of Germany. Russia's regular army was estimated at about 1,200,000, with a potential mobilization of 1,850,000 in 30 days. Her ultimate strength in men might reach 7,700,000 provided she had the necessary arms and equipment. Austria's regular army is about 400,000, initial mobilization, in about three weeks, 820,000 ultimate strength, 2,200,000. Japan maintains a peace army of about 250,000, initial mobilization, 600,000, ultimate trained strength, 1,500,000. The United States could mobilize in the United States proper an incomplete field army of about 25,000 regulars in about two weeks and four incomplete divisions (80,000 men) of partially trained militia of doubtful value in about one month; total, 105,000 men in one month. As

there are no trained reservists, further effective increase could not take place until the volunteer recruits had been trained, possibly in six months. All the above figures are estimates for 1914-15. The exact strength in each case is known only to officers of the general staffs, who are extremely careful in their efforts to mislead their possible national enemies.

Details of Mobilization. The new French plan and detailed methods of mobilization, though frequently practiced in peace, had its first complete test in the European War of 1914. The scheme worked smoothly, efficiently, and successfully. The general plan provided: 1. In peace, detailed instructions for the guidance of each reservist, for all private owners of horses, wagons, and automobiles, for all civilian officials, especially the railway and telegraph personnel. 2. Upon the declaration of war, a proclamation of martial law throughout the country, the announcement and posting of a brief general mobilization order designating the days of mobilization and making the requisition for private transportation previously inspected and accepted, putting into effect the military train schedules, taking control of the telegraph and telephone lines, assuming the censorship of the press and military control of cafés selling intoxicating liquor, the supervision of prices asked for food products, etc. The decree of the President of the Republic proclaiming martial law, posted Aug. 2, 1914, read as follows. "The 86 Departments, the territory of Belfort, and the three Departments of Algeria are declared under martial law. Martial law will be maintained throughout the duration of the war." Under French law, "by virtue of martial law, the powers with which the civil authority is clothed for the maintenance of order and police pass at once and in their entirety to the military authority, and the civil authority exercises only those powers of which it has not been dispossessed by the military authority." The powers thus transferred include the right of search of houses, the removal of suspects and individuals without domicile in the district under martial law, the enforced surrender of arms and ammunition and right to search for same, prohibition of publications and assemblages likely to cause excitement and disorder, jurisdiction over crimes and offenses against the safety of the state, against the constitution, or against the public peace, whatever the rank of the principals or accomplices. Citizens continue to enjoy all the rights guaranteed by the constitution, except those which are expressly suspended.

Mobilization was announced to the inhabitants throughout France by posting a copy of the order in conspicuous public places. In the smaller towns and villages the people were assembled by the beating of drums, ringing of bells, etc., the order then being read by a gendarme or town official. Individual reservists in country districts were reached by telephone or messenger. The order was promulgated in the afternoon of August 1 and read as follows:

"THE ARMY AND NAVY. ORDER FOR GENERAL MOBILIZATION"

By decree of the President of the Republic the mobilization of the Army and Navy is ordered, also the call for the animals, wagons, and harness necessary for the equipment of those forces.

The first day of mobilization is Sunday, Aug. 2, 1914

Every Frenchman liable for military service must, under penalty of being punished to the full extent of the law, obey the instructions of the mobilization section (see colored pages placed in his individual booklet)

There are included under the present order all men not present with the colors, belonging:

1st. To the Army, including colonial troops and the men of the auxiliary services

2d. To the Navy, including registered sailors and naval reservists.

Table Showing Calendar Dates of Mobilization Days

The first day of mobilization is Sunday, Aug. 2, 1914.

....

The fifteenth day of mobilization is Sunday, Aug. 16, 1914 "

By the promulgation of these two documents announcing martial law and general mobilization respectively the whole of France and Algeria passed smoothly and quickly from a status of peace to a status of war. Every French citizen liable for military duty dropped his work, consulted the colored pages of his individual instruction booklet, reported at a certain hour of a certain mobilization day at a designated railroad station for transportation to the headquarters of his regiment, where he was at once uniformed, armed, and equipped for service in the field with his organization. With equal ease and rapidity were assembled the vast number of animals, wagons, harness, and motor vehicles required for the armies being mobilized. The owner presents his property at a designated time and place, receives an order for the value previously agreed upon, and may, if he so desires, have this order cashed immediately by the local army paymaster. The civilian railway man, the telegraph operator, the business man, the doctor, donned a uniform and, in accordance with individual instructions received in peace, proceeded, if so ordered, with the practice of his business or profession under military control and for the sole benefit of the government or the army.

In the United States mobilization is accomplished as follows. If war appears imminent, mobilization camps are selected by the War Department for the organized militia and volunteers. The regular army is mobilized at its permanent stations. At the mobilization camps troops are assembled and raised to war strength, equipped, and prepared for service. Recruits for the regular army are assembled, equipped, and trained at the five permanent recruit depots (see DEPOT) and then sent to their organizations. Department (territorial) commanders are responsible that all military organizations leave mobilization points (1) with the full equipment required by existing orders, (2) with sufficient rations and grain to supply them fully while en route, and (3) with two days' rations and grain for use after their arrival at the concentration camps. A concentration camp is a place near the scene of intended operations or near an embarkation point, where troops are assembled for immediate use against the enemy or for transport to an over-sea theatre of operations.

Consult "Pages d'histoire," in *Mobilisation*, Librairie Militaire (Paris, 1914); *Field Service Regulations*, U. S. A. (Washington, 1914). See CAMP, FRONTIER; *Army* sections under countries.

MÖBIUS, mē'bē-us, AUGUST FERDINAND (1790-1868). A German mathematician, born in Leipzig. He studied at the universities of Leipzig and Göttingen. At first he devoted his attention to law, but later, under the influence of Gauss, he took up mathematical astronomy. In 1816 he was made professor at Leipzig and almost immediately afterward became director of the observatory in the Pleissenburg, which was built after his plans (1818-21). His important astronomical and mathematical memoirs appeared from this time on in the *Astronomische Nachrichten*, Crelle's *Journal*, and the *Berichte* of the Scientific Society of Leipzig. His leading mathematical work was *Der barycentrische Calcul* (1827). This contained a novel discussion of homogeneous coordinates, presented the first systematic discussion of the essential differences between the modern and the ancient geometries, set forth the generalization of figures, stated the invariant property of anharmonic ratios (which was, however, known to Menelaus and Proclus), and made extensive use of the principle of duality. He also wrote the following works: *Die Hauptsätze der Astronomie* (1836; 7th ed., 1890), *Lehrbuch der Statik* (1837); *Die Elemente der Mechanik des Himmels* (1843). His *Gesammelte Werke* have been edited by Baltzer, Klein, and Scheibner (4 vols., Leipzig, 1885-87).

MÖBIUS, KARL AUGUST (1825-1908). A German zoologist. He was born in Eilenburg; studied at Berlin, and in 1868 was made professor of zoology at Kiel. There he became especially interested in marine animals, and was a member of the commission of 1871 and 1872 for the investigation of German seas. Möbius went to Berlin in 1887 as director of the zoological museum, retiring in 1905. In 1901 he was president of the fifth International Zoological Congress at Berlin. His publications include: *Die Nester der geselligen Wespen* (1856); *Die echten Perlen* (1857); *Neue Seeesterne des Hamburger und Kieler Museums* (1859); *Fauna der Kieler Bucht* (1865-72), with H. A. Meyer; *Die Auster und die Austernwirtschaft* (1877); *Die Fische der Ostsee* (1882), with Heinicke; *Ästhetische Betrachtung der Säugethiere, Mollusken, Vogel, Insecten* (1900-05).

MÖBIUS, PAUL JULIUS (1853-1907). A German psychiatrist and medical writer. Born at Leipzig, he studied there and in Jena and Marburg, graduating as Ph.D. in 1874, as M.D. in 1876. In 1883 he was admitted as privatdocent to the medical faculty at Leipzig, resigning in 1893. From 1885 he was editor of *Schmidts Jahrbücher der gesamten Medizin*. He was a thorough investigator and a prolific writer, not only in medicine but also in social problems. Among his best-known medical works are: *Allgemeine Diagnostik der Nervenkrankheiten* (2d ed., 1894); *Abriss der Lehre von den Nervenkrankheiten* (1893); *Beiträge zur Lehre von den Geschlechtsunterschieden* (1903-04); J. J. Rousseaus *Krankheitsgeschichte* (1889); *Ueber das Pathologische bei Goethe* (1898); *Ueber Schopenhauer* (1899); *Ueber das Pathologische bei Nietzsche* (1902). His *Ausgewählte Werke* appeared in Leipzig in 1905. Of his writings intended for a wider circle of readers may be mentioned: *Ueber die Behandlung von Nerven-*

kranken und die Errichtung von Nervenheil-stätten (2d ed., 1896); *Ueber den physiologischen Schwachsinn des Weibes* (7th ed., 1905).

MÖBIUS, THEODOR (1821-90). A German philologist, one of the foremost students of old Norse literature and language, son of August Ferdinand Möbius, the mathematician. He was born at Leipzig, studied there and in Berlin, and in 1852 became docent of Scandinavian languages at Leipzig. He was promoted to professor in 1859, and from 1865 to 1888 he was a member of the faculty of Kiel as professor of Norse philology. Möbius' most valuable work was as an editor of Norse sagas. Especial mention should be made of *Fornsögur* (1860), with Vigfússon; *Edda Samundar* (1860); *Islandsgabók* (1869); *Málsháttakvæði* (1873); Snorre's *Háttatal* (1879-81); *Kormáks saga* (1886). His other work includes the dissertation, *Die ältere islandische Saga* (1852); the valuable bibliography, *Catalogus Librorum Islandicorum et Norvegorum. Etatis Medae* (1856, a supplemental volume in 1880), *Analecta Norræna* (1859; 2d ed., 1877); *Altnordische Philologie im skandinavischen Norden* (1864); *Altnordisches Glossar* (1866); *Dänische Formenlehre* (1871); *Ueber die altnordische Sprache* (1872).

MOCAYA OIL. See GRUGRU PALM NUT

MOC'CASIN. See SHOES AND SHOE MANUFACTURE

MOCCASIN FLOWER. See LADY'S-SLIPPER; also Colored Plate of ORCHIDS, AMERICAN.

MOCCASIN SNAKE, WATER MOCCASIN, or COTTONMOUTH. An aquatic, fish-eating, venomous pit viper (*Atractodes piscivorus*) of the southern United States, allied to the copperhead. It may grow to be 4 feet long, is thick and heavy in body, has a tapering tail, without any rattle or spine; and in color is dark chestnut brown, with light marks on the lips, obscure blackish bars on the sides, and the abdomen black blotched with yellowish white. The interior of the mouth, displayed when the snake is about to strike, is cottony white. This serpent exists in large numbers from southern Indiana and southeastern Virginia to the Rio Grande in swamps, marshes, on overflowed lands, and along rivers and bayous, where it is fond of lying in the sunshine upon banks, tussocks, driftwood, or bushes and trees overhanging the water. It never goes far away from such places, and is really a water snake, its food is mainly frogs and fishes. When disturbed it may escape by swimming, but is quite as likely to turn and fight fearlessly. It is one of the most virulent and deadly of all American serpents, but fortunately it does not wander into places where men usually go, except in the irrigated rice fields, where it is greatly dreaded. In captivity it is one of the most untamable and ferocious of known reptiles. It produces eight or ten young annually in midsummer, all fully prepared for offense or defense. The moccasin is "mimicked" by the quite harmless water snake *Natrix*, which, however, is usually much smaller, has a narrower, less triangular and forbidding head, and may always be distinguished by the double row of scales on the underside of the tail. Consult I. H. Stejneger, *Annual Report of the Smithsonian Institution for 1893* (Washington, 1895), and R. L. Ditmars, *The Reptile Book* (Garden City, N. Y., 1914). Cf. COPPERHEAD; RATTLESNAKE.

MOCENIGO, mō'chā-nē'gō. The name of a prominent Venetian family which furnishes several able commanders and doges to the Republic.

The most noted was Tomaso, Doge from 1414 to 1423. At a time when Venice was mistress of extensive possessions, Mocenigo endeavored to maintain her position by a policy of peace. His chief opponent was Francesco Foscari, the next Doge, who urged a policy of conquests on the mainland of Italy. Mocenigo was able to withhold Venice from this course, which afterward proved so disastrous to her power. To him was due the building of the present Doge's palace. At the time of Tomaso's death Venice had reached the zenith of her glory. Consult Althea Wiel, *Venice* (New York, 1894).

MOCHA, mō'kà, or MA'KHA. A strongly fortified seaport, and once the capital, of the Province of Yemen in Arabia. It is situated on the Red Sea, at the head of a little bay near the Strait of Bab el Mandeb, and 130 miles west-northwest of Aden (Map. Turkey in Asia, E 9). It stands in a dry, arid plain and its water is brought by aqueduct from the hills 16 miles distant. The town is ancient, but is now in a ruinous condition. The harbor is shallow and is frequented only by Arab dhows. It formerly exported large amounts of coffee and other produce, which are now distributed through the ports of Aden and Hodeida. Pop., 5000.

MOCHA STONE, or DENDRITIC AGATE. A name given to those cryptocrystalline varieties of quartz, such as agate and chalcedony, which contain mosslike or dendritic forms, usually consisting of manganese dioxide distributed through the mass. They were originally brought into Europe from Mocha. Of a similar nature is the moss agate.

MOCHNACKI, mòk-nats'kè, MAURZYCY (1803-35). A Polish publicist and critic, born at Bojaniec, Galicia. He took part in the revolution of 1830-31, and, after the capture of Warsaw, left his native country and spent the remainder of his life in France. He was the defender of the Romantic school in Poland, and is said to have dealt the deathblow to classicism in that country. His works are *A History of Polish Literature in the Nineteenth Century* (1830) and a valuable *History of the National Insurrection in Poland in 1830 and 1831* (1834).

MOCKING BIRD (*Mimus polyglottos*). The most famous, if not the sweetest and most beautiful, of American songsters. It receives its popular name from its extraordinary powers of vocal imitation. It is often called mocking thrush, and was formerly considered a peculiarly modified thrush, but now, with its near relatives the catbird and brown thrasher, it is classified very near the wrens. The genus *Mimus* is characterized by the elongate form, long tail, short wings, and straight bill, much shorter than the head, notched near the tip, and whiteness of the plumage on the inferior surface of the body. The mocking bird is about 10 or 11 inches long, the tail being nearly one-half the total length. The upper parts are ashy gray, the wings and tail are nearly black, extensively marked with white; under parts grayish white. The bird is very common in the South Atlantic and Gulf States, and in summer ranges as far north as Massachusetts and westward to the Pacific coast. The nest is built in bushes and low trees. It is made of twigs, leaves, weed stalks, and grasses, lined with rootlets, cotton, etc. The eggs are four to six in number, pale greenish blue, heavily spotted and blotched, especially near the larger end, with bright brown. Two and sometimes three broods are reared in the season, which be-

gins early in the spring and lasts until the end of the summer. During the spring and early summer the birds sing all day and even all night, and in many localities the air rings with their music. Their native song is extraordinarily beautiful, but it has in addition the power of reproducing the songs of other birds with such accuracy as to deceive even the imitated birds. There is, however, very great individual difference in this power, for while some birds seem seldom to attempt any mimicry, others are constantly imitating the sounds which they hear.

When taken from the nest young mocking birds readily become accustomed to cage life and may live for many years. They are easily taught and often improve greatly with careful training. The food of the mocking bird is largely composed of insects and berries or seeds. An inhabitant of gardens and roadsides, fond of human habitations, and seldom seen in the woods, the mocking bird is often found in villages and even in the streets of large towns.

Besides the common mocking bird more than a dozen other species of *Mimus* occur in the West Indies, Mexico, Central and South America. The mountain mocking bird (*Oreoscoptes montanus*) of the western United States is a much smaller and quite different bird and not especially notable as a songster. Its more common name is sage thrasher. See Colored Plate of SONG BIRDS with article THRUSH.

MOCKING WREN. The Carolina wren. See WREN.

MOCK MOONS. See HALO.

MOCK ORANGE. A hardy flowering shrub. See CHERRY LAUREL, PHILADELPHUS.

MOCK SUNS. See HALO.

MOCOA, mò-k'ò'a. An Indian village in southern Colombia, South America. Brinton includes in the Mocoan linguistic family the Almaguerenos, Mocoas, Engaños or Mgaños, Patias, Sebondoyes, etc., found between the first and second degrees, on the affluents of the Río Caquetá and near the source of the Putumayo. Consult A. F. Chamberlain in *Journal de la Société des Américanistes de Paris*, N. S., vol. VII (Paris, 1910).

MOCQUEREAU, mòk'kè-rò', DOM ANDRÉ (1849-). A French musical scholar, born at La Tessonalle, near Cholet. He received his education at Paris, and while still very young appeared as cellist in Dancal's chamber-music concerts. In 1875 he entered the order of the Benedictines of Solesmes. There he became intensely interested in Gregorian music, to the study and elucidation of which he devoted his whole life. In 1889 he began the publication of his famous and learned *Paléographie Musicale*, a series of photographic reproductions of mediæval manuscripts with monographs regarding the nature and interpretation of the same. In 1904 Pope Pius X issued an order that all reprints of Gregorian music appearing thereafter in the *Editio Vaticana* must conform to the versions given in the *Paléographie*. Besides this monumental work, of which 10 volumes had appeared to 1915, he wrote *L'Art grégorien* (1895), *Notes sur l'influence de l'accent et du cursus tonique latins dans le chant ambrosien* (1897), *Méthode de chant grégorien* (1899).

MODALISM. See MONARCHIANS.

MODDER, or KAIBA, RIVER. A left affluent of the Vaal River, South Africa, which it joins after an easterly course of 186 miles, about 31 miles above its junction with the Orange

River (Map: Cape of Good Hope, G 7). During the War of 1899-1902 its banks were the scene of much fighting and witnessed the repulse of the British troops at Maagersfontein in 1899 and the surrender of Cronje at Paardeberg in 1900.

MODELING (from *model*, from OF. *modelle*, Fr. *modèle*, from Lat. **modellus*, from *modulus*, standard, dim. of *modus*, measure) The process of preparing the original pattern or design from which a work in sculpture is to be cast or carved. Modeling is also practiced by medalists, the head or figure intended to be cut in the die being first modeled in relief with wax on a piece of slate. Goldsmiths, silversmiths, and jewelers also model intricate and artistic forms and ornaments of pieces of plate to be cast and chased by them, or in which jewels are to be set. Modeling is also a branch of the potter's trade. For large models the material employed is potter's clay, which, when used by sculptors, is mixed with a portion of sandstone, finely pulverized, to make it work freely. In painting the term "modeling" is used to denote that quality which conveys to the eye the sense of projection, volume, and bulk of an object.

MODEL YACHTING. The pastime of sailing model yachts. In England it is known as miniature yachting, under which name it was first generally practiced in America. The boats used were either exact models to scale of well-known large yachts, or of such perfection as to be capable of being built full size from the models. Departures from conventional design and new types are frequently tried out first in model yachts. Model yachting as an organized pastime is popular in Great Britain and the United States and several clubs have been formed in the larger cities to promote racing between model yachts. Model sailing yachts are usually of sloop or schooner rig and many of the modern ones are of the fin-keel type with outside lead ballast. The hulls of these model yachts are made in various ways, but are usually either shaped up from one piece of soft wood, dug out inside and decked, or are "built up" of layers of soft-wood plank, shaped to the horizontal section or plane before fastening together and then smoothed down to the sectional and profile shape, the labor of the modeling being thus lessened. These models are rigged with great accuracy and, in sailing them, they are usually steered mechanically. They sometimes have a weighted rudder, either with lead on the rudder or on the tiller, so that the former swings as the boat heels and thus counteracts its tendency to come up into the wind. Others have the main sheet attached to the tiller with a wire-spring control which returns the rudder to a fixed position when the pressure from the sheet is relieved, while some have other forms of balance gear or tillers that may be set in any desired position. They thus steer themselves on the various points of sailing. In the United States model yachts are sometimes built up to 5 feet or over in length, but are usually from 30 to 48 inches long. In regattas they are frequently handicapped according to local measurement rules. In experimental work the model department is one of the most important branches of modern shipbuilding plants, owing to the practice of "trying out" important yachts in the shape of models before proceeding with full-size construction. In this manner faults in design are discovered and remedied. Naval vessels are also usually tested out with models

in experimental tanks before building. In Great Britain model power yachting is very popular and models of various types of power boats are built from 2 to 4 or 5 feet in length, with miniature power plants (both steam and internal-combustion engines). These are operated on the small lakes and lagoons provided by the municipalities or in experimental tanks.

MODENA, mō'dā-nā (Lat. *Mutina*). A former duchy in northern Italy, south of the Po, included in the *compartimento* of Emilia in the modern Kingdom of Italy. The Roman colony of Mutina was founded on the Æmilian Way about 215 B.C., after the conquest of Cisalpine Gaul. Modena was acquired by the house of Este (q.v.) in 1288, and in 1452 the Marquis Boiso d'Este was made Duke of Modena by the Emperor Frederick III. He was at the same time made Duke of Ferrara by the Pope, and the political destinies of the two cities were therefore united until 1598, when Ferrara was seized as an escheated fief by its overlord, the Pope, while Modena, with Reggio and Mirandola, remained in the possession of the house of Este. In 1796 the Duke Ercole was de-throned by Bonaparte, and Modena, with Ferrara and Bologna, was erected into the Cispadane Republic, which in 1797 was merged in the Cisalpine Republic. By the Treaty of Lunéville (1801) the Duke of Modena received the Breisgau in exchange for his duchy. On the death of Duke Ercole III in 1803 the duchy devolved by marriage upon the house of Hapsburg, the daughter of Ercole having married Ferdinand, a son of Maria Theresa, and it was awarded by the Congress of Vienna to the son of this marriage, Francis IV, who proved a cruel despot. He married Beatrice, daughter of the King of Sardinia. In 1831 an uprising forced him to take refuge in Austria, but he was promptly restored by Austrian arms, and ruled by the methods which the Hapsburg connections made familiar in all parts of Italy at that time. Francis IV died in 1846 and was succeeded by his son, Francis V. In 1848 he was forced to flee from his state, which proclaimed itself a part of the Sardinian Kingdom, but he was soon reinstated by Austria. He fled when war with Austria broke out in 1859, and although it was provided by the Treaty of Zurich that he should be restored, the people of the duchy declared their wish to be united with Sardinia in the new Kingdom of Italy. Modena then became incorporated into united Italy. See ITALY.

MODENA. A city in northern Italy, formerly the capital of the Duchy of Modena and now the capital of the province of the same name, situated in a rich gardened plain between the Panaro and the Secchia, 24 miles northwest of Bologna (Map: Italy, C 2). A navigable canal connects it with both rivers. It is a city of spacious streets and roomy arcades and is divided into an old and a new part by the historic Via Æmilia. On the main piazza rises the fine Romanesque cathedral, dating from 1099, by Lanfranco. The exterior was restored in 1893 and the interior in 1897. The façade is embellished with curious sculptures. The exterior is also enriched by a rose window and by a colonnade encircling the whole edifice. The interior is at first disappointing, but is in reality imposing. There are here a good altarpiece by Dosso Dossi and a fine group by Mazzoni. The famous Campanile, dating from 1224, is

over 300 feet high. It leans slightly. The Gothic church of San Francesco has an immense and excellent terra-cotta "Descent from the Cross" by Begarelli. The church of San Pietro is remarkable for its fine brick Renaissance façade.

Modena is rich in palaces. The Palace Albergo Arti (1767) now holds the municipal museum, containing several interesting collections. The historic library here—Biblioteca Estense, one of the most famous in Italy—had 140,740 volumes and also over 8000 manuscripts in 1913, some of them very rare. It possesses in addition a coin collection and museum of archaeology. Its picture gallery is quite well known, comprising examples by Correggio, Dosso Dossi, Guido Reni, and Velazquez. The splendid ducal palace dating from 1635 is now used for a military school. Modena has statues of Tassoni and Victor Emmanuel II. The trade of Modena is not very important. There are weekly cattle markets—grain, beef, sausages, fruit, wine, and liquors being chiefly dealt in. The manufactures are few. Linen and woolen goods, leather, hats, vinegar, glass, and pottery are produced. Silk is woven, but less extensively than formerly.

In art history Modena is known for its terra cottas. It is the seat of an archbishop and has a university, a theological seminary, a military school for infantry and cavalry, a technical institute, a technical school, an agricultural college, and an academy of fine arts. The university, founded in 1683, has three faculties and a pharmaceutical and a veterinary school. The number of students was 455 in 1913. The public gardens are lovely, and the site of the former ramparts serves as a pleasure ground. Pop (commune), 1901, 64,843. census of 1911, 70,923. For history, see MODENA (duchy).

MODENA, GUSTAVO (1803-61). A noted Italian actor. He was born in Venice and began the practice of law, first at Bologna, then at Rome. He made his debut at the latter place in 1826 and at once sprang into prominence as a tragedian. Among his greatest impersonations were those in the plays of Alfieri, and several from the French, especially the rôle of Louis XI. Political troubles obliged him to live in exile from 1831 to 1837. In the movements of 1847 his patriotism again led him to take a prominent part. He published at this time his *Dialoghetti popolari*.

MODERATOR (Lat. *moderator*, one who regulates, from *moderate*, to regulate; connected with *modestus*, discreet, *modus*, measure, and ultimately with OHG. *mezan*, *mezzan*, Ger. *mesen*, Goth. *mitan*, AS *metan*, Eng. *metc*). A title of the presiding officer on certain occasions, chiefly academic and ecclesiastical. In the Congregational and Presbyterian churches of the United States the title of moderator is given to the presiding officer of assemblies. In the former the title is used not only in the meetings of congregations and district, State, and triennial conventions, but also in councils called to act in a judicial capacity. The presiding officers in the series of Church courts provided for in the Presbyterian system, viz., the session, the presbytery, the synod, and the General Assembly, are usually called moderators. The pastor of a local church is, ex officio, moderator of the session of the church, while in the other bodies mentioned the moderators are elected from among the presbyters. The most important function of these officers, apart from pre-

siding at the sessions of the body, is the naming of the standing committees. The term is also applied to the superintendent of the examinations for degrees and honors at the universities of Cambridge and Oxford. In the United States the presiding officer of a town meeting is also called moderator.

MODERN GREEK. See GREEK LANGUAGE (at the end). For the literature of modern Greek, see ROMANIC LITERATURE.

MODERN INSTANCE, A. A novel by W. D. Howells (1881). Though painful in its general features, it is a graphic picture of certain phases of New England life.

MODERNISM. A term applied to opinions advanced by Catholic writers—chiefly ecclesiastics—both in Europe and America, which ran counter to traditional orthodoxy. It was an attempt to adjust religious views to the spirit of modern progress. It finally drew from Pius X an Encyclical which reprobated the doctrine as modernism and its teachers as modernists. The system is considered an outcome of the French Revolution, liberalism, and modern critical scholarship. Its advocates, in many instances men of ability and education, are not always clear in their formulas. Their tendency appears to be a denial of the objective value of the Catholic creed and a confining of its dogmas to a mere symbolism begotten of the most intimate aspirations of individual human nature. Albert Houtin, at one time a partisan, in his *History of Catholic Modernism* (Paris, 1913) says modernism may be defined as "the desire of adapting religion to the social, moral, and intellectual needs of the times, and if the word employed to designate it is not very ancient, it at least represents the eternal conflict between the spirit of progress and the spirit of inertia, between those who make of religion a formula and those for whom it is life itself." They summoned to their aid principles advocated by Kantism, pragmatism, evolution, and higher criticism. The spread of the propaganda was rapid and wide. There were champions of the new doctrine in the Old World and the New. The antichristian and anticlerical press entered the lists. Names of note subscribed to it—names such as Father George Tyrrell (q.v.), whom Houtin calls the leader, Baron Frederic von Hügel, Alfred Loisy (q.v.), and others. From 1888 until 1907 there was no general censure. Some writings had been condemned and letters of remonstrance from some cardinals and bishops were issued. In July, 1907, a decree approved by the Pope appeared, its opening words were "Lamentabili sane exitu." It contained and condemned as heretical, false, rash, bold, and offensive 65 propositions, 38 of which related to biblical criticism and the remainder to modernism. Cardinal Vanutelli on Aug. 28, 1907, wrote to bishops and superiors of religious orders demanding an immediate and rigorous suspension of professors in all educational institutions who did not conform to the decree. He moreover proscribed the reading of all publications favoring modernism. On September 6 of the same year was communicated to the whole world the encyclical of Pius X beginning with the words "Pascendi Dominici Gregis," which words are now its historical title. Modernism, it says, is a synthesis of all heresies and has affected the layman, the theologian, the historian, the critic, the apologist, and the reformer. The causes of

this novelty are put down as curiosity, pride, and ignorance of scholastic philosophy. It has broached errors concerning the inspiration, truth, and study of Holy Writ; concerning the teaching of the Church, Christology, the sacraments, the institution and organization of the Church, and doctrinal evolution. The encyclical seeks the necessary remedies and imposes a series of energetic measures and closes with a stirring appeal to the rulers of the Church. It proposes the study of scholastic philosophy, the removal of all educators imbued with modernism, the prohibition of all publications of a like nature, and the convening by bishops every two months of a Council of Vigilance whose duty it shall be to abolish everything that savors of novelty in religious matters. Naturally those indicted in the encyclical were vehement in their protestations. The general attitude seems to have been one of peaceful surrender. But Pius X had not as yet struck the final blow. It came in the shape of a decree the initial words of which are "Sacrorum antistitum." It is dated Sept. 1, 1910. It impeaches modernist obstinacy and specious cunning. It adds to the practical measures laid down in the "Pascendi." It insists upon all members of the priesthood of all ranks and upon candidates for holy orders and upon all professors in all houses of ecclesiastical training taking a solemn oath respecting modernist views and adhering to all the authoritative teaching of the Church. It is simply a profession of faith, giving assent to all articles of Catholic belief and dissenting from all the tenets in all times condemned by the Church of Rome. All who take it swear that they admit the existence of God and the demonstrability of the same by the light of natural reason; that they accept the exterior proofs of revelation, i.e., miracles and prophecies, as indubitable signs of the divine origin of religion, that they acknowledge the Church as guardian and mistress of the revealed word which was declared by Christ during his life on earth and declared really and historically; that they reject the heretical supposition of the evolution of dogma; that they deny the substituting for the deposit of divine faith confided to the Church a philosophic fiction or an evolution of human conscience susceptible of indefinite progress, that they adhere to everything contained in the encyclical "Pascendi" and the decree "Lamentabili," all relating to the history of dogma; that they do not consent to the statement that anything proposed by the Church can contradict history or be incompatible with the most authentic origin of Christianity, that they refuse to affirm that there is nothing divine in sacred tradition or if it be divine it is so in a pantheistic sense only, that they will support unto the end that the certain criterion of truth is, has been, and will be till the end in the episcopacy transmitted through apostolic succession, not, however, in such manner as to hold that which is most in keeping with the culture of an epoch, but in the sense that the absolute truth preached in the beginning must never be believed in any other meaning.

This synopsis discloses more clearly perhaps than anything else can some of the most striking declarations made by the modernists. Practically the entire Catholic priesthood subscribed to these promises. Those who refused have been dealt with severely and are outside the

pale of the Church either as suspended or excommunicated. At the present moment there are apparent no symptoms of modernism within the Roman Catholic church.

Bibliography. The best reading on the subject of modernism will be found in the *Acts* of the Roman see and notably among the documents alluded to in this article; the works of Father George Tyrrell, especially *Medievalism* (London, 1909), also his *Autobiography and Life* (2 vols., 1b, 1912); Charles Gore, *The New Theology and the Old Religion* (New York, 1908); Cardinal Mercier, *Le modernisme* (Brussels, 1908, Eng. trans., St. Louis, 1910); Joseph Rickaby, *The Modernist* (London, 1908); A. L. Lilley, *Modernism: A Record and Review* (New York, 1908); Paul Sabatier, *Modernism*, translated by C. A. Miles, Jowett lectures (1b, 1908); Newman Smyth, *Passing Protestantism and Coming Catholicism* (ib, 1908); A. F. Loisy, *The Gospel and the Church* (1b, 1909); Vermeersch, *Tractatus de Modernismo* (Bruges, 1910); J. M. Bampton, *Modernism and Modern Thought* (London, 1913); Albert Houtain, *L'Histoire du modernisme catholique* (Paris, 1913).

MODERN MACCABEES, KNIGHTS OF THE A fraternal benevolent organization founded in 1881 for social and benevolent purposes. The organization had at the close of the year 1914 one great camp and 1290 subordinate tents or branches, with a total membership of 61,863. During the year 1914 the organization disbursed \$1,240,690, and the entire amount of benefits paid since the date of organization was \$21,590,889. This is the original order bearing this title.

MODES (OF., Fr. *mode*, from Lat. *modus*, measure, manner). The octave species in use before the time of the invention of harmony as well as during the period of the contrapuntal style up to the time of Bach. The original scale of the ancient Greeks was a *descending* minor scale with semisteps between the third and fourth and seventh and eighth degrees. Other tones than the fundamental were also taken as starting points, but the tones of the original scale remained unaltered. This shifted the position of the semisteps every time the starting tone was shifted. The combinations of tones thus obtained were regarded as separate scales and called octave species. This system the theorists of the early Middle Ages adopted, but instead of using *descending* scales they made use of *ascending* ones. At the same time they retained the original Greek names, but applied them to scales not corresponding to the original Greek scales. From among the nine octave species of the Greeks four were originally selected for the service of the Church. These were known as the *authentic modes*. Their establishment is commonly attributed to St. Ambrose, Bishop of Milan, who died in 397 A.D. Some time later—and tradition mentions St. Gregory I (Pope from 590 to 604) as their originator—four other modes were added. These were called the *plagal modes*. During the sixteenth century, when the principles of harmony began to be first understood, two more authentic with their corresponding plagal modes were added, so that the total number of Church modes was 12. Some theorists claimed the existence of two more, Locrian and Hypolocrian (one authentic and one plagal); but neither of these was ever used in actual practice. The

reason for their rejection will become apparent a little farther on. The following is a complete table of the fourteen modes:

(3) the mediant; (4) the participant. The *final* is the tone on which every melody ends. By means of this tone the mode in which any

AUTHENTIC MODES.

I Mode.	Dorian.
	
III Mode	Phrygian.
	
V Mode.	Lydian
	
VII Mode.	Mixolydian.
	
IX Mode.	Aeolian
	
XI Mode.	Locrian
	
XIII Mode (or XI).	Ionian.
	

PLAGAL MODES

II Mode.	Hypodorian.
	
IV Mode.	Hypophrygian.
	
VI Mode.	Hypolydian
	
VIII Mode	Hypomixolydian.
	
X Mode.	Hypoæolian.
	
XII Mode.	Hypolocrian.
	
XIV Mode (or XII)	Hypolyonian.
	

(In this table the final note, corresponding to our modern tonic, of each mode is indicated by a half note, the semisteps by slurs.) It will be seen that the compass of every *authentic* mode is from the final to its octave above, that of every *plagal* mode from a fourth below to a fifth above the final. Every *authentic* mode has its corresponding *plagal* distinguished by the prefix *hypo* (under), and beginning a fourth below the authentic mode. Furthermore, every mode must be considered as consisting of two series of tones forming either a pentachord or a tetrachord in such a manner that the highest tone of the lower series is at the same time the lowest tone of the higher series. In the authentic modes the first five tones constitute the pentachord, the last four the tetrachord. In the plagal modes the tetrachord comes before the pentachord. The former arrangement is called by the eminent theorist Zarlino (*q v*) *harmonic division* (*divisione armonica*), the latter arrangement, *arithmetical division* (*divisione aritmetica*). In examining the above table it will be noticed that the pentachords and tetrachords of all the modes, except the Locrian and Hypolocrian, exhibit the compass of a *perfect* fifth or fourth. In these two modes the pentachord represents the compass of a *diminished* fifth, the tetrachord that of an *augmented* fourth (tritonus). Both these intervals were strongly condemned by musical theory, and hence these two modes were rejected as impure, and therefore impracticable.

In every mode four notes have a special significance, just as the tonic, dominant, and subdominant have in our modern scales. These notes are. (1) the final; (2) the dominant;

melody is written is determined. If it moves within the range of the final and its octave, the mode is authentic, if it moves below or above the final, the mode is plagal. The *dominant* of every authentic mode is found a fifth above the final of its corresponding authentic mode. The only tone which can never serve as a dominant is B. Whenever B would occur C is substituted for it. The reason for this change is that B always forms a dissonant interval with F, either an augmented fourth or a diminished fifth. The *mediant* derives its name from the fact that in the authentic modes it always lies midway between the final and the dominant, it is always the third tone of the mode. In the plagal modes the position of the mediant is rather unsettled, owing to the necessity of obtaining a convenient tone for cadences, as in the case of the dominant, and for the same reason B can never appear as a mediant. C is invariably substituted. The *participant* in the authentic modes lies either between the final and the mediant, or between the mediant and the dominant. If, however, two notes lie between the mediant and the dominant, either tone may serve as the participant. In the plagal modes the participant is always the same as the dominant of the corresponding authentic mode. Since each plagal mode begins a fourth below its corresponding authentic, this dominant (participant of the plagal) is the same as the lowest tone of the plagal mode. Here, again, B is barred and C substituted. Likewise F can never be participant, the next higher tone (G) being substituted.

While every melody must end upon the final,

it may begin upon any one of the four just-mentioned tones. But any phrase except the last of a melody may also end upon these tones. Hence they are also called *cadences* or *modulations*. As in a long melody a feeling of monotony would be produced by the constant employment of these modulations, two or more tones are admitted. The final, dominant, mediant, and participant are called *regular* modulations and the additional tones *conceded* modulations. One of the most frequent of these conceded modulations is the seventh tone of the mode. This always appears an octave lower than the true pitch, on account of a license permitting the extension of every authentic mode by one tone below its final and of every plagal mode by a sixth above the final. In order to bring melodies within the range of certain voices it sometimes happens that they are written a fourth higher or a fifth lower than the regular mode. Such transposition is always indicated by a B flat in the signature. In these cases the true final will be either a fourth below or a fifth above the closing note.

According to their range melodies are classed as *perfect*, *imperfect*, and *superfluous*. A perfect melody moves within the range of the mode in which it is written; an imperfect melody does not exhaust the entire range, a superfluous melody exceeds the range either above or below. Some melodies exhaust the complete range of both the authentic and its corresponding plagal mode; these are said to be written in a *mixed mode*. See GREEK MUSIC, PLAIN CHANT, and for an explanation of the two modes in use at present, see MAJOR, MINOR.

MODESTO. A city and the county seat of Stanislaus Co., Cal., 77 miles south by east of Sacramento, on the Tuolumne River and on the Southern Pacific Railroad (Map, California, D 5). It has some manufactures and a trade in grain, fruit, wool, live stock, alfalfa meal, hay, and dairy products, being located in a productive region, the fertility of which is developed by an elaborate system of irrigation. The courthouse, public library, and county hospital are fine structures. Modesto adopted the commission form of government in 1912. The city owns its water works. Pop., 1900, 2024, 1910, 4034.

MODICA, mò'dè-kà. A city in the Province of Syracuse, Sicily, 33 miles southwest of the city of Syracuse, in the fertile and beautiful valley of the river Mauro. It is 1445 feet above the sea (Map, Italy, E 6). There are a public library, a hospital, an infant asylum, a Gymnasium, technical schools, a technical institute, and a theatre. The chief products are cattle, wine, grain, oil, and tropical fruits. Pop. (commune), 1901, 48,962, 1911, 55,924.

MODIFICATION OF TEMPO. See TEMPO.

MODILLION (OF. *modillon*, *modiglion*, Fr. *modillon*, from It. *modiglione*, *modillion*, from Lat. *modulus*, model). An ornamental bracket much used in classic architecture, especially in the cornices of the Corinthian and Composite styles. It is so called only when used in a long series—not singly—and is usually small. Larger and single brackets are called *consoles*.

MODIOLOIDES, mò'di-ò-loi'déz (Neo-Lat. nom. pl., from Lat. *modiolus*, nave of a wheel + Gk. *eidōs*, *eidos*, form). One of the very earliest fossil clams known, found in rocks of Lower Cambrian age. See FORDILLA, PELECYPODA.

MODIOMORPHA, mò'di-ò-mòr'fà (barrel-

shaped; from *modio*, an abbreviation of Lat. *modiolus*, the nave or hub of a wheel, and Gk. *μορφή*, *morphē*, form, shape). A group of pelecypods similar in aspect to the recent *Mytilus*, of which they are the Paleozoic prototype. The fossil *Modiomorpha* are extremely abundant in the Devonian rocks, especially of North America. See PELECYPODA.

MODJESKA, mò-jès'kà, HELENA (1844-1909). A noted actress, of Polish origin, who after 1876 resided in the United States. She was the daughter of Michael Opido, a musician, and was born in Cracow, Oct. 12, 1844. Married in 1860 to a manager named Modrzejewski, from the contraction of whose name comes that by which she is known, she became in 1865 the leading actress in the theatre of her native city. Her husband died in 1865 and three years later she was married to Count Bozenta Chlapowski and became the star of the Imperial Theatre of Warsaw. Political difficulties and ill health led her in 1876 to go with her husband and others, including Henryk Sienkiewicz, to California, where they established a Polish colony. This did not succeed, and after only a few months' study of English the Polish Countess made her début in San Francisco (July, 1877) as Adrienne Lecouvreur. She won a surprising success, and was soon seen in New York in the same play. In 1880 she made her London début in the part of Camille. In 1889 and 1890 she started with Edwin Booth, with whom she had already in 1883 appeared in *Romco and Juliet*. Her most notable impersonations were of Shakespearean characters, among them Ophelia, Rosalind, Viola, Imogen, Cleopatra, and Lady Macbeth, but she was also famous as Mary Stuart, and appeared with success in modern plays. Her great natural gifts gained her as a tragic actress a foremost rank upon the American stage, despite the fact that she never used English with ease. In May, 1905, she was given a farewell benefit in New York City at the Metropolitan Opera House. She then settled in Orange County, in southern California, and died April 8, 1909. She was buried at Cracow, Poland. Consult R. W. Gilder, in Matthews and Hutton, *Actors and Actresses of Great Britain and the United States* (New York, 1886), McKay and Wingate, *Famous American Actors of To-Day* (ib., 1896), L. C. Strang, *Famous Actresses of the Day in America* (Boston, 1899); William Winter, *The Wallet of Time*, vol. 1 (New York, 1913), and above all, *Memories and Impressions of Helena Modjeska: in Autobiography* (ib., 1910).

MÖDLING, mëd'ling. A town and favorite summer resort of Lower Austria, situated at the foot of the Wienerwald, 10 miles southwest of Vienna (Map, Austria-Hungary, E 2). It has a fifteenth-century church, a military academy, a girls' school, and an agricultural school with courses in brewing and horticulture. The manufactures consist of iron products, railway supplies, boilers, sash and blind work, cartons, lacquer, and shoes. Pop., 1900, 15,304, 1910, 18,067.

MO'DOC. A small but warlike and aggressive tribe, formerly ranging about Lower Klamath Lake and Lost River, and on the extreme northeast frontier of California. The name is said to mean 'aliens' (i.e., enemies), having been given by some one of the neighboring tribes. They call themselves *Maklaks*, 'people,' and with their northern neighbors, the Klamath,

whose language they speak and with whom they originally formed one tribe, are classified as a distinct linguistic stock known as Lutuamian. At some earlier period they seceded from the parent Klamath tribe and established themselves on Lost River. Their houses were round log structures, covered with earth, and their women were expert basket weavers and cradle makers. The Modoc made no alliances, but were at war with all the weaker surrounding tribes, and carried on a regular slave trade by selling their captives to the Columbia tribes in exchange for ponies. They came into early collision with the California immigrants, and a chronic warfare was inaugurated, marked by wholesale massacres on both sides. In 1850 they were severely defeated by troops under Captain Lyon. In 1852 they massacred a number of settlers, for which terrible retaliation was made by a band of miners under the notorious Ben Wright, who invited their warriors to a feast and peace conference and treacherously murdered 41 of the 46 who responded. Although thus diminished by nearly half their fighting force, the Modoc recommenced the war of extermination, which continued until 1864, when they entered into a treaty by which they agreed to go upon the Klamath reservation in Oregon. By this time they had been reduced to about 250. Finding their position there intolerable by reason of the persecution and insults of the Klamath, who considered them as rebels, the majority under a younger leader known as Captain Jack (qv) left the reservation and returned to their old home on Lost River. They were induced to return on promise of protection, but finding themselves again subjected to the same persecution without official redress, they returned to Lost River, leaving only about 100 behind under the old hereditary chief Skonchin. Orders were given to the troops to bring them back, and on Nov. 29, 1872, the final Modoc war was begun by a night attack on Captain Jack's camp. The Modoc retreated to the Lava Beds, just across the line, where they so intrenched themselves in the labyrinth of volcanic rocks that 400 regular troops were twice forced to retire with heavy loss without being able to come near enough even to see one of their concealed enemies. A peace commission to confer with the hostiles was then appointed, consisting of General Canby, Rev. Dr. Thomas, and Indian Superintendent Meacham. They met the head men of the Modoc on April 11, 1873. Jack repeated his demand to remain on Lost River and, on Canby's refusal, drew his revolver and shot him dead. At the same moment the other warriors fired, killing Thomas instantly and severely wounding Meacham, but were driven off before they could finish the work by the arrival of the troops whom Canby had kept hidden within easy reach. The war was continued under General Davis until the hostiles were finally starved out and compelled to surrender two months later. A part of the surrendered hostiles were returned to their kindred on the Klamath reservation, Oregon, while the rest were transported to the Quapaw reservation in Oklahoma. Those on the Klamath reservation now number 212, and are apparently fairly prosperous and advancing and coalescing with the Klamath. Those on the Quapaw reservation number 33, having decreased about one-half since the removal. See **KLAMATH**.

MO'DRED. The nephew of King Arthur.

Tennyson represents him ambitious to gain the throne, and after revealing Guinevere's unfaithfulness to the King, he stirs up a revolt, during which Arthur is slain.

MODUGNO, mò-doo'nyò. A town in the Province of Bari delle Puglie, Italy, 5 miles southwest of Bari. It has a twelfth-century Renaissance church and markets fruit. Pop. (commune), 1901, 11,885; 1911, 11,784.

MODULATION, IN MUSIC (Lat. *modulatio*, from *modulari*, to regulate, from *modulus*, dim. of *modus*, measure, manner). The process of changing from one key to another within the same composition. In a movement of even the smallest dimensions monotony would result if the composer should confine himself strictly to one key. There are two kinds of modulations—*passing* and *final*. Passing modulation introduces chords belonging to other keys only incidentally and soon returns to the original key. But when a piece modulates so that the original key is abandoned and a new key takes its place the modulation is final. In the sonata form (see **SONATA**) the first development of the principal subject confines itself only to *passing* modulations. A *final* modulation occurs at the entrance of the secondary subject (generally to the dominant key). The second or development section is concerned entirely with *passing* modulation. But even here the choice of keys is not arbitrary. However, no rules can be given; the artistic and æsthetic instinct of the composer is the sole guide. According to the theory of the present day, all modulation is regarded in its relation to the principal key of the piece, and, in a wider sense, all keys are but steps within the unlimited domain of tonality (qv). Older composers are very sparing and careful in the use of modulation, but those of the nineteenth century (especially Wagner, Schumann, Chopin) practically removed all barriers. The means of modulation are various and cannot be discussed in an article like the present. The most frequent expedient is the different interpretations put upon the same chord. Thus the chord c, e, g may be conceived as tonic of C, dominant of F, subdominant of G, etc., and consequently can be used to modulate at once to those keys. In modern music the chord of the diminished seventh plays an important part in modulation. Thus c♯, e, g, b♭ leads into D minor, the same chord conceived as e, g, b♭, d♭ into F minor, as g, b♭, d♭, f♭ to A flat minor, as a♯, c♯, e, g into B minor, etc. Consult F. Dräseke, *Einleitung zum kunstgerechten Modulieren* (Freienwalde, 1876). H. Riemann, *Systematische Modulationslehre* (Leipzig, 1887). id., *Harmonie und Modulationslehre* (ib., 1900). S. Jadassohn, *Die Kunst zu modulieren* (ib., 1890). See **HARMONY**.

MODULE (Fr. *module*, from Lat. *modulus*, small measure). In architecture, a conventional unit of measurement for determining the proportions of the various parts of a building, especially of the classic orders. Vitruvius (iv, 3) divides a hexastyle Doric front, e.g., into 44 modules, a tetrastyle into 28, the lower diameter of the column then measures two modules, the height of the column 14 modules, and so on. This scheme was undoubtedly derived from late Greek writers. The writers of the middle and late Renaissance, first in Italy and later in France, delighted in designing individual versions of the classic Roman orders

and in formulating for each of these a minutely detailed canon of proportions based upon modules divided into "parts." Thus, Vignola (q.v.), taking the lower semidiameter of the shaft as his module, divided this into 12 parts for the Tuscan and Doric orders and 18 for the other orders. Palladio and some French writers divided the semidiameter module into 30 parts for all the orders. The module of Perrault was one-third the diameter. Jomard adopted as a module for Egyptian architecture one-tenth the height of the column. Prof W. R. Ware simplified Vignola's scheme by taking the diameter as the module divided into six parts. See **ORDERS OF ARCHITECTURE**.

MODULUS (Lat., small measure). A term variously used in mathematics. In the theory of logarithms (q.v.) it designates the multiplier by which one system of logarithms is transformed into another. The expression $\sqrt{a^2 + b^2}$ is often called the modulus of the complex number $a + bi$, where i stands for $\sqrt{-1}$. (See **COMPLEX NUMBER**). In the theory of numbers the term congruence (q.v.) is applied to an equality in which we neglect certain quantities which are called moduli; e.g., $26 \equiv 12 \pmod{7}$ denotes that 26 is congruent to 12 to the modulus 7, i.e., that $26 - 12$ is a multiple of 7, or that the remainder found in dividing 26 by 7 (i.e., 26 with the multiples of 7 neglected) is equal to the remainder found in dividing 12 by 7, this remainder being 5 in both cases. See **CONGRUENCE**.

MODULUS OF ELASTICITY. See **ELASTICITY**.

MOE, mō, JÖRGEN (ENGBRETSSEN) (1813-82). A Norwegian poet, folklorist, and bishop. He was born at Høle in Ringerike, and before his entry at the University of Christiania became well acquainted with Asbjørnsen (q.v.), later his collaborator. From 1835 to 1852 hardly a year passed during which Moe did not make a long tour of the country in search of popular legends. The first collection of these tales, edited by Moe and Asbjørnsen under the title *Norske Folkeeventyr*, appeared in 1842-44, was republished by Moe in 1852, and was translated into English by Dasent (1859). His *Samlde Skrifter* (2 vols., 1877) include popular poems (1849) and the juvenile stories, *I Brønden og i Kjærnet* (1851). Moe died at Christiansand, where he had been Bishop for seven years. Consult J. B. Halvorsen, *Norsk Forfatter-Lexikon*, vol. iv (Christiania, 1896), and Henrik Jæger, *Illustreret norsk Literaturhistorie*, vol. iii (ib., 1896).

MOE, LOUIS MARIA NIELS PEDER HALLING (1859-) A Danish illustrator and etcher, born near Arendal, Norway. He studied at the Academy of Copenhagen and under Tuxen. He is best known for his illustrations of Saxo's *Kronike* (Winkel-Horn's translation), of Sagas, and of many books for children. To a number of his illustrations he himself wrote the text, such as *Langt, langt bort i Skog* (1904). After 1900 he interested himself also in etching, and published collections of fantastic pictures from fairy tales and from animal life, among them *Dyrefabler* (1909).

MOE, (INGEBRET) MOLTKE (1859-1913) A Norwegian folklorist, born at Krødsherred in Ringerike, son of Jørgen Moe. He studied theology and the history of religion at the University of Christiania and then took up the

study of comparative folklore. After 1876, when he became collaborator with P. Chr. Asbjørnsen, he went through the country on a government stipend, collecting traditions. In 1886 he was appointed professor of the Norwegian native language and of popular traditions, later also of Old Norse, at the University of Christiania. A learned and remarkably cultured man, Moe performed a real service in the field of folklore. He contributed to numerous periodicals and was a collaborator in many important literary enterprises. As an educational expert he was much consulted by the government. He revised several editions of Asbjørnsen's and Moe's *Folkeeventyr* and of Asbjørnsen's *Huldre-eventyr*. Among his own publications are: *Norske Fornkvæde og Folkemusik* (1877); *Ten Norske Folkemusik* (1899); *Retskrivning og Folkeedannelse* (1900), a valuable work. Consult J. B. Halvorsen, *Norsk Forfatter-Lexikon* (Christiania, 1885-1908).

MOEL, moil (Welsh, hill). A hill having a rounded outline in its upper portion because the summit is protected from rapid denudation by a layer of soil and a growth of forest trees or grass or by marshes of peat. Consult Marr, *The Geographical Journal* (London, 1901).

MOELLER, mē'ler, HENRY (1849-). An American Roman Catholic archbishop, born at Cincinnati, Ohio, where he studied at St. Xavier's College in 1863-69. He was then a student in Rome, where he received the degree of D.D. from the Propaganda in 1876. He held a pastorate at Bellefontaine, Ohio, in 1876-77; was professor at Mount St. Mary's Seminary in 1877-79; and served as secretary to Bishop Chatard, of Indianapolis, in 1879-80. From 1880 to 1900 he was secretary and chancellor of the archdiocese of Cincinnati, then served as Bishop of Columbus in 1900-03, and was promoted to Coadjutor Archbishop of Cincinnati, where he became Archbishop in 1904 and was invested with the pallium in 1905.

MOEN, mē'en. A Danish island in the Baltic Sea, separated from Seeland on the northwest by the Ulv Sound and from Falster on the southwest by the Grøn Sound (Map: Denmark, F 3). Area, 82 square miles. Pop., 1901, 14,504; 1911, 14,127. Its surface is remarkably irregular compared with the rest of Denmark. The limestone formation which underlies a large part of the country here crops out in the form of high and steep chalk cliffs of great natural beauty. The soil is very fertile. Agriculture and fisheries are the leading industries. The chief town and seaport is Stege, on the west coast, with a population in 1911 of 2250.

MÆRÆ. The Greek name of the Fates. See **PARCÆ**.

MÆRIS, mæ'ris (Lat., from Gk. *Μοῖρις*, *Moiris*), LAKE. The ancient name of a sheet of water in central Egypt, a remnant of which, it is generally agreed, exists in the present Birket Karun or Birket el Kerun (lake of horns), 34 miles long by $4\frac{1}{2}$ miles wide, extending along the northwestern borders of the Province of Fayum (Map: Egypt, C 2). Classical writers have left confused descriptions of a great artificial reservoir at this locality for storing the water of the Nile and irrigating the surrounding country by means of sluices. As the lake is at present 130 feet below the level of the sea, it must, within historic times, have hollowed out its bed 200 feet, or the artificial lake must have been a small reservoir southeast of it, or else the an-

cients must have totally misrepresented the whole matter. The investigations of Major Brown, which have been fully confirmed by Petrie, seem to point to the last-named solution. The lake formed by the Bahr Yusuf (Joseph's Canal) must have been much larger, until the kings of the twelfth dynasty, and later the second Ptolemy, diked off considerable portions. The semmythical King Menes of Herodotus is Amenemhat III, the builder of the Labyrinth (q.v.), whose two colossi have been discovered at Biahmu. Consult W. M. Flinders Petrie, *Hawara, Biahmu, and Arsinoë* (London, 1889).

MÆRITHERIUM. A very generalized fossil mammalian type, the most primitive known ancestor of the Proboscidea. It was about the size of a tapir and is found in Upper Eocene deposits of the Fayum, Egypt. It was a sub-aquatic animal, and its chief resemblance to the elephants was the enlargement of the same front pair of teeth as those constituting the tusks of the modern elephants, the structure of the grinding teeth showed them to be essentially ancestral to those of *Palaomastodon* (q.v.). Other parts of the animal exhibit analogies to the primitive sea cows or sirenians.

MOERO, mwā'ró, MOLRO-MKATA, or MWERU. A lake in south Central Africa, situated 100 miles west of the south end of Lake Tanganyika (Map Congo, Belgian, E 4). It lies on a plateau at an altitude of 3000 feet and is surrounded, especially on the north, by wooded mountains having an alpine aspect. It is 68 miles long, 24 miles wide, and its bottom slopes gradually downward towards the north, where depths of 40 feet are registered. An extensive swamp, 30 miles long, at the south end marks the former extent of the lake. It is evidently of great age, as it contains a remarkable species of fish belonging to the Silurian period and of amphibious habits. The Luapula River enters the lake at the southern end and leaves at the northern end to join the Congo. The lake was discovered in 1867 by Livingstone. The settlement of Rhodesia was founded on its eastern shore in 1892.

MÆSIA, mē'shī-ā (Lat., from Gk *Μαῖσια*, *Maísia*). An ancient Roman province, bounded by the Danube, and for a short distance by the Savus (Save) on the north, the Black Sea on the east, the mountain chains of Illyria (Balkan) and Orbelus on the south, and the range of Scardus and the river Drinus on the west (Map Rome, E 2). The river Cibiua (Tzibitza) divided it into two parts, of which the eastern (Mæsia Inferior) corresponded approximately to the present Bulgaria and the western (Mæsia Superior) to Servia. Its original inhabitants were mostly of Thracian race. Gaulish or Celtic invaders settled in western Mæsia about 277 B.C., under the name of Scordisci. The Romans first came in contact with the tribes of Mæsia after the conquest of Macedonia. In 75 B.C. C. Scribonius Curio, proconsul of Macedonia, forced his way as far north as the Danube and gained a victory over the Mæsians, but the country was not completely subjugated till 29 B.C. It was made a Roman province in the reign of Augustus and flourished for more than two centuries; but as a frontier province it was much exposed to hostile invasions and required a line of fortresses and stations all along the south bank of the Danube and a wall from Axiopolis to Tomi. The chief Roman towns were Viminacium in Mæsia Superior, and Istros, Marcianopolis, Nicopolis,

and Tomi (to which Ovid was banished) in Mæsia Inferior. In 250 A.D. the Goths (q.v.) made an irruption into the country and defeated and slew the Roman Emperor Decius in the following year, and about the end of the fourth century it was given up to them by the Emperor Theodosius I. (See MÆSO-GOTHS.) Slavic tribes settled in Mæsia in the sixth and seventh centuries, and towards the close of the seventh century the Bulgarians established their kingdom in the eastern part. Consult S. E. Stout, *The Governors of Mæsia* (Princeton, 1911).

MÆSO-GOTHS, mē'sō-gōths'. A name given to the Goths who, early in the third century, settled in Lower Mæsia, at the mouth of the Danube (See MÆSIA). In the fourth century they were converted to Christianity through the efforts of Ulfilas, who translated the Bible into their dialect (See ULFILAS). The name Mæso-Goths is applied especially to those Goths who remained in Mæsia after the great migrations early in the fifth century. See GOTHS.

MOFFAT, DAVID HALLIDAY (1839-1911). An American banker and railroad builder, born at Washingtonville, Orange Co., N. Y. He became a bank messenger in New York City in 1854, a bank clerk at Des Moines, Iowa, in 1855, and then clerk and cashier in a bank at Omaha. In 1860 he went by prairie schooner to Denver. During the Civil War he made several large shipments of gold bullion to the East. In 1866 he became cashier, and shortly afterward president, of the First National Bank of Denver, in which capacity he served until his death. He was president of the Denver and Rio Grande Railroad in 1884-91, built the Florence and Cripple Creek Railroad largely at his own expense, and was interested in more than 100 mines in Colorado.

MOFFAT, ROBERT (1795-1883). A Scottish Congregational missionary to South Africa, born in Ormiston, Scotland. In early life he was a gardener, but having made the acquaintance of some Wesleyan ministers, he determined to engage in religious work and sought to qualify himself to be a missionary. He was accepted by the London Missionary Society and set apart for the ministry in 1816, was appointed to South Africa, and arrived at Cape Town early in 1817. He proceeded to Namaqualand and to the kraal of Africander, a savage chief, who was converted and became an earnest Christian. The country, however, did not prove well adapted for the location of a mission centre, and Moffat, after having explored a considerable region, established the station of Kuruman in 1825. His missionary labors were very successful and productive of great benefits in the amelioration of the character of the people and the development of civilization. In 1859 a new centre was established among the Matabele at Inyati. The missionary labors of Dr. Moffat and his travels and adventures are described in his book, *Missionary Labors and Scenes in South Africa* (1842). During 1839-43 he visited England and then returned to Africa and remained there till 1870, when he went back to England and settled in Brixton, London, where he spent the rest of his life. In 1873 he was presented with the sum of £5800 in recognition of his great services. His wife (Mary Smith), whom he married in 1819, shared in all his missionary labors, and his daughter Mary became the wife of David Livingstone (q.v.). Besides the volume already men-

tioned, Dr. Moffat published *Africa, or Gospel Light Shining in the Midst of Heathen Darkness: A Sermon on Faith* (1841) and *Rivers of Water in Dry Places: An Account of the Introduction of Christianity into South Africa, and of Mr. Moffat's Missionary Labors* (1863). He also translated the Bible into the language of the Bechuanas. The full account of Moffat's life and labors is given in the *Lives of Robert and Mary Moffat*, by their son, John Smith Moffat (London, 1885; popular ed., 1889).

MOFFATT, JAMES (1870–). A British biblical scholar. He was born in Glasgow and was educated there in the academy, university, and Free Church College. He was ordained to the ministry of the Free church in 1896, was Jowett lecturer in London in 1907, and left his church at Broughty Ferry in 1911 to become Yates professor of Greek and New Testament exegesis at Mansfield College, Oxford. He translated (1904–05) *Harnack's Expansion of Christianity*, edited "Thessalonians" (1908) and "Revelation" in the *Expositor's Greek Testament*, and wrote *The Historical New Testament* (2d ed., 1901); *George Meredith, a Primer to the Novels* (1909), *Paul and Paulinism* (1910), a valuable *Introduction to the Literature of the New Testament* (1911), *The Theology of the Gospels* (1912), being lectures delivered at Glasgow; a new version of the New Testament (1913); *Expositor's Dictionary of Poetical Quotations* (1915).

MOFFETT, CLEVELAND (LANGSTON) (1863–). An American journalist and author, born at Boonville, N. Y., and educated at Yale, where he graduated in 1883. From 1887 to 1892 he was connected with the *New York Herald*, for four years on the European staff and for a year on the *New York staff*. In 1893–94 he was foreign editor of the *New York Recorder*. Magazine work then engaged him for a time, but he returned to the *Herald* as Sunday editor (1908–09). In the meantime, and subsequently, novels and plays came from his pen. *Real Detective Stories* (1898), *Careers of Danger and Daring* (1901), *A King in Rags* (1907); *The Battle* (1909); *The Bishop's Purse* (1913), and the plays, *Money Talks* (1906); *Playing the Game* (1907); *The Battle* (1908); *Greater than the Law* (1912). He also translated Bourget's *Cosmopolis* (1894).

MOGADOR, mög-a-dör', or SUERA. The principal seaport of Morocco, situated on the Atlantic coast, 120 miles west-southwest of the city of Morocco, of which it is the port (Map: Africa, C 1). It is built on a rocky promontory, surrounded on the land side by sand dunes. A channel between the town and a neighboring island forms the harbor. Mogador is the best-built town of Morocco, having been planned by a French engineer in 1760. A part of it, the Kasbah or castle, is surrounded by walls and contains the residences of the Moorish officials and of the protected Jewish and Christian merchants. Most of the Jews, however, live in a separate quarter of the city. Its equable climate renders it a health resort which is becoming increasingly popular with European sufferers from tuberculosis. The trade of the city is considerable and is mostly with Great Britain and France. The principal exports are olive oil, almonds, gum arabic, hides, goat skins, and wool. The city occupies the site of a much older town. In 1844 it was bombarded by the French. Pop., about 22,000, nearly half of whom are Jews.

MOGILA, mo-gé'la, or **MOGILAS**, PETER (c.1597–1647). A Russian theologian. He was born in Moldavia, of a noble Wallachian family, and was educated at the University of Paris. After serving in the Polish army he went into a monastery at Kiev and became metropolitan of that see in 1629. He set up a printing press and founded an academy and a library, to which he gave his own collection of books. He published a catechism in 1645 and other minor works. His great title to fame rests upon the *Confession of Faith of the Greek Church*, which was drawn up at his instance by the Abbot Kosslovski of Kiev, approved at a provincial synod in 1640, and accepted by the patriarchs of Constantinople, Jerusalem, and Antioch in 1642–43 and by the Synod of Jerusalem in 1672. It has been edited in Greek and Latin by Panagotes (Amsterdam, 1667) and Hoffmann (Leipzig, 1695). A German translation by Frisch appeared at Frankfurt in 1727. It is given by Von Kimmell in *Libri Symbolici Ecclesiae Orientalis* (Jena, 1843).

MOGK, mök, EUGEN (1854–). A German philologist, born at Dobeln, in Saxony. He was educated at the University of Leipzig; worked in 1879–80 in the libraries of Copenhagen, Stockholm, and Upsala, and became a teacher in the Leipzig Realgymnasium in 1883 and professor of Norse philology at the University in 1893. He edited the *Altnordische Sagabibliothek* (1891 et seq.) and *Altnordische Texte* (1886–90). To Paul's *Grundriss der germanischen Philologie* he contributed important monographs on the literature of Iceland and on Germanic mythology. He also wrote *Die deutsche Sitten und Bräuche* (1907) and *Das Menschenopfer bei den Germanen* (1909).

MOGOK, mö'gök. The capital of the District of Ruby Mines, Upper Burma, India, 36 miles east of Irrawaddy (Map: Burma, C 2). The town lies in a valley at an altitude of 4000 feet above the sea. It is a collection of 9 villages and is the headquarters of the ruby mines of Burma, which are controlled by the Ruby Mines Company, a European enterprise which has introduced complete modern mining equipment with hydroelectric power furnished by the Yen stream. Pop., 1901, 6078; 1911, 11,069.

MO'GONTI'ACUM. The Roman name of Mainz.

MOGUL', GREAT (more correctly *Mughal*, or *Moghul*; Hind. *Mughal*, from Mongol *Mongol*, Mongol, from *mong*, to be brave). The popular designation of the Emperor of Delhi as the impersonation of the powerful empire established in Hindustan by the Mongol conqueror, Baber, the great-grandson of Timur, in 1526. The most important princes of this line, after Baber (the first Great Mogul), who died in 1530, were Akbar (1556–1605), Jehangir (1605–27), Shah Jehan (1628–58), and Aurungzebe (1658–1707). In 1803 the Great Mogul, Shah Alam II, was deprived of his throne, and in 1827 he surrendered even the appearance of authority, becoming a pensioner of the British. In 1857 Mohammed Bahadur, the last of the dynasty, who had been invested with the Imperial dignity at Delhi at the outbreak of the Sepoy Mutiny, was condemned for his complicity in the mutiny and transported to Rangoon, where he died in 1862.

Bibliography. H. G. Keene, *History of the Mogul Empire* (London, 1888); Stanley Lane-Poole, *History of the Mogul Emperors* (ib.,

1892); Horn, *Das Heer- und Kriegswesen der Grossmoguls* (Leyden, 1894); E. S. Holden, *The Mogul Emperors of Hindustan* (London, 1895); Haidar, *History of the Moguls of Central Asia* (ib., 1898). The *Bābar-Nāma*, or autobiography of Baber, was published by Beveridge (London, 1905), while Mannucci's *Storia do Mogor*, or *Mogul India, 1653-1708*, has been translated by Irvine (3 vols., ib., 1906-07).

MOGULESKO, SIGMUND (1858-1914) A Jewish-American actor, born in the Province of Bessarabia. When he was nine years old, his musical talent was discovered by a famous cantor visiting the town. After several years of early training Mogulesko entered the Bucharest Conservatory of Music, and at 14 was already intrusted by the local cantor with the leadership of a choir of 20 voices, besides performing a similar function in an opera chorus. Six years later, with the opening of a Jewish theatre at Bucharest (the first of its kind in the world), his desire to go on the stage was realized. For seven years he played in Russian, Rumanian, and Galician cities, and in 1885, when Jewish theatricals were forbidden in Russia, settled in the United States. Mogulesko, though a character actor, was essentially a comedian. His art was spontaneous, not studied. He was undoubtedly one of the greatest Jewish actors since the founding of Jewish theatres. He composed some *entr'acte* music, which has been frequently played in New York theatres.

MOGYORÓSSY, mōg'yō-rōs'i, ÁRKÁD (1851-). A Latinist, better known as Arcadius Avellanus. He was born at Esztergom, Hungary; learned Latin as a child, finishing his education in Hungary, and, having come to the United States, was editor and publisher in Philadelphia (after 1894) of the *Præco Latinus* (or *Latin Herald*), a Latin periodical for promoting the adoption of this language for speaking. Mogyoróssy's publications include *Palastra: A Primer for Spoken Latin* (1893-1915); *Arena Palæstrarum* (1893); *Robinson Crusæus* (1897); *Medulla* (1898); *The Colloquia of Maturinus Corderius, the Teacher of John Calvin* (1904); *Fabula Tusculana* (1913); translations into Latin of Ruskin's *King of the Golden River* (1913) and of *The Adventures of Captain Mago* (1914), an account of an imaginary journey of a Carthaginian sailor to Spain.

MOHÁCS, mō'hach. A grand commune and market town in the County of Baranya, Hungary, on the right bank of the Danube, 23 miles east-southeast of Fünfkirchen (Map Hungary, F 4). It is poorly built, but is a railway junction point and an important station for steamers. It manufactures silk, lumber, and bricks and is the centre of the coal trade of the Fünfkirchen district. It is noted as the scene of the battle of Aug. 29, 1526, between the Hungarians under Louis II and the Turks under Solymán the Magnificent. The King and 24,000 Hungarians and Germans perished, and a large part of Hungary fell under the yoke of Turkey. On Aug. 12, 1687, a second battle was fought at Mohács, in which the Imperialists under Charles of Lorraine defeated the Turks, thereby putting an end to the Turkish dominion in central Hungary. Pop., 1900, 15,832; 1910, 17,092.

MO'HAIR (OF. *mouhaire*, *mouaire*, *mohere*, Fr. *moire*, from Ar. *mukhayyar*, fabric of goats' hair). The wool of the Angora goat (see GOAT) of Asia Minor and South Africa. Few animals

have so beautiful a covering as the fine, soft, silky, long, and usually pure white fibre of this goat. Each animal at the annual clip in April or May yields from two pounds to four pounds of wool. The fabric *mohair* made from this wool is characterized by its light weight, smooth, dust-shedding surface, and lustre. In pile fabrics, such as plushes and astrakhans, mohair is sometimes used for the pile warp, while the body is made of cotton. The fabric known as camel's hair is made from the best mohair, which enters into the manufacture of many fabrics. Mohair is used as a substitute for human hair in switches and wigs. Consult "The Angora Goat," *United States Department of Agriculture, Farmers' Bulletin, No. 137* (Washington, 1901). For the production of mohair in the United States, see WOOL.

MOHAMMED (Ar. *Muhammad*, praised, approved, or endowed with praiseworthy qualities). The founder of Islam. It is not certain whether Mohammed was his original name or a cognomen given him in the latter part of the Meccan period. Some scholars, among them Huart (*Histoire des Arabes*, p. 90, Paris, 1912), think that his proper name has remained unknown, or possibly was Kutham. Others, like Noldeke (in *Der Islam*, p. 160, Strassburg, 1914), maintain that Mohammed was his real name. If reliance can be placed upon the statements that he was about 63 years old when he died, the traditional date of his birth, 570 A.D., would be approximately correct. But tradition also connects his birth with "the year of the elephant." The march upon Mecca by Abrahā, the Abyssinian ruler of Yemen, at the instance of Justinian, who was at war with Khosrau I, must have occurred before 562. It is therefore doubtful when the prophet was born. His birthplace was undoubtedly Mecca. He was the son of Abdallah, of the family of Hashim, and Aminah, of the family of Zuhra. There is no reason to doubt that both belonged to branches of the powerful tribe of the Koreish. His father, a poor merchant, seems to have died before Mohammed was born, and his mother, following the custom of her tribe, is said to have given the child to Halima, of the tribe of the Banu Sa'd, that she might nurse him in the healthful air of the desert. A few years afterward his mother died. His grandfather, Abd al Muttalib, adopted the boy, and when the grandfather died, Mohammed's uncle, Abu Talib, a man of influence, though poor, took him into his house and remained his friend and protector as long as he lived. Concerning Mohammed's youth we have no trustworthy information. It is probable that he was about 25 years of age when he entered the service of a rich widow named Khadija, who was also of the Koreish, and accompanied her caravans, perhaps as a camel driver, to the fairs. In these travels he is said to have met a Christian monk, Nestor, and this is likely to be true. Whether his journeys took him to Syria, to Hira, and to Yemen cannot be determined with certainty, but is not improbable, and Noldeke suggests that he may have been even to Abyssinia. Khadija, who was older than Mohammed and twice widowed, offered him her hand, which he accepted. It was a happy marriage. As long as she lived he took no other wife. According to tradition, she bore him three sons, al Kasim, al Tahir, and al Tayyib, and four daughters, Zainab, Rukayya, Umm Kulthum, and Fatima. Kasim died before Mohammed's

prophetic ministry began. Al Tahir and al Tayyib are probably fictitious names. The daughters grew up, but only Fatima seems to have left any issue. Mohammed conducted Khadija's business with success and his surname al Amin (the faithful) seems to indicate the high esteem in which he was held for his integrity and good judgment.

The story of Mohammed's life from the time when the first revelations came to him until the emigration to Yathrib (Medina) is better known than that of his youth and early manhood, but is still very obscure and full of uncertainty, both as to the events and circumstances and in regard to the inner development. There are indeed numerous suras, or chapters, of the Koran that unmistakably come from this Meccan period, extending perhaps from 610 to 622 A.D., and it is even possible to distinguish between an earlier and a later group among these suras. These oracles, which in the main, no doubt, have come down to us in their original form, are invaluable testimonies, but do not yield much information concerning the succession of events or the growth of Mohammed's prophetic consciousness, and contain many allusions that cannot be understood without knowledge drawn from other sources. The collections of tradition (*hadith*), the early biographies (*sira*), and the exegetical elucidations in the commentaries on the Koran (*tafsir*) have been widely used as such extraneous sources, but the searching analysis of the *hadith* by Goldziher and the more recent investigations of the *sira* and the *tafsir* by Lammens (see *HADITH*) have led many eminent scholars to assume a more radical position than heretofore. A cautious and circumspect criticism must manifestly seek to steer its way between a skepticism tinged with prejudice and a generosity touched with apologetic interest to a purely historical viewpoint. While in a certain sense it still may be said that Islam is the only great religion born in the broad daylight of history, there are many serious obstacles in the way of securing a conception of Mohammed's life based throughout on well-authenticated facts and of securing a fair and carefully considered estimate of his character.

Vague and inadequate as our knowledge is concerning the undercurrents of religious life among the Arabs in the period immediately before the appearance of Mohammed, we are not wholly without evidence as regards some of the tendencies that prepared the way for the great prophetic movement. While the Arabian Jews mentioned in Acts ii. 11 may have come from Arabia Petraea, it is certain that the Jewish tribes Kamuka, Nadir, and Kurayza had been settled in Yathrib long before the immigration of Mohammed, other settlements existed at Khaibar, Fadak, and Taima, and in Yemen there were Jewish colonies as early as the fourth century A.D., and a Jew, Yusuf dhu Nuwas, reigned in Saba 520-525 A.D. Through the Abyssinian conquests in Yemen Christianity spread into Nejrān, and in the north the Ghassanids were at least nominal Christians. From Egypt and Syria Jews and Christians came as slaves or as merchants to Mecca. The Aus and the Khazraj in Yathrib seem to have come from Yemen, and Mazdaism is likely to have become known there through Sassanid influence before Christianity came in with the Axumites. Even the Sabians, or Mandaeans, on the lower Euphrates, are likely to have been known to the Lahmids in Hira and

the Arabs employed by them. The poets seem to have been especially subject to the foreign impact. Every *kahin* (diviner) or *sha'ir* (knowing one) cannot of course be supposed to have sung altogether after the fashion of the Moallakat (q.v.), and it must be remembered that the remnants of pre-Islamic poetry have been copied by Moslem hands; but the reticence about local divine names and the use of a neutral expression like Allah (*al ilahu*, 'the god,' 'the deity') by the great poets may be original and not wholly due to expediency on the part of singers called upon to recite their poems to Jewish and Christian audiences, but to some extent to a broadened outlook. The poems of Umayya ibn Abu'l Salt, recently collected, edited, and translated by Schultess (Leipzig, 1911), obviously composed for the edification of Arabs in the time of ignorance, and not intended for Jewish or Christian ears, reveal indeed such a familiarity with biblical lore that it is not impossible that they were one of the sources of Mohammed's knowledge. Although it is extremely difficult to sift the tradition as to the *hanifs*, two facts seem to be well established: the name was for some reason given to such men as Waraka ibn Naufal and Zaid ibn 'Amr who, without being either Jews or Christians, were opposed to polytheism and idolatry, and Mohammed himself used the term of Abraham as a worshiper of one god and not an idolater, as well as of his own followers, the Moslems. In Hebrew the word *hanif* designates a wicked, impious, godless person, an apostate from the faith; in Aramaic it acquired the special sense of heretic, in Arabic it may also have carried the meaning of one fallen away from the ancestral faith and practice or inclining to a monotheistic belief, the term of reproach becoming one of special honor on the lips of the prophet. There were, no doubt, many such *hanifs*, obscure forerunners of Mohammed in Arabia.

It was possibly about 610 A.D. that Mohammed began to be disturbed by certain experiences that came to him. As the result, apparently, of a physical malady he had hallucinations, he heard strange sounds as of the ringing of great bells, a voice seemed to speak to him, a spirit sought to take possession of him. At first he appears to have conceived of this spirit as a *jinn*, and of himself as called to become a poet, a seer, a diviner, as so many others. The tradition of such an original conception lived long at Mecca. But he gradually seems to have become impressed with the idea that it was no ordinary *jinn* producing poetic inspiration whose voice he heard, but that of "the faithful spirit," "the spirit of holiness." Later this being was identified as Gabriel. We have no means of determining which is the earliest of the suras. But the opening words, though not the whole, of Sura xvi may well claim to represent one of the oldest of Mohammed's recorded revelations. These words have sometimes been translated "Read, in the name of thy Lord." But there can be little doubt that they should be rendered "Recite (or proclaim), in the name of thy Lord." That the revelations came through the ear is the unanimous testimony of Moslem tradition: and Suras lxxv, 16 ff.; xx, 113; xxv, 34 clearly show that the process of revelation includes a reciting from the heavenly book by the spirit and repetition of what he has heard by the prophet. This has been emphasized by

Snauck Hurgronje and Nöldeke, and most recently in a very convincing manner by Pedersen (in *Der Islam*, Strassburg, 1914, pp. 110 ff.). Mohammed does not seem to have known how to read and write, but he knew how to proclaim in a very impressive manner what he was convinced that he had heard. The elevated prose he employed, approaching poetry in its rhythmic swing, its assonance, and frequent rhyme, naturally produced the impression upon those to whom he confided his visions that he was a poet inspired by a *jinn*.

It was only after inner struggles, testifying to the genuineness of his ecstatic experiences, that he thus revealed what had happened to him even to his wife Khadija, his friend Abu Bekr, and his cousin Ali, who encouraged him by their confidence. That he was receiving revelations from the heavenly book naturally created in him the conviction that he had been chosen by his Lord as an instrument to make known to his people the contents of this book, as others had to other nations, and that the message sent down to diverse persons at different times must be essentially the same, as it came from the same source, which could contain no contradictory statements. He consequently identified himself with an order of messengers to whom he counted not only Abraham, Moses, and Jesus, but also Hud, who was sent to Ad, and Salih, who was sent to Thamud, and others. It may not have been until he left Mecca that he assumed definitively such titles as *al nabi* (the prophet) and *rasul Allah* (the messenger of Allah). His message did not centre about himself, but about Allah, and not so much about his nature as about his authority, his righteous demands, the inevitability of his judgment, and his mercy to those who believe his messengers. Allah's rights are based upon the fact that he is man's creator. Through some channel, possibly a physician, Mohammed had obtained a knowledge, unusual in his age, of embryogeny. In view of this constantly recurring wonder of man's embryonic development, he found it easy to believe in a re-creation of man in the resurrection of the dead. The purpose of this resurrection could only be a judgment upon man's earthly life, the sentence to eternal punishment in hell or the acquittal and gracious gift of eternal life. With deep earnestness he realized the terrible danger of man's plight, the need of divine guidance, and the wonderful mercy of Allah. To his quickened moral sense it became clear that the issues of life depend upon the line of conduct that is followed. He looked with horror upon many practices prevalent in the community, such as murder, theft, adultery, exposure of female children, cruelty to women, dishonesty in trade, lying, usury, oppression of the poor, luxury, gluttony, and drunkenness; and he believed that only by a surrender of self to Allah (*islam*), by abandoning idolatry and seeking in prayer and meditation, after the fashion of the *hanifs*, to be guided aright, by encouraging one another to patience and well-doing, and by acting justly and mercifully, would it be possible to lead a life acceptable to Allah. As for himself, he had no further duty than to announce his message, to warn and exhort, he had no right to use force. Having been an orphan and poor himself, he could sympathize with those who were neglected and ill treated; having been honored by his Lord, he proclaimed, with fear and trembling, yet with unmistakable gratitude and

love, what came to him in moments of trance and ecstasy. How genuine these experiences were may be judged from the fact that the oracles sometimes contained rebuke of himself—his pride and indifference in turning away a beggar, his unseemly eagerness for revelations, his failure at times to distinguish between the voice of the spirit and that of the devil. There is no reason to doubt that after reciting the words "Have you seen al Lat and al Uzza, and that other, al Manat, the third idol?" (Sura liii, 19 f.), he once added "These are the exalted princesses, and their intercession is desired" (Tabari, I, 1192, 1195), but later announced that he had been reproached by the spirit for having uttered these words, by consequence of which they have disappeared from our present text of the Koran.

While the accounts of persecutions may be exaggerated, there can be no question that much disapproval was expressed, much mockery was indulged in, and occasionally violence was resorted to by the unbelieving Koreish. Finally the family of Hashim seems to have been forced into the part of Mecca called "the ravine of Abu Talib." This application of the principle of the Ghetto may have been dictated by fear of evil consequences to the community from Mohammed's blasphemies against gods and goddesses, or from the free association of men of different clans who had the same religious opinions which manifestly threatened the tribal organization, as well as by resentment because of what seemed like personal abuse, the consignment of their parents to hell, and an attack upon their prestige and revenue. A considerable number of the Moslems emigrated to Abyssinia, where they were well received by the Negus. Some of these returned many years later, some became converts to Christianity, and some, at least temporarily, relapsed into paganism. It was probably exclusion from the Ka'ba that caused that strange experience of the Prophet when, whether in the flesh or out of the flesh he probably did not himself know, he was carried away in a night to Jerusalem. Neither his enemies who laughed at him, nor Abu Bekr who vouched for the accuracy of his description, nor he himself, probably, could tell what actually happened; and we do not know whether Mohammed ever was in Jerusalem. Three years the boycott lasted; then a compromise was effected. But after the death of Khadija, about 619, and of Abu Talib, a little later, Mohammed naturally sought for other allies and protectors, and he first attempted to reach the tribe of Thakif at Taif. When this proved to be in vain, and his uncle Abu Lahab refused to protect him, he at last entered into negotiations with the pilgrims who came to Mecca from Yathrib, some of whom had come under the influence of his teaching. The invitation to Mohammed to become the political and religious head of Yathrib did not come as the result of a town meeting, but of a conspiracy. There was no plebiscite, but there is likely to have been a secret agreement between the local Moslems and some of the more eminent leaders of the Aus and the Khazraj and possibly also of the Jews. An oath of allegiance was given by the conspirators on behalf of the Banu Kaila at the second meeting of Akaba, near Mecca; and Mohammed then undertook to remove some 150 of his followers from Mecca to Yathrib. He remained in the city himself until the last of the emigrants had left; then he

cautiously picked his way, together with Abu Bekr, to his new home. After his arrival in Yathrib he sent to Mecca for his wife Saud and his daughters. There is no evidence of any effort on the part of the Koreish to prevent this departure. It was not a flight from persecution, but a deliberate removal, a voluntary emigration, as the word *hijra* implies. As to the date, it is certain that it occurred in the month of Muharram, 622 A D; but the calendar instituted 17 years later by Omar begins the year on the first of Muharram, i.e., fifth of July, which may or may not have been the date of Mohammed's leaving Mecca.

Concerning Mohammed's life in Yathrib, which now becomes known as *Medinat al nabi* (the city of the prophet) or simply *al Medina*, we are better informed than in the case of any other period of his career. There are indeed many gaps in our knowledge, many legends formed especially about his last illness and death; the stories of his domestic troubles have no doubt been colored in transmission by the prejudices and interests of rival factions; and some of the letters said to have been dictated by Mohammed may be suspected of being fictitious. But we possess a very important document in the treaty of Mohammed and the emigrants from Mecca with Yathrib, a kind of charter of the new community, preserved by Ibn Hisham (ed. Wustenfeld, pp. 341 ff.) and translated by Wellhausen (*Muhammads Gemeindeordnung von Medina*, Berlin, 1889). The bulk of the correspondence of Mohammed preserved by Ibn Ishak, al Wakidi, and Ibn Sa'd, and translated by Wellhausen (*Ibn Sa'd, die Schreiben Muhammads und die Gesundheitschaften an ihn*, Berlin, 1889), is no doubt genuine. Poems by enemies like Ibn Zibara and Umayya ibn Abu'l Salt copied by Moslem historians are of distinct value. The historical character of accounts of defeat and of dishonorable deeds calling for an apology cannot well be questioned; and the excellence of early Arabic historiography is quite remarkable.

The emigration to Medina brought with it a notable change in the Prophet's position. He became the civil head of a community. This *umma*, or community, consisted of the followers of Mohammed, called Koreish, *muhajiruna* (emigrants), or *ashab* (companions). Further, the Banu Kaila, i.e., Khazraj and Aus, made up of believers called *ansar* (helpers), and others spoken of as *munafikuna* (doubters, vacillating ones), and various Jewish tribes considered as clients of the Banu Kaila. The "emigrants" broke their natural tribal relations in Mecca and entered into a fictitious brotherhood (*huwa*) with the Yathribine "helpers." In the new charter Mohammed was referred to as "the Prophet." It was therefore unavoidable that the community became a theocracy: not a hierarchy, however, under foreign rule, as Judæa in the Persian period, nor a government by a priestly ruler, like the Hasmoneans, but an independent state whose civil and religious life is ordered by divine oracles that come through a prophet, resembling to some extent the theocracy of Florence in the days of Savonarola's power. This must be borne in mind if Mohammed's activity in Medina is to be understood and his character fairly judged. At Medina he became more fully acquainted with Judaism, and probably in a measure also with some form of Christianity. He sought to gain the Jews, and

at first made some notable converts; but he laid himself open to ridicule by maintaining that he knew that certain things could not be in the Law of Moses, but must be falsely ascribed to the legislator, since they did not agree with the revelations he had received from the heavenly book. In this he betrayed ignorance, but not insincerity, as the insistence by good men upon absolute harmony between all divine oracles is of very common occurrence in all religions. Allah could not contradict himself.

It became a serious question how much contradiction, mockery, and blasphemy his prophet, now responsible for the order and welfare of the community, should endure in patience. His disappointment in not seeing the Jews in larger numbers embracing Islam may have led him to change the *kibla* (see KIBLAH), or direction in prayer, from Jerusalem to Mecca, though it would not be strange if, entirely apart from this, a conviction should have grown up in his mind that the Ka'ba, purged from idolatry, would be the most acceptable temple of Allah on the earth. Neither was he quite certain how far the rules and conventions of the period of ignorance were still binding upon Moslems. At first he hesitated to justify the infraction of the customary month of truce, later he minimized the guilt by magnifying the sin of those who had rejected Allah and driven out his people. The problem whether a state, and he as the head of a state, had the right to engage in war probably never occurred to his mind, either in a truce or in a warring condition. The Koreish of Mecca were the enemies of Medina; they had made themselves the enemies of Allah. In the battle of Badr in February, 624, they were defeated by a small band of Moslems. Allah had given them victory, though the Koreish had greatly outnumbered them. Similarly, Mohammed is not likely ever to have considered whether the *lex talionis* could be set aside altogether, or even whether private blood revenge, the law of the desert, could be abolished. When, as the result of a quarrel, one of the Banu Qainuqa, a Jewish tribe, had been slain by the Moslems, and these had in turn killed the murderer, revenge for the Moslem was sought. The Qainuqa fortified themselves, were besieged by the Moslems, and finally forced to emigrate to Syria, their property being confiscated and given to the Muhajira, who thus were freed from their dependence upon the Banu Kaila.

At Ohod, in 625, Abu Sufyan and the Koreish gained a victory over the people of Medina. The Prophet was wounded and had to hide himself. When this misfortune was laid up against him by the "doubters" and some of the Jews of the tribe of al Nadir as a sign that he was not a true prophet, Mohammed gave indeed counsels of moderation to his zealous followers, and knew how to change the defeat into a moral victory by explaining that the cause of the disaster was the lack of faith in Allah, but he did not forget the attitude of the al Nadir, and when they refused to furnish their share of money needed as compensation for a case of manslaughter by error, their palm trees were ultimately cut down and they were driven out of Medina. Mohammed unquestionably did much to improve the conjugal relations of his people, by abolishing mota marriages contracted for a brief period, punishing adultery, forbidding fornication, limiting the number of wives to four, regulating divorce, insisting upon the rights of wives, and protect-

ing children. It is significant that, when one of the tribes indicating its willingness to accept Islam sought to secure a concession in favor of fornication, he refused with indignation to accede to their request. But his growing conception of holding a unique position in Allah's favor led him to feel that Allah would grant him exceptional privileges. Unselfish and abstemious, he asked little for himself in other respects, but his excitable erotic nature made large demands upon divine clemency and generosity. He not only increased the number of his wives beyond that permitted by Allah to others, but also took to himself Zainab, the wife of his adopted son Zaid ibn Harith, whom he had surprised in the bath. Zaid promptly offered to divorce her; Mohammed hesitated, but received a general dispensation covering all such cases, and Zainab afterward tried to poison him, proudly giving her reasons for this act. The suras of the period hint at many domestic troubles, which are more or less accurately explained by the tradition. His sensitiveness to ridicule also made him miserable and led him to countenance the removal of offending poets through zealous Moslems, if not to incite feuds by which he could get rid of them.

In 627 "the war of the trenches" broke out. The Banu'l Nadir had found a refuge in Khaibar, but longed for revenge, and entered into a coalition with the Koreish, the Banu Sulaim, and the Banu Ghatafan. With something like 5500 men they marched against Medina. The city seemed to be doomed, as it had no wall, and the buildings could be united for defense only on one side, while the others were altogether open. Then a Persian slave, Salman al Farisi, suggested the idea of digging a trench. Such a *kandaqa* was called in his language, the Pahlavi, *kandaka*. The siege lasted about a month. Mohammed made peace with the allies of the Koreish, and these returned to Mecca without having accomplished anything. While the war was going on there were diplomatic conversations between the Koreish and the Banu Kuraiza, the last important Jewish tribe in Medina. These demanded hostages of the Koreish, which they refused to give. The matter came to the attention of Mohammed, who besieged them for 25 days. When they finally surrendered without condition their men were to be executed and their women sold into slavery, though it is doubtful whether the sentence was actually carried out. Successful raids were then made in various parts of Arabia.

In 628 Mohammed desired to make a pilgrimage to the Ka'ba. He started with a large number of followers, and encamped in the plain of Hudaibiya. From there Othman was sent as an ambassador to deal with the Koreish, who had come out in large numbers ready for battle. He secured a treaty of peace for 10 years, and the right for Mohammed and the Moslems to hold possession of the city of Mecca and the Ka'ba for three days the following year, with the duty of returning Koreishite fugitives. Not realizing the advantages gained, but deploring their return without booty, the Moslems were dissatisfied with this treaty of Hudaibiya. Mohammed, therefore, sent them against the Jewish city of Khaibar, which they captured and plundered. The pilgrimage was made the following year (629) by 2000 Moslems, and made so strong an impression in Mecca that two of the leading generals of the Koreish, Amr and Khalid, soon

appeared in Medina and embraced Islam. It is possible that, when the news reached Arabia of the defeat and expulsion of the Persians by Heraclius, Mohammed sent a message to the Byzantine Emperor calling his attention to the prophecy he had made several years before of this victory of the Greeks (Sura xxx, 1 ff.), and that his messenger was slighted. There can be no reason to doubt that he dispatched a messenger to the Ghassanid King at Bosra, Amr al Harith, for the murder of this ambassador led to the expedition into the east Jordan country which ended in the ignominious defeat at Muta in September, 629. The letters said to have been sent to Khosrau Parvez, the Sassanid King, and to the Negus of Abyssinia, as well as the answers, may be spurious, but the fact that embassies were dispatched can scarcely be doubted. The Mukaukis of Egypt, possibly the head of the Coptic church, must have received a message, since he sent him several female slaves, one of whom, Mary, bore him a son, Ibrahim, who died at the age of 18 months. Haudha ibn Ali, King of Yemama, proposed a peaceful division of Arabia between them, which Mohammed declined, al Mundhir, the Lakhmid King at Hira, received a message from him. On the other hand, he also received many deputations from different parts of the peninsula seeking alliance with him. In 630 a quarrel between the Koreish and the Khuza'a, who were in alliance with Mohammed, was construed by him as a breach of faith on their part, and justified him in "cutting loose from the idolaters" (Sura ix, 1 ff.). He marched against Mecca in January, 630, with an army of about 10,000 men. Abu Sufyan was sent to discover Mohammed's design; he went over to Mohammed's side, and when he returned to Mecca presented the situation in such a light that the city capitulated. As it was impossible to allow the victors to pillage the city, which had not been defended, Mohammed imposed upon it a war indemnity, levying large sums from the richer citizens. He proclaimed a general amnesty from which only 10 were excepted, among them two female singers who had chanted derisive songs about Mohammed. Abdallah ibn Sa'd, who had been Mohammed's secretary in Medina, transcribing his revelations, but had been accused by the Prophet of reproducing them inaccurately, had renounced Islam and fled to Mecca. He was now an apostate and deserved death, but was finally pardoned after long and earnest efforts on the part of Othman. Abdallah's return to his ancestral faith may have been due to a too intimate acquaintance with the manner in which the later revelations came and were reproduced. While Mohammed in Medina never seems to have doubted his mission or lost the sense of being inspired, as did Savonarola after the fateful decision in the case of the Medici, the nature of these later discourses is such that it is extremely improbable that, as a rule, they were the result of ecstatic experiences like those of the Meccan period. He was no doubt subject at times to similar trance-like conditions, and occasional signs are not wanting of the power, originality, and freshness characteristic of the earlier days. But in the main these suras show by their length, monotonous repetition, shrewd wording, careful elaboration, and flowing style that they are homilies rather than oracles, apologies for the faith and practice of the Prophet rather than inspired utterances.

Medina remained the residence of Mohammed and the capital of the state even after the capture of Mecca. The adhesion of new tribes enlarged this growing empire. Taif was besieged and taken. There are grave doubts about some of the details of the reported campaign against Tabuk, but the expedition itself is certainly historical. In 632 Mohammed determined to make the pilgrimage to Mecca. He had performed the *'umra*, or pious visit, possible at any time of the year, before, but now for the first time he undertook, at the head of many thousand Moslems, the formal pilgrimage, with its holy rites, the procession around the Ka'ba, the run between Safa and Merwa, the visit to Mount Arafat, where he laid down the laws and ordinances concerning the pilgrimage, the meditation during the night at Muzdalifa, the stoning of the devil in the valley of Mina, the sacrifice, the shaving of the head and cutting of the nails, and the drinking from the well Zemzem (See ARAFAT, HAJJ; KAABA.) He was apparently conscious that his work was done; for after many exhortations to his followers to protect the weak, the poor, and the women, to abstain from usury, and to live a righteous life, he is said to have closed his prayers with the words: "Oh, Allah! Have I not completed my mission?" to which the people answered: "Yea, Allah." Soon after his return to Medina he was taken ill with pleurisy. But neither the remedies tried, such as the pouring of water over him and the injection of medicine in Abyssinian fashion, nor the care given him, in eager and loyal, even though not wholly unselfish, rivalry, by Ali and Fatima on the one hand and Ayesha, Abu Bekr, and Omar on the other, could help him, and he died on Monday, June 8, 632 (13th Rebi' I, 11 A.H.) in the arms of Ayesha, and was buried in her house Tuesday night. His death created a serious situation, as he had not indicated his wish, or Allah's will, in reference to a successor. While Ali's claims were urged in the council by Talha and Zubair, he undertook himself, as the nearest of kin, the embalming and burial of the Prophet; through Omar's influence Abu Bekr was chosen as Caliph (*khalifa*), "representative" of, or "substitute" for, Mohammed.

Mohammed is described as of middle height, lean, but broad-shouldered, with a well-developed head and somewhat curly hair. His eyes were large and black, his nose was prominent, slightly aquiline, and finely formed. He wore a long beard, which added to the dignity of his appearance. A black mole between his shoulders became known among Moslems as the "seal of prophecy." He is praised for his amiability, his loyalty to friends, his frequent readiness to forgive an enemy, his tenderness towards his family, his great generosity, his kindness to the poor, his care of orphans, the simplicity of his domestic life. Even after his removal to Medina he lived in simple quarters, mended his own clothes, and freed all his slaves. He had himself refrained from the use of wine and strong drink long before he imposed total abstinence upon his followers, for military reasons, in order to improve their discipline and fighting qualities. He shared with his men the hardships of warfare, though his physical bravery was never quite equal to his moral courage. He had the defects of his qualities. His remarkable practical sagacity and shrewdness sometimes degenerated into cunning and deceit. The ex-

traordinary intelligence which enabled him, the unlettered camel driver, to produce a literature also permitted him at times to indulge in disingenuous apologetics. His keen sensibilities and rich gifts of imagination made him occasionally irritable, melancholy, suspicious, and revengeful. With his deep earnestness he could not understand those who trifled or acted the part of hypocrites, the enemies of Allah became his enemies. The more convinced he became that his inspiration differed from that of the poets and the diviners, that he was possessed by a holy spirit and not by a *jinn*, the more horrible, blasphemous, and unendurable seemed to him the mockeries of those Jewish and pagan poets who made his life so bitter. The affectionate nature, strongly rooted in the life of the senses, which for many years had found its full satisfaction in Khadija's love, after her departure sought for gratification in many directions, but he may not have been conscious of any inconsistency between Allah's permitting all believers to have four wives and his graciously granting the Prophet a few more, and from his knowledge of what he considered Allah's revelation to the Jewish people he did not gather that there was in the heavenly book a prohibition of polygamy as such, nor is there any evidence that he was familiar with the views of Jesus on the subject. From his fundamental conception of the process of revelation followed, not only the recognition of Judaism, Christianity, and Sabianism, i.e., Mandaism, as permitted religions, and toleration of those who professed them as the *ahl al kitabi* (the people of the book), the recipients of a revelation from the heavenly book, but also suppression of paganism as a *religio illicita*, and the *Jihad*, or holy war, against idolaters, not accounted worthy of such a revelation. The very conviction that he had been intrusted with a message to his people and to mankind, was indeed a prophet like those who had been sent in earlier times, and as the latest of the prophets the one to whose voice his contemporaries were especially bound to listen—a conviction that has influenced the world profoundly during thirteen centuries—evidently tended to produce in his own mind the idea that he held an exceptional position among the sons of men, involving peculiar duties and compensating privileges. With all his serious limitations and aberrations, the essential sincerity of his nature cannot be questioned, and an historical criticism that blinks no fact, yields nothing to credulity, weighs every testimony, has no partisan interest, and seeks only the truth, must acknowledge his claim to belong to that order of prophets who, whatever the nature of their psychical experience may have been, in diverse times and in diverse manners, have admonished, taught, uttered austere and sublime thoughts, laid down principles of conduct nobler than those they found, and devoted themselves fearlessly to their high calling, being irresistibly impelled to their ministry by a power within.

Bibliography. The life of Mohammed by Ibn Hisham (ed Wustenfeld, Göttingen, 1858-60) was written on the basis of the biography by Mohammed ibn Ishak; Ibn Sa'd's biography has been published by Mitthoech (Leipzig, 1905); Wakidi's history of Mohammed's campaigns was edited by Kremer (Calcutta, 1856) and an abbreviated translation was published by Wellhausen, *Muhammed in Medina* (Berlin, 1882); Baladhuri's book on the conquests was edited by

De Goeje (Leyden, 1863-68); Yakubi's history was edited by Houtsma (Leyden, 1883). Bukhari's *Sahih* was edited by Krehl (Leyden, 1867-68); and Abu'l Feda's life of Mohammed was translated into French by Houdas and Marçais (Paris, 1903). A vast collection of the material will be found in L. C. Caetani, *Annali dell' Islam*, vols. i-vi (Milan, 1908-13). Among Western writers on the life of Mohammed the following should be mentioned: William Muir, *Life of Mahomet* (London, 1851-61, new ed., rev. by T. H. Weir, Edinburgh, 1912); Theodor Noldeke, *Das Leben Muhammed's* (Hanover, 1863); G. Weil, *Das Leben Muhammed's* (Stuttgart, 1864); St. Hilaire, *Mahomet et le Coran* (Paris, 1865); Aloys Sprenger, *Des Leben und des Lehre des Muhammed's* (Berlin, 1861-65, 2d ed., 3 vols., ib., 1869); G. L. E. Kiehl, *Das Leben Muhammed's* (Leipzig, 1884); August Muller, *Der Islam im Morgen- und Abendland* (Berlin, 1885); William Muir, *Mahomet and Islam* (London, 1887); Julius Wellhausen, *Skizzen und Vorarbeiten*, vols. iii, iv (Berlin, 1887-89); I. Goldziher, *Mohammedanische Studien*, vol. ii (Halle, 1890); Hubert Grimme, *Mohammed* (Munster, 1892); Snouck Hurgronje, "Une nouvelle biographie de Mohammed," in *Revue de l'histoire des religions* (Paris, 1894); Lamiaresse and Dujaric, *La vie de Mahomet* (2 vols., ib., 1897-98); Hubert Grimme, *Mohammed, die weltgeschichtliche Bedeutung Arabiens* (Munich, 1904); D. S. Margoliouth, *Mohammed and the Rise of Islam* (London, 1905); Fr. Buhl, *Muhammed* (Leipzig, 1906); Theodor Noldeke, *Geschichte des Korans* (2d ed., rev. by Schwally, ib., 1909); Chauvin, *Bibliographie des ouvrages arabes*, vol. xi *Mahomet* (Paris, 1909); C. H. Becker, *Christianity and Islam* (New York, 1909); Henri Lammens, in *Recherches de science religieuse*, vol. i (Paris, 1910); Huart, *Histoire des Arabes* (ib., 1912); Henri Lammens, *Fatima et les filles de Mahomet* (Rome, 1912); C. H. Becker, "Prinzipielle zu Lammens' Studien," in *Der Islam*, vol. iv (Strassburg, 1913); A. A. Bevan, "Muhammed and Islam," in *The Cambridge Medieval History*, vol. ii (Cambridge, 1913); Sell, *The Life of Mohammad* (London, 1913); L. C. Caetani, *Studi di storia orientale*, vol. iii *la biografia di Maometto profeta ed uomo di stato* (Milan, 1914); Henri Lammens, *Le berceau de l'Islam* (Rome, 1914); Theodor Noldeke, "Tradition über das Leben Muhammeds," in *Der Islam*, vol. v (Strassburg, 1914).

MOHAMMED. The name of five sultans of Turkey.—MOHAMMED I was the son of Sultan Bajazet I, who was defeated and captured by Timur in 1402 and died in captivity in 1403. Mohammed I, after sharing the supreme power with his brothers, became sole Sultan in 1413. He reigned until 1421. He consolidated the Empire, which had suffered from the inroad of Timur.—MOHAMMED II (c 1430-81) was Sultan from 1451 to 1481. He was surnamed *El-Ghazi*, i.e., conqueror (of infidels), and also *Buyuk*, i.e., the Great. He was born at Adrianople and succeeded his father, Amurath II. His first acts were the murder of his brother and the suppression of a rebellion in Karamania. Having thus secured himself on the throne, he bent all his energies in order to effect the capture of Constantinople. This city was now the sole remnant of the once mighty empire of the Cæsars, and after more than a year spent in preparations, Mohammed commenced the siege

on April 6, 1453, with an army of about 70,000 and a fleet of 320 vessels. The Greeks, aided by gallant bands under Gian Giustiniani, a noble Genoese, long maintained an obstinate resistance. On the morning of May 29 the Turks made a combined attack by land and sea without success, but the retirement from the ramparts of Giustiniani, who had been severely wounded, caused a panic among his followers, and the simultaneous charge of a chosen body of janizaries, with Mohammed himself at their head, proved irresistible. The brave Emperor, Constantine XI, died in the breach, and the Turks poured in over his corpse to plunder and devastate his capital. Mohammed now transferred the seat of his government to Constantinople, and sought to gain the good will of the inhabitants by promising them a free exercise of their religion. After achieving this great conquest he made formidable preparations for the invasion of Hungary. Belgrade was the first point of attack, but János Hunyady (q.v.) compelled him to raise the siege (1456). Soon after this Mohammed became master of the Morea, annexed Servia, and conquered the Empire of Trebizond, an offshoot of the Byzantine Empire. He then turned his arms against the Albanians, whose leader, Scanderbeg, long defied the Turkish power. Scanderbeg died in 1468, and 10 years later the subjugation of Albania was completed. In 1470 Mohammed conquered Negropont from the Venetians. In 1475 he made the Khan of the Crimea tributary, and at the same time deprived the Genoese of Kaffa. In 1480, however, he was repulsed by the Knights of St. John from Rhodes. In the same year he captured Otranto in Italy, the last achievement of his reign. Mohammed was possessed of great abilities; he was brave, enterprising, and sagacious, he is said to have spoken five languages fluently, and to have been well versed in geography, ancient history, natural sciences, and the fine arts. But the brilliancy of his career and the occasional generosity and even magnanimity which he showed cannot obliterate the recollection of those acts of cruelty and treachery which have justly branded him as the most ruthless tyrant of the house of Osman.—MOHAMMED III (1566-1603) was Sultan from 1595 to 1603. He succeeded his father and at once murdered 19 brothers. He waged war against Austria without success.—MOHAMMED IV (1641-91) was Sultan from 1648 to 1687. He succeeded his father, Ibrahim, who had been murdered by the janizaries. The real rulers were the Kiuprili (q.v.). The reign of Mohammed IV saw the decline of Turkish power in Europe. The great onslaught upon the house of Austria in 1683 resulted in the defeat of Kara Mustapha (q.v.). After other disasters Mohammed was dethroned in 1687.—MOHAMMED V (1844-) was chosen by the National Assembly on April 27, 1909, to succeed his brother Abd-ul-Hamid II (q.v.), whom they had just deposed. Consult Stanley Lane-Poole, *Story of Turkey* (New York, 1889).

MOHAMMED ALI. See MEHMET ALI.

MOHAMMED ALI MIRZA, *u'lê mēr'za* (1872-) A shah of Persia, eldest son of Muzaffar ed Din. He received a liberal education in the English and French languages and married one of his cousins, the daughter of Prince Naib Saltaneh, Minister of War. In 1899 he was intrusted with the government of the most important province of Persia, that of Azerbaid-

jan. He opposed the constitution and parliamentary government established by his father for the Persian people in 1906. When Muzaffar ed Din died on Jan. 10, 1907, Mohammed Ali succeeded him as Shah. He continually quarreled with the National Council and dissolved that body in 1908. A revolution resulted, the Shah made concessions when it was too late; and on July 15, 1909, the victorious rebels compelled him to take refuge in the Russian Legation. The Council declared this to be an act of abdication and elected his son, Ahmed Mirza (born in 1895), as his successor. Mohammed Ali went into exile in the Crimea, but was granted a pension. See *PERSIA, History*, and consult the corresponding article and section in the *NEW INTERNATIONAL YEAR BOOK* for 1909.

MOHAMMEDAN ARCHITECTURE. See **ARCHITECTURE**.

MOHAMMEDAN ART. The art produced by Mohammedan nations from the seventh century A.D. to the present time; called also **MOSLEM ART**. The most flourishing period was between the ninth and fourteenth centuries, though in certain places, such as Constantinople, Cairo, Persia, and India, the golden age came later. The homes of this art have been mainly Syria, Persia, Egypt, north Africa, Spain, Asia Minor, India, Sicily, and Constantinople. The Arabs, founders and propagators of Mohammedanism, possessed none of the arts (see **ARABIAN ART**), and consequently a period of at least two centuries passed before the amalgamation of converted peoples, after tentative efforts to adapt preceding artistic forms, created the special types of Mohammedan art. This work was done especially in Syria, Persia, and Egypt, though north Africa and Spain also contributed their share. Byzantine, Persian, and Coptic artists, even if Christians, were employed at first; but finally all the branches were practiced by Mohammedans. The religious prejudice against the representation of the human figure in art, especially in sculpture, prevented any development in the large fields of figure sculpture and painting, forcing the artist into decorative work in pure line and color, in which he became the most consummate master in the whole history of art. In Persia, it is true, this prejudice was far less strong, and a national school of figure painting was developed in the fifteenth and sixteenth centuries. But the exceptions to the hostility to sculpture, which was especially an idolatrous art in Moslem eyes, are very few. Surface ornamentation became the special domain of Moslem art, whether displayed on broad architectural surfaces or on the smallest article of furniture or decoration. This ornamentation, like the forms of architecture themselves, was at first derived from Byzantine models, as in the earliest Cairo work, with a large added element of stiff floral patterns, mainly of classic origin. But gradually the invasion of purely geometrical forms almost extinguished the flora, and the system was evolved and completed in the eleventh century, which is a combination of pure geometric and arabesque designs, used with ever-increasing profusion until all surfaces were covered with it.

ARCHITECTURE

The origins of Mohammedan architecture must be studied in the mosques (q.v.) As the Mohammedans in the countries which they conquered found themselves surrounded by magnifi-

cent monuments of all the past civilizations of the East, it was natural that they should turn to them for the type of their own places of worship. The first important mosque was that erected by the conqueror Omar at Jerusalem in 637—a purely Byzantine design, possibly even a Byzantine church slightly altered. This disappeared centuries ago. The earliest mosque of any pretension now extant was that of Amru (641 A.D.) at Fostat, which consecrated the Arab conquest of Egypt. It served as a type for two centuries. Its colonnades around an open court seem to combine the plan of the atrium of a Christian basilica and the hypostyle hall of an Egyptian temple. The columns were taken from churches and arranged in numerous rows, surmounted by round or pointed arches, on which rested a flat, wooden ceiling. There appear to have been no æsthetic beauty and no decoration in this perfectly plain brick structure. It was in Syria, where the Omniad caliphs had their capital at Damascus, that the first artistic monuments were erected under Abd al Malak and his son Al Walid (c 700 A.D.). They spent immense sums on three buildings which still remain: the mosque of Damascus (705), reputed the most sumptuous monument of the Mohammedan world and built to surpass the works of Christian architecture in Syria (repeatedly altered and badly injured by fire in 1893), the Al Aksa Mosque and the Dome of the Rock, commonly mis-called mosque of Omar (691), both in Jerusalem, built to rival the church of the Holy Sepulchre. The Al Aksa was of a different type from the Egyptian mosques and more like a hall or a Christian church. The principal side of its court, called the jami, containing the mihrab and pulpit (minbar), had a forest of 280 columns in 20 rows, and in the centre, in front of the mihrab, rose a dome. On the other hand the great Damascus Mosque was of the Egyptian type of the mosque of Amru, the type of the atrium, and had only a triple line of columns on the jami (main hall) side and a single row on the others. In both mosques the columns now support pointed arches. The courts were filled with secondary monuments, usually in the shape of domed chapels or fountains. The most important of these is the Dome of the Rock in the court of the Al Aksa Mosque. It followed the Byzantine domical type; its central dome, 112 feet high, is supported on four square piers with intermediate columns and is surrounded by two concentric aisles with eight piers and 16 columns on an octagonal plan.

The next important building in the Mohammedan world is the great mosque at Cordova, the capital of the new Kingdom of Spain. It was founded in 786, and its main hall, as it now stands after two enlargements in 876 and 976, is the largest of all mosques, measuring 534 by 387 feet and containing 856 columns in 19 aisles. Its wooden ceiling, notwithstanding this great length, is 30 feet high. The intricate effect of the maze of columns is increased by the lack of any broad and lofty central nave and by the unique arrangement of two stories of superposed horseshoe arches, as well as by the alternation of white and black marbles in the arches. The decoration shows an early form of stiff foliated arabesque in small separate compartments. The eighth century and the following witnessed a flowering of Mohammedan architecture in all provinces and in all classes of buildings: foun-

tains, baths, aqueducts, palaces, khans, bridges, caravanserais, minarets, mausoleums, monasteries and colleges, bazars and city gates, hospitals, cloisters. A large part of the revenues of the state was devoted to public works. Bagdad was built in 762 and became the capital of the caliphate. Great buildings were erected in the cities of north Africa, in Kairwan (mosque in 837), Algiers, Tlemcen, Tunis (mosque and arsenal in 742). The wonderful buildings of Bagdad, no longer extant, probably gave the keynote to the new art. Much of this early architecture and ornament betrays Byzantine origins; but gradually Persian preponderance makes itself felt through the dynasty of the Abbasides, with Bagdad as centre. The wooden roof is entirely abandoned for the dome. A purely Oriental system of ornament is invented, both geometric and arabesque. The wall surfaces, which had hitherto been left plain or ornamented in Byzantine fashion, are covered with intricate stuccoes and faience tiles, inherited from ancient Persia and Babylonia.

Egypt. Egypt remained for a while outside of this movement, probably because its architecture was still in the hands of native Christian Copts: no domes were used and brick had not yet given place to stone. The earliest mosque in Cairo was that of Amru (642), still extant, but greatly dilapidated, comprising a court, cloisters, and sanctuary. Far more magnificent was that built by Ibn Tulûn when he declared Egypt's independence (876-879). As Ibn Tulûn objected to employing Christian columns for the new mosque, his Christian Coptic architect offered to build it with piers in place of columns. This mosque is of the cloistered type, with two aisles on three sides of the court, or *sahn*, and five aisles in the sanctuary, these are formed of 160 rectangular piers supporting broad, stilted, pointed arches, such as the Copts had always employed. The entire construction was of brick stuccoed, the stucco being decorated with stiff arabesques in relief of the knop and flower pattern derived from ancient Oriental or Egyptian models. A flat wooden roof rested on the walls not far above the crown of the arches. The wall inclosing the mosque forms a court about 300 feet square. All the brilliant revetment and coloring have disappeared. Still this remains the finest example of the early type of mosque. It also has a couple of the earliest minarets, built, as were all the early ones, of brick (twelfth century). There is a small dome in front of the mihrab, as in the earlier Syrian and Palestinian mosques.

Under another dynasty another great mosque was built—the El Azhar or university mosque, in the newly founded capital, Cairo, begun in 969. Here the same cloistered plan was used, but with columns from churches in place of piers. When in 996 the mosque of El Hakim was built, however, the quadrangular pier was used as in the mosque of Tulûn, but its proportions are far slenderer and higher.

It was in the following century that Egyptian architects adopted the dome. Cairo's great characteristic is its multitude of domes. They were used mainly over funerary chapels. There now arose an important class of funerary mosques attached to royal tombs. The Egyptian rulers of the Fatimite dynasty displaced the caliphs of Bagdad as principal patrons of Mohammedan art, and the monuments of Syria, north Africa, and Sicily were inspired from

Egypt during the eleventh and twelfth centuries. Undoubtedly it was the thorough study and application of geometry by Arab writers of the schools of Bagdad and Cairo that made possible not only the scientific architecture of this period, but the wonderful system of geometrical ornament that became so much a part of it. A consistent style was finally developed, which spread over the entire Mohammedan world from Spain and Morocco to Persia, and from Asia Minor to India. The minaret towers were multiplied and began to lose their early heaviness (see MINARET) and to take on great variety of forms, and, being built of stone as well as brick, they were better adapted to a richer ornamentation. The heavy walls were crowned with delicate battlements.

Most characteristic was the invention of the stalactite motive in decoration, which was applied to every possible form of corbeling and by means of which a highly ornamental substitute was found for the Byzantine pendentive in effecting the transition from the square plan to the circular or polygonal dome. The historical tendency was ever to raise the domes higher and make them more pointed. Their numbers multiplied in the thirteenth and following centuries. The cemeteries of Cairo are full of ruined but beautiful mediæval domical tombs. The mausoleum mosques of sultans Hasan, Barkuk, Kart Bey, Kalaun, El Ghuri are the finest examples in Cairo of the domical style. Beginning with the tomb of Esh Shafî'y in 1211, passing through the stage of the tomb mosque of Es Salih in 1249, complete success was realized in adapting the dome to the mosque plan under the impetus given by the Mameluke sultans in the mosque of Hasan in 1356, where the plan is a Greek cross centring about an open court and with the domed tomb behind the mihrab. This magnificent building was regarded as unequalled in Mohammedan lands. Its proportions are grandiose, the tunnel vaults over the arms of its cross are bold. Stone and marble have definitely replaced brick. During this time, however, the type of the old cloistered mosque had been continued in buildings not connected with tombs, such as those of Bibars (1268), of En Nasir (1318), Kusun (1329), El Maridany (1339). The system of stalactite corbeling was used to fill up gaps between all different planes. Like most of Mohammedan work, it conceals under apparent irregularity and freedom, not to say vagrant fancy, the most scientific accuracy of form. The wonderful development of decorative work at this time in mosaic faience, wood carving, marble inlay, metal, etc., is noticed later in this article and in special articles.

Spain. Meanwhile other Mohammedan lands had been following the example of Egypt. The Arabo-Byzantine style of the monuments of Cordova had ruled for about two centuries, a national Mohammedan style was formed shortly before 1000, as in Egypt, as shown in monuments of Tarragona, Segovia, and especially Toledo and later in Granada and Seville. The horseshoe arch, often minutely cusped, was characteristic of this Hispano-Moresque style, together with a peculiar cubical form of capital and, above all, a system of mural decoration in all-over patterns molded or stamped in stucco and enriched with decorative inscriptions and brilliant coloring. The famous Giralda tower at Seville belongs to this middle style, while the alcázars, or Moorish palaces, at Seville (q.v.),

Segovia, and Malaga usher in the style of the Alhambra at Granada. When in 1238 Granada became the capital of the Moors in Spain, its monuments expressed the development of native arts for the ensuing century. Here is found the richest extant combination of the different kinds of surface decoration in which Mohammedan art excelled; arabesque and geometrical ornament, diaper patterns of extraordinary richness, stalactile corbeling, stucco and faience, mosaic and marble inlay cover every inch of space. But though so rich, the ornament of the Alhambra, being largely cast or stamped, lacks the life and dignity of the freer Egyptian work of the same kind. See ALHAMBRA.

Persia. The Turks and Mongols made such havoc of the earlier monuments of Mohammedan Persia, the region of Bagdad and the great northern states of Bokhara and Samarkand, that nothing has survived in these regions of earlier date than 1300. But the following three centuries, while they show a style no longer in its early prime, produced highly interesting works in Persia and in the derived styles of other countries. The Tatars and Seljuk Turks adapted their work from Persian models, in the buildings of the thirteenth and fourteenth centuries at Sivas, Kaisarieh, Komeh, Nigdeh, Nicæa, Brusa, etc. The contemporary buildings in Persia, at Tabriz, Sultanieh, Teheran, and especially those of the Sefi dynasty at Ispahan (the Meidan, mosque of Mesjid Shah, Bazar, and Medressah of Hosein Shah), show that Persian architecture was capable of grandiose conceptions finely executed. In Persian ornament, flowing lines were preferred to angular and geometrical designs, even its arabesques are more continuous and soft, and it hardly ever resorted to stalactile corbeling. The bulbous pointed dome is universal, and a vast niche, extending through the whole height of the façade, framed the main portal. The material of construction is brick, faced with enameled tiles of brilliant colors in minute arabesque patterns. A kind of four-centred pointed arch, somewhat like a Tudor arch, is almost universal. The minarets have circular shafts and are very slender, being topped by small domes.

India. At the same time Mohammedan art in India, which made its beginnings in the Kûtüb Minar and mosque and gate of Allah el Din and tomb of Altempsh at Old Delhi, and at Ajmere, in the thirteenth century, received a great impetus through the establishment of the Mogul supremacy (1526), and produced a style that was in many ways the grandest in the whole sphere of Mohammedan architecture. Buildings like the mosque and tomb of Mahmud at Bijapur, the mosques at Fatehpur-Sikri, Agra, and Delhi, the palace of Akbar at Allahabad, and the Taj Mahal at Agra are masterpieces. Red sandstone and marble are the chief building materials, the Taj is largely of alabaster. There is undoubtedly a dependence on the art of Persia in the shape of the pointed arches and domes and in the niche façades, but these Indian architects showed a surpassing sense of composition and effectiveness, never allowing, as the architects of Egypt and Spain so often did, the love of detail to become paramount.

Turkey. Finally, when the Turks captured Constantinople (1453), they adopted the Byzantine system of plan and construction (and specifically that of Hagia Sophia, which became their chief mosque) and superimposed upon this

a style of surface decoration which they had developed from Persian models. The architects they employed at first were Christian Greeks, but Sinan, the greatest of them all and a designer of extraordinary genius, was a Moslem. Their mosques have ever since been variations of the type of Hagia Sophia on a smaller scale. But some of them have great merit of dignity and composition and some originality in the exterior treatment, e.g., the mosque of Mohammed II, which has four semidomes grouped around the central one, and especially the Suleimanieh Mosque (1553). These have alternating white and black marbles in the interior voussours, and the simple brilliancy of the surfaces gives quite a different effect from a Byzantine interior. The mosques of Ahmet I (1608) and the Yemî Djami (1658), and at Adrianople the noble mosque of Selim, are works of impressive grandeur. The Turkish minaret is of stone, cylindrical, with a tall conical spire and carved galleries. For details regarding special classes of buildings and the delightful domestic architecture of the Moslems, see special articles, such as CARAVANSERAI, FOUNTAIN, BAZAR, TEKIYE; MINARET, MOSQUE.

MINOR ARTS

Decoration. The carving of the Mohammedans was purely decorative, becoming richer as the Middle Ages advanced. In the earlier stages it partook somewhat of Byzantine design, as in the mosque of Cordova and in early Egyptian and Syrian mosques. But it was then scanty and rather heavy. When the schools became more differentiated in the eleventh century, into the Persian naturalistic, figured and floral, the Syrian schematic, animal and floral, and the Egyptian, geometric and stiff floral schools, ornament began to spread over the entire building. Even the exterior surfaces of domes and walls were covered with a lacework cut in stone or stucco. Color was given by marble mosaics in Egypt, or in Syria and Persia by brilliantly colored tiles. The mosque of Omar is an early, the Alhambra at Granada a mediæval, and the mosque of Ispahan a late example. The tiles became an Oriental specialty and were imitated in Spain until recently. In Persia and in Asiatic Turkey the production of these decorative tiles is still an active craft. True sculpture, as distinguished from surface carving, is practically unknown in Moslem art, the Lion Fountain of the Alhambra offering the single notable exception. See AZULEJO.

Woodwork and Ivory. In no style of art has so varied an artistic use been made of wood. Where other styles have used stone and marble we find wood used, e.g., in carved ceilings, windows, pulpits, lecterns, screens, latticework, doors, balconies, carpets, tomb casings. In the richest pieces ivory and mother-of-pearl are sometimes used in connection with wood, being either inlaid in carved panels or being set as panels in wooden frames. Wood was used not only for the furniture of the private house, but for that of the mosque, such as cupboards, tables, and the classes of work mentioned above. Some of the best examples of floral design in Egypt are preserved in wood carvings. The most magnificent pieces are probably the pulpits, such as that of Kait Bey in South Kensington Museum, and the panels from those of Maridany, Lagin, and Kusun in the same museum. The

panels of the hospital of Kalaun show a Persian style of figures and animals rather than the floral and geometrical patterns. The reading platform of the mosque of Kait Bey is a fine instance of marquetry and ivory, largely in polygonal design. Ebony and ivory were often combined in mosaic-like patterns, sometimes framed in strips of metal, as in jewel cases and other boxes. But the most extensive of all the wood carvings and inlaid work were the ceilings of mosques and palaces, as in those of Kait Bey, El Moyyed, and El Bordem.

Metal Work. The Persians, Syrians, and Egyptians were skillful workers in metal. Perhaps the earliest centre was in Mesopotamia, at Mosul. Brass, bronze, and copper were chiefly used. While chased bronze and repoussé copper seem the earliest processes, the works came to be often inlaid with silver and sometimes with gold by different processes (1) by incrusting a thread of gold or silver into an undercut groove, (2) by inclosing a metal strip or plate between raised walls, (3) by pressing a thin leaf of metal into stipple marks. The entire metal surface was excavated according to the elaborate design, the edges undercut, the threads or plates of gold or silver inserted and burnished, and then the surfaces chased with all the details that could not be given by the general outlines. Animals, birds, human figures, hunting scenes, feasting scenes, and other genre subjects, as well as floral designs, characterize more especially the Persian and Syrian works, while arabesques and geometric patterns predominate in Egypt. Inscriptions are made almost always to contribute to the decorative effect. The Mesopotamian and Persian schools, though undoubtedly of much earlier origin, gained new life in the twelfth century, when Tatar and Turkish influence gave to artists far greater freedom in the use of the human figure. The school of Damascus was the most famous centre at the time of the Crusades, giving its name to the entire process of damaskeening or inlaying. The Egyptian school, with its centre at Cairo, flourished somewhat later, under the Mameluke rulers of the fourteenth century. The objects made wholly of gold and silver have almost entirely disappeared, but the inventories of the palaces of the rulers of Bagdad and Cairo prove the existence of many thousands of such objects—vases, boxes, mirrors, stands, lamps, trays, coffers, figures of birds and animals, dishes, cups, flagons, bowls. Of these classes many objects still remain in the baser metals, either plain or damaskeened, particularly interesting are the hanging lamps, lanterns, and chandeliers, the stands and tables, mosque doors, perfume burners, censors, boxes (especially writing boxes), trays, and bowls. It is in the magnificent arms and armor that the metal workers showed the supremest mastery, using all the processes—chiseling, damaskeening, enameling, jewel setting—to produce the masterpieces in the shape of poniards, swords, and yataghans, helmets, breastplates, and lances, stirrups, bits, and the rest of the military equipment and caparison, including, in later times, muskets, pistols, and halberds. In this special field the school of Syria (Damascus) reigned supreme, manufacturing the best pieces for the entire Mohammedan world. The Persian style was more ornate, standing midway between Syrian simplicity and Indian gorgeousness. See **INDIAN ART**.

Glass. It is in Egypt that stained-glass windows were made, rivaling on a small scale the cathedral windows of the Gothic period. Here, as in every other branch, there is originality of methods. The windows are small, forming usually an oblong of less than 2 by 3 or 4 feet. The frame is of wood, and the process consists of pouring a bed of plaster into this frame, letting it set, and then cutting out the design, leaving only narrow ribs or bands of plaster to hold the glass. The design is extremely elaborate, with a central motif, usually of flowers, plants, and trees, the bits of stained glass cut to fit over the openings are laid on and fastened with fresh plaster. The openings are often slanting towards the street and the plaster artistically finished on the outside. The effect on the inside is similar to mosaic. The commonest designs are pinks and other flowers growing from a vase, cypress with entwined flower stem; scroll of flowers and leaves, kiosk between buds or cypresses, one or two cypresses with flowers. Earlier than these are the more purely geometric designs, as in the tomb of Bibars at Cairo. Of course the plaster is far more fragile than lead as a frame, and the windows easily disintegrate and cannot be made large. Such windows (called *kamarayeh*) are found not merely in mosques, but in the *meshrabiyyeh* or latticed projecting windows of private houses. Such windows, of monumental size and importance, adorn the mosques of Solyman, Ahmet I, the Yeni Djami, and others at Constantinople. In harmony and quiet depth of color they equal or surpass their more colossal Gothic counterparts.

A different kind of artistic glass is exemplified in the mosque lamps of enameled and painted glass. It is true that there is a great quantity of exquisite glass, both white and colored, showing in Persia, Syria and Egypt still carried on in the Middle Ages the old Egyptian and Phœnician industry, with exquisite understanding of forms and tones, furnishing models to Venice, but it is in the mosque lamps that the glassworkers certainly enter the domain of fine art. Here the colors are enameled on a gilt ground and the designs are similar to those of metal work, with greater prominence given to inscriptions, cobalt, red, pale green, and white are the principal enamels, and the decoration is in bands with medallions. The most beautiful examples are works of the fourteenth century from the mosques of Cairo. The mellow light shining through the enamels and glass of these suspended lamps was of an exquisite effect.

Illumination of Manuscripts. The aversion to the representation of the human figure hindered the development of the art of illumination—a branch of art not cultivated extensively until the later Middle Ages. It is true that figured compositions were not unknown either to the Egyptian or the Syrian artists, but it was the Persian school, under Tatar and Mongol influences, which first boldly attempted scenes of daily life and of history. There are many manuscripts of the Koran belonging to the other schools, whose first and last pages are a mass of geometric and floral ornament. The finest collection of Egyptian manuscripts, executed mainly for the sultans of the fourteenth and fifteenth centuries, is that of the Cairo Museum rescued from the mosques, such as those of sultans Kalaun, Shaban, and Barkuk. Sometimes the flowers, arabesques, and polygons are in colors on a gold ground, sometimes in gold on a ground of

plain blue or red or of shaded and grouped colors. The finest of these illuminated pages surpass anything done by Christian artists in richness, in exquisite coloring, and in fineness of execution. They are executed not on vellum, but on fine Egyptian cream-colored or reddish paper. The Syrian and Persian schools avoided the geometric ornamentation, and their floral designs were freer and more naturalistic. The Persian fondness for legend and poetry shows itself in the rich illumination of poems and stories which gave occasion for charming genre scenes and vignettes, and the artist's fancy sprinkled animals and birds in riotous confusion on a background of beautiful garden scenes.

It is in these figured illuminations alone that we can study the style of the fresco painters of Mohammedanism, whose works have disappeared. It is plain from native writers that the caliphs of Bagdad, the rulers of Egypt and Spain, at different times lavishly patronized figure painters and that such works were not confined to the Persian school. It is interesting to note the similarity between Persian and Chinese painted design and to make the Mongols the intermediaries between the two schools. The primitive conception of composition and figure and the awkward conventionalities make the Persian school, though successful in coloring, less successful in its sphere than the purely decorative Egyptian. The most famous Persian illuminators belong to the sixteenth century, such as Fabrizi, Jehangir, Bukhari, and Bahzada. The latter's works are masterly in composition and correspond to the Italian Giottoesque masters. The last great master was Mari, a Naturalist from India.

Textile Fabrics. The Far East had always been famous for its artistic stuffs, embroideries, tapestries, rugs. It was as successors to the arts of Persia and Babylon that the Mohammedans developed this branch, though Bagdad, Damascus, Cairo, and Cordova all took part and the tribes and villages rivaled with the large cities. Nothing became more characteristic of the East, nothing influenced the West more strongly, through constant importation and the contact of the Crusaders. The haute-lice tapestry, after a method long lost in Europe, was in current use. The same difference finally appeared in the designs here as in other branches: geometrical and set patterns being more common in Egypt, free floral designs being used in Persia. The few known Persian rugs of as early a period as the thirteenth and fourteenth centuries are now valued at many thousand dollars (\$10,000 to \$40,000), and a study of their design shows an almost incalculable variety of native flowers naturalistically reproduced. The Syrian school had much in common with the Byzantine and, as usual, occupied a middle position, with medallions in a stiff floral ground containing heraldic animals or birds. There were in every Mohammedan country royal manufactories whose products were entirely reserved for the court and sovereign, the standards, baldachins, tents, royal robes, hangings, housings, and rugs were all of a magnificence unknown to the ruder West and unsurpassed at any time. The known specimens date no earlier than the eleventh century, and the art decayed before the sixteenth century.

Influence on Europe. Sicily, southern Italy, Venice, and Spain were affected by the Mohammedan arts during the Middle Ages and even as

late as the Renaissance. Hence the use of the pointed and the horseshoe arch in many parts of southern Europe. The cosmopolitan culture of the Norman kings of Sicily had a large Mohammedan element. The palaces of the kings—such as La Kuba, La Ziza, Favara, and Baida—were imitated from those of the Eastern emirs and sultans, San Giovanni degli Ereniti seems an importation from Cairo. Mohammedan artists executed the wonderful stalactite ceiling in carved wood and probably also the geometric mosaics in the Cappella Palatina at Palermo. The famous Ruffolo Palace at Ravello and several cloisters (e.g., at Amalfi) show the spread of Eastern architectural forms in Campania. It is interesting to see how in most cases where there are traces of Byzantine art there are also signs of Mohammedan influence, and vice versa. This is nowhere more evident than in Venice, where both forms of Oriental art were so prominent. Here quite a flourishing school of Mohammedan metal workers was established, existing as late as the sixteenth century, when Mahmud El Kurdi signed some exquisite pieces. The Italian artists who imitated them called themselves workers *all' agemina*, 'in the Persian style,' and even Cellini confesses to have copied Oriental aims. In fact, the Renaissance metal workers of the sixteenth century both in Italy and France owed more than their mediæval predecessors to Oriental design, and there are traces of a like influence in German ironwork and niellos of the sixteenth century, especially that of Nuremberg. Even more widespread and radical was the use and imitation in Europe of Oriental stuffs and fabrics, partly Byzantine, but especially Mohammedan—wonderful not merely for beauty of material, but for the figures and patterns woven or embroidered. The imported tents, baldachins, hangings, carpets, and the like furnished the models for the European ateliers in Sicily, Rome, Venice, Belgium, and France.

Bibliography. G. Le Bon, *La civilisation des Arabes* (Paris, 1883), contains the most suggestive general sketch of the Mohammedan arts, with numerous illustrations. Gayet, in *L'Art arabe* (ib., 1893) and in *L'Art persan* (ib., 1895), describes the various arts in Mohammedan Persia and Egypt in handbook form. A more thorough book of the same type is Stanley Lane-Poole, *The Art of the Saracens in Egypt* (London, 1886). Franz Pascha, *Die Baukunst des Islam* (Darmstadt, 1896), is a general historical and critical treatise on Mohammedan architecture and decorative details, with description of the different classes of buildings. For the designs and patterns used in decoration, the best textbooks are those of J. Bourgoïn, *Les arts arabes* (Paris, 1868-70) and *Précis de l'art arabe* (ib., 1889). In James Fergusson, *History of Architecture* (new ed., New York, 1907), considerable space, with not very scientific treatment, is given to the Mohammedan styles; see also his *Indian and Eastern Architecture* (London, 1876). M. von Berchem, in his "Notes d'archéologie arabe" (in various years of the *Journal asiatique*), is laying a good historic basis for an historic treatment and making known new monuments. The most sumptuous illustrative plates are still, for Egypt, in A. C. T. E. Prisse d'Avennes, *L'Art arabe d'après les monuments du Caire* (Paris, 1869-77), and, for Persia, Flandin and Coste, *Monuments modernes de la Perse* (ib., 1867). For Spain the

first serious work was Girault de Prangey, *L'Architecture des Arabes et des Maures en Espagne, en Sicile et en Barbarie* (ib., 1842), which should be supplemented by the Spanish government publication, *Monumentos arquitectonicos de España* (Madrid, 1877 et seq.); also A. F. Calvert, *Moorish Remains in Spain* (2 vols., London, 1905-07). The sumptuous *Seymour Portfolio of Architectural Details* edited by S. S. Jacob (7 vols., London, 1890-94) illustrates Moslem decorative art in one province of India. The architecture of Turkey is treated with some fullness in two works Montani, *Architecture ottomane* (Constantinople, 1873), and Parvillée, *Architecture et décoration turques* (Paris, 1874). By far the best general treatise on Mohammedan art is that of Saladin and Migeon, *Manuel d'art musulman* (2 vols., Paris, 1907). Nothing satisfactory has been published about the monuments of northern Africa, of Syria, or Asia Minor. Aside from the works remaining in situ there are not many collections of the smaller works of Mohammedan art. That of the South Kensington Museum is important, as are those of Cairo, of Constantinople, and of the Musée des Arts Decoratifs in Paris. See cuts in articles ARABESQUE and ARAHIAN ART.

MOHAMMEDANISM. The name commonly given in the West to the religion founded by Mohammed. The proper name is Islam (q.v.), suggested by Mohammed himself, which meant 'resignation,' or acceptance of the divine will, and was explained by the prophet to include the performance of five duties (the "five cardinal points of Islam"), viz.: acceptance of the formula, "there is no god but Allah, and Mohammed is his prophet"; prayer; almsgiving; the fast of Ramadan, and the pilgrimage to Mecca.

Doctrine and Practice. Like every organized religion, Islam, as developed by the Mohammedan theologians, presents two sides—the theoretical part, known as *imān* (faith), and the practical part called *dīn* (religion). The doctrine concerning God, His nature and attributes, coincides with the Jewish and Christian in so far as He is by both taught to be the Creator of all things in heaven and earth, who rules and preserves all things, without beginning, omnipotent, omniscient, omnipresent, and full of mercy. But, according to the Mohammedan belief, He has no offspring. Jesus is regarded, like Adam, Abraham, and Moses, as a prophet and apostle, although his birth is said to have been due to a divine intervention, as the Koran superseded the Gospel, so Mohammed superseded Jesus and all preceding prophets. Next to the belief in God that in *angels* forms a prominent dogma, and, like the former, may be traced back directly to Jewish and Christian and in a smaller degree to Persian influences. Created of fire and endowed with a kind of incorporeal body, angels stand between God and man. There are four chief angels. Gabriel, the angel of revelation, Michael, the special protector and guardian of the Jews, Azrael, the angel of death; Israfil (Uriel), whose office it will be to sound the trumpet at the resurrection. Besides angels there are good and evil *genii* (see JINN), of a grosser fabric than the former and subject to death. They have different names and offices (*pīris*, fairies; *deves*, giants; *takwīns*, fates, etc.), and are much like the *shēdim* in the Talmud and Midrash and the demons of other peoples. The chief of the evil

genii is Iblis (q.v.), once called Azazel, who, refusing to pay homage to Adam, was rejected by God. A third belief is that in certain divinely given *scriptures*, revealed successively to the different *prophets*. Originally there were 104 sacred books, but only four have survived, viz.: the Pentateuch, the Psalms, the Gospel, and the Koran, and the first three are in a mutilated and falsified condition. The number of prophets sent at different times is stated variously at between 200,000 and 300,000. Among them 313 were apostles and six were specially commissioned to proclaim new laws and dispensations, which abrogated the preceding ones. These were Adam, Noah, Abraham, Moses, Jesus, and Mohammed—the last the greatest of them all, and the propagator of the final dispensation. The belief in the *resurrection* and the *final judgment* is an important article of faith, which in the theological writings later than Mohammed is elaborately developed. The condition of the dead in the future world and the punishment of the wicked are pictured with a great multiplicity of details. The dead are received in their graves by an angel announcing the coming of the two examiners, Munkar (unknown) and Nakir (repudiating), who, described as two black angels with blue eyes, put questions to the dead respecting his belief in God and Mohammed and, in accordance with the answers, either torture or comfort him. The soul, awaiting a general resurrection, is treated according to its rank; prophets enter immediately into Paradise, martyrs, in the shape of a green bird, partake of the delights of the abode of bliss, common believers either stay near the grave, or are with Adam in the lowest heaven, or remain in the well Zemzem or in the trumpet of the resurrection, or rest in the shape of a white bird under the throne of God. The souls of infidels dwell in a certain well in the province of Hadramaut (interpreted as chamber of death), or, being first offered to heaven, then to earth, and rejected by both, are subject to unspeakable tortures until the day of resurrection. Concerning the latter considerable discrepancy reigns among the Mohammedan theologians. Mohammed himself seems to have held that both soul and body will be raised, and it is said that the rump bone will remain uncorrupted till the last day, and from it the whole body will spring anew after a forty days' rain. Among the signs by which the approach of the last day may be known are the decay of faith among men, the advancing of the meanest persons to the highest dignities, wars, seditions, and tumults, and consequent dire distress. Certain provinces shall revolt, and the buildings of Medina shall reach to Mecca. These are the eight "lesser" signs, of "greater" signs there are no less than 17; the sun will rise in the west, the Beast will appear, Constantinople will be taken by the descendants of Isaac, the Antichrist will come and be killed by Jesus at Lud (Lydda). Further, there will come a war with the Jews, Gog and Magog's (*Yājūj* and *Mājūj*) eruption, a great smoke, an eclipse, the Mohammedans will return to idolatry, a great treasure will be found in the Euphrates, the Kaaba will be destroyed by the Ethiopians, beasts and inanimate things will speak, and finally, a wind will sweep away the souls of those who have faith, even if equal only to a grain of mustard seed, so that the world shall be left in ignorance. The time of the resurrection even Mohammed could not learn

from Gabriel; it is a mystery. Three blasts will announce it—that of consternation, of such terrible power that mothers will neglect the babes on their breasts and heaven and earth will melt; that of examination, which will annihilate all things and beings, even the angel of death, save Paradise and hell and their inhabitants, and, 40 years later, that of resurrection, when all men, Mohammed first, will have their souls breathed into their restored bodies and will sleep in their sepulchres until the final doom has been passed upon them. The day of judgment, lasting from 1000 to 50,000 years, will call up angels, geni, men, and animals. The trial over, the righteous will enter Paradise, to the right hand, and the wicked will pass to the left, into hell, both, however, have first to go over the bridge *Al Sirât*, laid over the midst of hell, finer than a hair, sharper than the edge of a sword, and beset with thorns on either side. The righteous will proceed on their path with ease and swiftness, but the wicked will fall headlong. Hell is divided into seven stones or apartments, respectively assigned to Mohammedans, Jews, Christians, Sabians, Magians, idolaters, and—the lowest of all—to the hypocrites, who, outwardly professing a religion, in reality had none. The degrees of pain—chiefly consisting in intense heat and cold—vary, but the Mohammedans and all those who professed the unity of God will finally be released, while unbelievers and idolaters will be condemned to eternal punishment. Paradise is divided from hell by a partition (*urf*) in which a certain number of half saints will find place. The blessed, destined for the abode of eternal delight (*Al Jannah*, Heb *Gan-Eden*), will first drink of the pond of the Prophet, which is supplied from the rivers of Paradise, whiter than milk and more odoriferous than musk. Arrived at one of the eight gates, they will be met by beautiful youths and angels; and their degree of righteousness (prophets, religious teachers, martyrs, believers) will procure for them the corresponding degree of happiness. Mankind on the last day will be assembled in three classes: (1) those who go on foot, believers whose good works have been few; (2) those who ride, believers acceptable in the eyes of God; and (3) those who creep, the unbelievers. The various felicities which await the pious represent a conglomeration of Jewish, Christian, Zoroastrian, and other fancies to which the Prophet's own sensual imagination has added very considerably. Feasting in the most gorgeous and delicious variety, the most costly and brilliant garments, odors, and music of the most ravishing nature, and, above all, the enjoyment of the *Hur al 'uyûn*, the black-eyed daughters of Paradise (see HOURI), created of pure musk, are held out as a reward to the commonest inhabitant of Paradise, who will always remain in the full vigor of youth and manhood. For those deserving a higher degree of recompense rewards will be prepared of a purely spiritual kind—i.e., the "beholding of God's face" (*Shekinah*) by night and by day. The last of the precepts of pure faith taught by Mohammedanism is the full and unconditional submission to God's decree, and the predestination of good and evil, which is found from the beginning inscribed on a "preserved table." Not only a man's fortunes, but his deeds, and consequently his future reward or punishment, are irrevocably, and thus unavoidably, preordained—a

doctrine which is not, however, taken literally by all Moslems.

The first of the four chief duties of *din*, or the practical part of Islam, is *prayer*, "the Key of Paradise." Certain religious purifications are included as necessary preparations. They are of two kinds: the *ghusl*, or total immersion of the body, required on certain special occasions, and the *icudâ'*, a partial ablution, to be performed immediately before the prayer. This is of primary importance, and consists in washing the hands, face, ears, and feet up to the ankles—a proceeding generally accompanied at each stage by corresponding pious sentences, and concluded by the recital of the ninety-seventh sura of the Koran. If water is not to be had, sand may supply its place. Even the ground or the carpet upon which one prays must be as clean as possible, and the use of a special prayer carpet (*sajjâdah*) is therefore recommended. Every Mohammedan is required to pray five times in the space of 24 hours. The prayer (*salât*) itself consists partly of extracts from the Koran (*fard*), partly of sentences ordained upon the precept or practice of the Prophet (*sunnâ*). The times of prayer are: daybreak (*fajr*), noon (*zuhr*), afternoon, midway between the second and fourth (*asr*), evening (*maghrîb*); after night has closed in (*ishâ*). These several times of prayer are announced by the muezzins (qv) from the minarets of the mosques. The believer passes through a series of 13 postures during his prayers, and a certain number of such inclinations of head and knees, prostrations, etc., is called *rak'ah*. It is necessary that the face of the worshiper should be turned towards the kiblah, i.e., in the direction of Mecca (see KIBLAH). Women, although not forbidden to enter the mosque, yet are not supposed to pray there, lest their presence should be hurtful to true devotion. Besides these prayers there are others ordained for special occasions, as on a pilgrimage, before a battle, at funerals, during an eclipse, etc. The Moslems do not pray to Mohammed, but simply implore his intercession, as they do that of the numerous saints, the relatives of the Prophet, and the first propagators of Islam. Petitions, moreover, play a subsidiary part in the prayers, which are chiefly made up of thanksgivings and praise formulas. Mohammedanism has no clergy in the Western sense of the word, but there is always a leader (*imâm*), who takes his stand at the head of the congregation and "leads" the latter in prayer. (See IMAM; MOLLAH, MUFTI.) Next to prayer stands the duty of giving *alms*. These are twofold, legal (*zakât*) and voluntary (*sadakah*), but the former, originally collected by the sovereign and applied to pious uses, has now been practically abrogated. The *sadakah*, according to the law, is to be given once every year, of cattle, money, corn, fruits, and wares sold, at about the rate of from 2½ up to 20 per cent. Besides these, it is usual to bestow a measure of provisions upon the poor at the end of the sacred month of Ramadan. The duty of *fasting* follows. During the whole month of Ramadan the Moslem is commanded to refrain from eating, drinking, and every indulgence in worldly pleasure, from daybreak until sunset. During the night he is allowed to eat, drink, and enjoy himself. Certain classes are exempt, as it was Mohammed's special and express desire that no one should fast who is not equal to it, lest he injure his health and disqualify himself

for necessary labor. Of other commendable fast days, the most important is the *'Ashûrâ*, on the tenth of Muharram, corresponding in a measure to the Jewish Day of Atonement. The fast of Ramadan is universally kept, in letter if not in spirit, fasting being considered "one-fourth part of the faith" (See FAST; RAMADAN.) The last duty is the *pilgrimage* to Mecca, which every Moslem must make once in his life, if he be free, sound in body, and able to meet the expense. Women also perform the pilgrimage. To pay the way of one who cannot himself afford it is considered a pious act, and the Shiites allow the pilgrimage to be made by proxy. See HAJJ, HAJJI.

To the "positive" ordinances of Islam may be added the *saghir* or *lesser* and *kabir* or *greater festivals*. The first (*al fitr*, or breaking the fast) follows immediately upon Ramadan, beginning on the first day of the month of Shawwal, and lasts three days. The second (*'id al kurbân*, or sacrifice festival, also called *'id al duha* in India, *'id al Barram* in Turkey and Egypt) begins on the tenth of Dhu'l hijjah. The latter was intended to be the more important of the two, but the people have in most places changed the order, and make the lesser festival, which follows Ramadan, the more joyful and the longer. The day set aside for the weekly assembly is Friday, which, however, is not a day of rest.

Islam also enjoins a number of *prohibitory laws* based upon utterances of the Prophet. The drinking of *wine*, which includes all strong and inebriating liquors, is rigorously forbidden. Chiefly through European influence some Moslems have lost their scruples on this score, but the great majority of the faithful refuse even to make use of the proceeds of the sale of wine or grapes. Some scrupulous believers even include opium, coffee, and tobacco in the prohibition, but general practice has decided differently. The prohibitory laws respecting *food* resemble closely those of Rabbinical Judaism. Blood, the flesh of swine, animals which have died from disease or age, or on which the name of some idol has been invoked, or which have been sacrificed unto an idol, or which have been strangled, or killed by a blow, a fall or by some other beast, are strictly forbidden. "Pure" animals must be slaughtered according to certain fixed rules, and fish, bird, game, are generally allowed for food. All *games* subject to chance—such as dice, cards, tables, bets, etc.—are considered so wicked that a gambler's testimony is invalid in a court of law. Chess and other games depending on skill—provided they do not interfere with the regular performance of religious duties, and that they are played without any stakes—are allowed by the majority of Moslem theologians. *Usury* is strictly prohibited. Taking interest upon any loans, however large or small, or profiting in trade through questionable means, save by buying and selling, is severely condemned. To prevent the faithful from ever falling back into idolatry, the laws relating to *images and pictures* have been made very stringent. Whosoever makes an imitation of any living being in stone, wood, or any other material, shall, on the day of judgment, be asked to endow his creation with life and soul, and, on his protesting his inability to do so, shall undergo the punishment of hell for a certain period.

The civil and criminal laws of Mohammedan-

ism, founded on both the Koran and the Traditions (*Sunna*, q v), in instances where the letter of the written or oral precept allows of various explanations, or where the case in question is unprecedented, are interpreted according to the opinion of one of the four great masters of Islam: Abu Hanifah (born 702), Malik ibn Anas (born 714), Mohammed al Shafii (born 767), and Ahmad ibn Hanbal (born 780), within the pale of their respective sects. (See MOHAMMEDAN SECTS.) Upon the principal points all Mohammedans agree. In regard to *marriage*, polygamy is allowed, but not without restriction. Four wives, though he may cohabit with any number of concubine slaves, is the legal limit for a Moslem. The Prophet's example proves nothing to the contrary, since he was endowed with special privileges and was not in all respects subject to the common law. It is, moreover, added as advice that to marry one or two is quite sufficient for a man. As a matter of fact, the rule among Mohammedans of the present day is to have but one wife. A Moslem may marry a Christian woman or a Jewess, but a Mohammedan woman is not, under any circumstances, to marry an unbeliever. In all cases, however, the child born of a Moslem, whatever the mother's faith, is a Moslem, nor does the wife who is an unbeliever inherit at her husband's death. Forbidden degrees are the mother, daughter, sister, half sister, aunt, niece, foster mother, or a woman related to the faithful "by milk in any of the degrees which would preclude his marriage with her if she were similarly related to him by consanguinity"; the mother of his wife, even if he be not yet actually married to the latter, the daughter of his wife, if the latter still be his legal wife, his father's wife and his son's wife, two sisters at the same time, wives who stand to each other in the relation of aunt and niece, or the unemancipated slave, or another man's slave, if he have already a free wife. A simple declaration of a man and woman at the age of puberty, before two witnesses, of their intention to marry each other, and the payment of part of the dowry (which is indispensable, and must amount to at least 10 dirhems, or about \$1) is sufficient for a legal marriage. A girl under age is given away by her natural or appointed guardian, with or without her consent. To see the face of any woman who is neither his wife nor his concubine, nor belongs to any of the forbidden degrees, is strictly forbidden to the believer. *Divorce* is a comparatively light matter with the Mohammedans. Twice a man may send away his wife and take her back again without any ceremony, the third time, however, he may not receive her again in wedlock unless she have been married properly to another man in the meantime. Mere dislike is sufficient reason for a man to dissolve the conjugal ties, and his saying "Thou art divorced," or "I divorce thee," together with the repayment of the dowry, is all that is required from him by the law. A wife, on the other hand, is bound to her husband forever, unless she can prove some flagrant ill usage or neglect of conjugal duty on his part; and even then she forfeits part, or the whole, of her dowry. A divorced woman is obliged to wait, like the widow, for a certain period before marrying again. If she have a young child, she is to suckle it until it be two years old, and the father is to bear all the expenses of the maintenance of mother and child. If a

slave becomes a mother by her master, and he acknowledges the child to be his own, the latter is free, the mother becomes the wife of her master, and may not be given away or otherwise disposed of by him during his lifetime. A free person, wishing to marry his or her slave, must first emancipate this slave, and if the slave of another person has been married by a free man or woman, and afterward becomes the latter's property, the marriage becomes illegal, and can only be renewed by a legal contract and emancipation. As regards *inheritance*, males generally receive a double share. A person may not bequeath more than one-third of his property, unless there be no legal heirs. Children, whether begotten with the legal wife, or slave, or concubine, or only adopted, and their descendants, are the first heirs; next come the claims of wives, parents, brothers, sisters, in their order. Where there is no legal heir the property falls to the state. The law is very lenient towards *debtors*. Insolvency and inability to work for the discharge of the claim absolve from all further obligations. The most conscientious performance of all private contracts is constantly recommended in the Koran. *Murder* is either punished with death or by the payment of a fine to the family of the deceased, according to their own pleasure. There must, however, be palliating circumstances in the latter case. The Bedouins still maintain the primitive Semitic law of blood revenge, and up to this day the "vendetta" often rages not only between family and family, but between whole tribes, villages, and provinces. Unintentional homicide is expiated by freeing a believer from slavery and paying to the family a certain sum in proportion to the rank and sex of the deceased. He who has not the means of freeing a believer is to fast for two months by way of penance. According to the strict letter of the law a man is not liable to capital punishment for killing his own child or an infidel, but practically no difference is made by the Mohammedan governments (chiefly the Turkish) at the present time. Murder is punished with death and no fine frees the culprit. *Injuries to the person* are punished according to the primitive law of retaliation, i.e., a certain proportionate fine in money is to be paid to the injured. The payment for any of the single limbs of the human body (e.g., the nose) is the full price of blood, as for a homicide; for a limb which is found twice, like hand or foot, half; for a finger or a toe, the tenth part; etc. Women and slaves have smaller claims. Injuries of a dangerous or otherwise grievous nature pay the full price, those of an inferior kind, however, bring the perpetrator within the province of the lash or cudgel. The Koran orders small *theft* to be punished by cutting off the chief offending limb, the right hand; the second theft is punishable by the loss of the left foot; the third, of the left hand; the fourth, of the right foot, etc.; but the ordinary punishments of imprisonment, hard labor, and the bastinado have been substituted in later times. The property stolen must not, however, have been of easy access to the thief, nor must it have consisted of food, since he may have taken this to satisfy the craving of his hunger. *Unchastity* on the part of a woman was in the commencement of Islam punished by imprisonment for life, for which afterward, however, stoning was substituted in the case of a married woman and a hundred stripes

and a year's exile in the case of an unmarried free woman, a slave to undergo only half of that punishment. He who accuses a "woman of reputation" of adultery or fornication must produce four (male) witnesses, and if he be not able to do so he is to receive fourscore stripes, nor is his testimony ever after to be received unless he swear four times that he speaks the truth and the fifth time implicate God's vengeance if he speak false. Even this testimony may be overthrown by the wife's swearing four times that her accuser is a liar, and imprecating the fifth time the wrath of God upon herself if he speak the truth. In the latter case she is free from punishment, the marriage, however, is to be dissolved. Fornication in either sex is, by the law of the Koran, to be visited with a hundred stripes. *Infidelity*, or *apostasy* from Islam, is a crime to be visited by the death of the offender, if he have been warned thrice without recanting. Severer still, i.e., not to be averted by repentance or revocation of any kind, is the punishment inflicted for blasphemy—against God, Mohammed, Jesus, Moses, or any other prophet. Immediate death is the doom of the offender.

A further injunction of the Koran is that of making war against the infidels (*ḡhād*). He who is slain while fighting in defense of Islam or for its propagation is reckoned a martyr, while a deserter from the holy war is held up as an object of execration and has forfeited his life in this world as well as in the world to come. At first all the enemies taken in battle were ruthlessly slain, later, however, it became the law to give the people of a different faith against whom war was declared the choice of three things—either to embrace Islam, in which case they become Moslems at once, free in their persons and fortunes, and entitled to all the privileges of Moslems, or to submit to pay tribute, in which case they were allowed to continue in their religion if it did not imply gross idolatry or otherwise offend against the moral law, or to decide the quarrel by the fortune of war, in which case the captive women and children were made slaves and the men either slain if they did not become converts at the last moment or otherwise disposed of by the prince. The fifth part of the spoil belongs "to God," i.e., must be devoted to a sanctuary, to the Prophet and his kindred, to the orphans, the poor, and the traveler.

It must not be overlooked that the Islam of history and of the present time is not the pure and unmodified teaching of its founder. The Koran was not intended to be a systematically arranged code of laws. Such laws and regulations as it contains were called forth by some occurrence during the Prophet's life, and were, properly, supplementary to existing laws and customs, which they abrogated, confirmed, or modified according to the occasion. In course of time cases arose for which no written rules could be found laid down by Mohammed. Recourse was then had to traditional oral dicta or to the Sunna (*q v*); in time precedents were established and laws came into force by the concurrence of the learned (*ijmā'*), or by a process of reasoning (*ḡuyūs*). In this way the peculiar system which is called Mohammedan jurisprudence came into being, theoretically founded on the Koran, but often strangely at variance with the principles and spirit of its author. In like manner the reprehensible features of the doctrine and daily life of Islam

must not be charged indiscriminately against Mohammed. That part of the system which most distinctly reveals the mind of its founder, and which also has undergone least change in the course of time and constitutes its most complete and brightest part, is its ethics. Injustice, falsehood, pride, vindictiveness, calumny, mockery, avarice, prodigality, debauchery, mistrust, and suspicion are inveighed against as ungodly and wicked, while benevolence, liberality, modesty, forbearance, patience and endurance, frugality, sincerity, straightforwardness, decency, love of peace and truth, and above all trust in God and submission to His will, are considered as the pillars of true piety and the principal signs of a true believer. Mohammed never expressly laid down that doctrine of absolute predestination and "fatality" which destroys all human will and freedom, and which by the influence of Mohammedan theologians became a fixed element in the orthodox creed. A glance at his system of faith (so far as he had a system), built on hope and fear, rewards and punishments, Paradise and hell, both to be man's portion according to his acts in this life, and the incessant exhortations to virtue and denunciations of vice, are sufficient to prove that aboriginal predestination is not in the Koran, where only submission to Allah's will, hope during misfortune, modesty in prosperity, and entire confidence in the divine plans are supported by the argument that everything is in the hands of the highest Being and that there is no appeal against His absolute decrees. This is but one instance of the way in which Mohammed's dicta have been developed and explained—in such a manner that he has often been made to teach doctrines which he really did not teach; and thus many elements now found in the Moslem creed, if carefully traced back to their original source, will be seen to be the growth of later generations.

In a general estimate of Mohammedanism it should not be forgotten what Islam has done for the cause of humanity and more particularly the share it had in the development of science and art in Europe. Broadly speaking, the Mohammedans may be said to have been the teachers of barbarous Europe from the ninth to the thirteenth century. It is from the days of the Abbasid rulers that the real renaissance of the Greek spirit and Greek culture is to be dated. Classical literature would have been irredeemably lost had it not been for the home it found in the schools of the "unbelievers" of the "dark ages." Arabic philosophy, medicine, natural history, geography, history, grammar, rhetoric, schooled by the old Hellenic masters, and the "golden art of poetry," brought forth an abundant harvest of works, many of which will live and teach as long as there will be generations to be taught. See ARABIC LANGUAGE AND LITERATURE.

History. In the first three years of his mission Mohammed won 40 converts, including his wife, Khadija, Abu Bekr, and Othman. Then followed Ali, Omar ibn Khattab, and Hamza. In 615 the persecutions of the Koreish drove 15 of the converts into Abyssinia, and they were later joined by 100 more. After Mohammed's return from Taif to Mecca he won over some of the Bani Khazraj of Yathrib (Medina), who then made converts among the Bani Aus, formerly their enemies. The new faith spread rapidly from tribe to tribe, the Bani

Abd al Ashhal going over in a body. In 622 the number of Mohammedan pilgrims from Yathrib is said to have been 73. After the departure from Mecca Mohammed became the arbiter between the Aus and the Khazraj in Yathrib, and the civil head of the commonwealth. Thus Islam became a political as well as a religious movement.

Mohammed's plans included now nothing less than the conversion of the world to Islam. If he had at first hoped to accomplish this by peaceful measures alone, the aggressiveness of his enemies in advancing against Medina soon forced the preacher to become warrior also, and military success won more and more converts. In 628 Mohammed sent letters to the Byzantine Emperor, Heraclius, to the King of Persia, to the Governor of Yemen, to the Governor of Egypt, and to the King of Abyssinia, inviting them to join the new religion. In the same year he converted part of the Bani Daus of Yemen, and two years later the rest of the tribe followed. In the meanwhile 15 other tribes responded. With the fall of Mecca in 630 A.D., the triumph of Islam in Arabia was assured. Some of the Prophet's bitterest enemies became his most ardent followers; and the next year saw so many embassies suing for alliance that it became known as the "year of the deputations."

After Abu Bekr had brought about the subjugation of the northern tribes, who had revolted on Mohammed's death, an army was sent into Syria, as the Prophet himself had planned. A second army was sent into Irak. The latter came into contact with the Persian forces, and in Omar's caliphate, by the victory at Kadisiyah, Chaldaea and Mesopotamia were assured to the Arabs. Christian Bedouins of both sides of the Euphrates became converted at this time, even though tolerance was extended to those who kept their own faith. In Syria almost the only opposition came from Heraclius' armies. The great mass of the people, oppressed by the Byzantines, welcomed the Arabs. By 639 the Greeks had been driven out of the province, most of the large towns having made treaties which guaranteed them toleration of religious belief and protection of life and property on the mere payment of the *jizyah* (poll tax) and *kharaj* (land tax). Friendly relations being thus established, in the following years there was a gradual assimilation of Arabic manners and customs throughout Syria, which made the conversion of the natives easy. Many Christians were converted in the 50 years between Omar and Abd al Malik in Irak, Khorasan, etc. Omar II (717-720) was particularly successful by lightening the burdens of Mohammedan landowners. In addition, the children of women captives were brought up as Moslems, and slaves were allowed to purchase their freedom at the price of conversion. In the tenth century the Nestorian Bishop of Bet Garmai was a noted convert, in 1016 Ignatius, the Jacobite Metropolitan of Takrit (at Bagdad), became Abu Muslim. Converts were won in the following centuries, even from among the Crusaders. Barnaud and his followers embraced Mohammedanism in a body; 3000 Crusaders accepted Islam in Phrygia in 1148 as a result of Mohammedan kindness contrasted with ill treatment on the part of Greek Christians. To-day over 50 per cent of the population of Syria and Palestine is Moslem.

The rapidity with which Mohammedanism spread in Syria and Mesopotamia was not duplicated in the country to the north. In Armenia, even after the Christian power had been overthrown by the Seljuks of the eleventh century, the mass of the population continued Christian. Georgia resisted until the invasion of the Mongols. After the fall of Constantinople (1453) the western and central portions of the country became converted, and after the ruling dynasty of Samtskhé in 1625 had become Mohammedan, progress was rapid among the aristocracy. The eastern portion of the country had submitted to Persia, and hence was naturally subject to Mohammedan influence. In the seventeenth century there were two petty kingdoms in the East the rulers of which, though native princes, were Moslems. Since the beginning of the nineteenth century Georgia has belonged to Russia, but certain parts are still Mohammedan.

After the Mohammedans had succeeded in subduing Syria they turned their attention to Egypt. Amr ibn al Asī drove the Byzantines out between 639 and 641 A.D., and the whole of the country as far south as Abyssinia and as far west as Libya came under Moslem influence. The conquerors, who treated the natives, and especially the Copts, with great favor, were welcomed by them. Many Copts accepted Islam even before the fall of Alexandria; while the number of converts, partly forced, partly willing, up to the caliphate of Omar II (717-720) was large. In the twelfth century Islam was carried, principally by Moslem merchants, into Lower Egypt, and in the fourteenth century into Nubia, the King of Dongola becoming a Moslem in 1340. In Abyssinia conversions were first made in the coast towns in the tenth century, and towards the end of the twelfth a Mohammedan dynasty was founded. In the sixteenth century the Mohammedan Kingdom of Adal, between Abyssinia and the southern end of the Red Sea, came into existence, in the seventeenth one-third of its entire population was Moslem, while in the middle of the nineteenth one-half of the central province of Abyssinia had likewise been converted.

Amr ibn al Asī conquered northern Africa as far as Barca (Cyrenaica). Before the end of the century rapid progress had been made among the Berbers, who made their last resistance at the Spring of Kahina in 703. Musa ibn Nusair and Omar II, the Conqueror, made innumerable converts. In 789 western Africa (Mauretania) became separated from Egypt as a kingdom under Idris, founder of the Idrisite dynasty, in addition to converting many Berbers, he is said to have forced Christians and Jews to apostatize. The Berbers, however, under the Idrisites as under the Aghlabites (a dynasty founded in 800 by Ibrahim ibn Aghlab, hereditary Governor of Ifrikiyyah) were in constant revolt. In the beginning of the tenth century Abu Abd Allah appeared among them as the apostle of the Ismailian sect and succeeded in winning over the whole of the powerful Kitamah tribe to the support of the imamate of Ubaid Allah, and the dynasty of the Fatimites was thus successfully established in Kaiawan. Early in the eleventh century the faith spread rapidly among the Berbers of the Sahara also, among whom it had been introduced in the ninth century. The revival was due principally to a chieftain of the Lantuna

tribe, Abd Allah ibn Yasin, who founded a monastery, *ribat*, and won many disciples from various tribes, to which he sent them back as missionaries. In 1042 he led his followers, known as the *Murabituna* (Almoravides), against the neighboring tribes, and by force and persuasion succeeded in establishing a vast empire. Before the end of the century it extended from Senegambia to Algiers. Mohammedan Spain was brought under the sway of the Almoravides. In the beginning of the twelfth century another dynasty was founded among the Berbers, when Abu Abd Allah Muhammad ibn Tumart appeared in the Mauretanian mountains and preached especially against the laxity of morals and the excessive veneration paid to saints. His followers became known as the *Munahhiduna* (Almohades, or Unitarians). The conquests and conversions of the Almohades were likewise enormous, by 1160 they had an empire extending from Barca to the Atlantic, and embracing Mohammedan Spain. After these events but few of the Berbers remained heathen.

From northern Africa Islam soon penetrated into the interior of the continent. The Almoravides made many converts in the eleventh century among the negroes of the Sudan, who had already become familiar with the new faith through the visits of merchants and missionaries. The negro tribes of the west were first won over; as early as 1010 the King of Surhay (southeast of Timbuktu) became a Moslem; the states on the upper Niger, Timbuktu (founded in 1077) and Melle (west Sudan, founded by the Mandingos), followed and furnished active missionaries as well. The kingdoms of Bornu and Kanem, along Lake Chad, became converted in the eleventh century, the latter kingdom extending as far as Egypt and Nubia. In Daifur a Moslem dynasty was founded in the fourteenth century, at the end of the sixteenth century Wadai and Bagirmi, and in the seventeenth portions of the Hausa country, became Moslem. In the nineteenth century there was a remarkable revival of Mohammedanism due to the influence of the Wahabites. The Fulahs were united into one political organization by Sheik Othman Danfodio, and compelled all the remaining tribes to accept Islam. In French West Africa and French Equatorial Africa Mohammedanism has spread far and wide; and active missionary work has been carried on in Kamerun. The nineteenth-century movement was aided by such religious orders as the Amirghaniyyah, the Tijaniyyah, the Kadriyyah, and the Sanusiyyah. The vast theocracy of the Sanusiyyah has settlements and schools extending from Egypt to Morocco, in the Sudan, Senegambia, Somaliland, the Sahara, and the Galla country; they have gained many converts by education and the purchase of slaves.

Along the west coast of Africa Islam has made steady progress; e.g., on the Guinea coast, in Sierra Leone, in the Ashanti country, Dahomey, the Gold Coast, Lagos (where there are 10,000 Moslems), and Liberia (where there are more Moslems than heathen). Often the common people are converts where the chieftains are not. There is hardly a town along the coast for 2000 miles from the Senegal which has not a mosque.

On the east coast the Emozaydi, made settlements before the tenth century; they were Shiites, and were followed by Sunnis, who

founded the town of Magadoxo, and other towns on the coast from Aden to the tropic of Capricorn. Arab traders made Zanzibar Mohammedan. Inland, however, only the Galla and Somali tribes are even partly Moslem. In Cape of Good Hope there have been Moslems since the seventeenth and eighteenth centuries, Islam having been carried there by the Malays. Even among the Hottentots there are converts who make the pilgrimage to Mecca, while in the diamond fields the coolies are said to be missionaries.

Islam was introduced into Spain in 711 by Tarik with 12,000 Berbers. The first converts were from among the ill-treated slaves. The remnant of the heathen population followed, then the nobles and the middle and lower classes of the Christians, so that the majority of the population soon consisted of Mohammedans of non-Arab blood. In 1311 there were 200,000 Mohammedans in Granada alone, only 500 of them being of Arab descent. On the whole, conversion was carried on peacefully except when the Almoravides at the close of the eleventh century came to Spain. The Moslem power began to decline as early as the eleventh century. After the fall of the Almohades, in 1257, it continued chiefly in Granada, the last Moors were driven out in 1609.

The Aghlabites made themselves masters of Sicily in 827-878, and under this dynasty and their successors, the Fatimites, a flourishing Moslem civilization existed in the island, the effects of which were still felt after the Norman Conquest (1061-1090) and under the Hohenstaufens (1194-1266).

The Turkish Empire made its first conquests in Europe, at the time of the decline of Islam in Spain. The inception of the Ottoman Empire dates from the beginning of the thirteenth century, when 50,000 Turks settled in the north-west of Asia Minor. In 1353 they entered Europe for the first time and in 1361 made Adrianople their capital. Before the end of the century Bulgaria, Macedonia, Thessaly, and most of Thrace had been subdued by Bajazet. Amurath II (1421-51) added to this territory, and Mohammed II (1451-81), after taking Constantinople in 1453, extended his rule over Greece, Servia, Bosnia, and Albania. A large part of Hungary was added by Suleiman II (1520-66); in the seventeenth century Crete was taken, and Podolia was ceded by the Poles. The most noted example of forced conversion was the enrollment of Christian children in the ranks of the Janizaries (qv). Large numbers were converted peaceably from all ranks, in the fifteenth century Adrianople was the home of countless renegades, in the seventeenth converts were made even among the Christian clergy. Progress was very rapid at this time. The power of Servia was broken by the Turks in 1380, but the country was not reduced to the position of a Turkish province until 1459, when the inhabitants chose Mohammedan rule in preference to the Roman Catholicism of Hungary. However, though the nobles became Moslems, only in Old Servia (northeast of Albania) since the seventeenth century has the spread of Islam been rapid. The same period was the date of the rapid conversion of Montenegro, in Bosnia the Bogomiles joined Islam in large numbers after Mohammed II had released over 70 cities from Catholic persecution. The other inhabitants followed gradually, and the Chris-

tians left the way clear by emigrating into the neighboring countries. The conversion of the inhabitants of Crete first took place in the ninth and tenth centuries, when the whole population joined Islam, at the beginning of the thirteenth century the Venetians acquired the island, and in 1609, when it was taken from Venice by the Turks, the inhabitants had to be reconverted, within 50 years half of them were again Moslem.

In Persia Islam made progress very early, for under Zoroastrianism the people were oppressed by priest and ruler alike. After the fall of the Sassanid dynasty in the middle of the seventh century converts were easily made, at first mainly from among the despised industrial classes and artisans. Later the Shites met with great success, for Husain, son of Ali, had married Shahban, daughter of Yazdegerd, the last Sassanid, and in the middle of the eighth century the Ismailians showed a wonderful power of adapting themselves and their teachings to all classes and creeds. At the close of the ninth century Saman, a noble of Balkh, became a Moslem and founded the dynasty of the Samanids (874-999). Conversions were made in the ninth century by Karim ibn Shahriyar, the converted King of the Kabusiyah dynasty, and by Nasir al Hakk of Dailam, in 912 Hasan ibn Ali, of an Abd dynasty on the Caspian, made many converts in Dailam and Tabaristan.

North of Persia there had been much opposition to Islam, and allegiance to the Caliph was often renounced as soon as the armies were withdrawn. In Samarkand, however, conversions were brought about by Ibn Kutabiah, who burned the heathens' idols. Among the Afghans the King of Kabul was converted about 800; in Transoxiana many converts were made in the eighth century, and by the middle of the ninth Mohammedanism was general. The greatest impetus to the spread of the new faith came about the middle of the tenth century, when some of the Turkish chieftains were converted, in Turkestan the founder of the Ilak Khans converted 2000 families of his tribe, who became known as Turcomans. In 956 the Seljuk Turks had their origin, when Seljuk migrated with his clan to Bokhara from the Kirghiz steppes.

Much of the progress which Islam had made was lost by the Mongol invasion. Bokhara, Samarkand, Balkh, and Bagdad were left in ruins, and almost without inhabitants. Many Mongol rulers, such as Kublai Khan, were energetic in their opposition to Islam. But in the time of Ogdaï Khan (1229-41) certain Buddhists were converted; Yisun Timur Khan (1323-28) was an earnest Moslem and made converts of his troops, Baraka Khan (1256-65) turned Moslem with his subjects—the first ruling Mongol prince to take this step in the eastern portion of the Mongol territory. But it was not till 1295 that Islam became the ruling religion of Persia; at that date Ghazan, seventh of the Ilak khans, joined the new faith. In the Middle Kingdom, in the reigns of Tirneashirin Khan (1322-30) and Tughlak Timur Khan (1347-63), Islam became generally adopted, though Burak Khan (1266-70) had also been a Moslem. In the Golden Horde the leaders and aristocracy followed Baraka Khan when he became converted, Uzbek Khan (1313-40) placed Islam on a solid basis. The Mongols were likewise successful, to some extent, in introducing Mohammedanism into Russia;

e.g., in the Crimea and among the Finns, the Tchermishes, the Tchuvashes (whole villages of which are Moslem), and the northeast Russian tribes, among whom there are many Mohammedans. In Siberia the first conversions were made in the latter half of the sixteenth century. Since 1745 the Baraba Tatars, between the Irtysh and Ob, have been converted. After the proclamation in 1905 of an edict granting religious liberty large numbers of nominal Christians in Asiatic Russia have openly embraced Islam.

In India the first great Mohammedan conqueror was Mohammed Kasim (711), who took Darbul (capital of Sind), Multan, and other cities early in the eighth century. Under Omar II the native princes were called upon to become Mohammedans, and received Arabic names; but many of them later became heathens again. In 1019 Hardat and 10,000 men accepted Islam; but it was some time before the new religion gained a firm footing in India. Down to near the close of the twelfth century Mohammedan India was only a province of Ghazni; at that time Mohammed Ghuri conquered the northern part to the mouth of the Ganges, and his slave Kutb al Din was made Viceroy of Delhi. The latter then proclaimed himself sovereign of Hindustan and founded the dynasty of the "Slave Kings," the first Mohammedan dynasty in India. Mohammed Ghuri likewise converted the Ghakkars, in the mountains north of Punjab. Under the succeeding dynasty, the Khiljis (1295-1320), Mohammedan rule was extended to the Deccan. The Tughlak dynasty which followed was troubled by revolt and desertion, and its power was much reduced, the Sayyids, as well as the Lodis (1451-1526), were rulers over but one province, Bengal, Jaunpur, Malwa, and Gujarat having independent Moslem dynasties. The Mogul Empire was established in 1526 by Baber, and then Islamic influences were more successful. Many rajputs were converted when idolatry was made a bar to advancement at court. In the eastern districts of the Punjab and in Cawnpore many converts were made in the reign of Aurungzebe.

In southern India and in Bengal the spread of Islam was more rapid. The southern coast was subject to the Mohammedan influences of traders; even in the eighth century refugees had come there from Irak, and missionaries in the eleventh. In Malabar the Mappilas, descendants of the early refugees, are estimated at one-fifth of the population. The Laccadive and Maldive islands, as well as Malabar, have an almost exclusively Moslem population. In the Deccan Arabs settled in the tenth century, it had the Mohammedan dynasties of the Bahmanids (1347-1490) and Bijapur (1489-1686). Bengal was the scene of most active propaganda, and Islam was welcomed especially among the lower-caste Brahmins. Lower Bengal has been the scene of a great Mohammedan revival even in the last few years. Kashmir had a Mohammedan king in the fourteenth century, Islam became supreme in the time of Akbar, and to-day claims over 70 per cent of the population. In Baltistan there has been a Mohammedan population for over three centuries, and the faith is being carried by merchants from Kashmir, as well as from Persia, even into Tibet. In the various parts of India there are about 67,000,000 Moslems, the number of annual converts being estimated at about 600,000. It is

worth noticing, however, that in Agra only about one-tenth and in Delhi only about one-fourth of the population is Moslem, and these are prominent centres of Mohammedan power.

Mohammedanism penetrated into China from the south and from the west. Friendly relations were established between the caliphs and the emperors in the time of the Caliph Walid (705-717), when the general Kutaibah ibn Muslim sent ambassadors to the Chinese court. Later Moslem traders entered from Arabia, Bokhara, and Transoxiana. The first mosque was built in 742, in the capital city, Shensi, northern China. In 758, 4000 Arab soldiers were sent by the Caliph Al Mansur to aid the Emperor Sah-Tsung in crushing a rebellion; they remained in China and intermarried with the natives. The annals of the Tang dynasty (618-907) record the arrival of Moslems at Canton, there in the ninth century they lived as a separate community. They were joined later by other arrivals, and intermarried with the natives. Mohammedans entered the Province of Kansu (part of the Empire of Hoey-hu), and the Khan was converted, in the tenth century. The Uigurs, a Turkish tribe transferred to the Great Wall in the Tang dynasty, became Moslems in the ninth century. All of these Moslem communities formed centres for the spread of Islam throughout the Empire. Further accessions of Syrians, Arabs, and Persians followed the great Mongol conquest. Under the Mongol khakans Mohammedans were well treated and rose to positions of trust (in 1244 Abd al Rahman was head of the Imperial finances). At the beginning of the fourteenth century all the inhabitants of Yunnan were Moslems, and in every town throughout the Empire there was a special Moslem quarter. After the expulsion of the Mongols the Mohammedans avoided all external signs of their religion, and assimilated themselves as far as possible to the rest of the population, while keeping the essentials of their religion intact. Missionary efforts were continued quietly and slowly but surely; the only conversion in large numbers took place in 1770, when a revolt was put down in Sungaria and the 10,000 military colonists who were sent there all embraced Islam, and after a famine in 1790 in the Province of Kwangtung, when 10,000 children are said to have been bought and brought up as Moslems. There was a general revival of interest in the eighteenth century, when commercial relations were reestablished with the outside Mohammedan world. To-day there are about 12,000,000 Mohammedans in the Chinese Republic, of which three-fourths are in the provinces of Kansu and Shensi, in the northwest. As an example of the cities in the east, Peking has 20,000 Moslems, with 13 mosques.

The spread of Islam into the Malay Islands dates from the twelfth century, when more or less successful attempts were made to introduce it into Sumatra; in the fourteenth century the Sherief of Mecca sent missionaries to the island and succeeded in making many converts. In the fifteenth century the great Kingdom of Menang-Kaban had many converts, and the larger part of central Sumatra is now Moslem. On the Malay Peninsula the Kingdom of Malacca was converted in the thirteenth or fourteenth century; the Moslems of the peninsula to-day are said to be most strict in their religious practices, though extremely tolerant.

Converts have been made among the Siamese Buddhists of the north and among the wild tribes of the peninsula. In Java the first notable success of Islam took place in the fourteenth century, and in the following century the new faith was firmly established on the east coast. In the fifteenth century Radan Rahmat, nephew of the Hindu King of Majapahit, made many converts in Ampel and in other places on the east coast; at the same time conversions were made in the west. Radan Patah headed a confederacy which, in 1478, defeated the King of Majapahit, replacing the Hindu with a Moslem dynasty. To-day nearly the whole of Java is Mohammedan. In Celebes general conversion along the coast began in the seventeenth century. The Macassais were the first converts, they then, after much resistance, converted the Bugis, who likewise became propagandists. In the north the Kingdom of Balaang-Mongondou, which was Christian for centuries, was finally converted in 1844. The population of this Kingdom is now half heathen and half Moslem. The island of Sumbawa has had a Moslem population since 1540, Lombok was one of the scenes of conversion by the Bugis.

In the Philippine Islands there has been a long struggle between Christianity and Islam. In Mindanao and the Sulu Islands civilized Mohammedan tribes existed as early as 1521, when the Spaniards came to the islands. Owing to their obnoxious and ill-advised methods, the Spaniards could make no progress in the face of Islam. The Mohammedans, as elsewhere, learned the language of the people, adopted their customs and intermarried with them, thereby winning great success. The independent Kingdom of Mindanao had 360,000 Moslem subjects in the nineteenth century. The Sulu Islands have also been a Mohammedan stronghold. Among the lower classes in the northern islands Islam has not made much headway, as indeed has been the case throughout the archipelago. In New Guinea and the islands to the northwest of it progress has been made only on the coasts. In the archipelago as a whole, however, Islam is spreading. The religious orders, especially the Sanusiyyah, are very active.

It is almost impossible to give reliable figures of the total Mohammedan population of the world. According to a recent estimate (1915), the number may be placed approximately at 220,000,000. This is based in part on the latest available census reports, in part on official and private estimates of varying degrees of probability. The unwillingness of Moslem householders to give an account of the members of their harems interferes everywhere with scientific census taking, and in many lands where Mohammedan missions have been particularly active in recent times no census has ever been taken. The following figures can therefore only claim to be approximately correct. In Asia: Turkey, 15,000,000; Persia, 9,200,000; Afghanistan, 5,000,000; India (1911), 66,623,412; Russia (1911), 13,906,972; China, 12,000,000; Indo-China and Siam, 2,000,000, total in Asia, about 124,000,000, in the East Indies and other islands of the Pacific, about 35,000,000; in Africa: Egypt (1907), 10,336,826; Sudan, 3,000,000; Abyssinia, 5,000,000; Barca and Tripoli, 2,000,000; Tunis, 2,000,000; Algiers, 5,000,000; Morocco, 5,000,000; Liberia, 1,000,-

000. French West and Equatorial Africa, about 10,000,000; British West, East, Central, and South Africa, about 10,000,000; West and East German, Belgian, and Italian East Africa, about 3,000,000, total in Africa, about 56,000,000; in Europe: Turkey, Bulgaria, Servia, Albania, Greece, Austria, and Russia, about 5,000,000. It is significant that only about 31,000,000, or less than 15 per cent, of this Mohammedan population are found in politically independent Moslem states, viz.: in Turkey, 16,500,000; Persia, 9,200,000; Afghanistan, 5,000,000, while Great Britain has about 95,000,000, Holland about 30,000,000, France about 22,000,000, Russia about 14,000,000, China about 12,000,000, and Abyssinia about 5,000,000 Mohammedans.

MOHAMMEDAN SECTS. The movement which led to the division of Islam into opposing parties was at first a political one, though religious, theological, and philosophical questions soon arose which added to the complexity of the situation and caused a further subdivision into sects. Mohammed died without naming his successor; and while Abu Bekr was looked upon by many as the natural leader, others felt that Ali, who was not only the cousin and son-in-law but also a decided favorite of the Prophet, should be his successor. Among the Arabs, however, leadership was not a matter of inheritance but of election, and when Abu Bekr was chosen Caliph he received the recognition of all, including Ali. Omar's election likewise resulted in general satisfaction, although the Omniads, who, even when they had accepted Islam, were still rivals of the Prophet's family, began to show their opposition to those who had been the Prophet's intimate companions. On Omar's death the caliphate was again denied to Ali, Othman being chosen. Othman's misrule, however, caused great dissatisfaction, and when he was assassinated Ali finally came to the caliphate. The hostility of the Omniads, however, continued, and soon turned into open revolt, with Moawiyah, the Omniad Governor of Syria, at its head. The question as to the right of succession, which was soon to cause the permanent separation of the whole Mohammedan world into Shites and Sunnites, had even then presented itself in great seriousness, the followers of Ali claiming that only the Prophet's family had the right to the caliphate, the Omniads opposing this claim.

There was also a third party, afterward known as the Kharijites (those who go forth), who held the old Arab view on the question of succession and were thus directly opposed, in principle, to the "legitimists." They were, in reality, in favor of a theocracy, and they claimed that any man might be called to the *imamah*, or leadership, even if he did not belong to the Koreish, or was not even a freeman, provided only that he was just and pious and fit in every other respect. As a result of this they also claimed that an unrighteous imam might be deposed, or even put to death; and furthermore, that there was no absolute need for any imam at all. Since Ali, however, united in his person the claims of heredity and of election, they were at first among his partisans. But when, at the battle of Siffin, Ali submitted to arbitration the decision of his right to the caliphate as against Moawiyah, they refused to stand by the decision and swear allegiance to either one or the other. Twelve thousand of them conse-

quently deserted Ali's camp in a body; they proclaimed "no rule but that of Allah alone." The Kharijites, though often defeated in this and succeeding caliphates, appeared again and again as the assailants of the established government.

After Ali's death, when Moawiyah had finally succeeded in establishing himself in control, he induced Hasan (qv), the elder son of Ali, to yield up his prerogatives. Ali's followers, however, refused to recognize Moawiyah and espoused the cause of Husain, Ali's second son. A bloody struggle followed, in which Husain lost his life. The division of the Mohammedans into Sunnites and Shites was now fixed, and the Shites consistently developing the theory of legitimism, refused to recognize that there had ever been any legitimate caliph between Mohammed and Ali. See SHIITES; SUNNITES.

Despite the fact that with Ali's death and the Omniad supremacy the question as to the caliphate was settled, the Shites still looked to the descendants of Ali as their religious leaders, or imams. But even among the Shites themselves unanimity in regard to the imamate did not long prevail, and discussions of a theological nature likewise proved a source of trouble. The impulse to such discussion came from Persia, into which Mohammedanism had well penetrated, and which, since the principle of hereditary succession had always obtained there, naturally espoused the cause of Ali.

Down to the sixth imam, Ja'far al Sadik (died 765), there was agreement among the Shites; Ja'far, however, had two sons, Ismail and Musa al Kasim. The former, as the elder, should have been successor to the imamate. The father, however, is said to have declared in favor of Musa; and on Ja'far's death a division ensued between the adherents of Ismail—the Ismailians (*Ismā'īliyyah*)—and those of Musa, the greater part of the Shites following the latter.

From this time on the question of the imamate received more and more a theological, mystical treatment. The notion of the imam, in general, was that of an ever-living, though at times hidden, supreme guide of the people, who after a time is restored to humanity, or at least to the believing part of it. (See MAHDI.) The Ismailian doctrine was that the imam had been revealed in Ali, whereas during the preceding ages the imams had been concealed, that Ali himself had reappeared in every imam till the time of Ismail, and had then become invisible again, but that he would descend some day "from the clouds" to unite all believers and to restore the pure faith. The real importance, however, of the Ismailians, who existed unobserved for some time, dates from Abd Allah ibn Maimun, whose father had been executed for professing materialistic doctrines and trying to turn people away from the doctrines of Islam. Abd Allah seems to have practically carried out his father's notions. Aided by favorable circumstances, he matured a plan which, for the boldness and genius of conception and for the energy and vigor with which it was carried out, has not many parallels in history. Nothing less was contemplated than the union of the Arabic conquerors and the many races they had subjected since Mohammed's death, and the enthronement of what afterward was called "Pure Reason" as the sole deity to be worshiped. The advanced should be free of all so-called religious fetters,

which, as symbols and allegorical actions, should be laid all the heavier on the necks of the less advanced strata of society. The "believers" and "conquerors" were to be made missionaries for unbelief and the implements for the destruction of their own empire. With an extraordinary knowledge of the human heart and human weakness, he offered devotion to the believer, liberty, if not license, to the "free in spirit", philosophy to the "strong-minded"; mystic hopes to the fanatics, miracles to the masses. The Messiah whom Abd Allah preached stood higher than Mohammed himself, and, though he did not reject the Koran, he yet contrived to allegorize and symbolize away nearly all its narratives and precepts. An elaborate secret doctrine was worked out, into which the members of the sect were initiated by degrees. Missionary schools were established, and the instruction given to the young missionaries was artfully designed to win over not merely all the different Mohammedan sects, both Sunnites and Shites, but also Jews and Christians. By the time the neophyte had completed the ninth and concluding degree of initiation all his earlier religious beliefs had been explained away. He had learned that no miracle had ever been performed, that the prophet is merely a man distinguished by his purity and the perfection of his intelligence, and that this purity of his intelligence is precisely what is called prophecy. God throws into the prophet's mind what pleases Him, and that is what is understood by the Word of God. The prophet clothes this Word afterward with flesh and bones and communicates it to the multitudes. He establishes by this means the systems of religious institutions which appear to him the most advantageous for the ruling of men, but these institutions and behests are but temporary and intended for the preservation of order and worldly interests. No man who has knowledge need practice any single one of them, to him his knowledge suffices.

The creed of the Ismailians was gradually built up and many changes were introduced into it at different times, from it sprang various other sects, notably that of the Karmathians. This sect sprang up in the ninth century, under the caliphate of Al Mutamid, and by a combination of extraordinary circumstances succeeded in establishing itself for a time as a political power which threatened to overturn the caliphate itself. The practical exertions of Abd Allah ibn Maimun and their wonderful results had soon attracted the attention of the authorities. Obligated to flee from place to place, he sought refuge successively in Karaj, in Ispahan, in Ahwaz, in Basra, finally in Salamina, in Syria, where he died, leaving his son Ahmad his successor as chief of the Ismailians. One of Ahmad's missionaries (or, according to other accounts, a convert of a missionary) was Al Karmat. He lived in Irak, and was a fit man to carry out the plans of Abd Allah ibn Maimun. His house in Kufa became the centre whence all the missionaries were sent forth and where all the details of a great conspiracy were directed. One of the most noted of the missionaries, Abu Said, won over a great part of the people of Bahrein, the majority of whom were not Mohammedans and were impatient of Moslem rule. In 900 Abu Said defeated an army of 10,000 men sent against him by the Caliph and captured the latter's general. He then gained undisputed possession of the whole country, de-

stroyed the old capital, Hajar, and made Al Hasa, his own residence, the capital. At the same time two other Karmathian chieftains arose to threaten the court of Bagdad, one near Kufa and the other in Syria. The former was defeated, captured, and tortured to death. The latter at first defeated the Governor of Damascus most ignominiously, but in 907 the Caliph's general, Wasif, won a decisive victory and made an end of this branch of the Karmathians. Meanwhile both Al Karmat and Abu Said disappear from view and the leadership passed to Abu Said's son, Abu Tahir. In 923 he seized Basia. The next year he pillaged the Meccan caravan and plundered Kufa. In 927 he gained a decided victory over the Caliph's troops in Irak. In 929 he appeared at Mecca at the head of his army, when the pilgrimage was at its height. Attempts to buy him off were unavailing, and a fearful massacre, lasting several days, ensued. The holy places were desecrated and the Black Stone was carried off. Abu Tahir may have thought that this act would destroy the sanctity of Mecca and the Kaaba in the eyes of the faithful, but if so he was mistaken, the caravans still went on their usual annual pilgrimage as often as he did not restrain them by force. In 939 the emir of the pilgrimage, Abu Tahir's personal friend, persuaded him to conclude a treaty by which the pilgrimage was again allowed, on payment of five dinars for every camel and seven for every horse. The Black Stone was returned for an enormous ransom in 950, seven years after Abu Tahir's death. At that time the Karmathians were masters of Irak, Syria, and Arabia. Little of importance is heard of them again till 990, when they were defeated before Kufa—an event which seems to have made an end of their dominion in Irak and Syria. About 993 they were again defeated by Asfar, and their chief lost his life. They retreated to Al Hasa, where they fortified themselves, while Asfar marched against Al Katif, captured it, and carried away all the baggage, slaves, and animals of the Karmathians of that town and then retired to Basra. The Karmathians retained Al Hasa for a considerable time, but nothing further is heard of them in history. In 1862-63 Palgrave found remnants of them still living in Najran and in Bahrein and Oman, and their hatred of Islam seemed in no wise abated.

Concerning the special beliefs of the Karmathians, so far as they have been preserved, their system seems in the beginning to have been merely a sort of reformed Islam. The prophet Al Karmat, it was held, had brought a new law into the world, by which many of the tenets of Mohammedanism were altered, many ancient ceremonies abrogated, new forms of prayer introduced, and an entirely new kind of fast inculcated. Wine and a few other things prohibited by the Koran were allowed. Certain of the precepts of the book were turned into mere allegories. Instead of tithes they gave the fifth part of their property to the imam. Prayer was merely the symbol of obedience to the imam. Fasting was the symbol of silence, or rather of concealment of religious doctrine from the stranger.

Another offshoot of the Ismailians is the sect known as Assassins (*hashshashin*, a name derived from *hashsh*, a drink drawn from hemp, to which the members of the sect were addicted). The sect owed its origin to Hasan ibn Sabbah,

a Persian fanatic, who at the beginning of the eleventh century formed a secret society, the members of which swore blind obedience to their leader, known to history as the "Old Man of the Mountain." From their mountain fastnesses in Persia (Alamut) they bade defiance for two centuries to the strongest armies sent against them by Moslem rulers, and they were reduced to harmlessness only by the Mongol invasion (1255). They owed their power chiefly to the perfection of their secret organization and to the unscrupulousness with which they carried out their plans. They were perhaps best known for the countless assassinations of which the members of the sect were guilty. From Persia they spread into Syria and Asia Minor. While Hasan ibn Sabbah was still alive the Governor of Aleppo had invited them to settle in his territory, and they had taken possession of various mountain fastnesses from which they were enabled to play an important rôle in the Crusades. There are still a few Assassins in the neighborhood of Homs. See ASSASSINS.

When the Assassins came into Syria they found the mountain regions around Hama in possession of the Nosairians, apparently a remnant of the ancient Syro-Phœnician population of the land, which had preserved its own religion through the centuries despite all the efforts of Christianity. Most of the Nosairians displayed a bitter enmity towards the Ismailians, though some embraced their cause, and at the end of the tenth century there was a strong infiltration of Ismailian doctrines into the general Nosairian religious system. In fact, the Nosairian religion, without being identical with Ismailism, shows many strong points of analogy with it. The Nosairians are divided into four sects—*Haidariyyah*, *Kalaziyah* (or *Kamariyyah*), *Shamaliyyah* (or *Shamsiyyah*), and *Gharbiyyah*. The *Shamaliyyah* and *Kalaziyah* are the most important. They all possess the same religious book (*Kitāb al Majmu'*), and differ from one another only on points of minor importance. The chief variations from the Ismailian doctrines are these, while the Ismailians taught that of the seven cycles corresponding to the various manifestations of the deity, the sixth, that of Mohammed, was closed with the death of Ja'far, and the seventh, which was to be characterized by the coming of the Mahdi, or Messiah, was thereby opened, the Nosairians taught that the seventh was closed by the seventh divine manifestation, that of Ali. Furthermore, the Nosairians recognized Musa instead of Ismail as the successor of Ja'far al Sadik. This was probably due to the fact that they had accepted as their leader Mohammed ibn Nosair, who was a partisan of the eleventh imam, a descendant of Musa; and with Musa (died 799), who was the seventh imam, they considered the number of imams to have been completed. Another striking characteristic of the Nosairian belief was their attitude towards the *natiks*, the various divine incarnations. The Ismailians held that all the *natiks* excepting Mohammed were superior to their *assas* (foundations) or *samets*, while the Nosairians placed all of their *assas* above the *natiks*. But of greatest importance was the degree to which they carried their doctrine of the divinity of Ali. Ali, while he confided the word to Mohammed, had reserved the *ma'na* (meaning) for himself. Ali is their god in heaven and their imam on earth; he is concealed from man because of his divine na-

ture; he is not created and has no attributes; his essence is the light. He created Mohammed to be the veil with which he conceals himself, the place in which he resides, the bearer of his name. Mohammed in his turn created Salman al Farisi to be the *bab*, or gate—the one through whom man communicates with the deity, and who is charged by the divinity with the making of his propaganda. Salman created the five "incomparables" (in reality five planets) which created the world. See NOSAIRIANS.

Besides the Assassins and Nosairians, a third sect with Ismailian tendencies found refuge in the Syrian mountain districts—the Druses. When Abd Allah ibn Maimun found himself persecuted by the authorities he fled to Syria and continued to preach there the coming of the Mahdi. His son Mohammed continued the propaganda, and finally the Mahdi himself appeared among the Berbers of north Africa. This Mahdi founded the dynasty of the Fatimites (909), the sixth of which, Hakim, probably under Ismailian influence, declared himself an incarnation of the deity. He disappeared mysteriously, which helped to support his contentions. Hamza and Al Darzi (whence the name Druse) were his propagandists (*dā'is*), and gained many followers in the Lebanon mountains. It is interesting to note that one of Hamza's treatises was intended as a refutation of the Nosairian doctrines, and tried to show that Hakim, not Ali, was God. See DRUSES.

A sectary whose name has become familiar through the use made of his story by Thomas Moore in his *Lalla Rookh* was Hakim ibn Allah, better known as Al Mokanna (the veiled) because he wore a mask to conceal the disfigurement of his face. He lived in the eighth century and headed a revolt against the Mahdi, the third Abbasid Caliph. He claimed to be an incarnation of the deity and won repute as a miracle worker. He made many followers and for a time maintained himself against the Caliph, but was ultimately defeated and committed suicide. He left word that he would reappear as a gray man riding a gray beast, and his followers long expected his coming. They dressed only in white. See HAKIM IBN ALLAH.

All of these Shiite sects were political, or at least politico-religious, sects, whose doctrines turned about the question of the imamah. But there were in Islam also some sects purely theological, differing on such questions as predestination, free will, belief, idea of God, and revelation—points upon which Mohammed had not expressed himself clearly. It was again in Persia that the movement looking towards independent religious views took its rise, under the influence of Greek philosophy.

The most important of these theological or philosophical sects was perhaps the rationalistic sect of the Mutazilites (*Mu'tazilah*, from *azala*, to separate). They were called also Muattalites—i.e., those who divest God of His attributes (*Ar Mu'atṭilun*)—and Kadarites—i.e., "those who hold that man has a free will (*Ar. kadar*) and deny the strict doctrine of predestination." The first beginnings of this sect are traced to Mabad, who already in the time of Mohammed himself began to question predestination by pointing out how kings carry on unjust wars, kill men, and steal their goods, and all the while pretend to be merely executing God's decrees. The real founder of the sect, as such, however, was Wasil ibn Ata (c.745). He denied God's

"qualities," such as knowledge, power, will, life, as leading to, if not directly implying, polytheism. As to predestination, he held that it existed only with regard to the outward good or evil that befalls man, such as illness or recovery, death or life, while man's actions are entirely in his own hands. God, he said, had given commandments to mankind, and it was not to be supposed that He had at the same time preordained that some should disobey these commandments and that, further, they should be punished for it. Man alone is the agent in his good or evil actions, in his belief or unbelief, obedience or disobedience, and he is rewarded according to his deeds. These doctrines were further developed by Wasil's disciple Abu'l Hudhail al Allaf (died c845), who did not deny so absolutely God's "qualities," but modified their meaning in the manner of the Greek philosophers, holding that every quality was also God's essence. The attributes are thus not without but within Him, and so far from being a multiplicity they merely designate the various ways of the manifestations of the Godhead. God's will he declared to be a peculiar kind of knowledge, through which God did what He foresaw to be salutary in the end. Man's freedom of action is possible only in this world. In the next all will be according to necessary laws immutably preordained. The righteous will enjoy everlasting bliss, and for the wicked everlasting punishment will be decreed. A dangerous doctrine of this system was the assumption that before the Koran had been revealed man had already come to the conclusion of right and wrong. By his inner intellect, Abu'l Hudhail held, everybody must and does know—even without the aid of the divinely given commandments—whether the thing he is doing be right or wrong, just or unjust, true or false. His belief in the traditions was also by no means an absolute one; indeed, it was held by the Mutazilites that even some of the earliest "traditioners" may have told untruths, or have been imposed upon, and every tradition was to be rejected which was opposed to the Koran, to more authentic traditions, or even to mere reason. As to the Koran, although its authority was recognized, it was held to be created and not an object of worship.

Many were the branches of the Mutazilites. There were, apart from the disciples of Abu'l Hudhail, the *Jubbaians*, who adopted Abu Ali ibn Abd al Wahhab's (Al Jubbai, died 914) opinion to the effect that the knowledge ascribed to God was not an "attribute", nor was his knowledge "necessary", nor did sin prove anything as to the belief or unbelief of him who committed it, who would anyhow be subjected to eternal punishment if he died in it. Besides these, there were the Hashimites, the disciples of Abu Hashim Abd al Salam, son of Al Jubbai, who held that an infidel was not the creation of God, who could not produce evil. Another branch of the Mutazilites were the disciples of Ahmad ibn Habit (or Hart), who held that Jesus was the eternal word *incarnate*, and that he had assumed a real body; that there were two gods or creators, one eternal—viz., the Most High God—and the other not eternal—viz., Jesus—not unlike the Arian and Socinian theories on this subject; that there is a successive transmigration of the soul from one body into another, and that the last body will enjoy the reward or suffer the punishments due to each

soul, and that God will be seen at the resurrection with the eyes of understanding, not of the body.

Four more divisions of this sect are mentioned—viz., the *Jahiziyah*, whose master's (Amr ibn Bahr al Jahiz) notion about the Koran was that it was "a body that might grow into a man, and sometimes into a beast, or to have, as others put it, two faces, one human, the other that of an animal, according to the different interpretations." He further taught that the damned would become fire and thus be attracted by hell, also that the mere belief in God and the Prophet constituted a "faithful one." Of rather different tendencies was Isa al Muzdar, the founder of the branch of the *Muzdariyyah*. He not only held the Koran to be uncreated and eternal, but so far from denying God the power of doing evil, he declared it to be possible for God to be a liar and unjust. Another branch was formed by the *Bishriyyah* (from Bishr ibn al Mutamir), who, while they carried man's free agency rather to excess, yet held that God might doom even an infant to eternal punishment—all the while granting that He would be unjust in so doing. The last of these Mutazilite sectarians to be mentioned are the *Thumamiyyah*, who held, after their master, Thumamah ibn Ashras, that sinners will undergo eternal damnation and punishment, that free actions have no producing author, and that, at the resurrection, all infidels, atheists, Jews, Christians, Magians, and heretics will be returned to dust and will not enter either Paradise or hell. For the scientific development which the doctrines of the Mutazilites begot, and which resulted in the encyclopaedic labors called "The Treatises of the Sincere Brethren and True Friends," see *SINCERE BROTHERS*.

Allied to the Mutazilites in their view of the divine attributes, but diametrically opposed to them in their view of predestination, were the Jabarites (Necessarians). They held that man's every act is the result of the will of God and that there is no human responsibility. There are pure Jabarites and middle Jabarites.

Opposed to both the Mutazilites and the Jabarites were the Sifatites ("Attributists"). With them God's attributes, whether essential or operative, or declarative or historical—i.e., used in historical narration (eyes, face, hand); anthropomorphisms, in fact—were considered eternal. But here again lay the germs for more dissensions and more sects. Some, taking this doctrine of God's attributes in a strictly literal sense, assumed a likeness between God and created things, while others gave it a more allegorical interpretation, without, however, entering into any particulars beyond the reiterated doctrine that God had no companion or similitude. The different sects into which the Sifatites split were, first, the *Ash'arites*, so called from Abu'l Hasan al Ash'ari (893-951), who, at first a Mutazilite, disagreed with his masters on the point of God's being bound to do always that which is best. He became the founder of a new school, which held (1) that God's attributes are distinct from His essence, and that any literal understanding of the words that stand for God's members in the Koran is reprehensible; (2) that predestination must be taken in its most literal meaning—i.e., that God preordains everything. The opinions on this point of man's free will are, however, much divided, as, indeed, to combine a predestination which ordains every act

with man's free choice is not easy. The middle path, adopted by the greater number of the doctors, is expressed in this formula. there is neither compulsion nor free liberty, but the way lies between the two, the power and will being both created by God, while the merit or guilt is imputed to man. Regarding mortal sin, it was held by this sect that if a believer die guilty of it without repentance, he will not, for all that, always remain a denizen of hell. God will either pardon him or the Prophet will intercede in his behalf. Further, he in whose heart there is faith of but the weight of an ant shall be delivered from hell fire. From this more philosophical opinion, however, departed a number of other Sifatian sects, who, taking the Koranic words more literally, transformed God's attributes into grossly corporeal things; the *Mushab-bihites*, or Assimulators, conceived God to be a figure having limbs like those of created beings, either of a bodily or a spiritual nature, capable of locomotion, ascent, or descent, etc.

The *Murjites*, likewise regarded as a sect of the Sifatites, are sometimes regarded as the representatives of the whole sect, for their doctrines were very widespread, and they counted among them such men as Said ibn Jubair. The sect arose in Syria or north Arabia. It is worthy of note that some of the Murjites hold views approaching closely not only to those of the Mutazilites and Jabarians, but even, with reference to the Imam, to those of the Kharijites.

Aside from the sects which owed their rise to political or theological differences, there were others in Islam which sprang from mysticism and asceticism. It is true that the secluded life of the monastery or hermitage was forbidden to Mohammedans by the Koran, nevertheless as early as the first and second centuries of the Hejira a sect of mystics had come into existence the distinguishing external mark of whom was a garment of coarse wool (*suf*), such as had been worn by the founder of the sect, Abu Saïd ibn Abu'l Khair (815); they came therefore to be known as Sufis. Their main idea was that to attain to a nearer friendship with God there was necessary a certain course of life which, without demanding entire withdrawal from the world, insisted that religious laws be scrupulously observed and that, God being loved above all else, everything worldly be despised. Merx has shown that this Oriental mysticism goes back finally to Palestine and Neoplatonic philosophy, having come to the Mohammedans through the writings of Syrian philosophers. The main stronghold of the sect, however, was, like that of so many others, in Persia, where Sufism made many converts from among the heterodox and also gradually altered its original character. At first the Sufi had aimed by ascetic practices and religious contemplation to enter into a state of ecstasy in which he might attain to a real knowledge of the deity; but later Sufism became in certain regards a real pantheism, and its adherents in the ecstatic state felt themselves united with, and a part of, the Godhead. Sufism had its organization like other religious orders, the religious meetings were called *dihirs*; novices (*muïd*) were held to regular and exacting duties, as well as to strict compliance with the commands of the sheikh.

A later development (twelfth and thirteenth centuries) of mysticism is represented by the various orders of Dervishes—*Kadiryyah*, *Ri-*

fayyyah, *Maulawyyah*, etc.—each with its own garb and symbols, rules of faith and practice as determined by its founder. Their *dihirs* take place once or oftener every week in their religious houses (*takkiyyah*). There are howling, whirling, and dancing dervishes, and in some orders the members become so insensible to physical sensation while in the state of ecstasy that they swallow glass or glowing coals, and often wound themselves severely in other ways. Most dervishes follow a trade and do not withdraw from the affairs of life. There are also some begging dervishes, who have no dwelling places and live entirely from alms. See DEKVISCH.

Babism (q.v.) and *Baháism* may be regarded as the last of the Shiite religious movements in Islam, though the former only outwardly conforms to the religion of Mohammed and the latter has practically developed into a distinct religion rather than a Moslem sect. Mirza Ali Mohammed ibn Radhik was the founder of Babism. He was born at Shiraz, March 26, 1821, proclaimed himself as the *bab al dm* (door to the religion), June 11, 1844, and was shot to death at Tabriz, July 8, 1850. Ali Mohammed at first appeared only as a reformer of Islam, but as he declared himself to be the mirror in which God is reflected so that every one can see Him, it became evident that he regarded Mohammed not less than Moses and Jesus as superseded. Both in its theology and its social ethics Babism differs from the orthodox schools in Islam. Its pantheism is of such a nature that it clearly connects itself with Sufism, but many of its practical precepts are at least less obviously related to Moslem mysticism. Ali Mohammed wrote several works, extant in manuscripts, but not yet published in the original Arabic and Persian. Only the Arabic *Bayan* has been translated into French by Nicolas. At Teheran the two half brothers Mirza Yahya Nuri, called Subh i Azal (the dawn of eternity), and Mirza Husain Ali Nuri, later known as Baha Allah (the glory of Allah), became converts to Babism. Husain Allah Nuri was born in Mazenderan, Nov. 12, 1817, and was 30 years of age when he became a follower of Bab, whom he never saw. Mirza Yahya had been designated by the Bab as his successor and was recognized as such by the Babis, but in 1867 Husain Ali Nuri claimed to be "he whom Allah shall manifest," and that Bab was only his herald and forerunner. This led to a schism, and since that time there are two sects, the Bahais and the Azalis. The strife between the two parties, in which many were killed, forced the Turkish government to intervene. Subh i Azal was sent to Famagusta, Baha Allah to Akka. The former looked upon the revelation in Bab as final, at least for a millennium, and kept in touch with Islam. The latter appealed to all men, not only the Moslems, sought a common ground on which all religions could meet, and emphasized the distinction of his "manifestation" and teaching from Babism. Among his writings are *Ilam*, translated into French by Dreyfus and Habib Allah in 1904. *Kitab i Iktas*, translated into Russian by Tumanski in 1899, and some epistles, translated into English by Browne in 1889. Baha Allah died in 1892, and differences as to the succession immediately arose between his two sons, Abbas Effendi, also called Abdu'l Baha (the servant of the glory), or Ghuzn i A'zam (the most mighty branch), and Mirza Mohammed Ali,

called Ghuzn i Akbar (the most great branch). Abbas Effendi seems to have claimed that the revelation was not ended, while Mohammed Ali and his followers abided by the manifestation in Baha Allah. Thus Bahaism in its turn split up into two rival sects. In recent years that of Mohammed Ali has on the whole decreased, though there have been some notable accessions from the other camp. Abbas Effendi has had a larger following. During the years when he was kept under surveillance in Akka many men and women made pilgrimages to this "holy city" to see "the Master," among them not a few from England and America. The first missionaries of the faith in America were Khairallah, who afterward espoused the cause of Mohammed Ali, and Abu'l Fazl, who was sent over to prevent the schism from spreading. In 1913 Abbas Effendi visited the United States. His *Mufasssat* (outpourings) were translated by Dreyfus into French and by Laura Barney into English in 1908. He also seems to be the author of *The Traveler's Narrative*, translated by Brovne. Numerous messages, designated as "tablets," sent to believers, also set forth his ideas on a variety of subjects. Although his works contain no new development of thought, and he has made no further claim for himself than to be "the servant of the glory," the fact that through him Bahaism has become known and has won a number of disciples in England, America, Germany, and France, to whom he is the last of the prophets, the organ of revelation, the final "manifestation," has enhanced his prestige, and probably also affected to some extent the emphasis of his teaching. Religious toleration, search for the essence of truth in different religions, opposition to the *jihad* and war in general, demand for certain social reforms, a more or less pronounced mysticism, and self-effacing devotion to a leader characterize Bahaism and Babism alike. In politics the Persian Bahais seem to have supported the court and favored the interests of Russian and English diplomacy, while the Azalis have espoused the popular cause of the Nationalists.

Such are the numerous sects against which orthodox Mohammedanism has been forced to contend, but, although Shiite doctrines more than once threatened to gain the ascendancy, Sunnism has always remained the victor in the end. The four sects into which the Sunnites are divided—the *Hanbalites* , *Malikites* , *Hanafites* , and *Shaf'ites* —differ only in regard to a few points of minor importance connected with religious observances and civil and religious jurisprudence. These sects have remained almost without change since their foundation under the Abbaside dynasty. Nevertheless, certain innovations had crept into the life of orthodox Mohammedans, principally an exaggeration of the reverence paid to the numerous saints, which amounted often to actual worship. It was against such abuses, as well as against all forms of luxury in everyday life, tobacco smoking, etc., that Abd al Wahhab and his followers, the Wahabis, arose in the middle of the eighteenth century. From Nejd they carried on an iconoclastic warfare throughout the country. They conquered Mecca and Medina, and in destroying the many sanctuaries there did not even spare the grave of Mohammed. Previous to this they had taken Kerbela, a holy city of the Shiites in Mesopotamia. They were defeated finally by Egyptian troops, and driven back into the in-

terior of the peninsula. But the Wahabite state, with Riyadh for its capital, is still independent and, according to recent accounts of travelers (1915), more powerful than it has been for a long time, while as a sect the Wahabis have spread their influence into Africa and India. See WAHABIS.

MOHAMMED BEN MOHAMMED BEN YAHAYA, yā'ha-yā. ABUL WEFĀ, or WAFĀ (940-998). An Arabic mathematician and astronomer, born at Buzjan and generally known as Abul Wefā. He translated and commented upon works of several Greek mathematicians and calculated a table of sines at intervals of half a degree and also a table of tangents, which, however, was used only for determining

the altitude of the sun. The ratio $\sin a / \cos a$ was called by him the shadow. He is, however, most famous for having made the oldest known attempt to solve geometric problems with only one opening of the compasses. He wrote a book containing 12 chapters on geometrical constructions. Our knowledge of this work is due to a Persian translation of an Arabic manuscript, written by a pupil of Abul Wefa. The problems may be divided into three groups: (1) those dealing with the solution of geometrical problems by one opening of the compasses; (2) to divide a given square into a given number of squares and to construct a square equal to a number of given squares; this is done by juxtaposition and not by the Pythagorean method; (3) problems having for aim the construction of regular polyhedra. In the problem due between Tartaglia (q.v.), on one hand, and Cardan (q.v.) and Ferrari, on the other, problems of the first group were given for solution and appear in the works of Leonardo da Vinci and Cardan. They also occur in several other works of the sixteenth century, but first found accurate scientific expression in Steiner's *Geometrische Constructionen*, etc. (1883). Consult Volpeke, *Journal Asiatique*, vol. v (5th series, Paris, 1855), and Cantor, *Geschichte der Mathematik*, vol. 1 (Leipzig, 1900).

MOHAMMED'S COFFIN. See MAHOMET'S COFFIN.

MOHAMMED, SIDI. See SIDI MOHAMMED.

MOHAMMERAH, *mô-ham'mâ-râ*. A town in southwest Persia, Province of Khuzistan, situated on a canal leading from the Karun River to the Shat el Arab, 35 miles from the Persian Gulf (Map: Asia, Central, C 7). The harbor is good, and the town has had an active trade since the opening of the Karun to international navigation in 1889. Pop. 15,000.

MOHAUNT. See HIBISCUS.

MOHAVE, *mô-hâ'vâ*. An interesting tribe of Yuman stock (q.v.), residing along both banks of the lower Colorado River, in Arizona and California. Their popular name, corrupted from *hamok-habv*, signifies "three mountains," in allusion to the three buttes known as the Needles, which they regard as the central point of their ancient territory. They are agricultural, although somewhat nomadic in habit, and in physical type they rank among the finest specimens of the American aborigine. They live in low wickiups of brushwood covered with sand, make pottery and baskets, and cultivate corn, pumpkins, melons, and beans, which, with fish and mesquite beans, give them an abundant subsistence. They practice tattooing and cremate their dead. They have certain hereditary family names and a chiefship hereditary in the male line, but do not seem to have the true clan system. Consult A. L. Kroeber, "Preliminary Sketch of the Mohave Indians," in *American Anthropologist*, vol. iv (N. S., New York, 1902), and P. E. Goddard, "Indians of the Southwest," in *American Museum of Natural History, Handbook Series No. 2* (ib., 1912).

MOHAVE DESERT. A desert region in

south California, lying principally in San Bernardino County (Map: California, J 7). It is a part of the Colorado Desert (q.v.), although the two names are often used synonymously.

MOHAWK (New England Algonquian name, *Maqua*, *Mahaqua*, Bear, they call themselves *Gamoga-rono*, Bear People, or Flint People). The leading tribe of the Iroquois (q.v.) Confederacy and formerly occupying the lower Mohawk River valley in New York. They were considered the keepers of the eastern door or frontier of the long house of the Confederacy, the Seneca being assigned the duty of guarding the western door. The Mohawk territory was supposed to extend northward to the St. Lawrence, eastward to the country of the Mahican and Wappinger along the Hudson, and southward to the watershed of the Delaware River and the Catskill Mountains, where they bordered upon the Delaware and Munsee. Their geographic position thus brought them into early and intimate contact with the Dutch and English settlers, from whom they procured the firearms which soon made their very name a terror to the remoter tribes. This exposed situation, however, caused them to suffer much more than their confederates in the Colonial wars, so that their seven villages of 1644 were reduced to five in 1677, some whole clans seeming to have been wiped out. See IROQUOIS.

MOHAWK RIVER. The largest affluent of the Hudson. It rises in the sandy hills south of Boonville, Oneida County, and about 40 miles from the east end of Lake Ontario, flows southward until it reaches the city of Rome, then turns eastward, and continues in nearly that direction until it enters the Hudson at Cohoes (Map: New York, F 5). Its total length is about 140 miles, and its drainage area embraces 3470 square miles. Its course lies chiefly in the celebrated Mohawk valley, one of the most beautiful and fertile agricultural regions in the United States. In Colonial times the valley was the main highway to the Great Lakes, and during the Revolution a bitter contest was waged between the American and British forces for its control. There are many thriving manufacturing cities along the Mohawk, which is paralleled by the Erie Canal and by the New York Central and the West Shore railroads, forming a great trade route between the Atlantic seaboard and the West. See NEW YORK.

MOHEGAN (dialectic form of *Mahican*, from which tribe the Mohegan were originally an offshoot). An Algonquian tribe formerly residing chiefly upon the Thames River in eastern Connecticut and claiming dominion by conquest over several smaller adjoining tribes, not all of which, however, admitted the claim. They seem to have been an eastern extension from the Mahican (q.v.) of the Hudson, while the warlike Pequot (q.v.) were in turn a branch of the Mohegan. At the period of the first settlement of Connecticut the two last-named tribes formed one body under the rule of Sassacus. Uncas, a subordinate chieftain, rebelled against him and assumed a distinct authority as the leader of a small band on the Thames, near the present Norwich. This band became known in history as the Mohegan, while those remaining with Sassacus were distinguished as Pequot. In the struggle between the Pequot and the colonists Uncas aided the English, and in consequence, on the destruction of the Pequot tribe in 1637, the greater part of the survivors were placed

under the dominion of the Mohegan chief, who thus obtained control of the territory of both tribes. He took such care to strengthen his power with the English that after the death of King Philip in 1676 the Mohegan were the only important tribe remaining in southern New England. As the settlements extended they sold most of their lands, retaining only a small reservation on the Thames River in New London Co., Conn., centring about their village, Mohegan. The villages of Groton and Stonington, occupied chiefly by the remnants of the conquered Pequot, were considered also as under Mohegan jurisdiction. They rapidly dwindled when surrounded by the whites, many joining the kindred mission bands at Scaticook and Brotherton in New York. The rest continued to reside at Mohegan, until now they are so mixed with negro and white blood that they have practically lost their identity, although they still retain official State recognition. In 1705 they numbered 750 at Mohegan, reduced to 206 in 1774, 69 in 1809, and 22 in 1910. Consult F. G. Speck, *Notes on the Mohegan and Niantic Indians* (New York, 1909).

MOHILEV, mó-hé-lyé'. A government of European Russia consisting of 11 districts and bounded by the Government of Vitebsk on the north, Smolensk on the east, Tchernigov on the southeast and south, and Minsk on the west (Map Russia, D 4). Area, 18,551 square miles. The northern part of the government is slightly elevated, forming the watershed between the Dnieper and the Dûna. The southern and larger part belongs to the region of Polhessie (qv) and is low and partly marshy. The government is well watered, the Dnieper and its tributary the Sozh are the chief rivers. Mohilev has a moderate but rather damp climate, and in the low and marshy parts fever is prevalent. Agriculture, which is the principal industry, is carried on by the most primitive methods and famines are not infrequent. The live stock is of a very inferior breed. Gardening is carried on extensively in the vicinity of the towns. The forests, covering more than one-third of the total area, yield turpentine and charcoal and supply the material for the production of wood implements, wagons, etc., which are manufactured on a small scale. In addition there are produced paper, oil, wire nails, flour, glass, matches, etc. The trade is largely in the hands of the Jews. Pop., 1909, 2,164,800. 1913, 2,333,300. Capital, Mohilev (qv.). In early times the present Province of Mohilev belonged to the Principality of Smolensk. Annexed in the fourteenth century to Lithuania, it afterward became part of the Polish monarchy and was annexed to Russia at the first partition of Poland in 1772.

MOHILEV. The capital of the Government of Mohilev in west Russia, situated on both banks of the Dnieper, 483 miles south of St Petersburg and 375 miles southwest of Moscow (Map: Russia, D 4). It lies in a picturesque region and has a number of interesting buildings. The Public Park, the Roman Catholic cathedral, in Greek style, whose corner stone was laid in 1780 by Catharine II and the German Emperor Joseph II, the town hall (1679) with an octagonal tower, and the new theatre are among the centres of interest at Mohilev. There are also some interesting monasteries, numerous churches of different denominations, and a museum with noteworthy collections. The

educational institutions include two Gymnasias, two theological seminaries, several special schools, a manual-training school, and a public library. Mohilev produces largely leather, linseed oil, flour, and tobacco. A considerable part of its inhabitants are engaged in gardening and fishing. Pop., 1911, 54,058, of whom more than half were Jews.

MOHILEV. The capital of a district of the same name in the Russian Government of Podolia, situated on the Dniester, 89 miles east-southeast of Kamenetz-Podolsk (Map. Russia, C 5). The inhabitants are chiefly engaged in gardening and the transit trade in agricultural products and lumber with Galicia and Odessa. The town has several educational institutions. Pop., 1897, 22,100. 1910, 32,604, over one-half Jewish.

MOHL, möl, Hugo von (1805-72). A German botanist. He was born in Stuttgart, a brother of Julius and Robert von Mohl, was educated in the classics at the Gymnasium at Stuttgart, and studied medicine at the University of Tübingen (1823-28). After making investigations at Munich (1828-32), he served as professor of physiology in the Academy (1832-34) and University (1834-35) of Bern, and finally was professor of botany at Tübingen (1835-72). There were two distinct periods in his career. During 1827-45 he was mainly concerned with the anatomy of plants, in which he was the leading investigator. During 1845-72 he was concerned chiefly with the development of organs and tissues, and was specially interested in cell formation. His contributions to botanical knowledge fall into three categories. In phytotomy he demonstrated that the cell, as distinguished from fibres, tubes, and intercellular substances, is the sole and fundamental element in plant structure, advanced the theory that secondary thickening of cell walls comes from within; developed with great clearness the idea of the chemical nature of the cell wall; showed the nature of intercellular substances; and classified tissues for comparison in different groups of plants. In cytology he showed that chloroplasts consist of protoplasm, and gave the name "protoplasm" to the "primordial utricle," explaining its rôle in cell division. In physiology he discovered the influence of contact on the movements of tendrils. He published 90 monographs, each of which represented a distinct contribution to botany, mostly in the fields of anatomy and histology. Perhaps his three most notable publications were *Vermischte Schriften botanischen Inhalts* (1845), a collection on various subjects, containing also a considerable number of his most important monographs, *Mikrographie* (1846), *Grundzüge der Anatomie und Physiologie der vegetabilischen Zelle* (1851). Von Mohl also established, in 1843, the *Botanische Zeitung*, which has continued to be one of the most influential of botanical journals. He remained its editor until his death in 1872.

MOHL, JULIUS VON (1800-76). A German Orientalist, brother of Hugo and Robert von Mohl. He was born at Stuttgart, Oct. 28, 1800; studied Persian and Chinese at Tübingen, Paris, London, and Oxford; was professor of Oriental literature in Tübingen (1826-32), went to Paris and became professor of Persian at the Collège de France in 1847 and in 1852 inspector of the Oriental department of the national printing office. He died at Paris, Jan. 3, 1876. His

principal work is his edition of Firdausi's *Shāh Nāmāh* (6 vols, 1838-66), of which he also made a complete French translation, published after his death, *Le livre des rois traduit et commenté* (1876-78). His reports to the Société Asiatique were collected after his death and published under the title *l'ingt-sept ans d'histoire des études orientales* (2 vols, 1879-80). His *Lettres de M. Botta sur les découvertes à Khorsabad* (1845) relate to the excavations at Nineveh. His wife, who was Miss Mary Clarke (1793-1883), maintained for many years a salon frequented by the wits and scholars of her time. She was the author of a work on *Madame Récamier* (London, 1862). Consult Simpson, *Letters and Recollections of Julius and Mary Mohl* (London, 1887).

MOHL, ROBERT VON (1799-1875). A German jurist and statesman, brother of Ilugo and Julius von Mohl. He was born in Stuttgart, studied law at Heidelberg, Göttingen, and Tübingen, and in 1824, after publishing *Das Bundesstaatsrecht der Vereinigten Staaten von Nord-Amerika*, was made a professor of public law at Tübingen. In 1836 he was made head librarian of the university. But his attack on the political régime in 1845 forced him from his chair and from the government employ. Almost immediately afterward he was elected to the Lower Chamber of Württemberg, became professor at Heidelberg (1847), and was a member of the Vorparlament and of the National Assembly at Frankfurt. After acting for seven months as Minister of Justice in the Imperial ministry set up by the Frankfurt Parliament he returned to his professional duties in Heidelberg (1849), and from 1857 represented the university in the First Chamber of Baden. From 1861 to 1866 he was representative of Baden at the German Bund at Frankfurt, and during 1867-71 he was Envoy at Munich. In 1871 he was appointed president of the financial chamber of Baden. A year before Mohl's death he was elected to the German Reichstag from Baden. Among his writings are: *Staatsrecht des Königreichs Württemberg* (2d ed, 1840); *Die deutsche Polizeiwissenschaft nach den Grundsätzen des Rechtsstaats* (1832-34, 3d ed., 1866); *Encyclopädie der Staatswissenschaften* (1859; 3d ed., 1887), *Das deutsche Reichsstaatsrecht* (1873).

MÖHLER, MEËLER, JOHANN ADAM (1796-1838). One of the most distinguished modern polemical divines of the Roman Catholic church. He was born at Igersheim in Württemberg, May 6, 1796. He received his education at the Gymnasium of Mergentheim, the lyceum of Ellwangen, and the University of Tübingen. He received priest's orders in 1819 and for a short time was employed in missionary duty. In 1823 he began to lecture on canon law and Church history at Tübingen and in 1826 became professor extraordinary, in 1828 professor ordinary, of theology. His earliest publication was *Die Einheit in der Kirche oder das Prinzip des Katholizismus* (1825), which was followed in 1827 by a historico-theological essay *Athanasius und die Kirche seiner Zeit*. His reputation rests mainly on his *Symbolik* (1832; Eng. trans., London, 1843, reprinted, 1894). This work led to a controversy with his Protestant colleague in the university, F. C. Baur (q.v.), and Möhler's two replies were important for Catholic theology (late editions, Ratisbon, 1900, Mainz, 1906). In 1835 Möhler removed to the Univer-

sity of Munich. His first appointment was nominally the chair of biblical exegesis, but he really devoted himself to the department of Church history, in which his opening course was eminently successful. He died in Würzburg, April 12, 1838. His miscellaneous works were collected and published posthumously in two volumes (Regensburg, 1839-40) by his friend Dr Dollinger, his lectures on Church history by Gams (ib., 1867-70). Consult his biography by Wörner (Regensburg, 1866) and by Friedrich (Munich, 1894).

MOHLER, MÖL'ER, JOHN FREDERICK (1864-). An American physicist, born at Boiling Springs, Pa. He graduated at Dickinson College in 1887 and at Johns Hopkins University (Ph.D.) in 1897. After teaching mathematics in academies at Dover, Del., and at Wilbraham, Mass., from 1887 to 1894, he became (1896) professor of physics at Dickinson. His researches include investigations on the surface tension of water below 0° C. He assisted in the discovery that the pressure surrounding the electric arc changes the wave length of the light emitted, and discovered the relation of the shift of spectral lines to the atomic volume, as well as a peculiarity in the light spectrum of magnesium. He also measured the pressure in the electric-light spark. His publications include *1 Manual of Practical Physics* (1897-1903) and numerous articles in scientific journals.

MOHN, MÖN, HENRIK (1835-). A Norwegian meteorologist, born at Bergen and educated at Christiania. In 1860 he won the King's gold medal and obtained a government scholarship in astronomy, in 1861 became connected with the astronomical observatory, and in 1866 director of and professor in the meteorological institute of Christiania University. Mohn represented Norway in many international congresses of meteorology and was a member of the Polar Commission which organized magnetic and meteorological stations (1882 et seq.). His writings include *Les orages dans la péninsule scandinave* (1888), with Hildebrandson; a very valuable *Grundzüge der Meteorologie* (1875, 5th ed., 1898, trans. into Italian, Spanish, French, Russian, Polish, and Flemish); *The North Ocean, its Depths, Temperature, and Circulation* (1887); two large works *The Norwegian North Polar Expedition, 1893-96*, vol. vi, *Meteorology* (1905); *Meteorology. Report of the Second Norwegian Arctic Expedition in the "Fram," 1898-1902* (1907).

MO'HO. A tropical tree. See HIBISCUS.

MOHO. A honey sucker of the Sandwich Islands whose native name has become the designation of a local genus of the family Meliphagidae, which contains two species, the yellow-tufted moho or o-o or uho (*Moho nobilis*) and another (*Moho apicalis*). They are handsome, long-tailed, blackish birds with bright yellow tufts of feathers on each side of the wings and some white tail feathers. After the disappearance of the mamo (q.v.) the feathers of the moho were used for making the ceremonial robes and ornaments of Hawaiian chiefs, until they were superseded by European clothes and insignia of rank. Early accounts of the islands record that this bird, which frequented the mountains and forests and had much the appearance and habits of a North American oriole, was captured by means of birdlime. Its yellow feathers having been plucked out, it was then freed, in hope that it would furnish an-

other supply the next year. These feathers, from which also a beautiful head-dress (for women) called leis was made, were received by the King as a poll tax; yet it took many years to collect enough for a mantle, the price of which, estimating the time and labor at modern standards, would probably exceed a million dollars. A few examples of these feather cloaks are preserved in European museums. See Plate of CREEPERS.

MO'HOCKS. The name by which the members of the Mohock or Mohawk Club of London in 1711-12 were known. The object of the club was mischief. With the Restoration it had become a favorite amusement of dissolute young gentlemen to swagger at night about the town, breaking windows, upsetting sedans, beating quiet men, and offering rude caresses to pretty women. The Mohocks, who formed one of the ruffian clubs of the time, made a specialty of slitting men's noses, beating people, and rolling women in hogsheds down Snow Hill. Prince Eugene of Savoy was charged by a Jesuit spy with having suggested that they should assassinate the Earl of Oxford. A royal proclamation dissolved the club after about a year's existence. Consult Jonathan Swift, *Journal to Stella* (new ed., New York, 1904).

MOHONK' LAKE. A summer settlement in Ulster Co., New York, 14 miles northwest of Poughkeepsie and $5\frac{1}{2}$ miles from New Paltz, from which it is reached by stage. In the Shawangunk Mountains, it is situated on the north end of Lake Mohonk, which is fed by underground springs, at an elevation of about 1200 feet near the summit of "Sky Top," and is surrounded by mountain scenery of distinctive beauty. The settlement is the work of Albert Keith Smiley (q.v.), who purchased a large tract of land here in 1860 and in 1870 built a large hotel. The estate is beautifully laid out and consists of a tract of land of about 5500 acres. It is chiefly noted as the home of the Lake Mohonk Conference (q.v.).

MOHOS. See MOXOS.

MOHR (Ar. *mahr*, colt, from *mahara*, to be adroit). A West African gazelle (*Gazella mohr*), called the swift, and among the largest of its group, which is much hunted by the Arabs of Senegal because its stomach often contains the bezoars called mohr's eggs, so highly valued in Morocco and the western Sahara for their supposed medicinal properties. See BEZOAR.

MOHR, CHARLES THEODOR (1824-1901). An American botanist and forester. He was born at Esslingen in Württemberg, studied at the Stuttgart Polytechnic, and with Kappler explored Dutch Guiana in 1845. He went to California on the discovery of gold in 1849 and, after four years as a druggist in Louisville, Ky., removed to Mobile, Ala., in 1857. He was a member of the committee on revision of the United States Pharmacopœia in 1890, and in 1892 gave himself up to forestry and botany. He had been appointed botanist of the Alabama Geological Survey in 1884 and agent of the Forestry Division of the United States Department of Agriculture in 1889. He contributed to Berney's *Handbook of Alabama* and wrote *The Timber Pines of the Southern United States* (1896-97) and *Plant Life of Alabama* (1901).

MOHR, KARL FRIEDRICH (1806-79). A German chemist, born at Coblenz. He was educated at Heidelberg, Berlin, and Bonn, and then entered his father's apothecary business, to

which he succeeded in 1840. He retired from business in 1857, and after financial losses became a lecturer in 1864 and professor of pharmacy in 1867 at Bonn. Before his death Mohr had become the best-known pharmaceutical chemist in Germany. His publications include: *Pharmacopœia Universalis* (2 vols., 1845), *Lehrbuch der pharmaceutischen Technik* (1847; 3d ed., 1866); a famous *Lehrbuch der chemisch-analytischen Titrimethode* (2 vols., 1855-59, 7th ed., 1896), *Geschichte der Erde* (1866, 2d ed., 1875).

MOHSITE. See ILMENITE.

MO'HUN, MICHAEL (1625-84). A noted English actor of the period following the Restoration. He had been a soldier both in the Civil War and afterward in Flanders, where he got the title of major, by which he was known. He was a member of the company in the early days at Drury Lane, then the Theatre Royal, and created rôles in several of the plays of Dryden and of Lee. King Charles II., for whose father he had fought, regarded him highly. He died in London in October, 1684. Consult Geneste, *History of the English Stage* (Bath, 1832); Doran, *Annals of the Stage* (ed. Lowe, London, 1888); Downes, *Roscius Anglicanus* (reprinted, ib., 1886).

MOIDORE, moi'dôr (Portug. *moeda d'our*, money of gold). A former gold coin of Portugal, of the value of 4800 reis, equivalent to 21s. 2d. or nearly \$5.18. It was also called lisbonne.

MOIGNO, mwâ'nyô', FRANÇOIS NAPOLÉON MARIE (1804-84). A French mathematician, born at Guéméné in Morbihan. He entered the Society of Jesus in 1822 and devoted himself to the study of mathematics and physics. During the revolution of 1830 he sought refuge with others of his order in Switzerland. In 1836 he became professor of mathematics at the preparatory school of Sainte-Geneviève in Paris. He resigned from his order in 1843 and became connected with various journals, of which he founded *Cosmos* (1852) and *Les Mondes* (1862). In 1873 he was appointed one of the canons of the chapter of Saint-Denis. Among his works are *Leçons de calcul différentiel et de calcul intégral* (1840-61), *Répertoire d'optique moderne* (1847-50), *Saccharimétrie* (1869), *Les splendeurs de la foi* (1879-83), *Les livres saints et la science* (1884).

MOIR, DAVID MACBETH (1798-1851). A Scottish physician and author, born at Musselburgh, a small seaport near Edinburgh. He studied medicine and practiced in his native town. Moir became widely known by his essays and poems contributed to *Blackwood's Magazine* under the signature Δ (delta). He died July 6, 1851. Moir's most interesting production is a Scottish novel entitled *The Autobiography of Mansie Wauch* (1828, new ed., 1895). Consult also *Poetical Works*, edited with memoir by Aird (Edinburgh, 1852).

MOIR'A, second EARL OF. An English general and administrator in India. See HASTINGS, FRANCIS RAWDON-HASTINGS, MARQUIS OF.

MOIRE, mwîr (Fr., mohair). A silk figured by the peculiar process called waterwing. The silks for this purpose are moistened and then folded from one end to the other in triangular folds. After being thus reduced to a comparatively small length they are submitted to heavy pressure, generally in a hydraulic press. After being removed from the press the fabric is

found to be covered with wavy lines. As only one side is to be waved, the fabric is made up for the press with a pasteboard above each second fold. The silk is next hot-pressed, and the side next to the pasteboard comes out glazed, while the other remains watered. The finest kinds of watered silks are known as moires antiques. The same process has been applied to woolen fabrics called morcen.

MOIS, mō'ez (an Annamese term corresponding to the Cambodian *Peunong*, Loatian *Kha*, Tonkinese *Myong*, *Muong*, etc.). An extensive group of so-called savage tribes dispersed over the table-lands and mountains between the Mekong and the Annamese coast, from the frontiers of Yunnan to Cochin-China. They have been regarded as one of the older groups of Farther Indian aborigines. In spite of the multitude of tribes into which the Mois are divided they exhibit a remarkable uniformity in physical type and manners. In physical type they are rather short, dolichocephalic, straight-eyed, somewhat wavy-haired, with reddish dirty-white skin. The Mois are as a rule of peaceful disposition, being hunters and husbandmen of a primitive sort. In the Mois a sub-Caucasic (white) physical trait has been detected, and others ally them, by reason of their manners and customs and implements, with the Malayan peoples. Consult Dourisbouye, *Les sauvages Ba-Hnars* (Paris, 1873), and Billet, *Deux ans dans le Haut-Tonkin*, etc. (ib., 1896). See INDO-CHINESE.

MOISSAC, mwā'sāk'. A town in the Department of Tarn-et-Garonne, France, on the river Tarn, 17 miles west-northwest of Montauban (Map, France, S. F 4). The church of St. Pierre, dating from the year 1100, has a portal with very unusual carving. There are also an abbot's palace, a communal college, a library, and a museum. Moissac has a good trade in flour, grain, oil, wine, poultry, and fruit. Pop. 1901, 8407, 1911, 8137.

MOISSAN, mwā'sān', HENRI (1852-1907). A French chemist, born in Paris. He studied at the Museum of Natural History, became connected with the School of Pharmacy (1879), its professor of toxicology (1886) and of mineral chemistry (1889). In 1900 he was appointed professor at the Sorbonne. He won the Lacaze prize in 1887 for his valuable experiments with fluorine, which he was the first to isolate and to liquefy. Considerable notoriety attended his announcement, in 1893, that he had succeeded in producing artificial diamonds by suddenly chilling a molten mass of iron containing dissolved carbon. More practical was his simplification of the production of acetylene gas and his inorganic syntheses by the use of the electric furnace. In 1906 he was awarded the Nobel prize for chemistry. Moissan contributed articles on chromium, manganese, and iron to Frémy's *Encyclopédie chimique*; wrote: *L'isolement du fluor* (1886), *Reproduction du diamant* (1893), *Carbure de calcium* (1894), *Etude complète des carbonées amorphes et des graphites* (1898), *Classification des éléments* (1904), and edited an excellent *Traité de chimie minérale* (1905).

MOISTURE. See HUMIDITY.

MOIVRE, mwā'vr', ABRAHAM DE. A French-English mathematician. See DE MOIVRE.

MOJAPRA, mō ha'ra (Portug. name). Any of many carnivorous sea fishes of moderate or small size, allied to the porgies (Sparidae).

and constituting the tropical family Gerridae. Some of them are well known and of some importance as market fishes. The small silvery Pacific coast species of the genus *Eucinostomus* are called mojarritas. The mojarra blanca, or broad shad (*Xystema cinereum*), is a favorite food fish on both coasts of Central America and in Cuba. Another species of that region (*Gerrus olivostomus*) is called Irish pompano and mutton fish by fishermen. The term is applied, by the aid of a discriminative adjective, to various outside fishes, e.g. the cow-pilot.

MOJI, mō'jē. A town of Japan situated at the north extremity of the island of Kiusiu, on the Strait of Shimonoseki and opposite the city of that name (Map: Japan, B 7). It has grown rapidly to an important place since 1891, when it became the terminus of the Kiusiu Railroad. The extensive coal deposits in the neighborhood also add to its importance. The Moji side of the channel, which is here 1 mile wide, is more convenient as a landing place for steamers than the port of Shimonoseki. The imports and exports at Moji in 1913 were valued at \$19,687,969 and \$10,406,112, respectively. Pop. 1903, 38,065, 1908, 55,682.

MOJOS. See MOXOS.

MOJSISOVICS, mor'sē-sō'vich, EDMUND VON (1839-1907). An Austrian geologist and student of the Alps. He was born and educated at Vienna, founded the Austrian Alpine Society—the first of the kind in Europe—in 1862, and in 1869 a like association in Germany, which joined the Austrian society in 1873. In the Imperial Geological Institute he became chief geologist in 1870 and assistant director in 1892. He retired in 1901. His more important works include: *Das Gebirge um Hallstatt* (1873-76); *Die Dolomitriffe von Südtirol und Venetien* (1878-80); *Die Cephalopoden der mediterranen Triasprovinz* (1882), *Arktische Triasfauna* (1886); *Die Cephalopoden der Hallstätter Kalke* (1873-1903), *Die Cephalopoden der oberen Trias des Himalaya* (1896).

MOKANNA, mō-kan'nā, AL. See HAKIM IBN ALIAH. MOHAMMEDAN SCIS.

MOKI, mō'kē. A Pueblo tribe of Arizona. See HOPPI.

MOLA DI BARI, mō'la dē bā'rē. A city in the Province of Bari delle Puglie, Italy, on the Adriatic Sea, 12 miles southeast of Bari (Map, Italy, F 4). The exports consist of oil, live stock, leather, and wine. Pop. (commune), 1901, 13,962, 1911, 14,911.

MOLA DI GAETA, dē gā-ā'ta. The old name of Formia (q.v.), a seaport in south Italy.

MOLALA, mō-lā'lā. See WAILATPUAN.

MOLARIA. A genus of arthropods, found fossil in the Stephen formation, of Middle Cambrian age, in British Columbia. It consists of a semicircular cephalic shield without any trace of eyes, a trilobed dorsal test, and a long slender telson. It is supposed to belong to the Arachnida and is placed in the family Aglaspidæ. Other similar forms are Habelia and Emeraldella. See MEROSTOMATA, STEPHEN FORMATION.

MOLAR WEIGHT. See MOLECULES.

MOLASSE, mō-lās' (Fr. fem of *mol*, from Lat. *mollis*, soft). An extensive middle Tertiary deposit occupying the central lake region of Switzerland between the Alps and the Jura. It consists chiefly of sandstone, marls, and limestone, but at the foot of the Alps it usually

takes the form of a conglomerate called Nagel flue, which is said to attain the astonishing thickness of from 6000 to 8000 feet in some localities. The molasse includes the Oeningen group of strata, which is remarkable for its fossil insects and plants.

MOLASSES. See SUGAR.

MOLAY, mô'lâ', JACQUES DE (c.1243-1314). The last Grand Master of the Templars. He was a native of Burgundy, and entered the Order of Templars in 1265, and was elected Grand Master in 1297. About this time Philip IV of France (1285-1314) undertook to carry out the project which he had formed to destroy the order, chiefly because the French monarchy was in sore financial straits and the Templars were wealthy. There was at this time constant talk of a new crusade, and Clement V called the Grand Master of the Templars to Europe. The call was answered by Molay, who appeared in France in the fall of 1306, accompanied by a chosen band of distinguished knights of the order. He repaired to Poitiers in 1307 to render his allegiance to the Pope, and was there informed of serious charges against the order. He went away believing that he had cleared the order and remained in high honor with the King. But the latter was working secretly through the officers of the Inquisition in France and procured the arrest of every Templar in France on Oct. 13, 1307. Jacques de Molay was seized in the house of the Temple and taken before special commissioners of the Inquisition. Although the Pope was indignant at this action on the part of Philip, and suspended the powers of the Inquisition in France, the King finally induced him to take part in the action. Molay was examined repeatedly by papal commissions, confessed the truth of some of the charges, and finally on March 18, 1314, he was condemned to perpetual imprisonment. He, however, immediately retracted all he had said, and thereupon was burnt the same evening, protesting the innocence of the order. Consult: F. Gmelin, *Schuld oder Unschuld des Tempelordens* (Stuttgart, 1893). Ernest Lavisse, *Histoire de France*, vol. iv, part ii (Paris, 1901); H. C. Lea, *History of the Inquisition of the Middle Ages*, vol. iii (new ed., New York, 1906). See **TEMPLARS KNIGHTS**.

MOLBECH, mô'l'bék, CHRISTIAN (1783-1857). A Danish philologist and historian, born at Sorø. He had a position in the Royal Library at Copenhagen and was professor of literature in the university of that city from 1829 to 1843, being simultaneously codirector of the Royal Theatre. He wrote several works, critical, poetical, historical, and philological, the most important of which is a Danish dictionary (2 vols., 1828-33, 2d ed., 1854-59), the first of real value ever compiled. He also wrote a Danish dialect lexicon (1833-41) and a Danish glossary (1853-66). His other works include: *Dansk Haand-Ordbog til Retskrivnings og Sprogrigtigheds Fremme* (1813) and editions of *Den danske Rimekronike* (1825); *Henrik Harpestrengs Lægebog* (1826); *Den ældste danske Bibel-Over-sættelse* (1828).

MOLBECH, CHRISTIAN KNUD FREDERIK (1821-88). A Danish poet and critic, born at Copenhagen, the son of Christian Molbech. He was professor of Scandinavian literature at the University of Kiel for 11 years (1853-64) and wrote several romantic dramas, such as *Klætekongens Brud* (1845), *Dante* (1842), *Venus-*

bjerget (1845), and *Ambrosius* (1878; 15th ed., 1909; Eng., Fr., Ger. trans.), and published collections of poems, such as *Billeder fra Jesu Liv* (1840), *Lyriske Digte og Romancer* (1863), *Dæmring* (1851, 3d ed., 1856), and *Efterladte Digte* (1888). As critic and theatrical censor Molbech was in touch with stage matters, and much of his work in this line is of interest. The most valuable contribution he made to the literature of his country was an excellent translation of Dante, *Den guddommelige Komedie* (4 vols., 1851-63, 4th ed., 1909).

MOLD (AS. *molde*, Goth. *mulda*, OHG. *molta*, dialectic Ger. *Molt*, dust, connected with Goth., OHG. *malan*, Ger. *mahlen*, Ir. *melim*, Lith. *malti*, Lat. *molere*, to grind). A term applied to various saprophytic fungi, but chiefly used in connection with the black molds (Mucorales). These molds are common on organic material, such as stale bread (kept moist and warm), fruits, fruit juices, etc., and possess a characteristic cobwebby, fleecy, white mycelium (qv), composed of large, often glistening and profusely branching hyphae (see *HYPHA*). The common bread mold is *Rhizopus nigricans*, so named because the spores and sporangium stalk are dark, or often black, a fact which also suggests the common name, black mold. The ordinary mold on manure is *Mucor mucedo*. Recent investigations of the black molds have shown that the mycelia are sexually differentiated, so that two different strains must be brought together before the sex act occurs or even before the sex organs are formed. The term "mold" is also applied frequently to the so-called herbarium mold (*Aspergillus*), which occurs also on bread, preserves, etc., and to the blue mold (*Penicillium*) on bread, etc. These forms are usually differentiated from the black molds by being called blue and green molds. For black molds, see **PHYCOMYCETES**, and for blue and green molds, see **ASCOMYCETES**.

MOLDAU, mô'l'dou (Bohem. *Vitava*). The chief river of Bohemia and an important tributary of the Elbe (Map. Austria, D 2). It rises in the Bohmerwald, on the southwest frontier, at an elevation of 3800 feet above the sea, and flows first southeast, then northward past the city of Prague, and enters the Elbe opposite Melnik, after a course of 265 miles. It becomes navigable at Budweis, and by means of canalization vessels of 700 to 800 tons can reach Prague at any season.

MOLDAVIA. A former principality in southeastern Europe, now forming, together with Wallachia (qv) and the Dobrudja (qv.), the Kingdom of Rumania (Map. Balkan Peninsula, F 1). It is bounded on the north and east by the Pruth, which separates it from Russia, on the south by Wallachia, and on the west by Transylvania. Area, 14,759 square miles. Pop., 1899, 1,832,106, 1912, 2,145,464. The chief town is Jassy, the capital of the principality. For further description, see **RUMANIA**.

History. The Principality of Moldavia was founded about the middle of the fourteenth century by the Wallach Voivode Bogdan. Its cradle appears to have been in the northeastern Carpathians, near the sources of the Theiss. It soon grew to be a large state, embracing, in addition to the present Moldavia, Bukovina and Bessarabia. The dominion over this region was coveted by the kings of Poland and Hungary, and the Moldavian princes leaned now on the one power and now on the other, neither being abli

permanently to assert its overlordship. Prince Stephen the Great was a powerful ruler (1457–1504). He defied the armies of the great Sultan Mohammed II, winning a signal victory over the Turks at Rakova in 1475. His successors, however, were unable to withstand the growing power of the Moslems, and early in the sixteenth century Moldavia became tributary to the Porte. The Turks proceeded to build fortresses in the Moldavian territory, and their hold on the country was gradually tightened, although Moldavia remained without the sphere of Turkish settlement. From the early part of the eighteenth century down to the outbreak of the Greek revolution in 1821, which began with Ypsilanti's brave deed at Jassi, Moldavia, as well as Wallachia, was governed by hospodars appointed by the Sultan from the aristocratic Greek families, known as Fanariots. The designs of Russia in the direction of dominion in the regions held in subjection by the Turks—designs which she sought to advance by claiming a protectorate over the Greek Christians in the Turkish dominions—violently affected the fortunes of Moldavia, which lay in the path of the Russian armies and was repeatedly subjected to Russian occupation. In 1812 Bessarabia was ceded by Turkey to Russia, Bukowina having been annexed to Austria in 1777. After 1821 native princes were once more at the head of the government. The protectorate accorded to Russia by Turkey in the Treaty of Adrianople (1829), which threatened to make Moldavia and Wallachia mere dependencies of Russia, was terminated by the Crimean War and the Treaty of Paris (1856). In 1859–61 Moldavia and Wallachia were united into the Principality of Rumania. In March, 1907, there was a peasant uprising, resulting in many deaths and great loss of property. See RUMANIA.

MOLDING. See FOUNDRY

MOLDING (from mold, OF. *moller*, *moler*, Fr. *mouler*, Sp., Portug. *moldar*, to measure, from Lat. *modulare*, to measure, from *modulus*, dim. of *modus*, measure, melody, manner, mode). A decorative strip or edging projecting or receding from the general surface adjoining it and having the same section or profile from end to end, the profile being usually composed chiefly or wholly of curves. Moldings are employed to frame pictures and panels, to decorate the edges of arches and openings, to form belts, bands, and cornices, and to emphasize all manner of architectural features, by the narrow lines or strips of modulated light and shade which they produce. Classic moldings generally project, Romanesque and Gothic moldings generally recede, from the general surface. Moldings may be plain or they may be carved with repeated ornament motives. In the classic styles there are eight typical moldings: the *fillet* and *bead* or *astragal*, very narrow projecting moldings, square and half-round respectively; the *cavetto* and *ovolo*, quarter-round moldings, respectively concave and convex, the *scotia*, half-elliptical concave, and *torus*, half-round convex; the *cyma recta* and *cyma reversa*, each composed of a quarter-round convex and quarter-round concave profile. The *cyma* or *ovolo* or group of moldings at the bottom of a cornice is called the *bed mold*; the *cyma* above the corona is the *zymatum*; the fillet at the top of the architrave is the *taenia*. In Romanesque and Gothic architecture the variety of moldings is greater, the hollows are deeper, the convex moldings bolder,

and it is by the multiplying of rolls or *boutels*, hollows, oblique fillets and other profiles that much of the splendid decorative effect of Gothic interiors is produced, especially in English architecture. Enriched moldings are those which are carved with repeated ornaments—the bead-and-reel, egg-and-dart, water-leaf, acanthus, and anthemion in classic art, the zigzag, billet, dog-tooth, and beakhead in Romanesque art, the ball-flower, crocket, and leaves and vines of all sorts in Gothic art. While in the classic styles the convex moldings are the ones most generally carved, in Gothic art the chief adornments are in the hollows, in which the flowers or vines produce spots of light against the shadow. The Oriental styles make little account of moldings. Egyptian architecture knew only the bundle torus, in Assyrian and in Moslem design moldings hardly appear.

In carpentry and cabinetwork moldings are of the first importance and of great variety, with

FORMS OF MOLDING IN CARPENTRY

special names for each—ogee, cove, thumb mold, plowed bead, belection, etc. A picture molding is a horizontal strip of molding on a wall, from which pictures may be hung. The treatment of moldings constitutes one of the distinguishing marks of styles in architecture and decoration. See special articles on the different forms of molding above enumerated, also ORDERS OF ARCHITECTURE.

MOLDING SAND. Under this term are included siliceous sandy materials employed for making either molds or cores for use in casting iron, steel, bronze, brass, etc. The materials used vary in character from a loamy clay to a sand or even a gravel, often but not always of highly siliceous character, the grade of the material employed depending on the size or character of the casting, the kind of metal, or the portion of the mold in which the sand is to be used. Smaller castings and those with a smooth surface call for a fine sand, while large castings and cores used to fill the hollow spaces of the castings call for coarser material. One or more grades of sand may be mixed together, and the blending of molding sands is now quite extensively practiced both at the pit and foundry. But even so, certain foreign substances, as flour, oil, molasses, etc., may sometimes have to be added to increase the sand's bonding power. A molding sand should be strong enough to hold its shape in use, resistant to heat, and porous enough to permit the escape of gases but not admit the molten metal. Its value, then, depends on its physical properties, which are not indi-

cated by a chemical analysis but have to be determined by laboratory and foundry tests. Molding sands for ordinary work are obtainable at many places, but the better grades for finer work are less common and are obtained chiefly from the upper Hudson valley in New York and from the localities of Conneaut, Ohio, Newport, Ky., and Valparaiso, Ind. Consult: Kummel and Parmalee, in New Jersey Geological Survey, *Annual Report* (Trenton, 1904); Ries and Rosen, in Michigan Geological Survey, *Annual Report* (Lansing, 1907); Heinrich Ries, *Economic Geology* (3d ed., New York, 1910), also *Proceedings of the Foundrymen's Association* (Cleveland).

MOLE (abbreviation of *molewarp*, *moldwarp*, *mouldwarp*, OHG *moltwercf*, *multwercf*, Ger *Maulwurf*, from AS. *molde*, dust + *wearpan*, Goth. *warpan*, OHG. *werfan*, Ger *werfen*, to throw). A small mammal belonging to the order Insectivora and to the family Talpidae, although the name is often applied to other nearly related forms. It is a small animal, generally less than 8 inches in length, thickset, with short stout limbs, the anterior pair powerful and especially adapted for digging. The fur is dense and soft, lying backward or forward with equal ease, the tail is short, and the eyes are very small. In many species the eyes are covered over by a membrane, and recent investigations on the common American mole show that the eye itself is much degenerated and probably is of practically no use as an organ of sight. Moles are subterranean in their habits and more or less nocturnal. They are very voracious and eat animal food exclusively. The earthworm is the principal article in their diet, but all other worms, grubs, caterpillars, and insects are readily eaten, and in captivity raw meat, small birds and mammals, and even other moles, will be seized and eaten greedily. Although the limbs are short, moles are capable of very rapid movements. When in pursuit of earthworms moles often travel long distances underground, and frequently so near the surface that the earth becomes raised up above the tunnel which they make. Moles are therefore constantly hunted and trapped by gardeners. The favorite method of capture is by means of a trap set in one of these underground galleries. The simplest form of trap is a wire noose so arranged on a spring that when the mole enters it the spring is released and the wire is drawn taut.

Moles build very remarkable nests, or homes, consisting of two circular galleries, the smaller above the larger, and connected with it by five straight passages, at the centre is a chamber connecting with the upper gallery, while from the lower gallery horizontal passages run out in all directions. From these horizontal passages are given off the various subsurface tunnels made when the mole is in search of food. The central chamber and circular galleries are built in a mound of earth, more or less elevated above the surface, and larger than the ordinary heaps of earth, or molehills, thrown up by these animals. From the central chamber there is also a vertical tunnel leading downward and then bending upward again to join one of the horizontal galleries. The young are brought forth not in the central chamber, but in a special chamber formed where two or three horizontal galleries meet, which is lined with leaves and other warm materials. Four or five young ones are usually produced at a birth, and some writers state that a second brood is produced late in the summer.

Moles take to water readily and swim well, so that they are able to cross considerable lakes and streams.

The anatomy of moles is interesting because it is so modified as to adapt the animal admirably to its manner of life. The fore limbs are attached to the skeleton so far forward that they lie beside the neck and thus add but little to the general width, yet remain sufficiently long to reach earth ahead of the nose. The hind limbs are also so arranged as not to occupy unnecessary space, the hip joints being closely approximated to the axis of the body. The humerus is very short and of a peculiar shape, and the carpal bones are very wide. On the inner (radial) side of the hand is a large sickle-shaped bone, regarded by some as a prepollex. The teeth vary in number from 36 to 44, in different genera. The Old World moles have 42 or 44 teeth, and the first and second upper incisors are of about the same size, while the moles of America have 36 or 44 teeth, and the first upper incisor is much larger than the second. The common mole of Europe (*Talpa europaea*) is very widely distributed, ranging from England to Japan and from the Altai to the Himalaya mountains. The eyes in this species are not covered by a membrane, as they are in the rest of the genus. The habits of the European mole have been carefully studied, and the remarks made above in regard to the burrows and nests of moles refer especially to that species. Seven other species of *Talpa* are known, chiefly Asiatic, but only two occur south of the Himalayas. Moles are absent from Africa and Australasia. Two peculiar moles occur in Tibet, one of which is placed in a distinct genus, as it has a somewhat narrower hand and only 42 teeth.

DENTITION OF THE MOLE

The American moles belong to the genera *Scalops*, or *Scalopus*, having 36 teeth, webbed hind feet, and a narrow, slender muzzle; *Scapanus*, with 44 teeth and a narrow, tapering muzzle; *Parascalops* and *Condylura*, with 44 teeth and a remarkable snoutlike muzzle, fringed with a circle of about 20 slender, soft, cartilaginous processes. This last genus contains only a single species, the well-known star-nosed mole (*Condylura cristata*), which is not uncommon throughout the northern United States. Its very curious snout is somewhat piglike, but the fringing processes give it a unique appearance. In habits this species closely resembles the more ordinary moles. The common mole of the eastern United States (*Scalopus aquaticus*) is a rather shrewlike animal, partial to the banks of streams. No moles occur south of the United States.

The name mole is often given to other insectivorous burrowing mammals, as the mole shrew of northwestern America (*Neurotrichus gibbsii*), which in structure approaches the desman (q.v.) but in habits is somewhat like a mole. The golden moles (see GOLDEN MOLE) of South Africa belong to a different family, the Chrysochloridae, and are not closely related to the Talpidae, although in external appearance they are strikingly like them. There are seven or eight species in the single genus *Chrysochloris*. The

strange marsupial mole (q.v.) of southern Australia and the duck mole (i.e., the duckbill) are marsupials with more or less molelike appearance and habits.

Moles are found fossil throughout the Tertiary strata of Europe, a fact of great significance as showing how ancient must be the insectivorous type of mammals. The genus *Talpa* may be traced back even as far as the Lower Miocene, with its peculiarities of structure already well developed, while true members of the family *Talpidae* appeared at least as early as the Lutetian in the Middle Eocene.

MOLE. See *NÆVUS*.

MOLE, GOLDEN. See *GOLDEN MOLE*.

MOLE, mō'lā', LOUIS MATTHIEU, COUNT (1781-1855). A French statesman, born in Paris. He was a descendant of the famous French magistrate Matthieu Molé (1584-1656), prominent at the time of the Fronde (q.v.). His father, president of the Parliament of Paris, died by the guillotine in 1794. After spending his early life in exile he returned to France, and first attracted notice by his *Essais de morale et de politique* (1805), in which he vindicated the government of Napoleon on the ground of necessity. The attention of the Emperor was then drawn to him, he was appointed to various offices in succession, was raised to the dignity of a count, and became Minister of Justice (1813). After Napoleon's return from Elba he refused to subscribe to the declaration of the Council of State banishing the Bourbons forever from France, and declined a seat in the Chamber of Peers. In 1815 Louis XVIII made him a peer of France. In 1817 he was for a short time Minister of Marine, but afterward acted independently of party, and was one of the principal orators in the Chamber of Peers. In 1830 he became Minister of Foreign Affairs in Louis Philippe's first cabinet, but remained in office only a short time. From 1836 to 1839 he was Prime Minister as successor to Thiers. He also held the portfolio of Foreign Affairs. In 1840 he was chosen a member of the French Academy. From that time he took little part in political affairs, but after the revolution of 1848 exerted himself to rally and unite the party of order in the National Assembly, to which he had been elected. After the coup d'état he retired to private life.

MOLECH, mō'lek. The name or designation of a deity referred to in the Old Testament. It is generally recognized that the form *Molech* is an intentional distortion of *melek* by the substitution of the vowels of *bosheth* (shame). Most of the passages in which it occurs have reference to human sacrifice as forming a part of the cult of this deity, and particularly to child sacrifice or the sacrifice of the firstborn, referred to as "passing through the fire" (Lev. xvii. 21; 2 Kings xxiii. 10). This phrase only implies that the victims were "given over" to the deity as a sacrifice, first slain and then burnt, as is evident from Ezek. xvi. 20 f., xxiii. 39, Jer. vii. 31, xix. 4 ff.; Deut. xii. 31; and other passages. At a later time, when all memory of the rite had passed away, the expression was explained by imaginary tales of children walking or leaping alive through the flames as an ordeal or of their being burned to death in the arms of an idol. There is no foundation for these stories. As to the god to whom these sacrifices were offered, scholars generally hold that Yahweh is meant. He is often designated as *ha-melek* (the king) (Isa. vi. 5, Jer. lvi. 18, xlviii.

15; and elsewhere.) The testimony of Jeremiah (vii. 31) and of Ezekiel (xvi. 20 f., xxiii. 37 ff.) is sufficient to prove that the rite survived among the Jews to a comparatively late period, though very possibly it was only a last resort, in time of great distress, to avert disaster or placate an angry deity, as was the case among the Moabites (see *MESHA*), and also that such offerings were made to Yahwe, since Jeremiah takes pains to deny that Yahwe had commanded them, and Ezekiel explains that Yahwe had indeed given them statutes that were not good, and defiled them by their sacrificial gifts in offering every firstborn, but only to fill them with horror. The law to which Ezekiel refers is clearly that of Ex. xiii. 12: "Thou shalt offer every firstborn to Yahwe." The anxious question of Mic. vi. 7: "Will Yahwe accept thousands of rams, ten thousand streams of oil? shall I give my firstborn for my transgression, the fruit of my body for the sin of my soul?" also shows how earnestly this sacrifice was contemplated as the supreme test of devotion to Yahwe. But the historian censures Ahaz for following the manner of the nations in performing the rite (2 Kings xvi. 4); it is forbidden in Deut. xviii. 10 and Lev. xviii. 21, xx. 2-6, and provision is made for the redemption of the firstborn (See *FIRSTBORN*). It has been supposed that the custom came into vogue in the days of Manasseh through Assyrian influence, but there is as yet no trace of it in Assyrian literature. Since it existed to a late time among the Carthaginians, it has been conjectured that it came into Judah from Phoenicia in the seventh century. It is probable, however, that it had existed sporadically from the earliest times among the Hebrews. While it manifestly was connected with the Yahwe cult, there is room for a question whether the Melek to whom the offering was made was always thought of as identical with Yahwe, or was not sometimes considered as a separate deity. As the Canaanites (including the Phœnicians) had their Milk and Melkart (cf. Abu Milki in the Tel el Amarna tablets and Milk Natan in later inscriptions), the Ammonites their Milcom (q.v.), and the Edomites their Malik (cf. Malik Ramu in an Assyrian text), so Israel and Judah may also have recognized a distinct Melek, of whose worship the child sacrifice was a prominent feature. The tone of some of the denunciations and legal prohibitions strongly suggests this. It is even possible that the commandment to offer the firstborn to Yahwe (Ex. xiii. 12, xxii. 29) was at first a protest against offering them to Melek or any other Baal, and the arrangement for redeeming them a later method of combating both the child sacrifice to Melek and its use in the worship of Yahwe in his capacity of melek, or king.

MOLE CRICKET. Any one of the crickets of the genus *Gryllotalpa* and its close allies, forming a tribe *Gryllotalpides*, remarkable for the dilated front legs, which superficially resemble those of the mole, and which are admirably adapted to an underground life. The en-

tire existence of the insect is subterranean. It travels in burrows of its own digging, and lays its eggs and rears its young in the same excavation. The adaptation of the front legs to the economy of the insect is very striking, as the tibia and tarsi are so arranged as to act as shears with which rootlets are severed. Mole crickets are furnished with a curious auditory apparatus on the front leg below the knee, concealed in a deep fold of the surface. The male makes a sound which has been reduced to a scale by Scudder, and which differs from the songs of the other crickets. Sharp calls it a "dull, jarring note somewhat like that of the goatsucker." The mole cricket is principally carnivorous in its diet, although it feeds also to some extent upon vegetation, and the principal damage it does is in cutting roots which come in the way of its burrows. It is considered the most destructive insect to agriculture in Porto Rico, where it is called *changa*. The female lays from 200 to 400 eggs, and the young are at first gregarious, the mother watching over them and supplying them with food until their first molt, after this they disperse and begin to make burrows for themselves. These young are often devoured by the adult males. Consult David Sharp, "Insects," in *Cambridge Natural History*, vol. v (London, 1895), and O. W. Barrett, *The Changa, or the Mole Cricket* (Washington, 1903). See illustration under CRICKET.

MOLECULES—MOLECULAR WEIGHTS (Fr. *molécule*, from Neo-Lat. *molēcula*, dim. of Lat. *moles*, mass). It is now universally assumed by chemists and physicists that all bodies are made up of very small but finite material particles, the weight and composition of which determine the various properties of substances. These particles are called molecules. Each of these molecules is conceived to be formed by a group of elementary atoms, the sum of whose weights equals the weight of the molecule. When a substance is divided and subdivided by physical or mechanical means (e.g., by dissolving a small amount in a very large volume of some liquid and dividing the latter into small portions), its molecules become separated from one another without undergoing any change. When the substance is decomposed chemically, each molecule breaks up and its unity is destroyed. Atoms cannot be subdivided even by chemical changes of the substance containing them, and as up to the beginning of this century physical and chemical changes were the only types of change known and the only ones considered at all possible, atoms were assumed to be "incapable of subdivision by any means whatever." At present it may be considered as a definitely established fact that atoms undergo decomposition—true subdivision—during all radioactive processes. See ELECTRON; HELIUM; RADIUM.

The relative weights of molecules, termed molecular weights, are among the most important constants of nature, and their experimental determination presents no difficulty whatever. But it has been shown that even the absolute dimensions of molecules, their absolute weight, their actual number in a given volume of substance, their specific gravity, etc., can be ascertained with a high degree of probability. Brief mention may be made here of some of the simpler methods employed in searching for those absolute dimensions in the unseen world of molecules. Such theoretical researches are carried out mainly on the principle that when a hypothe-

sis is admitted within the scope of an exact science we must have exhaustive knowledge of the deductions that can possibly be made from it. Only by correlating the deductions with facts can we judge whether the hypothesis is reliable or not, and experience teaches that deductions seemingly incapable of experimental verification may ultimately not be so at all. Of course, the calculation of the absolute dimensions of molecules is also fascinating in itself. Like certain speculations in astronomy, it shows that there is no limit in the depth of the invisible and inaccessible beyond which scientific thought may not be expected to penetrate.

ABSOLUTE DIMENSIONS OF MOLECULES

The fundamental hypotheses of the kinetic theory of gases lead to the proposition that at any given temperature the volume of a gas is inversely proportional to its pressure. This relation, which had been known as a matter of fact long before it was established deductively, may also be expressed by saying that at any given temperature the product of the pressure and volume of a gas is constant

$$pv = c$$

From the point of view of the kinetic theory, v represents in this formula the empty space within which the molecules of the gas are free to move—i.e., the total volume filled by the gas minus the volume actually occupied by its molecules and minus a certain further fraction of the volume rendered unavailable by the disorderly motions of the molecules. As long as the gas is not too highly compressed, the total volume may be used in the above formula instead of the unknown intermolecular space. For, under low pressures, the difference between the volume of a gas and the volume of its empty intermolecular space is very slight, and hence the error committed amounts practically to nothing. But as the pressure exerted on the gas increases its volume becomes small, and the fraction of that volume rendered unavailable by the bulk of the molecules and by the irregularity of their motion becomes considerable. In other words, the difference between the volume filled by the gas and the available intermolecular space becomes too great to be neglected. At the same time, as the distance between the molecules becomes smaller they begin to exercise a certain amount of attraction upon one another. The result is that the tendency of the gas to expand and the pressure exerted by it upon the containing vessel are appreciably diminished. Under such circumstances the simple formula mentioned above ceases to express the relation between the observed pressure and volume of gases, and the following formula, first constructed by Van der Waals, has to be employed instead:

$$\left(p + \frac{a}{v^2}\right)(v - b) = c.$$

In this formula p denotes the pressure actually observed. To conform to the theoretical law, we add to p the quantity $\frac{a}{v^2}$ depending on the specific mutual attraction of the molecules and therefore also upon the volume occupied by the gas. The factor $(v - b)$ in the formula represents the total volume filled by the gas, diminished by four times the volume actually occupied by its molecules, which are assumed to be

spherical. We thus obtain theoretically a set of ideal conditions, such as are in reality approached only when the volume occupied by the gas is very great. We have, namely, the ideal pressure—i.e., the pressure determined by the motion of the molecules and undiminished by their mutual attraction—and we have the actual volume within which the molecules are free to move, the product is evidently the same as in the case of the simpler law, $p v = c$, under low pressures.

The attraction of the molecules and their volume depend, of course, upon the nature of the gas. By actually determining the pressures and volumes of various gases, numbers may be substituted for c , p , and v in Van der Waals's formula, and thus equations may be obtained containing only two unknown quantities, a and b , the numerical values of which can then be easily computed. The following table shows the values of $\frac{1}{4} b$ (i.e., the fraction of the volume of a gas actually occupied by its molecules) for a few gases and vapors. These values are calculated for the temperature of freezing water (0°C.) and for normal atmospheric pressure.

SUBSTANCE	$\frac{1}{4} b$
Carbonic-acid gas	0.00050
Nitrous-oxide gas	0.00048
Sulphur-dioxide gas	0.00062
Ethylene gas	0.00056
Ethyl-chloride vapor	0.00097
Alcohol vapor	0.00093
Ether vapor	0.00141
Benzene vapor	0.00128
Carbon-disulphide vapor	0.00082

With the aid of these figures the specific gravity of the molecules, say of carbonic acid, may be readily calculated as follows. at 0°C. and under normal atmospheric pressure, 22,405 cubic centimeters of carbonic-acid gas weigh about 44 grams. The volume actually occupied by the molecules being $22,350 \times 0.00050$ cubic centimeters, one cubic centimeter entirely filled by carbonic-acid molecules, with no space between them, would evidently weigh

$$\frac{44}{22,350 \times 0.00050}$$

or about 4 grams, i.e., the specific gravity of a molecule of carbonic acid is about 4. Similarly, the specific gravities of the molecules of other substances are found to be as follows

SUBSTANCE	Sp. gr. of molecules
Nitrous oxide	3.7
Sulphur dioxide	4.6
Ethylene	2.4
Ethyl chloride	2.9
Alcohol	2.2
Ether	2.3
Benzene	2.7
Carbon disulphide	4.3

Considerations of a somewhat more complicated nature lead to the conclusion that at 0°C. , and under a pressure of 1 atmosphere, 1 cubic millimeter of any gas or vapor contains approximately 54,000,000,000,000,000 molecules. Since 1 cubic millimeter of hydrogen weighs 0.00009 milligram, the absolute weight of a single molecule of that gas is therefore

$$\frac{0.00009}{54,000,000,000,000,000}, \text{ which equals}$$

$$0.000,000,000,000,000,000,0166 \text{ milligram.}$$

In a similar manner the absolute weight of a molecule of any other gas or vapor may be readily calculated, by dividing the weight of one cubic millimeter by 54,000,000,000,000,000.

MOLECULAR WEIGHTS

The practical value of the above results is, at least for the present, not nearly so great as that of the purely relative molecular weights constantly used in scientific work. For it is on our knowledge of these relative molecular weights that the modern theories concerning the structure and the mutual relations of chemical compounds, especially the numerous compounds of carbon, are based.

The principle underlying the determination of the relative molecular weights of gaseous or vaporized substances is Avogadro's rule (q.v.), according to which equal volumes of gases (under the same pressure and at the same temperature) contain equal numbers of molecules. Let a given volume of some gas weigh g_1 grams and let, under the same conditions, an equal volume of some second gas weigh g_2 grams. If the weight of a single molecule of the first gas is m_1 and the number of molecules in one volume is n_1 , then the total weight g_1 is obviously the product of m_1 and n_1 , $g_1 = m_1 n_1$. Similarly, if m_2 and n_2 are, respectively, the weight of a single molecule and the number of molecules of the second gas, then $g_2 = m_2 n_2$. But, the two volumes being equal, Avogadro's rule tells us that $n_1 = n_2$. Consequently we have

$$\frac{g_1}{g_2} = \frac{m_1 n_1}{m_2 n_2} = \frac{m_1}{m_2}.$$

In words: the ratio of the weights of two single molecules of different gases is the same as the ratio of the weights of equal volumes of the gases under the same conditions of pressure and temperature. And of course the weights of equal volumes of gases can be readily determined.

Chemists have agreed to call "molecular weight" or "molar weight" the weight of 22.407 liters of any gas or vapor at 0°C. and under a pressure of 1 atmosphere (i.e., 760 millimeters of mercury or, what is the same, a pressure of 1033.3 grams per square centimeter). The volume just mentioned is that occupied by exactly 32 grams of oxygen gas, and so 32 is given as the molecular weight, or molar weight, of oxygen.

In most cases it would be inconvenient, or even impossible, to put vapors at 0°C. under a pressure of 1 atmosphere, most vapors would be liquefied before this pressure is reached. In practice, therefore, the chemist determines the weight of some convenient volume (say 250 or 300 cubic centimeters at most) and under convenient conditions of pressure and temperature. Then, using the gas laws, he calculates what would be the weight of 22.407 liters under the normal conditions. The gas laws are mathematically expressed by the equation

$$PV = RT,$$

where V denotes the volume occupied by the molar weight of the gas under the pressure P and at the temperature T ; the symbol R denotes the so-called gas constant, and its numerical value (when volumes are measured in liters, pressures in atmospheres, and temperatures on the absolute scale) is 0.0820. If we denote by M the molar weight of a gas and by v its specific volume (i.e., the volume occupied by 1 gram), then obviously $V = Mv$. The equation of the gas laws may, therefore, be written:

$$PMv = RT, \text{ or } 0.0820T,$$

and therefore

$$M = \frac{0.0820T}{Pv}.$$

Thus in any given case the molar weight M becomes known if T , P , and v have been determined. This last equation may be referred to as the molar-weight formula.

Turning to the practical methods of carrying out such determinations, we find a method described by Menzies in 1910, which consists in fixing beforehand the temperature T and the specific volume v and determining what the pressure P will be when at the temperature T the gas has been forced to occupy, per gram, the volume v . In 1912 Porter described a practical procedure which consists in fixing beforehand the pressure and the specific volume and determining at what temperature the given vapor will under the pressure P occupy, per gram, the fixed volume v . Both these methods may be found explained in detail in the *Journal of the American Chemical Society*. The purposes of the present sketch will be served best by a description of the older, classic methods, which are still most commonly used in chemical laboratories. In these methods it is T and P that are fixed beforehand, and what is sought is the specific volume v of the gas under those fixed conditions of temperature and pressure. Following are the apparatus used.

A. *Dumas's Apparatus* consists of a light glass flask (of about 250 cubic centimeters' capacity), whose neck is bent and drawn out into a long and narrow point. After carefully weighing the flask, 15 or 20 grams of the substance to be examined are introduced into it, it is then immersed in a bath whose temperature is constant and from 30 to 50 degrees higher than the boiling temperature of the substance in the flask.

DUMAS'S APPARATUS

The substance soon begins to boil, and its vapors drive all the air out of the flask. When the substance has completely evaporated and the flask contains nothing but its vapor, the open end is carefully sealed off with the aid of a blowpipe. On cooling, the flask is cleaned and again weighed. Finally, its end is broken off under water, which rushes into the flask owing to the low pressure within, and when the latter is completely filled it is weighed a third and last time, together with the end that has been broken off. From the three weighings the weight and the volume of the vaporized substance in the apparatus become known. Dividing the volume (expressed in liters) by the weight, we get the specific volume v required by the molar-weight formula given above. The temperature T is that of the bath; the pressure P is that of the air as shown by the barometer, but expressed in atmospheres. Dumas's apparatus can be employed only when a considerable amount of substance is available.

B. *Victor Meyer's Apparatus* consists of a wide glass tube a , the lower end of which is closed and the upper joined on to a long glass tube b of smaller diameter. The narrow tube is provided, near its upper end, with a side tube c . During a determination this apparatus is placed in a long test-tube-like vessel d containing some liquid boiling at a higher temperature

than the substance to be experimented upon. A little of the substance is carefully weighed in a small glass capsule; the rubber stopper closing the top end of the apparatus is for an instant removed, and the weighed capsule is dropped in. The substance quickly evaporates, driving out through the side tube c a volume of air equal to the volume of its own vapor. The air is collected in a graduated tube, and thus the volume of the vaporized substance becomes known. Di-

VICTOR MEYER'S APPARATUS

viding the volume by the weight employed gives the required specific volume. The temperature T is that of the graduated tube at the time of observing the volume, the pressure P is that prevailing within the graduated tube at the same time—usually the same as the barometric pressure outside. Victor Meyer's apparatus requires but a very small quantity of the substance that is to be experimented upon, which is an important advantage, for the preparation of large quantities of a substance may often involve great loss of time and also be very difficult.

Effusion Method. An entirely different method of determining the relative molar weights of gaseous substances is based on a law discovered by Graham. When different gases are, under similar conditions, allowed to escape through a small opening, the lengths of time taken by equal volumes of the different gases to escape are proportional to the square root of the weights of those equal volumes. In other words, the weights of equal volumes of different gases are proportional to the square of the times of effusion. But as, according to Avogadro's Rule, the weights of equal volumes are proportional to the molecular weights, we may say: *the molecular weights of gases or vapors are proportional to the square of the times of effusion*, a proposition which may be called the *Graham-Avogadro law*. Denoting the times of effusion of two given

gases by t_1 and t_2 , and their molecular weights by M_1 and M_2 , we have

$$\frac{M_1}{M_2} = \left(\frac{t_1}{t_2}\right)^2.$$

In practice one chooses as a reference substance some gas of known molecular weight, say oxygen, with the molecular weight 32 (M_2 in our formula), and determines the time of effusion of a suitable volume of it under practically convenient conditions of temperature and pressure (the time t_2 in our formula). Then one determines the time of effusion (t_1) of the gas whose molecular weight (M_1) is required. The latter is then given by the expression

$$M_1 = M_2 \left(\frac{t_1}{t_2}\right)^2.$$

A valuable advantage of the method consists in the fact that it requires but very small amounts of substance, so that Debiene was able to use it in the case of so scarce a substance as the emanation of radium. The method is much used as a test in the illuminating-gas industry. The gases are allowed to effuse out of a glass tube the open lower end of which is immersed in a cylinder of mercury, the upper end being sealed with a disk of platinum having an effusion hole whose diameter should be at most one four-hundredth of the thickness of the disk.

Determination of Molecular Weights by Direct or Indirect Measurement of the Osmotic Pressure of Solutions. As Van't Hoff has shown, substances in solution exert an "osmotic pressure" which is in a sense analogous to the pressure of gases or vapors and in very dilute solutions obeys the same law as the pressure of gases. If we denote by π the osmotic pressure, by V the volume (in liters) of solution containing the molar weight of the dissolved substance, and by T the absolute temperature, we thus have

$$\pi V = RT,$$

where R is again the "gas constant" and has the value 0.0820. If, further, we denote by v the volume of solution containing *one* gram of the dissolved substance, and by M the molar weight of the latter, our equation may be written

$$\pi v M = RT,$$

from which we obtain a molar-weight formula analogous to the one given above for gases and vapors: viz.,

$$M = \frac{0.0820T}{\pi v}.$$

Thus, by measuring the osmotic pressure π of a solution of a given dilution at a given temperature, we can ascertain the molar weight M of the dissolved substance. But as the direct measurement of osmotic pressure is exceedingly difficult, indirect methods are usually employed by the investigator. When a substance enters some solvent, say water, it changes the characteristic freezing and boiling temperatures of the solvent: the freezing point is lowered, the boiling point is raised. Now, the depression of the freezing point and the elevation of the boiling point have been shown to be proportional to the osmotic pressure of the solution. Therefore, instead of directly carrying out a determination of osmotic pressure, the chemist measures the change of freezing or boiling temperature caused by dissolving a given weight of substance. The laboratory methods commonly employed in de-

termining the depression of freezing point and the rise of boiling point are described in the articles FREEZING POINT and BOILING POINT. See also SOLUTION, AVOGADRO'S RULE.

The osmotic-pressure methods just referred to are of the greatest practical importance to the chemist, for, while the number of substances that can be vaporized (and hence whose molecular weights can be determined by the vapor-density method) is limited, practically all substances can be obtained in solution.

Chemical Methods. It is often possible to determine the molecular weight of a substance by purely chemical methods, i.e., by studying its formation and chemical transformations. Consider, e.g., acetic acid. Analysis leads us to assign to it one of the following formulas: CH_3O , $\text{C}_2\text{H}_3\text{O}_2$, $\text{C}_3\text{H}_5\text{O}_3$, $\text{C}_4\text{H}_7\text{O}_4$, etc., corresponding to the molecular weights, 30, 60, 90, 120, etc. (See CHEMISTRY.) The fact that acetic acid is readily formed from ordinary alcohol, whose molecule ($\text{C}_2\text{H}_5\text{O}$) cannot possibly contain less than two carbon atoms (because for every two carbon atoms it contains a single atom of oxygen)—this fact renders it probable that the molecule of acetic acid, too, contains two carbon atoms. In other words, it becomes probable that $\text{C}_2\text{H}_3\text{O}_2$ is the formula, and hence 60 the molecular weight, of acetic acid. That CH_3O cannot be the formula of acetic acid is shown by the fact that the molecule ($\text{C}_2\text{H}_3\text{O}_2\text{Ag}$) of silver acetate, a compound made from acetic acid, cannot possibly contain less than two carbon atoms (because for every two carbon atoms it contains a single atom of silver). To sum up, the molecular weight of acetic acid is shown by purely chemical methods to be *probably* and *at least* 60. More exact information chemical methods cannot furnish. The *physicochemical* methods described above lead usually to much more definite conclusions. And because the molecular weights found by physical methods (i.e., on the basis of Avogadro's rule) are invariably found to be in perfect agreement with chemical facts, the molecular theory of the physicist can be, and is, inseparable from the atomic theory of the chemist, the two theories widening each other's scope of usefulness and together forming a powerful instrument for the study of nature.

See CHEMISTRY, and consult the literature of theoretical and physical chemistry recommended in that article. See also ATOMIC WEIGHTS, AVOGADRO'S RULE, BOILING POINT, FREEZING POINT; GASES, GENERAL PROPERTIES OF, SOLUTION.

MOLENAER, mō'le-nār, JAN MIENSZE (1605-68). A Dutch genre painter, born at Haarlem. He is thought to have been a pupil of Frans Hals, whom he imitated in his early works. Later he was influenced by Rembrandt. His pictures are usually scenes of peasant life, painted with much brilliancy and variety of characterization, combined, in his later works, with compactness of composition and subordination of local color to a warm brown tone. Good examples of his early manner are a "Scene in a Painter's Studio" (Berlin Gallery) and "A Family Party" (Van Loon collection, Amsterdam). In his later manner are "Grace before Meat" (Rijks-Museum, Amsterdam) and "A Flemish Wedding" (Haarlem). In 1636 he married Judith Leyster, one of the few distinguished women painters of that day.

MOLE RAT. One of the rodents of the family Spalacidae, which spend their lives moving

about through the soil like moles and have assumed many molelike features and traits. The countries about the Mediterranean contain the typical mole rat (*Spalax typhlus*), a queer, yellowish-brown creature about the size of a rat, with the minute eyes completely covered by the skin and the ears and tail rudimentary. Its fur lies either way, and the animal seems able to dig backward as well as forward. It constructs tunnels like those of moles, throwing out heaps of earth at intervals. It is common in Egypt, where it burrows in sandy soil full of asphodels and hyacinths, whose bulbs it eats or stores in large quantities in deep chambers underground. South Africa contains several closely related animals of the subfamily Bathyerginae, one of which, the coastwise strand mole (*Bathyergus maritimus*), is a foot long and numerous. Its eyes are still open, but are mere beads, of little use. Still stranger relatives of these are the sand rats (*Heterocephalus*) of Somaliland, which are about the size of mice, almost naked and blind. They remain always underground, tossing the sand out of the crater-like openings from their tunnels, but never themselves coming to the surface.

MOLESCHOTT, mō'le-shōt, JACOB (1822-93). A physiologist and writer on dietetics, born at Herzogenbusch, Holland. He studied at Heidelberg and began the practice of medicine (1845) at Utrecht. Thence he removed, in 1847, to Heidelberg, where for seven years he lectured on physiology at the university. A real or supposed tendency towards materialism in his lectures alarmed the authorities, and in consequence he resigned. In 1856 he was appointed professor of physiology at the polytechnic at Zurich and in 1861 at Turin. He was called upon to fill the same chair in Rome in 1879, three years earlier he had been appointed a Senator of the Kingdom. He was a popular lecturer, and his physiological researches, particularly in regard to diet, muscular formation, the blood, and bile, are of value. Without asserting the impossibility of a spiritual life, he explained the origin and condition of animals by the working of physical causes. His characteristic formula was "No thought without phosphorus." His most important works are: *Physiologie der Nahrungsmittel* (1850, 2d ed., 1859), *Physiologie des Stoffwechsels in Pflanzen und Thieren* (1851); *Der Kreislauf des Lebens* (1852, 5th ed., 1887), *Untersuchungen zur Naturlehre des Menschen und der Tiere* (1856-93, continued after his death by Colosanti and Fubini), *Lehre der Nahrungsmittel* (1858), *Sulla vita umana* (1861-67), a collection of essays, *Physiologisches Skizzenbuch* (1861), *Consigli e conferiti nei tempi da colera* (1864, 3d ed., 1884), *Sull' influenza della luce mista e cromatica nell' esalazione di acido carbonico per l' organismo animale* (1879), with Fubini *Kleine Schriften* (1880-87) contains his collected essays and addresses. After his death appeared his autobiography *Fur meine Freunde* (1894).

MOLE SHREW. A book name for the common North American short-tailed shrew (*Blarina brevicauda*). See **SHREW**.

MOLESKIN (so called from its soft, thick shag, like the fur on a mole). An extra-strong double-twilled fustian, dyed after the pile is cut. See **FUSTIAN**.

MOLESWORTH, mōlz'wërth, SIR GUILFORD LINDSEY (1828-). An English civil engineer. He was educated at the college of civil

engineers at Putney. In 1852 he became chief assistant engineer of the London, Brighton, and South Coast Railroad, but soon resigned to conduct the constructions at Woolwich Arsenal during the Crimean War. After practicing his profession in London for a number of years he went to Ceylon in 1859 and in 1862 became chief engineer of the government railroad in that island. In 1867 he was appointed Director of Public Works and Director General of Railways to the Ceylon government and from 1871 to 1889 was consulting engineer to the Indian government with regard to State railways. He received medals from the British government for his services during the Afghan War and the Burma War. In 1904 he was president of the Institution of Civil Engineers. He published a *Pocket-book of Engineering Formulae* (27th ed., 1914), which is regarded as authoritative. Among his other publications are: *State Railways in India* (1872); *Metrical Tables* (1880, 4th ed., 1909); *Imperialism in India* (1885); *Silver and Gold* (1891), *Our Empire under Protection and Free Trade* (1902), *Economic and Fiscal Facts and Fallacies* (1909).

MOLESWORTH, MARY LOUISA, néc STEWART (1842-). An English writer of books for young people, born in Holland and educated in Switzerland. She spent some time in France and Germany. She wrote several novels while young, and in 1875 published her first book for children. As a writer of juveniles her success was immediate. Through a delightful verisimilitude and an easy grace of style she found wide audience for many volumes, among which are *Carrots* (1876), *Tapestry Poems* (1879), *The Green Casket* (1890), *The Laurel Walk* (1898), *The Grim House* (1899); *Jasper* (1906); *The Story of a Year* (1910), *Fairies Afield* (1911). Of *The Cuckoo Clock*, a classic of its kind, a new and handsome edition was published in 1914.

MOLESWORTH, SIR WILLIAM (1810-55). An English statesman, known as the originator of colonial self-government. He was born in London, May 23, 1810, and was descended from an old Cornish family of large possessions. He early showed promise of distinction, although his university career at Cambridge was cut short by his sending a challenge to his tutor to fight a duel. He continued his education at the University of Edinburgh and subsequently at Munich. He succeeded to the family baronetcy in 1823. After making the usual tour of Europe he returned home and threw himself in 1831 into the movement for parliamentary reform. Next year, although only just of age, he was elected member of Parliament for East Cornwall. He sat for Leeds from 1837 to 1841. He was the friend of Bentham, James Mill, and George Grote and was regarded as the parliamentary representative of the philosophical radicals. In 1839 he commenced and carried to completion, at a cost of £6000, a reprint of the entire miscellaneous and voluminous writings of Hobbes, which were placed in most of the English university and provincial libraries. The publication did him great disservice in public life, his opponents endeavoring to identify him with the freethinking opinions of Thomas Hobbes in religion as well as with the philosopher's conclusions in favor of despotic government. In 1845 he was elected to Parliament for Southwark, which he continued to represent until his death. He was the first to call attention to the abuses connected with the transportation of criminals

and as chairman of a parliamentary committee brought to light the horrors of the convict system. He pointed out the maladministration of the Colonial Office, explained the true principles of colonial self-government, prepared drafts of constitutions for remote dependencies, and made investigations as to the true and natural relations between the Imperial government and its colonial empire. Molesworth's views, although at first unwelcome to the legislature, were adopted by successive administrations and became part of the colonial policy of Great Britain. In January, 1853, he accepted the office of First Commissioner of Public Works in the administration of the Earl of Aberdeen and in 1855 the post of Secretary of State for the Colonies in that of Viscount Palmerston. Before he could give proof of his administrative capacity he died, Oct. 22, 1855. He established the *London Review*, a new quarterly, in 1835 and afterward purchased the *Westminster Review*, the organ of the philosophical radicals. The two quarterlies being then merged into one, under the title of the *London and Westminster*, Molesworth contributed to it many articles on politics and political economy. The enduring influence of his views was attested by the fact that his speech on the abandonment of the Orange River Territory in 1854 was advanced by the Boer government in 1878 as the chief argument for the British withdrawal from the Transvaal. Consult M. G. Fawcett, *Life of Sir William Molesworth* (London, 1901).

MOLESWORTH, WILLIAM NASSAU (1816-90). An English clergyman and historian. He was born at Millbrook, near Southampton, graduated M.A. at Cambridge in 1842, and entered the English church. He was presented to St. Andrews, Manchester, in 1841 and to St. Clement Spotland, Rochdale, in 1844. He was a strong advocate of cooperation and had an interest in the well-known experiment of cooperation in the industries at Rochdale. Molesworth's most important writings are: *Essay on the French Alliance* (1860); *A History of the Reform Bill of 1832* (1864); *History of England from the Year 1830 to 1874* (3 vols., 1874); *History of the Church of England from 1660* (1882).

MOLFETTA. An episcopal city in the Province of Bari delle Puglie, Italy, 16 miles northwest of Bari on the Adriatic Sea (Map: Italy, F 4). The city is pleasantly situated, and the old section, surrounded by walls studded with towers, presents a very striking aspect when approached from the sea. It has a twelfth-century Byzantine cathedral, a new cathedral, a lyceum, a Gymnasium, a seminary, a library with 22,000 volumes, a museum, and a theatre. A spacious harbor adds to the attractiveness of the new town and serves to render it an important commercial centre. There are extensive manufactures of flour, vermicelli, soap, bricks, and wine, and a large export trade in oil, almonds, carobs, nitre, and fish. Pop. (commune), 1901, 40,135; 1911, 43,263.

MOLIÈRE, mō'lyâr'. The name assumed by JEAN BAPTISTE POQUELIN (1622-73). The greatest dramatist and perhaps the greatest writer of France. Molière was born Jan. 15, 1622, in Paris. His father was a well-to-do tradesman and titular tapissier valet de chambre of the King, an office held later by Molière. Molière's mother died in 1632. He was educated by the Jesuits at the Collège de Clermont (1636-41) and came into touch with some literary men

(Luillier, Chapelle, Gassendi). Some say he went to Orléans to study law; others that he studied theology at the Sorbonne; and others still that he went with the court as a minor officer to Narbonne and formed Bohemian associations, among them being the Bérarts, whose daughter, Armande, he afterward (1662) married. In 1643 Molière abandoned his office and family prospects for the stage. After two unsuccessful theatrical ventures he was imprisoned for debt (1645), and in the winter of 1646-47 he became chief of a troupe of players which for 12 years (1647-58) acted in the provinces. In October, 1658, Molière played for the first time before the King, acting in *Nicomède* and *Le docteur amoureux*. In these years of wandering Molière learned the practical side of his profession; as dramatic adapter and composer he learned its literary side. More than all, he learned human nature by observing the provinces in the excited period of the Fronde from the vantage ground of an actor who could view objectively the panorama of high and low life; and at the same time as manager he gained seriousness from responsibility—a seriousness that gives his satire sometimes a tinge of bitterness and always the seal of superiority.

On Molière's return to Paris (1658) he had the prestige of provincial success, and he had written two plays which he thought worthy of preservation, *L'Étourdi* and *Le dépit amoureux*. These were sufficiently superior in their easy, natural dialogue and the alert brilliancy of their style to win for him a court patronage which he never lost and a popularity which assured his troupe a permanent support in Paris. This work was, however, Italian in spirit, but in 1659 Molière discarded, with *Les précieuses ridicules*, the stereotyped pattern, with its stock characters, and inaugurated a new era in comedy with the first dramatic satire on cultured society in France. Not the affected language and manners of the Hôtel de Rambouillet, but those, rather, of its bourgeois imitators, who abounded in Paris, were ridiculed with such infinite good humor that the play has not yet lost its comic force.

As typical of Molière's genius, though of a quite other phase of it, is *Sganarelle* (1660), the first of those gay yet profound farces that still hold the stage because they evoke first a laugh and then a thoughtful smile. He was still feeling his way, and *Don Garce de Navarre* (1661), a five-act tragic-comedy in verse, marks a relapse to the traditions of the Spanish stage. *L'École des maris* (1661) shows, however, a decided advance. The plot is from Terence, but the aged lover is treated with a pathos and a fidelity to nature that bear the print of genius. From this point onward it becomes necessary to distinguish the work of Molière the born dramatist from that of Molière the theatrical manager and purveyor of court entertainments. He wrote very much in the latter capacity that he would not have written in the former. The financial success and prosperity of his company were also an obligation not to be neglected. To satisfy this he wrote conventional comedies and extravagant farces, and to please the royal taste he composed for festivals at Versailles some 13 semioperatic comedies, in which the text was only a pretext for dancing and singing, wherein high dignitaries of the court sometimes took part. He was distracted, too, by bitter attacks which he condescended occasionally to answer in his farces, though such controversy seems to

have spurred him to his greatest efforts and lent a keener edge to his attacks on hypocrisy and pharisaism.

Les fâcheux (The Bores), a comedy ballet in three acts, acted at Vaux (August, 1661) for Fouquet on the eve of his downfall, illustrates this diversion of genius and is interesting because Louis XIV suggested one of its scenes, *L'Ecole des femmes*, which follows (December, 1662), is an exhibition of Molière's mature art as a satirist aiming at social and moral reformation, and *La critique de l'école des femmes* with *L'Impromptu de Versailles*, which immediately follow this in 1663, are answers to the criticism that it evoked—criticism embittered by Molière's success and given a handle by his marriage (February, 1662) to Armande Béjart. She was probably the sister of an old member of his company, herself an actress, and her indiscretions were a source of constant vexation and jealousy to Molière.

L'Ecole des femmes is the first of Molière's great comedies, the first great serious comedy of French literature. It deals with the part of woman in society and her proper preparation for it and treats both in a spirit more liberal than the France of to-day wholly approves. This alone would have insured violent criticism, but to it was added a bold and contemptuous satire on the prevalent materialistic views of future punishment. The play was denounced, not merely as vulgar and obscene, but as impious, e.g., by Boursault in his *Portrait du peintre Boursault* was answered by name in the merciless *Impromptu de Versailles*, where, too, the rival company of the Hôtel de Bourgogne were parodied and ridiculed.

This controversy had by no means subsided when Molière, after the trivial *Mariage forcé* (1664) and *La princesse d'Élide* (1664), two comedy ballets, provoked redoubled fury by two attacks on hypocrisy, *Tartufe* and *Don Juan*, or *Le festin de Pierre*. Of the former, only three acts were presented in 1664. Jesuits and Jansenists alike winced at it, and five years of persistent effort barely extorted permission to present the masterpiece as a whole. *Don Juan* appeared in February, 1665, and in August the King significantly adopted Molière's troupe as his own. But even his sympathy had its limits, and this appointment was perhaps in the nature of a consolation for the suppression of *Don Juan* in the midst of a prosperous run. The full text of this play is preserved to us only in a copy kept by the chief of police.

While awaiting permission to act *Tartufe* in its entirety, with *Don Juan* forbidden, Molière wrote *L'Amour médecin* (1665), a clever attack on the medical practitioners of his day, and *Le misanthrope* (July, 1666), in which his rivals and critics rightly discerned "a new style of comedy," wherein the constant motive forces of universal human nature are shown modified by the highest refinement to which civilization had yet attained. The easy optimist is set off against the noble pessimist, and a social school for scandal supplies the lighter comedy and offers a pillory for fops and poetasters.

About this time Molière's health seems to have begun to fail. Cold and fatigue brought on a disease of the lungs, and what he says of the distracted and pedantic doctors of his day, when superstition and tradition were struggling with one another and with half-understood fragments of science, lent sad point to the *Médecin malgré*

lui, the second of his noteworthy attacks on the quackery of that time. Then follows a period of relaxed activity with only three comedy ballets, *Mélicerte* (1666), *Le pastoral comique* (1667), and *Le Sicilien* (1667), followed by the comparatively insignificant *Amphitryon* (1668), a coarse yet witty adaptation from Plautus. In July of 1668 Molière shows his old self again in *George Dandin*, an immortal type of the man who marries above his social station and suffers the consequences with rueful self-accusation. The story is at least as old as Boccaccio, but Molière's squararchic Sotenvilles are his creation and an abiding delight.

This little master stroke was followed in September, 1668, by a masterpiece, *L'Avare*, whose central figure, the caricatural Harpagon, is one of Molière's greatest studies of vitiated character. Several lighter pieces followed, first *M. de Pourcuaugnac*, a comedy ballet with much railery at the physicians; then *Les amants magnifiques* (1670), a persiflage of astrological extravagances, then that excellently comic farce, *Le bourgeois gentilhomme* (1670), then *Psyché* (1671), a tragedy ballet, written in collaboration with Corneille and Quinault. The music was by Lulli. Then followed the lively *Fourberies de Scapin* (1671) and finally the *Comtesse d'Escarbagnas*, a study of provincial manners and an attack on financiers, heralding thus Lesage's *Turcaret*. Much greater than any of these are the last legacies to French comedy of the dying Molière, *Les femmes savantes* (1672) and *Le malade imaginaire* (1673). The former recurs to the subject of the *Précieuses ridicules* and with ripest power attacks the admirers of pedantry and the affectations of learning. The latter, primarily a last gibe at physicians, is important for its widening of satiric comedy to include the perversion of childhood.

Le malade imaginaire was first acted Feb. 10, 1673. On the seventeenth Molière undertook the part of the hypochondriac invalid, though suffering from what he called a fluxion. In a fit of coughing he burst a blood vessel on the stage and died at his house a half hour later. His enemies pursued him in death. He was buried half clandestinely. The Archbishop of Paris, thinking Molière's ethics irreconcilable with Christianity, forbade public ceremony, but the command was evaded. The body was laid in St. Joseph's churchyard, but the site of the grave is uncertain.

No dramatist, save perhaps Shakespeare and Aristophanes, ever joined so much wit to so much seriousness as did Molière. There is often a pathetic, even a sad background to his scenes, but this never gets the better of his healthy humor. This humor depends for its effects not so much on plot as on revelation of character, and the satire is directed not so much against the excesses of nature as against those social faults or conventions which disguise or suppress nature. He is more apt to typify phases of character than to present complex natures, and in doing this he gave direction to the development of French comedy for several generations. There is no question that in the analysis of character Shakespeare, even Corneille, is more profound, and they tell a story with more dramatic force, but neither Corneille nor Racine gives so accurately picturesque, so fascinatingly truthful a portrait of French society as we find in the naturalistic, observant humorist, Molière.

Of Molière's *Works* the first edition was by his

friends and fellow actors, La Grange and Vinot (1682); by far the best is Despois and Mesnard's (11 vols., 1873-96). Excellent also are the editions of A. France (7 vols., 1876-91) and Monval (10 vols., 1879-89). One of the first English translations of Molière's *Works* appeared in London in 1748 in 10 volumes. There is a good cheap edition in two volumes with a study by Sainte-Beuve and English translations by Van Laun (6 vols., London, 1875-77), Wall (3 vols., 1876-77, 1891-1901), and K. P. Wormeley (Boston, 1894-97). Waller published an English and French edition (8 vols., Edinburgh, 1907). *Plays from Molière* translated by English dramatists, edited by Henry Morley, appeared in London in 1883. Consult for Molière's style, vocabulary, and usage, C. L. Lavet, *Lexique de la langue de Molière* (Paris, 1895-97). Of the *Lives* of Molière that of Mahrenholtz, in German (Heilbronn, 1881), is most comprehensive. Consult also the periodical *Le Moliériste* and the biographies by F. Lothessen (Frankfort, 1880), Moland (Paris, 1886), Gustave Larroumet (ib., 1886), Paul Mesnard (ib., 1889), Desfeuilles (ib., 1900), and Heinrich Schneegans (Berlin, 1901), the full *Bibliographie moliéresque*, by Paul Lacroix (Paris, 1875): L. H. Vincent, *Molière* (Boston, 1902). H. M. Trollope, *Life of Molière* (New York, 1905). H. C. Chatfield-Taylor, *Molière* (ib., 1906), Martineche, *Molière et la théâtre espagnol* (Paris, 1906), E. Rigal, *Molière* (1910), Brander Matthews, *Molière, his Life and his Works* (New York, 1910), M. L. Wolff, *Molière, der Dichter und sein Werk* (Munich, 1910), D. H. Miles, *Influence of Molière on Restoration Comedy* (New York, 1910); Emile Faguet, *Rousseau contre Molière* (Paris, 1912); also Currier and Gay (comps.), *Catalogue of the Molière Collection in Harvard College Library* (Cambridge, Mass., 1906).

MOLIÈRE, HOUSE OF. See COMÉDIE FRANÇAISE.

MOLINA, mò-lé'nà, ALONSO DE (c.1510-c.85). A Spanish missionary in Mexico. He was born at Escalona, Spain, early went to Mexico, learned the Aztec language, and was interpreter to the Franciscan friars. He subsequently joined the Franciscan Order and rose to be the superior of Santo Evangelio Province. His publications include translations into Aztec of the catechism and of a confessional manual, and a grammar of that language. His greatest work is his *Vocabulario en lengua castellana y mexicana* (1555; rev. ed., 1571), containing both Spanish-Mexican and Mexican-Spanish parts.

MOLINA, COUNT OF. See CARLOS, DON

MOLINA, JUAN IGNAZIO (1740-1829). An historian of Chile. He was born at Talca, Chile, studied in a Jesuit college at Santiago, taught there and at Bocalomo, and at the age of 20 became librarian at Santiago. He joined the Jesuits and on their expulsion from the country went to Italy in 1767. For several years he was a priest at Imola and in 1774 went to Bologna, where he taught in a private school. His views of the vitality of matter and of the sensibility of metals brought him into disfavor with the Church and he was removed from his professorate for a time. A legacy which Molina received in 1815 was devoted entire to the foundation of a library in Talca. Works: *Compendio di storia del Chile* (1776); *Saggio sulla storia naturale del Chile* (1782); *Saggio della storia civile del Chile* (1787).

MOLINA, LUIS (1535-1600). A celebrated Spanish theologian, specially famous in the history of the controversy about divine grace. He was born at Cuenca in New Castile, entered the Jesuit Order at the age of 18, studied and then taught theology and philosophy at the College of Coimbra in Portugal, and was later appointed professor of theology at Evora, where he taught for 20 years. He then returned to Spain to devote himself to literary work and six months before his death was appointed professor of moral theology in a Jesuit school in Madrid. His fame rests mainly upon his celebrated work, *Concordia Liberi Arbitrii cum Granta Donis*, first printed in Lisbon in 1588, but not published until the following year. It was the first work of formal scholastic theology produced by the Jesuit Order, as it was the first written by any of them in the nature of a commentary on St. Thomas Aquinas, and scarcely any theological work has ever excited so widespread and lasting a controversy. The latest edition of it is by Lethellieux (Paris, 1876). (For further details of this controversy, see MOLINISM.) Among his other works are his commentaries on the first part of the *Summa* of Aquinas (1592) and *De Justitia et Jure* (1592). His complete works were published in seven volumes (Venice, 1614) and with biography and bibliography in five volumes (Cologne, 1733).

MOLINA, TIRSO DE. A pseudonym of the Spanish dramatist Gabriel Téllez (q.v.).

MOLINARI, mò-lé'nà're', GUSTAVE DE (1819-1911). A Belgian political economist, born at Liège. He became a physician at Brussels, wrote works on homœopathic medicine, removed to Paris (1843), where he gained some distinction as a radical journalist, but was obliged by the coup d'état (1851) to return to Belgium, and there was appointed professor of political economy in the Musée Royal de l'Industrie Belge (Brussels) and later at Antwerp. In 1857 he went back to Paris, and in 1874 he was elected corresponding member of the Academy of Moral and Political Sciences of the Institute of France. He became editor of the *Journal des Débats* (1867) and of the *Journal des Economistes* (1881). From 1873 to 1875 he traveled and published his observations on the United States in *Lettres sur les Etats-Unis et le Canada* in 1875. He assisted in establishing the journals *L'Economiste Belge* and *La Bourse du Travail* and published numerous works, including *Etudes économiques* (1846), *Questions d'économie politique et de droit public* (2 vols., 1861); *L'Evolution économique du XIXème siècle* (1880); *Le droit de la paix et de la guerre* (1887); *Comment se résoudra la question sociale* (1896), *Questions économiques à l'ordre du jour* (1906); *Théorie de l'évolution* (1908).

MOLINE, mò-lén'. A city in Rock Island Co., Ill., on the Mississippi and Rock rivers and on the Hennepin Canal, 3 miles east of the county seat, Rock Island, which is opposite Davenport, Iowa, the three cities being closely connected by steam and electric railroads, ferries, and bridges (Map. Illinois, D 2). The railroads entering the city are the Chicago, Milwaukee, and St. Paul, the Chicago, Rock Island, and Pacific, and the Chicago, Burlington, and Quincy. Moline derives excellent water power from the Mississippi, which is here dammed from the shore to the mid-river island,

an advantage which has contributed materially to the city's importance as an industrial centre. Coal is mined in the vicinity, and besides extensive automobile and plow works, there are manufactories of steel, elevator and milling machinery, scales, pianos, organs, furniture, carriages and wagons, steam engines, saw and planing mill products, foundry and machine-shop products, and pumps. A large trade is carried on in machinery, farming implements, grain, lumber, etc. Moline has a high-school library and a large public library, a park system comprising 150 acres, a fine city hall, and a well-equipped city hospital. Of interest in the vicinity are Black Hawk Watch Tower, Campbell's Island, and the Rock Island Arsenal. Moline has adopted the commission form of government. The water works are owned and operated by the municipality. Pop., 1900, 17,248; 1910, 24,199, 1914 (U. S. est.), 26,403.

MOLINET, mò'lé'ná', JEAN (?-1507). A French poet and troubadour. He was a canon of the college church of Valenciennes, chronicler of the house of Burgundy, and librarian to Margaret of Austria, then Regent of the Low Countries. Molinet was one of the "grands rhétoriqueurs", his poetry is pedantic, heavy, and complicated in rhythm, and his prose full of Latinisms, while both are replete with astonishing puerilities. A volume of his poems was printed in 1531, and his chronicles were published by Buchon in 1828. He also made a prose translation of the *Roman de la rose* (1503).

MOLINISM. The name commonly applied to the doctrine of Luis Molina on the relation between divine grace and the will of man. The problem which it is meant to solve is as old as the fourth century, when it led to the well-known Pelagian controversy. (See PELAGIANISM.) In reconciling with the freedom of man's will the predestination of the elect to happiness and of the reprobate to punishment, Molina asserts that this predestination is consequent on God's foreknowledge of how man's will would act under any conceivable combination of circumstances, and that therefore it in no way affects the freedom of the particular actions. Accordingly, God gives to all men sufficient grace to enable them to live virtuously and merit happiness, certain individuals freely respond to this grace, while others resist it, God foresees both courses and founds His decrees upon this knowledge. This exposition was assailed in the schools first as a revival of the Pelagian heresy, inasmuch as it appears to place the efficacy of grace in the consent of man's will, and thus to recognize a natural power in man to perform supernatural acts, secondly, as setting aside altogether what the Scriptures represent as the special election of the predestined, by making each individual the arbiter of his own predestination or reprobation. The Dominicans, who were never very friendly to the Jesuits and who felt that this teaching misrepresented that of their great authority, St Thomas, entered fiercely into controversy; the name of Thomists is generally applied to them and to the other antagonists of Molina. The dispute was brought under the cognizance of the Inquisitor General of Spain, who referred it to Pope Clement VIII. In 1597 he appointed the celebrated Congregatio de Auxiliis Divinae Gratiae to consider the entire question; the commission consisted of 11

members, representing different orders and schools. Before the death of Clement VIII in 1605 it had already held 68 sessions, and 17 more were held under Paul V, still without leading to any very definite result. Paul V finally dissolved it after nine years of anxious consultation and in 1611 forbade anything to be printed on either side without license from the Inquisition. The decree was confirmed by Urban VIII in 1625 and again in 1641, with special reference to a new outbreak of controversy occasioned by the publication of the *Augustinus* of Jansenius. The Jesuits had never committed themselves to Molina's doctrine as a whole, and they came gradually to a general support of a modified form of it known as congruism, taught especially by Suarez (q.v.) and Bellarmine (q.v.). While, according to the supporters of this teaching, Molina had placed the effective power of grace altogether in the assent of the free will, Suarez found it rather in the perfect harmony (*congruentia*) of grace with the character, temperament, tendencies, and habits of the individual. The real congruism of Suarez is, however, not so much a departure from the teaching of Molina as a clearer and more precise definition of it. Consult Gerhard Schneemann, *Die Entstehung und Entwicklung der thomistisch-molinistischen Kontroverse* (Freiburg, 1880); De Régnon, *Baïes et Molina: histoire, doctrines, critique métaphysique* (Paris, 1883); Gayraud, *Thomisme et Molinisme* (ib., 1890).

MOLINO DEL REY, mò-lé'nò dèl rà'è (Sp., King's Mill). A series of massive stone buildings about 3000 feet west of Chapultepec (q.v.) and about 3 miles southwest of the city of Mexico; the scene, Sept. 8, 1847, of the most hotly contested battle of the war between the United States and Mexico. At the close of the armistice which followed the battle of Churubusco (see MEXICAN WAR) General Scott determined to destroy a cannon foundry and some military supplies supposed to be located here and on September 7 ordered an attack. Early on the following day General Worth, at the head of about 3100 men, assaulted the buildings, which had been strongly fortified and were then garrisoned by a force of 4000. After suffering severely from the artillery fire the Americans finally drove the Mexicans from their position and held the fortifications for the rest of the day, in spite of a large Mexican reinforcement sent forward by Santa Anna. Of the Mexicans 690 were made prisoners and probably as many as 3000 were killed or wounded. The American loss was heavier, in proportion to the force engaged, than in any other battle during the war, 116 being killed and 671 wounded. The Mexicans, supposing the attack to be part of a movement against Chapultepec (q.v.), regarded the engagement as a victory for their side and still commemorate it as such. Consult H. H. Bancroft, *History of Mexico*, vol. v (San Francisco, 1885); Wilcox, *History of the Mexican War* (Washington, 1892); R. M. McElroy, *The Winning of the Far West* (New York, 1914).

MOLINOS, mò-lé'nòs, MIGUEL DE (1640-96). A Spanish mystic and leading representative of the doctrines of Quietism. He was born at Patacina in Aragon of noble parents and pursued a course of theological studies at Pamplona and Coimbra, from which university he received the degree of doctor of divinity. Hav-

ing been ordained priest, he acquired a high reputation as a director of conscience and a master of the spiritual life. He went in 1669 to Rome, where he made the same impression and won the friendship of many distinguished people. He declined all preferment and devoted himself entirely to the direction of souls. In 1675 he published an ascetical treatise in Spanish, under the name of *The Spiritual Guide*, which had a wide popularity and was translated into many languages (into English 10 years later, reprinted at Glasgow, 1885). His leading principle was that of habitual abstraction of the mind from sensible objects, with a view to gain, by passive contemplation, not only a profound realization of God's presence, but so perfect a communion with Him as to end in absorption into His essence. The dangers of his doctrine (for an examination of which and its subsequent history, see *QUIETISM*) were pointed out by not a few, among them the distinguished Jesuit Segneri, but so great was the popularity of Molinos that no decisive steps were taken until, in 1685, he was cited before the Holy Office and submitted to close imprisonment and examination. The Inquisition finally condemned 86 propositions extracted from his writings and in a decree, which was confirmed a few months later by a bull of Pope Innocent XI, required him publicly to abjure them and sentenced him to imprisonment for life. He underwent public penance and was admitted to absolution, but was detained until his death in 1696. Consult John Bigelow, *Molinos the Quietist* (New York, 1882), and J. S. Short-house, *Golden Thoughts from the Spiritual Guide of Molinos* (London, 1883).

MOLIQUE, mó'lék', WILHELM BERNHARD (1802-69). A German violinist and composer, born at Nuremberg. His father was a musician, and the boy studied various instruments, but finally devoted himself to the violin. In 1815 he received some lessons from Spohr and then studied for two years under Rovelli in Munich. In 1820 he succeeded Rovelli as court violinist and after several successful tours became leader of the Royal Band at Stuttgart in 1826. In 1849 he resigned to go to England, in which country he remained till 1866, when he returned to Cannstadt, near Stuttgart, where he died. His compositions, especially his six violin concertos, are still in use.

MOLISE. See ABRUZZI E MOLISE

MOLITOR, mó'lé'tôr', GABRIEL JEAN JOSEPH, COUNT (1770-1849). A French soldier, born at Hayange (Lorraine). He became a captain of volunteers in 1791, by 1799 had risen to the rank of general of brigade, having fought under Hoche, Massena, and Moreau. Subsequently he was commissioned a general of division and in 1805 fought in the Army of Italy and took part in the battle of Austerlitz. In 1806 he was appointed Governor of Dalmatia and in 1807 Governor of Pomerania, in 1809 contributed to the victory of Wagram, and in 1811-13 was in Holland. He was appointed inspector general of infantry at the Restoration, but received a command in Alsace from Napoleon during the Hundred Days. After the Second Restoration he did not again obtain his offices until 1818. In 1823 he commanded the Second Army Corps in the Spanish expedition and defeated Ballesteros, for which he was commissioned marshal. In 1847 he became commandant of the Invalides and was made

Grand Chancellor of the Legion of Honor in 1848.

MOLKO, SOLOMON. See MESSIAH.

MOLLAH (more properly Ar. *maulā*, Turk. pron. *mevlā* or *mullā*). Among the Turks, the title of a superior judge. The mollahs are divided into two classes. Those in the first class exercise jurisdiction over the more important pashaliks. The mollahs of the second class hold office for a lunar month at a time, and their lowest rank is composed of the naibs over the inferior provinces, towns, and villages. The mollah is an expounder of civil, criminal, and canon law, he must, therefore, be a lawyer as well as an ecclesiastic. Under him is the qadi (or kadi), the judge who administers the law, and superior to him are the kadilesker and the mufti (q.v.). They are all, however, subject to the Sheikh ul Islam, who is the supreme mufti. In Persia the office of mollah, who is generally called akhun, is similar to what it is in Turkey. This superior there is the sadr, or chief of the mollahs. In the Mohammedan church the mollahs are beneficed clergy in receipt of some small salary attached to mosques and other pious foundations.

MOLLENDÓ, möl-yên'dó. A coast town in the Department of Arequipa, Peru (Map: Peru, C 7). It is the principal port of south Peru and one of the chief points through which Bolivian trade is carried on. It is connected by railway with the mining districts of the interior of Peru and with Bolivia (La Paz). It exports alpaca wool, quinine, tin, gold, antimony, silver, and copper ores and imports chiefly merchandise for Bolivia. In 1913 its imports amounted to £580,802 and its exports to £1,104,580, giving it second rank in the former and third rank in the latter among the ports of Peru. It is the seat of a United States consular agent. Pop (est.), 4000.

MÖLLENDORF, möl'-len-dörf, RICHARD JOACHIM HEINRICH VON (1724-1816). A Prussian general, born at Lindenberg in Brandenburg. He was in the first and second Silesian wars and was made a captain for bravery at Soor (1746). In the Seven Years' War he rose to the rank of major and received the Order for Merit. At Torgau (1760), where he showed great bravery, he was captured by the Austrians, but he was released in 1761 and was made general a year after. Möllendorf was division commander in the War of the Bavarian Succession (1779), during which he received the Order of the Black Eagle, Governor of Berlin (1783), and commander in 1793 of the troops which put into effect the second partition of Poland, having been made field marshal. He was appointed commander in chief of the Army of the Rhine in 1794. In 1806 he again took the field, was wounded at Auerstädt and captured at Erfurt, but was released by Napoleon, who gave him the cross of the Legion of Honor.

MÖLLENDORF, ULRICH VON WILAMOWITZ-. See WILAMOWITZ-MÖLLENDORF, ULRICH VON.

MOLLENHAUER, möl'en-hou'ër, EMIL (1855-). An American orchestra and choral conductor. He was born in Brooklyn and was educated at Russell's Academy, New York. He became a member of Booth's Theatre Orchestra in 1869, first violin of the Theodore Thomas Orchestra in 1871, and a member of the New York and Brooklyn Philharmonic societies. Moving to Boston in 1884, he was a member of

the Boston Symphony Orchestra for four years, and served as conductor of the Germania Orchestra and the Municipal Concerts until 1903. He afterward served as conductor of the Handel and Haydn Society and of the Boston, Lynn, Brockton, Newburyport, and Salem oratorio societies.

MÖLLER, GEORG (1784-1852). A German architect. He was born in Hanover and studied architecture in Karlsruhe and Italy. After his return from Italy he was appointed court architect to the Grand Duke of Hesse. He designed the ducal palace at Wiesbaden, a number of public buildings and private residences at Darmstadt, and the theatre at Mainz. He discovered the original design of the Cologne Cathedral, the two towers of which have been finished in accordance with his published facsimile. His most important publications include *Denkmäler deutscher Baukunst* (1815-31) and *Beiträge zur der Lehre von den Konstruktionen* (1833-44).

MÖLLHAUSEN, mōl'hau-zen, BALDWIN (1825-1905). A German traveler and novelist, born at Bonn. He studied agriculture in Pomerania and spent several years in North America, traveling with Duke Paul of Württemberg (1851) and, at the instance of Humboldt, acting as draftsman to a scientific expedition to the Far West. After a second trip through the western part of the United States, especially Colorado, he wrote *Tagebuch einer Reise vom Mississippi nach den Küsten der Südsee* (1858) and *Reisen in die Felsengebirge Nordamerikas* (1861). His many novels, mostly on American topics, include *Die HalbIndianer* (1861), *Das Mormonenmädchen* (1864; 3d ed, 1871), *Das Monogramm* (1874), *Die beiden Yachten* (1891), *Fegefeuer in Frappes Wigwam* (1901). His *Illustrierte Romane, Reisen, und Abenteuer* were published in three series and 30 volumes (1906-13).

MOLLIN, mō'lyān', NICOLAS FRANÇOIS, COUNT (1758-1850). A French statesman, born in Paris. Early connected with the financial department of the French government, by 1784 he had charge of raising the taxes through the farmers-general. He narrowly escaped with his life during the Revolution, and in 1794 he retired to England for a time. He reentered the ministry of finance under Gaudin in 1799, and when Napoleon became Emperor in 1804 Mollin was made a member of his Privy Council. Napoleon, who consulted him frequently on financial matters, made him Minister of the Treasury in 1806 and created him Count in 1808. He retired upon the first abdication of Napoleon in 1814, but again took up his ministerial duties during the Hundred Days in 1815. He lived in retirement under the Restoration and in 1819 was made a peer of France. He wrote *Mémoire d'un ministre du trésor public 1780-1815* (Paris, 4 vols., 1845; new ed, 3 vols, 1898).

MOLLITIES (mōl-līsh'ī-ēz) **OS'SIUM**. See OSTEOMALACIA.

MOLLUS'CA (Lat. nom. pl. neut. of *molluscus*, from *mollis*, soft). One of the chief divisions, or phyla, of the animal kingdom, the study of which is conchology or malacology. The body is bilaterally symmetrical except in snails (Gastropoda), not segmented as in worms and arthropods, but soft, fleshy, and usually protected by a bivalve or univalve shell; moving by a "foot" or muscular creeping disk in gastropods, or, in bivalves, by a tonguelike process;

breathing by external gills which are either lamellate or plumelike. A shell is secreted by the fleshy mantle, and in nearly all except the Pelecypoda (q.v.), which are headless, the mouth is armed with an odontophore, an apparatus of muscles and tendons bearing a rasp-like lingual ribbon (radula) for sawing or cutting the food or for drilling holes through shells. Many mollusca in their young or larval swimming stages begin as a trochosphere (q.v.), pass through a veliger stage, living at the surface of the sea and gradually sinking to the bottom by gravity as the shell grows larger and heavier. The Mollusca form a highly specialized group, the number of species amounting to upward of 40,000, about one-half of which are living, the other extinct, the earliest known species occur in Cambrian rocks. The group has a wide geographical and bathymetrical range, occurring in all seas from the shore to the abysses of the ocean and also on land and in fresh waters.

A SEGMENTED LARVA
Trochosphere of Chiton

The affinities of this phylum are not yet settled. Mollusks have evidently descended from some wormlike form, as their larvae are in some cases segmented and like the trochosphere or trochophore stage of seaworms (Annelida). In the adult segmental organs like those of worms are often present. On the whole they are a grade inferior to the spiders and insects. Mollusks are divided into five classes, i.e., (1) Amphineura (q.v.), (2) Pelecypoda (q.v.) or Lamellibranchiata; (3) Scaphopoda (q.v.); (4) Gastropoda (q.v.); and (5) Cephalopoda (q.v.). The Amphineura comprise a few forms formerly supposed to be worms (Chaetoderma and Neomenia). These are primitive types from which, as some authors think, the other mollusks may have descended, all have a ladder-like nervous system, as in Chiton, and are either shell-less or somewhat like that of some Turbellaria (q.v.) and Peripatus (q.v.).

Bibliography. A. H. Cooke, "Molluscs," in *Cambridge Natural History*, vol. iii (New York, 1895). A. F. Arnold, *Sea-Beach at Ebb-Tide* (ib., 1901). A. G. Mayer, *Sea-Shore Life* (ib., 1905). J. E. Rogers, *Shell Book* (ib., 1908); S. P. Woodward, *Manual of the Mollusca* (4th ed., London, 1890). W. H. Dall, *Land and Fresh Water Mollusks* (Washington, 1910). See MOLLUSK.

MOLLUS'CUM CONTA'GIO'SUM. A comparatively rare skin disease occurring chiefly in children of the poorer class and believed to be contagious. Upon the skin are observed waxy-white, semiglobular, smooth elevations varying in size from a pinhead to a pea. The tumors consist of degenerated epithelial cells contained in the globules of hair follicles. The lesions are distributed chiefly upon the face, increase slowly in size and eventually suppurate, or they may be destroyed by incision, after which the contents are squeezed out or curetted away. Ointments containing mercury are sometimes efficacious.

MOL'LUSK. An animal of the phylum Mollusca (q.v.). Mollusks are usually easy to distinguish from other animals on account of their shell, whence they are commonly called shellfish, but the more we study their development

and morphology the more difficult is it to draw a definite line between them and certain worm-like forms. In their early development they travel along apparently the same developmental path as the worms (planarians as well as annelids) and then diverge into a separate path. That the type is a very successful one is proved

TRANSVERSE SECTIONS OF BIVALVE MOLLUSKS.

A clam (*Mya*) and a fresh-water mussel (*Unio*), showing the ligament (*L*) and adductor muscle (*M*).

by the enormous number of species both living and extinct—a success evidently due to the protection afforded them by their shell. In bivalves as well as univalves (Gastropoda) the shell is more or less solid, is composed mainly of carbonate of lime and secreted by the mantle.

A bivalve mollusk like the clam is completely protected by a pair of solid calcareous shells connected by a hinge consisting of a large tooth (in most bivalves there are three teeth) and ligament. The shells are equivalve or with both valves alike, but unlike at each end, the head end being more rounded. On the interior are two muscular impressions, or scars, made by the two adductor muscles. The shell of gastropods is spiral, and that part of the animal contained in the skin is asymmetrical, the twist or torsion being due to gravity or lopping over of the young shell in the larva stage.

As to the most primitive forms we are in the dark. The most characteristic mollusks are the cephalopods. They are bilateral and very highly modified, with a well-marked head containing two highly specialized eyes and two ears. The concentrated ganglia form a brain with cartilaginous protections, while the parts around the mouth are modified to form the tentacles and funnel. The heart and blood vessels are highly specialized.

The "foot" is a modification of the part of the mantle below and behind the mouth, it varies

A BIVALVE MOVING

A fresh-water mussel (*Unio*) moving through the sand towards the left by means of its extended "foot"

greatly in shape, and is by disuse wanting in oysters and other fixed forms; in the pelecypods or bivalves it is tongue-shaped, and by being filled with water is thrust out between the valves of the shell, so that by means of it the clam can dig deep into the mud, or the fresh-water mussel can plow its way through the

sand. In the snails (q.v.) the foot forms a flattened creeping disk extending along the whole length of the body. See illustrations under CONE SHELL; CONCH, ETC

In the clam (q.v.) and most bivalves the hinder end of the body is prolonged into a double siphon, popularly called the head, through the lower division of which enters the water laden with microscopic animals and larvæ, which pass through the mantle cavity into the mouth, which is situated at the opposite end from the siphons. The upper division of the siphon opens out opposite the end of the intestine, which makes two and a half turns in the central or visceral mass, which is composed mostly of the ovaries. The bivalves breathe by a pair of leaflike gills, on each side of the visceral mass between it and the mantle; in the gastropods and cephalopods the gills are plumelike processes, called ctenidia. There is in mollusks a definite heart, which in the primitive forms is three-chambered, i.e., a ventricle and two auricles. The ventricle in the clam and most other bivalves surrounds the intestine, the arteries and veins are well developed, the blood is colorless. Mollusks as a rule differ from other animals in the nervous system, the ganglia, connected by threads (commisures), being grouped around the œsophagus, one pair (the brain) situated above, another, the pedal ganglia, in the foot, and the pair of visceral ganglia, nearer the middle of the body, and innervating the siphon, gills, digestive canal, and heart. See GASTROPODA; CLAM. OYSIER, DFCAPODA, and the accompanying illustrations and plates.

Sense organs vary much in situation, number, and size. The eyes of the scallop, which leads an active life, leaping out of the sand and skipping over the surface, are large, highly developed, and numerous, being situated around the edges of the mantle, in those mollusks which burrow (clam) or are fixed (oyster), or live in holes in limestone or coral, etc., the eyes are atrophied. In the squid and other cephalopods they are large and as complicated as those of a fish. The eyes of the land snails are borne at the ends of the tentacles, but in burrowing marine gastropods they may be wanting through disuse, though present in the larvæ.

Our knowledge of the nature of vision in gastropod mollusks has hitherto been very scanty, no observations having been made since those of Lezpès in 1851, until experiments by Willem brought out the following results: (1) Snails possess a well-developed power of touch, permitting them to perceive feeble jars of the soil beneath and slight movements of the surrounding media. (2) They see very badly and direct their movements principally by means of the senses of smell and touch. They form a confused image of large objects at an estimated distance of about a centimeter (40 inch). They clearly distinguish the form of objects only at a distance of one or two millimeters. (3) The fresh-water snails do not have distinct vision at any distance. (4) There does not exist, in mollusks a special vision of movements, such as insects possess. In general pulmonate mollusks respond to the action of light, in a degree differing in different species. They have dermatoptic perceptions, which vary much in intensity in different species. Organs of orientation, equilibrium, or hearing are the otocysts. In bivalves a single one is situated in the centre of the foot; in cephalopods they are large and placed one

behind each eye. The otocyst is a primitive form of ear, being a sac containing a minute particle of lime, the otolith. The sense of smell resides in the tentacles of the snail, the olfactory nerve branching out at the end. Also near the visceral ganglia is a group of sense cells (osphradia) supposed to be either olfactory or for testing the purity of the water entering by the respiratory current or, in snails, passing directly into the mantle cavity. Thus the organs of smell appear to be in all the forms represented by groups of specialized cells, which are persistent in nerve supply and position in all mollusks, showing that the sense of smell is all-important. Special organs of taste are as yet unknown in mollusks. Excretory organs are a single pair of highly modified tubes (nephridia) situated one on each side of the body just below the heart. See NERVOUS SYSTEM, EVOLUTION OF THE, EXCRETORY SYSTEM, COMPARATIVE ANATOMY OF THE; and similar titles.

The female ovaries and male reproductive glands are unpaired. The eggs are small and exceedingly numerous, and pass out in bivalves among the folds of the gills, where the young develop. The animal after hatching passes through a gastrula, trochophore, and veliger stage, the last so called from the two ciliated flaps on each side of the head. Towards the end

LARVAL STAGES OF MOLLUSKS

A, a trochophore of the cockle (*Cardium*), v, ciliated crown, fl, flagellum. B, veliger stage, with the shell developing, v, velum, m, mouth, li, liver lobes, st, stomach, i, intestine, mt, mantle, f, foot, ml, muscle, n, nervous ganglion.

of the veliger stage the shell appears, arising from the incipient mantle as a cup-shaped body in both bivalves and univalves, but the hinge and separate valves are indicated very early in the Pelecypoda. In the young *Unio*, or freshwater mussel, the development history is more condensed. The velum is wanting or vestigial, and the young live between the gills of the parent fastened to each other by their threads (byssus). The shells (glochidium) are triangular, broader than long, with the apex hooked.

Fossil Mollusks. Remains of representatives of all the classes of mollusks occur in the lowest Paleozoic strata, having existed from the Cambrian period down to the present time. As they are so abundant, owing to their preservation as fossils (the shells in the absence of the animal being as a rule useful in classification), the mollusks are of great value as time marks and serve to distinguish the different formations.

The class which occurs fossil in the earliest (Cambrian) strata and concerning which there is no doubt is the Gastropoda. At the base of

the Cambrian (Olenellus zone) have been found the shells of such primitive gastropod genera as *Scenella*, *Stenotheca*, *Platyceras*, *Rhaphistoma*, and *Pleurotomaria*. The last-named genus is remarkable for having persisted to the present time, as it is still found at great depths in the Atlantic Ocean. More doubtful are the pteropods of the Cambrian, of the genera *Hyalithes*, *Forrellella*, etc., though their shells are much more abundantly found than those of the Gastropoda proper. Of pelecypods the Cambrian forms are obscure and doubtful, the only ones yet found being a tiny little shell (*Modioloides*), and *Fordilla*, which may turn out to be the shell of a crustacean, and this group is comparatively rare even in the Ordovician strata. Of cephalopods the earliest known genus is *Folborthella*, a minute orthoceratite detected in the Lower Cambrian rocks of Finland and Esthonia and in the St John group, Nova Scotia.

The Cambrian, Ordovician, and Silurian mollusks present (except in generic and specific characters) comparatively unimportant differences from living forms. The earliest known pelecypods were the forerunners of the Nuculidæ; the earliest gastropods were *Pleurotomaria* and allied genera, some still living at great depths, the pteropods were in the main similar to existing forms, while the earliest cephalopods were the Orthoceratites, which are straight, uncoiled nautiloids. In tens of millions of years, therefore, the shelled mollusks have been one of the most numerous and characteristic groups of invertebrates, and became more and more differentiated and abundant in species, genera, and families as time went on, moreover, they are extremely abundant in the Mesozoic and Cenozoic eras, hence they afford unusually favorable data for the study of the phylogeny of both the chief and subordinate groups. This state of things was taken advantage of by Alpheus Hyatt in studies carried on for nearly 40 years, during which he applied the biogenetic law of Fritz Muller and Haeckel to the cephalopods, showing that the life of the individual during its rise and decline displays phenomena correlative with the collective life of the order to which it belongs. In these and similar studies he was followed by Wurtemberger and Neumayr. Their works on fossil cephalopods bear directly on such subjects as quick evolution, the effects of changes of environment, the action of use and disuse, acting throughout numberless generations. The facts gleaned from these mollusks also bear directly on the causes and mode of origin of the different classes, not only of mollusks, but of all other animal groups. The famous researches on the transmutations of the Tertiary shells of Steinheim by Hilgendorf and by Hyatt, those of Neumayr on the successive forms of *Paludina*, and the studies in the variations and evolution of other types by later authors, prove how valuable the shells of mollusks are in such studies.

For the uses by man of mollusks as food or ornament or money, see under CLAM, GASTROPODA, GILL, OYSTER, PEARL, PELECYPODA, SHELL MONEY.

MOLLWITZ, mól'vits. A village of Prussian Silesia, in the Government of Breslau, 7 miles west of Brieg. To the east of it lies the battlefield where Frederick II of Prussia gained his first victory over the Austrians under Marshal Neipperg, April 10, 1741. The Prussian cavalry was thrown into confusion by the Austrian and put to flight. Frederick left the field at the earnest solicitation of Marshal Schwerin, who saved the day with the infantry after a five hours' battle. The Austrians suffered heavily in killed, wounded, and prisoners.

MOLLY MAGUIRES, má-gwírz'. A secret criminal order which existed in 1854-77, and possibly afterward, in the anthracite coal mining region of northeastern Pennsylvania. Here 400 collieries employed 60,000 men, Americans, Germans, Welshmen, Englishmen, and Swedes comprised in one-half the number, the remainder being Irish. Among the latter appeared the Molly Maguires, a branch of the Physical Force party of Ireland. The order is alleged to have been affiliated with the Ancient Order of Hibernians. About 1865 the Molly Maguires first became generally known as a dangerous organization. In 1875, having been instrumental in forcing a general strike in the coal regions, it succeeded in obtaining an ascendancy in the councils of the miners, and from that period was prominent in assassinations and other outrages, committed usually on the persons and against the property of justices of the peace, police officers, and mining bosses. Only Irishmen, or the sons of Irishmen, who professed the Catholic faith, were admitted to membership; but by the laws of the Church they could not remain Catholics in good standing. The order was organized in divisions, each having a chief official known as a body master; and there were signs and passwords to enable members to distinguish each other. These signs and passwords were given to the members by the body masters, who received them from the county delegate, who got them from the State delegate, to whom they were furnished by the national delegate or national board in New York City; to the latter they came quarterly from Ireland by the hands of the steward of one of the transatlantic steamships. A central and governing organization known as the Board of Erin held quarterly meetings in England, Scotland, or Ireland. The final exposure, capture, and punishment of the Molly Maguires were largely due to the energy and determination of Franklin B. Gowan, president of the Philadelphia and Reading Coal and

Iron Company, through the immediate instrumentality of James McParlan, a Pinkerton detective, who joined the Molly Maguires and became acquainted with their members and the secrets of their organization. Many members of the organization were apprehended, tried, and condemned, and their execution—that of a number of them occurring on the same day—so alarmed the members of the order that it ceased to have any extended influence. Consult. F. P. Dewees, *The Molly Maguires: The Origin, Growth, and Character of the Organization* (Philadelphia, 1877); Allan Pinkerton, *The Molly Maguires and the Detectives* (New York, 1878); J. F. Rhodes, "The Molly Maguires in the Anthracite Coal Region of Pennsylvania," in *American Historical Review*, vol. xv (ib., 1910).

MOLLYMOKE. One of the many variants of malleumuck. See FULMAR.

MOLMENTI, mól-mán'té, POMPEO GHERARDO (1852-) An Italian scholar, born in Venice. He studied law at Pisa and Padua and subsequently became professor of Italian literature at the Liceo Marco Foscarini. Almost numberless monographs on various aspects of Venetian history led up to his monumental *Storia di Venezia nella vita privata* (Bergamo, 1908-09; Eng. trans. by Brown, Bergamo-New York, 1908). For this work he was made Senator of the Kingdom.

MOLOCH, mó'lók. See MOLECH.

MOLOCH, mó'lók. An extremely spinose lizard (*Moloch horridus*) of Western and also South Australia, belonging to the family Agamidae (see AGAMA), and locally known as York devil or mountain devil. It is 5 to 7 inches long, broad and flat, and its thick skin is covered with spines and tubercles much like those of the American horned toad. This skin, which is yellowish, with reddish-brown blotches, is highly hygroscopic, absorbing water like blotting paper. It inhabits sandy districts, is quite harmless, and apparently lives entirely upon ants, which it catches in enormous quantities upon its long, glutinous tongue. Consult Saville Kent, *The Naturalist in Australia*. See Plate with article LIZARD.

MOLOCH, DER. An opera by Schillings (q.v.), first produced in Dresden, Dec. 8, 1906.

MOLOCHATES. See GEMS.

MOLO DI GIRGENTI, mó'ló dè jér-ján'té. The former name of Porto Empedocle (q.v.), a seaport in Sicily.

MOLOKAI, mó'ló-kī. One of the Hawaiian Islands (q.v.).

MOLOKANI, mó'ló-kā'né (Russ. pl. of *molo-lanū*, from *moloko*, milk). A Russian sect. It is said the name was given them in derision by the orthodox because, unlike the latter, they do not observe fasts. They call themselves Spiritual Christians. They are rationalists, basing doctrine and practice on the Scriptures interpreted by the individual judgment. As a consequence much diversity of opinion prevails among them, a condition which they do not consider reprehensible. They take the early Apostolic Church as depicted in the New Testament for the model of their ecclesiastical organization and have no hierarchy or paid clergy. A presbyter and assistants are chosen from their own number to care for the spiritual and moral interests of the community. At their religious services, held on Sunday in private houses, as they are not allowed to build churches, they

sing psalms, read the Scriptures, and engage in religious conversation. Doctrinal difficulties and questions of interpretation are freely discussed. They regard the sacraments as only symbolical, and lay aside the numerous ceremonies of the Russian church. They reverence Jesus, but do not believe in his divinity, and consider the miraculous portions of the New Testament narrative as fabulous. They have a system of strict supervision of the conduct of individuals. Offenders against morality are admonished in private or public, or excluded from the religious meetings, or even expelled. The Molokani are described as intelligent, well versed in the Scriptures, and in moral conduct and material prosperity decidedly superior to their orthodox neighbors. Because of their principle of private judgment and readiness to change their views, they are easily influenced by adventurers or fanatics, in several instances communities of them have been led astray by such individuals. They have also developed a tendency to break up into different sects, one of which has adopted many of the canons of the Jewish religion, another has made the common ownership of property one of its principles. Their origin is uncertain. A vague tradition says the sect was founded in the sixteenth century by foreign Protestants. Their original seat was in the south. They have been persecuted by the government, and many have been transported to remote parts of the Empire. Their number is estimated at several hundred thousand. Consult A. F. Heard, *The Russian Church and Russian Dissent* (London, 1887).

MOLON, APOLLONIUS. See APOLLONIUS.

MOLOSSINÆ, mōl'os-sī'nē. See BAT.

MOLTESEN, mōl-tā'sen, LAUST JEYSEN (1865-) A Danish Church historian, born at Rodhede. Educated for the ministry at the University of Copenhagen, he wrote *Det kristne Munkevæsens Oprindelse og forste Udvikling* (1901) and, as a result of studies in Rome (1894-95), *De Arignonske Pavers Forhold til Danmark* (1896), for which he obtained the doctorate, and *Acta Pontificum Danica, 1316-78*, vol. 1 (1904). In his field he made large contributions.

MOLTING (ME *mouten*, *mouten*, from Lat. *mutare*, to change, frequentative of *movere*, to move, Skt *miv*, to push), or ECDYSIS. The process of periodically shedding the skin, or integument, or its appendages, as hair or feathers, exuviation.

Molting of Plumage in Birds. The change of plumage, or shedding of the old feathers, and their replacement by a new set. The whole plumage, says Dwight, may be renewed or only a part of it. In the case of most of the passerine birds there are two seasons of molts peculiar to the adults—a complete one, in all species, following the breeding season, and an incomplete molt which in certain species precedes the nuptial season. "The first, the postnuptial, restores the worn-out plumage, the second (when it is not suppressed), the prenuptial, adorns birds for the nuptial season." In a few species the prenuptial molt is complete, though usually the wing and tail are not involved, and often the renewal is confined to "a sprinkling of new feathers here and there." Young birds may also molt several times before they even acquire the feathers of adult structure, and many species need to pass through at least two molts

besides those of the first summer before the plumage becomes wholly of the pattern and color of the adult. The loss of feathers during the molting process is so compensated for by the renewal of feathers that few birds (the Anatidæ and some other groups excepted) lose either the ability to fly or the protection afforded by their plumage. The feather areas are systematically replaced, the remiges falling out one after another in definite sequence and almost synchronously from each wing. The greater coverts are regularly replaced before the fall of the secondaries beneath them, the lesser coverts before the median, while even in the rows of the lesser coverts an alternation appears to be attempted. On the body the protective sequence is less obvious, but the molt regularly begins at fairly definite points.

The month of August marks the maximum of the molting season, though there is more or less shedding of feathers in nearly every month of the year. A complete molt is accomplished in from four to six weeks, while partial molts require much less time. A resemblance to the shedding of the skin of reptiles is seen in the ecdysis of the scaly feathers of the penguin, which peel off in flakes.

In certain species of European grouse the claws, which grow to an inordinate length in winter, may be partly shed or worn off as spring advances, the white pelican, both sexes of which during the breeding season bear on the ridge of the bill a horny projection, sheds it, so that these excrescences may be "gathered by the bushel." The puffin (q.v.) and some of its allies molt even the horny sheath of the bill, together with the outgrowths over the eyes.

Molt has recently been given a new importance by the researches of Bureau and Beebe. The former has spent many years in the intensive study of the European partridge and red-legged partridge, and has proved that the sequence of molt of the flight and other feathers is invariable. This lends support to the selection by Beebe of the sequence of tail molt as a trenchant character in dividing the Phasianidæ into subfamilies.

Shedding of Horns, etc., by Mammals. In mammals the periodic shedding of the hair or pelage is comparable with molting; as is also the process of annually shedding the antlers, the new antler being larger and consisting of a larger number of branches or tines. In the deer family the horns of the male are deciduous towards spring, while the pronghorn drops its horns in the autumn.

Molting, or Ecdysis, in the Lower Classes. In animals like Crustacea, Myriapoda, insects, and spiders, with a more or less solid exoskeleton, too dense to permit of gradual growth or increase in volume, there must be a periodical casting of the skin, or ecdysis. The same occurs in salamanders, and especially in the scaly reptiles, as snakes and lizards.

In the Crustacea, insects, and similar animals the old skin dies and the new integument is formed by a secretion thrown out by the inner layer of epithelial cells called the hypodermis. On removing the shell of the lobster the hypodermis is seen to be a richly colored, reddish, soft layer. The formation of the new layer of chitin arrests the supply of nourishment to the old skin, so that it dries and hardens and is finally shuffled off. In the crayfish and presumably in the lobster (q.v.), as well as in

lizards and snakes, the casting of the old skin is materially induced and aided by the growth on the surface of the hypodermis of a layer of very fine and equally distributed hairs, called casting hairs, which, by their rigidity and position, mechanically loosen and raise the old skin. These remain as vestiges, forming spikes, ridges, or warts, serving to ornament the crust of eels or the outer edges of the skin scales of snakes and lizards.

In insects, where casting hairs are exceptional, the loosening and casting of the skin are brought about by the secretion of a fluid by the cells of the hypodermis. This fluid spreads over the whole surface when the cells are still soft and not hardened by exposure to the air. This same fluid, when the pupa extricates itself from the larval skin, extends around the whole pupa and serves to protect it and to glue together the wings, legs, antennæ, etc., in their new position.

The process of molting as seen in caterpillars (e.g., *Tolea polyphemus*) is thus. It changes its skin five times before changing to a chrysalis, and the ecdysis occurs at regular periods, i.e., about every 10 days for the first four moltings, while about 20 days elapse between the fourth and fifth casting. The operation usually takes place after 4 P.M. A little before this time it holds its body erect, grasping a leaf with the two pairs of hind legs only, the skin is wrinkled and detached from the body by the fluid previously mentioned, the body now energetically contracts, so that the skin is pulled off and pushed towards the end of the body; the skin thus becomes so stretched that it soon tears just under the neck, and then separates from the head. When this is accomplished the most difficult operation is over, and now the process of casting goes on very rapidly. By repeated contractions the skin is folded towards the tail, like a glove when taken off, and the lining of the spiracles, mouth, fore stomach, and rectum comes out in long filaments. When about one-half of the body appears, the shell still remains like a cap, inclosing the jaws; then the worm, says Trouvelot, as if reminded of this loose skullcap, removes it by rubbing it on a leaf, this done, the worm finally crawls out of its skin, which is attached to the fastening made for the purpose. Directly after the ecdysis the larva increases in size, the head becoming distinctly larger as well as the body, which soon fills out.

The lobster frequently molts after maturity. But in insects which undergo a complete metamorphosis and which have the longest lives the number of molts is greatest. When the number is excessive this seems to be due to some physical cause, such as lack of food combined with low temperature. In caterpillars the number of ecdyses appears to be dependent on climate.

Bibliography. For birds, consult J. Dwight, Jr., "The Sequence of Plumage and Molts of the Passerine Birds," in *Annals of the New York Academy of Sciences*, vol. xiii (New York, 1900), with a full bibliography as regards passerine birds; Newton and Gadow, *Dictionary of Birds* (London, 1893-96); Bureau, "L'Age des Perdrix": I, *La perdrix grise* (Nantes, 1911), and II, *La perdrix rouge* (Nantes, 1913); C. W. Beebe, "Preliminary Pheasant Studies," in *Zoologica*, vol. i (New York, 1914); also the authorities mentioned under CAGE BIRDS.

For mammals: J. D. Caton, *Antelope and*

Deer of America (2d ed., New York, 1881), and F. E. Beddard, *Mammalia* (London, 1902).

For reptiles and Amphibia, authorities mentioned under AMPHIBIA, SNAKE.

For insects, etc.: Karl Sempër, *Animal Life as Affected by the Natural Conditions of Existence* (New York, 1881); A. S. Packard, *Text-Book of Entomology* (New York, 1898), with the writings of Trouvelot, Riley, Newport, Bugnion, Gonin, and Tower.

MOLTKE, mól't'ke, ADAM WILHELM (1785-1864). A Danish statesman, born at Einsiedelsborg, Fünen. He studied law and in 1831 became Minister of Finance. Upon the death of Christian VIII, in the crisis of 1848, Moltke, who had served two absolute kings, formed a ministry including the most advanced and popular agitators, thus bridging over the gap between the old era and the new. The service he thereby rendered Denmark was very important. His administration introduced the constitution of June 5, 1849, and he also presided over the third constitutional ministry, formed in July, 1851. In 1852 he resigned, disapproving of the decree which sought to change Denmark into a composite, indivisible monarchy. He continued to serve in the Landsting, or Upper House, and from 1855 to 1863 was a member of the consultative Council of State.

MOLTKE, HELMUTH JOHANNES LUDWIG VON (1848-1916). A German general, nephew of the great field marshal Count von Moltke. His brother Friedrich (1852-) was Prussian Minister of the Interior in 1907-10. Helmuth was born at Gersdorf in Mecklenburg-Schwerin, entered the army when he was 20, and served in the Franco-Prussian War as a lieutenant. He was at the Kriegsakademie in 1876-79, became captain with the general staff in 1880, and in 1882-91 was second adjutant to his uncle. Thereafter his advance was rapid, and in 1906 he became chief of the Imperial general staff, receiving the rank of general of infantry in the same year. When war broke out in 1914 (see WAR IN EUROPE) his health was poor, and after repeated reports of his removal he was definitely superseded in December by Gen. Erich von Falkenhayn, former Minister of War, who for some weeks had been taking his place. Moltke's removal was supposed by many to have resulted from an unwillingness to accept the Kaiser's plan of campaign.

MOLTKE, HELMUTH KARL BERNHARD, COUNT VON (1800-91). A famous Prussian general. He was born at Parchim, Mecklenburg-Schwerin, Oct. 26, 1800, of an old noble family. In 1811 he was sent to the military academy at Copenhagen, and in 1819 became an officer in the Danish service, but in 1822 entered the Prussian army as second lieutenant. From 1823 to 1826 he studied at the military college at Berlin. In 1832 he served on the general staff, and was several times promoted, attaining the rank of captain in 1835. In the same year he went to the Orient and, with the sanction of the Prussian authorities, took a prominent part in the reorganization of the Turkish army initiated by Mahmud II. In 1839 Moltke returned to Prussia. His promotion was fairly rapid. In 1850 he was created major general and in 1858 he became chief of the general staff. In 1859 he was appointed lieutenant general. While on the general staff Moltke continued that remarkable development of the Prussian army which had been begun by Scharnhorst in 1807. Staff

schools were established, and Moltke, who was himself a lucid lecturer, succeeded in inspiring his officers with an enthusiastic interest in their work. A constant interchange of line and staff duties kept the staff in touch with the actual discipline, drill, and handling of troops and the business administration of each corps and division. Moreover, plans for possible campaigns and topographical surveys of neighboring countries were made in the minutest details.

After serving for a year as adjutant to Prince Henry of Prussia in Rome, Von Moltke returned to Germany and rose rapidly in the military ranks until in 1848 he became a member of the general staff and in 1855 first adjutant to Prince Frederick William. In 1857 he was appointed chief of the general staff of the army and labored to perfect the military organization. The first test of the system came in 1864 with the war of Prussia and Austria against Denmark. The full revelation of the Prussian efficiency was brought about by the Seven Weeks' War between Prussia and Austria in 1866. Europe was surprised to see a campaign so rapid and successful directed, so to say, from the seat of government, for Moltke had not gone to the front until shortly before the end of the war. The great strategist received from his King, William I, the Order of the Black Eagle, and from the Prussian Landtag 50,000 marks. The Franco-German War of 1870-71 was the crowning triumph of Moltke's career. The war had been long expected, and the marvelous readiness of the Prussian army was in striking contrast to the disorder existing in French military affairs. Moltke did not himself enter France until the war had already been strategically decided, but it was his plan that had been carried out with an astounding certainty and precision. He was rewarded in September, 1871, by promotion to the rank of field marshal and a large grant of money. The title of Count had been conferred upon him in 1870. Other European states also showered honors upon him. On Aug. 9, 1888, Moltke retired from active service. In 1841 he had married a stepdaughter of his sister, who died in 1868.

Moltke's writings on military matters, which include valuable essays on Turkish affairs, have all been published in various editions, the best being *Gesammelte Schriften und Denkwürdigkeiten* (8 vols., Berlin, 1892). English translations have been made under the following titles: *The Russians in Bulgaria and Rumelia in 1828 and 1829* (London, 1854); *Field Marshal Count Moltke's Letters from Russia* (New York, 1878); *The Franco-German War of 1870-71* (ib., 1892; new ed., 1901); *Moltke: His Life and Character, Sketched in Journals, Letters, Memoirs, a Novel, and Autobiographical Notes* (ib., 1892); *Letters of Field Marshal Count Helmuth von Moltke to his Mother and his Brothers* (ib., 1892); *Essays, Speeches, and Memoirs of Field Marshal Count Helmuth von Moltke* (2 vols., London, 1893); *Field Marshal Count Helmuth von Moltke as a Correspondent* (ib., 1893); *Moltke's Letters to his Wife and Other Relatives* (2 vols., ib., 1896); *Moltke's Tactical Problems from 1858 to 1882*, edited by the Prussian general staff (ib., 1899).

Bibliography. Fircks, *Feldmarschall Graf Moltke und der preussische Generalstab* (2d ed., Berlin, 1887); Wilhelm Müller, *Moltke* (3d ed., Stuttgart, 1889); Morris, *Biographical and Critical Study of Moltke* (London, 1894); W.

Buchner, *Feldmarschall Graf Helmuth von Moltke* (Lahr, 1895); M. Jähns, *Feldmarschall Moltke* (Berlin, 1900); W. Bigge, *Feldmarschall Graf Moltke* (2 vols., Munich, 1901); F. A. Dressler, *Moltke in his Home*, translated by Barrett-Lennard (London, 1907).

MOLUCCAS, or **SPICE ISLANDS**. An archipelago constituting part of the Dutch possessions in the East Indies and comprising most of the islands situated between Celebes and New Guinea and between the Philippines and the Timor Archipelago (Map East India Islands, G 5, 6). The group lies on both sides of the equator. Its aggregate area is 21,516 square miles. It is divided into the northern and southern Moluccas. The former comprise the islands of Gilolo, the Obi group, Ternate, Tidore, and Morotai, with the adjacent islets, while the latter take in the islands of Ceram, Buru, and the Kei, Aru, and Banda groups with their surrounding islands. Certain authorities include other groups of adjacent islands under this general title, bringing the area thus included up to 43,864 square miles. In geological structure the Moluccas resemble the island of Celebes, being mostly composed of Archæan or Paleozoic rocks. The highest point is Mount Nusa Ieli in Ceram, 10,000 feet high. The Moluccas lie in the line of volcanic activity which extends from the Sunda Islands northward through the Philippines and Japan. Many of the smaller islands are of volcanic formation throughout, and on Ternate, as well as in Gilolo, Morotai, Banda, and Tidore, there are active cones. The climate is hot, but as a rule not unhealthy. The Moluccas are not so well watered or rich in vegetation as the more westerly islands in the Dutch East Indies, but the production of spices, from which they derive their name, is very large. The pepper, nutmeg trees, and various other spice-producing plants are here indigenous. Coffee, cacao, tobacco, indigo, and rice are cultivated with success, and the pith of the sago palm is the staple food of the natives. In regard to the fauna, the islands are in the zone of contact of the Indonesian with the Australasian region. Besides species of marsupials there are wild hogs, civet cats, and a species of goats. Birds of bright plumage abound in the forests. Among insects the butterflies are remarkable for their size and the brilliancy of their colors. Sulphur is the most important mineral of the islands, but petroleum, porcelain clay, tin, and coal are also found.

Industry is chiefly confined to the raising of spices and food products. While the clove tree and the nutmeg occur in all the islands, clove culture is carried on especially in Amboina and the Uluassers, and the cultivation of the nutmeg in the Banda Islands. This is due mainly to the fact that the Dutch, in their desire to retain their supremacy in the spice market, restricted the cultivation of these spices to the above-mentioned islands until 1863, when the restriction was taken off. The trade of the group is centred chiefly around Amboina and Ternate. The exports consist mostly of cloves and other spices, sago, and coconuts. Administratively the archipelago is divided into the two residencies of Ternate and Amboina. The chief city as well as the commercial centre is Amboina (q.v.), on the island of the same name. The population is estimated at 450,000, and consists chiefly of Alfuresc (q.v.) and Malays, the former being

frequently considered the original inhabitants, and found especially in the interior of the islands. The number of foreigners is insignificant.

The Moluccas were discovered by the Portuguese in 1512 and were formally taken possession of by them in 1521. They were soon, however, taken by the Dutch, who started the cultivation of spices here. In 1605 Amboina was made the chief station of the Dutch East India Company, which also built forts on several other islands. With the annexation of the Moluccas to the Dutch possessions in the East Indies the government also acquired a part of New Guinea and Celebes and a few other islands which constituted parts of the former vast possessions of the sultans of Ternate and Tidore. In 1867 the political unity of the islands was dissolved.

Bibliography. W. B. Hemsley, "Report on the Botany of Juan Fernandez, South Eastern Moluccas, and Admiralty Islands," in *Challenger Voyage Reports, Botany*, vol. i (London, 1885); Heinrich Botemeyer, *Die Molukken* (Leipzig, 1888); Willy Kükenthal, *Ergebnisse einer zoologischen Forschungsreise in den Molukken und Borneo* (Frankfurt, 1897 et seq.); Martin, *Reisen in den Molukken. geologischer Teil* (Leyden, 1897 et seq.); A. R. Wallace, *The Malay Archipelago* (London, 1906); A. S. Walcott, *Java and her Neighbours* (New York, 1914).

MOLUCHE, mò-lòw'chá (Western people). An important tribe of Araucan stock (q.v.), residing on the northern head streams of the Limay River in southwestern Argentina. They are distinguished for their light complexion and regular features. Unlike most of their kindred, they are sedentary and industrial, having large herds of sheep and extensive apple orchards, whence they are sometimes called by the Spaniards Manzaneros, or apple people.

MOLY (Lat., from Gk. μῶλυ). A magic herb with a black root and flower white as milk, given by Hermes to Odysseus as a protection against the magic of Circe (q.v.). (Cf. *Odyssey*, x, 305 ff.) Some scholars have identified the Homeric moly with hellebore (q.v.), much used in ancient times as a remedy against madness. In later writers the word is applied to garlic.

MOLYB'DENITE (from *molybdæna*, from Lat. *molybdæna*, from Gk. μολύβδαινα, *molybdaina*, galena). A mineral, molybdenum disulphide, that crystallizes in the hexagonal system in soft, flexible, nonelastic plates, has a metallic lustre, and is of a bluish-gray color. It occurs in granite, gneiss, limestone, and other crystalline rocks and is found at various localities in Sweden, Norway, Finland, Saxony, France, Italy, Canada, and in the United States at various points in New England, New York, Pennsylvania, and California. It was long confounded with certain compounds of lead and of antimony until about 1778, when Scheele clearly showed that it was quite distinct from those substances. Molybdenite is the chief source of the molybdenum salts which are of considerable importance in chemical analysis and in the chemical industries such as dyeing, coloring pottery, etc. See **MOLYB'DENUM**.

MOLYB'DENUM (Neo-Lat., from Lat. *molybdæna*, galena or litharge). A metallic element isolated by Hjelm in 1790, after Scheele had transformed the known sulphide of molybdenum into molybdic acid in 1778. The name was applied by the ancients to various sub-

stances containing lead. Subsequently it was applied to graphite and the mineral molybdenite. Molybdenum is not found native, but in combination as the sulphide (*molybdenite*), which is the source of the commercial supply of molybdenum, as the oxide (*molybdite*), with lead (*wulfenite*), and with cobalt (*paterite*). In smaller quantities it is also found in other minerals. The metal itself is obtained by heating its chloride or trioxide to redness in a current of hydrogen. Molybdenum (symbol, Mo, atomic weight, 96) is a silver-white metal with a specific gravity of 8.6 and a melting point above that of platinum and but slightly below that of tungsten. It combines with oxygen to form the following four oxides: a monoxide (MoO), a sesquioxide (Mo₂O₃), a dioxide (MoO₂), and a trioxide (MoO₃), of which the trioxide is the only important commercial compound of molybdenum. The trioxide, usually called molybdic acid, combines with bases to form molybdates, of which the ammonium molybdate, (NH₄)₂MoO₄, is of value as a reagent for phosphoric acid. Molybdenum itself is used for hardening steel, molybdenum steel being even better than tungsten steel for the manufacture of tools. For this purpose it is used either as comparatively pure molybdenum or in the form of ferromolybdenum, an alloy made in the electric furnace and containing from 50 to 85 per cent of molybdenum, from 10 to 50 per cent of iron, small percentages of carbon, and very small quantities of silicon, sulphur, and phosphorus. See **MOLYB'DENITE**.

MOLYN, mò-lín', PIETER DE (c.1595-1661). A Dutch landscape and genre painter and etcher, born in London. A pupil of Frans Hals at Haarlem, he was received into the guild there in 1616. Besides landscapes in the style of Jan van Goyen, enlivened with biblical and other accessory figures or animals, he painted village festivals, military scenes, and the like with a broad touch and warm, forcible coloring. His pictures are very rare. The Brunswick Gallery contains a fine landscape of "Sandhills with Group of Trees" (1626) and the Berlin Museum a "Ravine with Figures" of very powerful effect. In the Museum at Brussels may be seen a "Night Festival" (1625), at Haarlem the "Sacking of a Village" (1630), and in the Metropolitan Museum, New York, a "Cottage with Landscape." Several of the pictures attributed to him in other galleries are probably by Pieter Mulier (q.v.).

MOLYN, PIETER DE, THE YOUNGER. See **MULIER**.

MOLYNEUX, mól'i-núks, WILLIAM (1656-98). An Irish philosopher and author, born in Dublin. He graduated at Trinity College, Dublin, in 1675, studied law at the Middle Temple, London, in 1675-78; published a translation of Descartes's *Meditationes de Prima Philosophia* in 1680, and in 1683 assisted in founding the Dublin Philosophical Society, of which the Royal Irish Academy was successor. In 1689-90, owing to the disturbances attending Tyrconnel's government, he resided in Chester, England, where he wrote the major part of his *Dioptrica Nova: A Treatise of Dioptrics* (1692) which long continued to be the most important work on the subject. From 1692 until his death he represented Dublin University in the Irish Parliament. He published in 1698 his *Case of Ireland Stated, in Relation to its Being Bound by Acts of Parliament Made in England* (1698),

his best-known work, in which he sought to prove the independence of the Irish Parliament and which evoked much discussion. His further writings include *Sciothericum Telescopicum* (1686), describing "a new contrivance of adapting a telescope to a horizontal dial."

MOLZA, mól'tsá, FRANCESCO MARIA (1489-1544) An Italian poet, born at Modena. He went as a youth to Rome, and after living for five years in Modena, returned to Rome in 1516. From this time he led a life of reckless dissipation. At times he was in the service of Cardinal Ippolito de' Medici and again in that of Cardinal Alessandro Farnese, but he wrote much graceful verse in the meantime. The most celebrated of his poems is the *Vinfa Tiberina*, composed in honor of Faustina Mancini. He wrote also sonnets, builesques, romances, elegies, and epigrams. Consult *Poesie volgari e latine* (Parma, 1747-54). His granddaughter, TARDUQUINA MOLZA (1542-1607), was also a poet. Several of her poems have been printed with the works of her grandfather.

MOMBASA, móm-bás'a, or **MOMBAZ**. The chief seaport town of the British East Africa Protectorate, situated on a small coral island off the coast in lat 4° 3' S and long. 39° 43' E, about 150 miles north of Zanzibar Island (Map Africa, J 5). The shores of the island are rocky and abrupt, the island is connected with the mainland by a railway line. Mombasa is an important commercial centre, a naval coaling station, and the terminus of the Uganda Railway. It has a sheltered but shallow harbor with an iron pier and a stone wharf. There are a number of ancient buildings which testify to the ancient prosperity of the place, but the houses in the native quarter generally are poorly built. The chief object of interest is an extensive fort on a scarped rock built in 1596 by the Portuguese and restored in 1635. To the south of the fort is an attractive European quarter containing the bungalows of the official and commercial classes, the Anglican cathedral, the Roman Catholic church, three well-equipped hotels, and numerous European shops. Near the fort are the buildings of the High Court of British East Africa, of which Mombasa is the seat, the European Club, and the White Hospital. On the other side of the island, some 2 miles west of Mombasa, is Kilindini, now the chief port of entry for British East Africa and Uganda. It has the deepest landlocked harbor on the east coast of Africa, and vessels of the largest tonnage can enter safely. It is connected with Mombasa by a trolley line and contains the cable station of the Eastern Telegraph Company and numerous warehouses situated near the wharf. Mombasa has a thriving population both native and white and contains a number of East Indians, for whom special schools are provided by the government, which also furnishes an elementary school for the children of European parents. Mombasa was visited by Vasco da Gama in 1497 and held by the Portuguese during the greater part of the period from 1529 to 1698, when it appears to have become independent. The English held it from 1824 to 1826, after which it passed to Zanzibar and was ceded in 1891 to the Imperial British East Africa Company. At present it is under the direct administration of the crown. Pop., 1913, about 30,000, mainly Swahili, but containing some 4600 East Indians and 267 Europeans. Consult *Handbook for East Africa*

(Mombasa) and Lord Cranworth, *A Colony in the Making* (London, 1912).

MOMBERT, móm'bért, JACOB ISIDORE (1829-1913). An American Protestant Episcopal clergyman and scholar. He was born at Cassel, Germany, studied in England, at Leipzig, and at Heidelberg; was ordained priest in 1857; and afterward held charges in Quebec, Lancaster (Pa.), Dresden (Germany), Jersey City and Passaic (N. J.). After 1882 he devoted himself largely to study and writing. He translated Tholuck's *Commentary on the Psalms* and wrote: *Faith Victorious* (1882), a life of Archdeacon Johann Ebel of Königsberg, *Handbook of the English Versions of the Bible* (1883, new ed., 1907), *Great Lives* (1886); *Life of Charles the Great* (1889), *Short History of the Crusades* (1894), *Raphael's Sistine Madonna* (1895). In 1884 he brought out a verbatim reprint of the edition of 1530 of William Tyndale's *Five Books of Moses*, with various collations and prolegomena.

MOMENT (Fr. *moment*, from Lat. *momentum*, movement, alteration, particle sufficient to turn the scales, moment, from *movere*, to move, Skt. *miv*, to push). When portions of matter are in rotation about an axis those physical quantities which are used to describe motion of translation—e.g., force, momentum, inertia, or mass—cease to be useful in expressing the properties of the angular motion. Analogous expressions, however, can be found which are called moment of force, moment of momentum, moment of inertia—all with reference to the axis of rotation—which play the same part in the equations of rotation as do force, momentum, and mass in translation. The moment of a force about an axis is the product of the numerical value of the force by the perpendicular distance from the axis to the line of action of the force. The moment of momentum of a particle about the axis is the product of the momentum by the perpendicular distance from the axis to the direction of the velocity of the particle. (If the particle forms part of a rigid body rotating about a fixed axis, the moment of momentum equals the product of the moment of inertia and the angular velocity.) The moment of inertia of a rigid body about an axis is the summation of a series of terms, $m_1 r_1^2 + m_2 r_2^2 + \dots$ (or $\Sigma m r^2$), where m_i is the mass of a particle of the body and r_i is its distance from the axis, etc. See MECHANICS.

MOMENTUM (Lat., movement, alteration, particle sufficient to turn the scales, moment), or QUANTITY OF MOTION. The product of the mass of a moving particle and its linear velocity. (It is a vector quantity.) Both terms were used by Galileo; the latter by Newton. It is a fundamental principle of mechanics (q.v.) that the numerical value of the influence of any external body in changing the motion of a moving particle is the rate of change of momentum with reference to the time, or the change in one second if the change is uniform. The total change of momentum in any time equals the impulse of the external force, or the product of the force and the interval of time. If a bullet enters a target, the time required for it to come to rest depends upon its momentum; but the distance it enters, upon its kinetic energy. Thus, to produce a powerful blow a great momentum (mv) is required; but to do destructive damage, great kinetic energy ($\frac{1}{2}mv^2$). If a system of bodies is moving free from external

influence, the geometrical sum of the linear momenta of all the bodies of the system remains unchanged regardless of how the momenta of the individual bodies are altered by impacts, explosions, etc. This is called the principle of the conservation of linear momentum. (By geometrical sum is meant the process of adding geometrically the lines which indicate the momenta of the individual bodies of the system.)

If a rigid body is rotating about a fixed axis, the product of its moment of inertia about this axis and its angular velocity is called its angular momentum, and it plays the same part in motion of rotation that linear momentum does in translation. See MECHANICS.

MOMIERS, mō'myā' (Fr., mummers). The name given in derision to a class of evangelical Protestants of Switzerland and adjacent parts of Germany and France which sprang up about 1817 and whose members exhibited an uncommon degree of fervor in their religious services. They charged the national church with apostasy from the reformed faith, especially by denying the divinity of Christ. This subjected them to opposition, restraint, and fines. Among those who belonged to the Momiers or sympathized with them were César Malan, Louis Gaussen, Merle d'Aubigné, and F. Monod (qq.v.). Out of this sect sprang the French society styled the Evangelical Society for the Conversion of Roman Catholics, and the Free Church of Switzerland. Consult: *Geschichte der Momiers* (Basel, 1825); Von der Goltz, *Die reformirte Kirche Genfs im 19. Jahrhundert* (ib., 1864); Chenevière, *Quelques mots sur la Genèse religieuse au XIX^{ème} siècle, de M le Baron de Goltz* (Geneva, 1863).

MOMMSEN, môm'zen, THEODOR (1817-1903). An eminent German classical scholar. He was born Nov. 30, 1817, at Garding in Schleswig, where his father was a pastor. From 1838 to 1843 he studied at the University of Kiel, devoting himself especially to legal and historical subjects. From 1844 to 1847 he traveled and studied in Italy and France, giving special attention to inscriptions. In 1848 he became editor of the *Schleswig-holsteinische Zeitung* at Rendsburg, and in the autumn of the same year was called to Leipzig as professor extraordinary of law. Two years later, however, having been removed for political reasons, he withdrew to Switzerland, where he became professor of Roman law at the University of Zurich in 1852. After two years he was called to a similar position at Breslau and from 1858 he was professor of ancient history at Berlin. From 1874 to 1895 he was permanent secretary of the Berlin Royal Academy of Sciences. He also served as deputy in the Prussian Parliament from 1873 to 1882 and was a powerful factor in all liberal movements. Mommsen's literary activity began in 1843 with his famous monograph, *De Collegis et Sodalicis Romanorum*, and from that time he continued to make most important contributions to almost every field of classical learning. In 1902 he was awarded the Nobel prize for literature. His greatest works are *Die unteritalischen Dialekte* (1850); *Römische Geschichte* (1854-56); vols. i-iii, in 8th ed., 1888; Eng. trans., New York, 1894), unquestionably one of the most masterly histories ever written; *Römische Chronologie* (2d ed., 1859); *Die Geschichte des römischen Munizipals* (1860); *Römisches Staatsrecht* (3d ed., 1887-88); *Römisches Strafrecht* (1899); *The Provinces of the Roman Em-*

pire (1885; 5th ed., 1894; Eng. trans. by W. P. Dickson, 1886, revised by F. Haverfield, 1909). Mommsen more than any other man became the founder of modern Latin epigraphy. (See INSCRIPTIONS, *Latin*.) By his publication of the volume *Inscriptiones Regni Neapolitani Latinae* (1852) and his *Inscriptiones Confederationis Helveticae Latinae* (1854) he set the model which has been followed in the great collection of Latin inscriptions, the *Corpus Inscriptionum Latinarum*, which has been published at the expense of the Berlin Academy since 1863. Of this great work Mommsen himself edited vols. i, iii, viii, and ix. He published also a large number of epigraphical works, one of the most important of which is the *Monumentum Ancyranum*, with extensive commentary (2d ed., 1883). This work deals with the great inscription described under ANGORA. He also edited many Latin works, including the *Digest*, the *Edict* of Diocletian (1893), and the *Codex Theodosianus* (1904-05), and served as coeditor of the *Monumenta Germaniae Historica*. Many of his separate papers were gathered together in two volumes entitled *Römische Forschungen* (1863-79). Since his death his *Gesammelte Schriften* have been published in 8 volumes. For a full list of his publications up to 1887, consult Zangemeister, *Theodor Mommsen als Schriftsteller* (Heidelberg, 1887, expanded by Jacobs, 1905). See also C. Wachsmuth, *Worte zum Gedächtniss an Theodor Mommsen* (Leipzig, 1904), and J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

Two of Theodor Mommsen's brothers were recognized scholars in special fields. TYCRO (1819-1900) was born at Garding, studied at Kiel, and was engaged in educative work until 1885, when he retired. He published a critical edition of Pindar (1864) and other works on the Greek poet AUGUST, who was born at Oldesloe, and studied at Kiel, was also engaged in educational work, and published several volumes relating to Greek and Roman chronology.

MOMORDICA (Neo-Lat., from Lat. *mordece*, to bite; so called because the seeds look as if bitten). A genus of the family Cucurbitaceae. *Momordica balsamina*, a native of southern Europe and of the East, used to cover arbors, produces a curious, oblong, much-warted fruit, called the balsam apple, which, when green, is infused in oil to form a vulnerary much esteemed in Syria and some other countries. The large, red, thorny fruit of *Momordica cochinchinensis*, called golkakra in India, is there used for food. *Momordica charantia*, a native of Asia and Africa, grown as an ornamental in the United States, is noted for its peculiarly sculptured seeds, the pulp surrounding which is eaten by the Chinese. *Momordica involucrata* is also cultivated as an ornamental.

MOMOSTENANGO, mō'mōs-tā-nān'gō. A town of the Department of Totonicapan, Guatemala, 60 miles northwest of the city of Guatemala. It is situated on a high plateau in the midst of an important agricultural region producing rice, corn, and beans. Its inhabitants, chiefly Indians, are also engaged in weaving woolen cloth. Pop., about 18,000.

MOMOTOM'BO. A volcano in Central America, situated on the northwest shore of Lake Managua in Nicaragua (Map: Central America, D 4). Its height is 6124 feet. It is still active; its last great eruption occurred in 1852.

MOMPÓS, môm'pós, or **MOMPOX**. A town

of the Department of Bolívar, Colombia, situated on the Magdalena, 110 miles southeast of Cartagena (Map: Colombia, C 2). It has two colleges and several elementary schools. It was formerly an important port, but the river at this point is no longer navigable. The chief occupation of the inhabitants is the manufacture of jewelry, tools, and instruments. Pop. 1912, 14,703.

MOMUS (Gk. *Mṓuos*, *Mōmos*, ridicule). To the Greeks the personification of mocking censure. In Hesiod, *Theogony*, 214, he is the offspring of Night, and in the lost epic poem, *Cypria* (q.v.), he seems to have suggested to Zeus the marriage of Thetis and the birth of a fair daughter, which would together bring about the Trojan War. His story was chosen for satyr dramas, and his name became proverbial for a carping and mocking critic. In Lucian and his contemporaries Momus is more prominent than in the earlier writers, and criticizes all the gods for their defects, even to the shoes of Aphrodite, who was otherwise faultless. For this Zeus finally drove him out of heaven. Consult Lucian, *Hermotimus*, 20, and *Deorum Concilium*.

MONA, mō'na. An opera by H. Parker (q.v.), first produced in New York, March 14, 1912.

MO'NA. The name given by the Romans to an island invaded by Suetonius Paulinus in 60 A.D., and conquered by Agricola in 79 A.D. The island is commonly identified with Anglesey (q.v.), though on that island only meagre traces of Roman occupation have been found. The name Mona was sometimes applied by error, rather to the Isle of Man (q.v.).

MONACA, mōn'a-ka. A borough in Beaver Co., Pa., 25 miles west of Pittsburgh, on the Ohio River and on the Pittsburgh and Lake Erie Railroad (Map: Pennsylvania, A 5). There are manufactories of enameled porcelain ware, glass, tile, tubing, drawn steel and wire, tools, etc. Fire clay is found in large quantities in the vicinity. Thiel College was founded here in 1866 and was removed to Greenville five years later. Monaca owns its water works. Pop., 1900, 2008. 1910, 3376.

MONACHISM, mōn'a-kiz'm. See MONASTICISM.

MONACI, mō-na'ché, ERNESTO (1844-). An Italian scholar in Romance philology, born at Soriano (Province of Rome). He studied the Romance languages and became professor of Romance philology at the University of Rome in 1876. The *Rivista di Filologia*, which he founded in 1872, with Stengel and Manzoni, ceased publication in 1876, but the *Giornale di Filologia Romanza* (1878-84) was virtually a continuation of it. Monaci published detached essays along the same line in the *Studi di Filologia Romanza* and under the following titles: *Uffizi drammatici dei disciplinati dell' Umbria*, in the *Rivista di Filologia* (1872); *Il canzoniere portoghese della Biblioteca Vaticana* (1875); *Il canzoniere portoghese Brancuti-Colucci* (1875-80); *Il canzoniere chigiano* (1878); with Molteni, *Testi antichi fiorentini* (1889); *Faccsimili di antichi manoscritti per uso delle scuole di filologia neolatina* (1881, 1892). *Crestomazia italiana dei primi secoli con prospetto delle flessioni grammaticali e glossario* (1889, 1912); *Sull' antica parafrasi dei disticha de moribus verseggiata da un rimatore anagnino* (1899). He also edited the *Studi romanzi* of the Società Filologica Romana (10 vols., 1903-13).

MONACO, mōn'a-kō. An independent Italian principality under the protection of the French government since 1860, and the smallest sovereign state of Europe, bounded by the Mediterranean and the French Department of Alpes-Maritimes (Map: France, S., M 5). Its area is about 8 square miles and the principality practically consists of the capital, Monaco, Monte Carlo (q.v.), and the village of Condamine, between the two towns. It is in a mountainous country, renowned for its picturesque scenery. The chief exports are oil, oranges, lemons, perfumeries, liquors, and artistic potteries, although its inhabitants are engaged chiefly in providing accommodations for tourists. In 1913 there were 1,692,258 visitors. The government of the principality is that of a constitutional hereditary monarchy. In 1911 Prince Albert granted a constitution, which established a National Council of 21 members. They are elected for four years by universal suffrage with *scrutin de liste*. The government is carried on by the Prince with the aid of a cabinet and a Council of State. There is a court of first instance and a court of justices of the peace, but no jail, all prisoners being sent to France. The judges are appointed by the Prince, mostly from members of judicial bodies in France, and the French Code has been adopted with some modifications by the principality. The police force consists of 4 officers and 82 gendarmes. There is no army and little taxation, the revenue being derived almost entirely from the profits which are received from the famous gaming tables at Monte Carlo. The principality forms a Roman Catholic bishopric, and the Roman Catholic church is recognized and supported by the state. Pop., 1908, 19,121; 1913, 22,956. The population of Monte Carlo is about 10,000.

Monaco was conferred on a member of the Genoese house of Grimaldi in 968. In 1450 the principality passed under the protection of Aragon, but, dissatisfied with the Spanish rule, it came under the protection of France in 1641. In 1731 the last male member of the house of Grimaldi was succeeded by his daughter Louise Hippolyte. She had married James de Goyon Matignon in 1715. Upon her death he acceded to the throne and added the name Grimaldi to his own. Thus the present ruling house is the Goyon-de-Matignon-Grimaldi. The National Convention annexed the principality to France in 1793. By the Treaty of Vienna it came under the protection of Sardinia. In 1861 the communes of Mentone and Rocca-bruna (Roquebrune) were ceded by Sardinia to France, for which the Prince of Monaco received in the following year an indemnity of 4,000,000 francs. The war which broke out in Europe in 1914 (see WAR IN EUROPE) was very disastrous for Monaco. The gaming tables were perforce deserted and thus its most profitable source of income cut off.

MONACO. The capital of the Principality of Monaco, situated on a promontory in the Mediterranean, about midway between Nice and Mentone (Map: France, S, M 5). Its chief buildings are the palace of the Prince, with a beautiful garden, and the new cathedral, built in the Romano-Byzantine style. Near the town is the famous gambling resort of Monte Carlo (q.v.). The adjoining commune of Condamine has a railway station and some industries. Monaco is a sea-bathing resort and its climate is considered very healthful. Pop., 1913: Monaco, 2247; Condamine, 11,082.

MONACO, ALBERT HONORÉ CHARLES, PRINCE OF (1848-). Ruler of the Principality of Monaco (q.v.) and an oceanographer. Born in Paris, he received a French education and served in the Spanish navy as ensign, but entered the French navy as lieutenant in 1870 during the Franco-German War. In 1889 he succeeded his father Charles III (1818-89). He was married twice, but divorced each time. His first wife was Lady Mary Douglas-Hamilton (later Countess Festetics), by whom he had a son, the heir apparent, Louis Honoré Charles Antoine, born at Baden-Baden in 1870; his second wife was Alice Heine, the widow of the Duke of Richelieu and a member of the family of Hamburg bankers. In 1911 he granted a constitution to the principality. The Prince of Monaco undertook a number of scientific voyages to investigate deep-sea life and sea currents, in 1899, with Thoulet and Saverweiss, he was appointed a member of the committee charged by the Geographical Congress at Berlin with the preparation of a map of the oceans (24 parts, finished 1904). On one of his trips he visited the United States (1913). He is the author of *La carrière d'un navigateur* (2d ed., 1905) and many essays on oceanographic researches.

MONACO, LORENZO. See LORENZO MONACO

MONAD (from Lat. *monas*, from Gk *μόνας*, unit, from *μόνος*, *monos*, single; connected with Ger. *man*, only, Lith. *mindu*, throughout). 1. In early modern philosophy, a term used to designate the ultimate elements of reality (Bruno). By Leibnitz, from whose system the name has derived importance, it is used to designate the spiritual atoms which compose the universe. (See LEIBNITZ.) 2. In biology, a generic term for a simplest organism defined as being without a nucleus. In the old system of Ehrenberg, *Monas* was a large genus, but it has become more and more restricted, as better methods and apparatus have resulted in the discovery of a nucleus where none was believed to occur. The forms once included in the genus are now distributed among the flagellate Infusoria on the one hand (Haeckel's *Monera*; see MONER) and the bacteria on the other. As it is quite probable that there is no organism without nuclear matter, the name is practically obsolete.

MONAD'NOCK. A hill or mountain which projects above the general level of an old eroded mountain surface. In the process of denudation it not infrequently happens that certain prominences by reason of their being formed of very hard resistant rocks withstand the wear much

more effectually than the surrounding mountains so that they still present considerable elevations after the latter have been reduced to a nearly plane surface. Such remnant mountains are called monadnocks, after the mountain of that name in New Hampshire.

MONAD'NOCK, GRAND. An isolated mountain in Cheshire County, in the southwestern corner of New Hampshire (Map New Hampshire, E 8). It is regarded as an outlying member of the White Mountain group, is 3186 feet high, and commands a fine view from its summit.

MONAGAS, mó-na'gas, JOSÉ GREGORIO (1795-c.1870). A President of Venezuela, brother of José Tadeo Monagas (q.v.), born in Maturín. His early life was spent as a hidsman on the plains and he served with some distinction in the War of Independence. He aided his brother in the insurrections of 1831 and 1835 and in 1850 was elected to the presidency through the support of José Tadeo. His administration was tranquil and his one service to the country was the signing of the law abolishing slavery, which was passed at the close of his term (March 24, 1854).

MONAGAS, JOSÉ TADEO (1788-1868). A Venezuelan soldier and president, born at Maturín. Having received a common education, he became manager of a large estate, and when the War of Independence broke out he joined the Patriot army and served with distinction. He led revolts against the conservative oligarchy in 1831 and 1835, but later aided this party in crushing out a liberal revolt (1846). In this latter year, with the support of ex-President Páez and the conservatives, he was elected to the presidency. Preferring to govern with the liberal element, he alienated the conservatives, who endeavored to bring charges against him in Congress. He saved himself from making a defense by instigating a riot in Congress in which a number of the conservatives were killed (Jan. 24, 1848) and opposition to his dictatorial rule was crushed. Páez started a revolt, but Monagas forced him to surrender (1849) and sent him into exile. In 1850 he secured the election of his brother José Gregorio to the presidency, but four years later he himself was again elected to this office. He carried out a revision of the constitution (1857), partly with a view to maintaining himself in power, and was reelected again for a term of six years (April 18, 1857). The next year a revolution headed by Castro took place, and Monagas was forced to resign and to go into exile. Ten years later he returned to Venezuela, led a successful revolt against President Falcón, and was again elected President, but died before taking office.

MONAGHAN, mōn'a-gan. An inland county in the southern part of Ulster, Ireland (Map Ireland, E 3). Area, 496 square miles. The surface is in general undulating, with a gradual slope from southeast to northwest. The highest point is 1250 feet above the sea. It is watered by the Finn and the Blackwater. Less than half the area of the county is arable, producing cereal crops (with the exception of wheat) and flax. There are manufactures of linen; free-stone and slate are quarried; cattle, sheep, and pigs are raised. The principal towns are Monaghan (q.v.), the county seat, Carrickmacross, Clones, and Castle Blaney. Pop., 1841, 200,500; 1901, 74,611; 1911, 71,455.

MONAGHAN. The capital of County Mon-

aghan, Ireland, 52 miles southwest of Belfast (Map: Ireland, E 3). Among its public buildings are the market house, courthouse, a national model school, Roman Catholic college, convent of St. Louis, and the modern cathedral of St. MacCarthain. The town is the centre of a trade in flax and grain. Two markets for agricultural produce are held weekly and there is also a monthly fair. Near by is Rossmore Park, the residence of Lord Rossmore. Pop., 1901, 2932, 1911, 4272.

MONALDESCHI, mō'nāl-dēs'kē, GIOVANNI, MARCHESE. An Italian noble of the seventeenth century, a favorite of Christina of Sweden. He was a member of a noble family of Ascoli and a leader of the French party at Rome, and after the disgrace of Pimentelli and the Spanish party at the Swedish court came into the favor of the Queen. In 1657, during her visit at the French court, she accused him of high treason and had him assassinated at Fontainebleau. The real reason for his murder is unknown. Consult Martens, *Causés célèbres du droit des gens* (2d ed., Leipzig, 1858).

MONA LISA, mō'nā lē'zā. See VINCI, LEONARDO DA.

MONA (Sp, Portug., It., female monkey) **MONKEY**. A west African guenon (*Cercopithecus*, or *Lasopygga mona*), familiar in menageries and as a pet. It is of small size, black on the back, with the face purple, except the pink lips and chin. The undersurface is white, abruptly demarked from the black mantle, the bushy whiskers are yellow, a gray band extends across the forehead; and there is an oval white spot on each side of the root of the tail. It is a docile and interesting animal. Cf. GUENON; DIANA MONKEY.

MONARCH. See MILKWEED BUTTERFLY.

MONARCHIANS, mō-nār'kī-anz (from Gk. μοναρχία, *monarchia*, sole power, from *μόναρχος*, *monarchos*, monarch, from *μόνος*, *monos*, single + *ἀρχεῖν*, *archein*, to rule). A term of Christian theology, applied to certain persons in the early Church who objected to the orthodox Christology on the ground that it suggested two gods (or three, if the Holy Spirit was included), and who maintained, in opposition, what was called the divine 'Monarchy' (Gk. *μοναρχία*), or essential oneness of the Deity. The questions at issue were the relationship of Christ to the Father and Christ's preexistence. If Christ was God incarnate, as the Church taught, then it must follow, said some, that God has entered the world and has lived, suffered, and died among men. Christ is indistinguishable from God the Father and is merely a form or mode of manifestation of the supreme Deity, who might reveal Himself as Father, Son, or Spirit. This doctrine was called Modalism, or, more exactly, Modalistic Monarchianism. It was also known as Patripassianism, from the fact that it represented the Father as suffering. Among its adherents were Praxeas, an Asiatic Christian, who visited Rome late in the second century and was opposed by Tertullian and by Noëtus of Smyrna, whose views were combated by Hippolytus. The most celebrated Modalist, however, was Sabellius (qv), who flourished early in the third century and, who taught that the Trinity consisted of three successive manifestations of God in history. Eastern Modalism was commonly called Sabellianism after him, and this name ultimately came into use in the West also.

But there were some Christians who at tempted, in just the opposite fashion, to answer the question how Christ was related to God. Their method was not identification but distinction. Christ they held to be a created being, a man like other men, but they believed he became the Son of God by adoption, through an impartation of divine powers, usually regarded as received at his baptism. These persons are known as Dynamic Monarchians (from Gk. *δυνάμεις*, powers), to distinguish them from the other Monarchians described above. One of the leaders of this school was Theodotus the Tanner, who came to Rome from Byzantium late in the second century and was there excommunicated by Pope Victor I. Another leader also bore the name Theodotus. He was a money changer, a disciple of Theodotus the Tanner. Artemon, in the third century, continued the same teaching. All these three appear to have been laymen. The Theodotians and Artemonites were called after them and figure prominently among the third-century heretics. Dynamic Monarchianism found an able representative in Paul, Bishop of Samosata and Prime Minister of Zenobia, Queen of Palmyra, who was excommunicated by an Asiatic synod about 268. (See PAUL OF SAMOSATA.) The Dynamic Monarchians were probably much less numerous than the Modalists.

Over against all these Monarchians of either type the main body of the Church maintained the divinity of Christ along with his personal distinction from the Father. The orthodox doctrine was that Christ is a preexistent divine hypostasis (qv), who became man through the incarnation and is therefore both God and man, two natures in one person. Irenæus, Tertullian, Hippolytus, Novatian, and especially Origen, all contributed towards this doctrinal development, and in the fourth century the Monarchian controversy gave way to the Arian. (See ARIUS.) Consult Adolf Harnack, *History of Dogma*, vol. iii (Boston, 1897); G. P. Fisher, *History of Christian Doctrine* (New York, 1896); Smith and Wace, *Dictionary of Christian Biography* (4 vols., London, 1877-87), articles "Theodotus," "Artemon," "Praxeas," "Noëtus," "Sabellius," "Paul of Samosata," etc. See CHRISTOLOGY.

MONARCHY (Lat. *monarchia*, from Gk. *μοναρχία*, sole power). In the strict sense of the term, that form of state in which the sovereign authority is vested in a single person. It is only when the king or chief magistrate of the community possesses the entire ruling power that he is, in the proper acceptance of the term, a monarch, but in a mere popular sense the term "monarchy" is applied to any state in which the chief executive authority is vested in a single hereditary ruler. The degenerate form of monarchy is tyranny, or government for the exclusive benefit of the ruler. When the head of the state, still possessing the status and dignity of royalty, shares the supreme power with a class of nobles, with a popular representative body, or with both, the government, though no longer in strictness monarchical, is called in popular language a mixed or limited monarchy, the term "absolute monarchy" being applied to a government properly monarchical. If the monarch in the exercise of his powers is restrained by the precepts of a constitution, the state is commonly styled a constitutional monarchy. Monarchy, although usually hereditary, has sometimes been elective, a condition generally attended with feuds and distractions, as

was the case in Poland (q.v.). Constitutional monarchy may be in its origin elective, or combine both systems, as when one family is disinherited and the sceptre declared hereditary in the hands of another under certain conditions, as occurred in England in 1688. See GOVERNMENT; KING; REPUBLIC.

MO'NAS. See MONAD.

MON'ASTERY (Lat *monasterium*, from Gk. μοναστήριον, monastery, solitary dwelling, from μοναστής, *monastēs*, solitary man, monk, from μονάζειν, *monazein*, to dwell alone, from μόνος, *monos*, single). The generic name of the residence of any body of men (or even, though more rarely, of women) bound by monastic vows. In its strict application it is confined to the houses of monks properly so called, but is frequently used of the establishments of the mendicant and more modern orders. The older monasteries were divided into two great classes, abbeys and priories. The former name was given only to the important or mother houses, governed by an abbot, who was commonly assisted by a prior, subprior, and other functionaries. An abbey always included a church, and the English word minster, still applied to churches no longer part of a monastic establishment, had its origin in the Latin *monasterium*. A priory supposed a less extensive and less numerous community. It was governed by a prior and was originally subject to the jurisdiction of an abbey. This was the Benedictine rule, but in other orders, such as the Carthusian, the title of prior was uniformly used instead of abbot. In the military orders the names commandery and preceptory were used instead of abbey and priory. The name cloister is sometimes applied to the whole monastery, considered as an inclosed place, the term is also used, in a narrower sense, to designate the arcaded ambulatory which runs around the inner court of the buildings. Below the officials already mentioned the ordinary monks were generally divided into two great classes—choir brothers (frequently, in later times almost universally, in holy orders), so called because they were required and by their education qualified to take part in the singing of the choir offices, and lay brothers, who, instead of this duty, had the household cares of the community. For the principles of monastic life and the history of its development, see MONASTICISM, and, for the important part played by monasteries in the growth of architecture and its kindred arts, see MONASTIC ART.

MONASTERY, THE. A novel by Sir Walter Scott (1820). It is a story of the sixteenth century, of the days of Murray, the Regent, and had for its sequel *The Abbot* (q.v.).

MONASTIC ARCHITECTURE. The architecture of monastic and conventual institutions or communities. The Buddhists of India practiced monasticism from an early date (see INDIAN ART, ARCHITECTURE), and their *chaityas* or rock-cut chapels and *viharas* or community-buildings, many of which are also rock-cut, are mostly contemporary with the earliest Coptic monasteries, dating from between the fifth and eighth centuries A.D. Eastern orthodox monasticism has persistently retained, in the building and decoration of its chapels, refectories, etc., the Byzantine tradition down to the present day as at Mount Athos, Hagia Iriada, Rilo in the Balkans, Ani and Etchmiadzin in Armenia, and other centres.

The Western church, on the other hand, developed an architecture, as well as monastic systems of its own, especially in France, where the various branches of the Benedictine Order were particularly influential in architectural development. Amid the social and political chaos of the so-called Dark Ages it was the monasteries which, in France, England, and Germany at least, represented to the multitude most forcibly the universal power, authority, and discipline of the Church, unshaken by all the tumults about them. They became the refuges of all who wished to flee from war and feudal service, the centres of Christian learning, culture, and art; and by the middle of the eleventh century had acquired great wealth in land, men, and money, populous communities of clerical and lay brethren, for whom and by whom were built churches (abbeys), cloisters, refectories, hospitals, bakeries, hostels, and cells or houses for residence. In these the Western Romanesque style was developed to its highest expression, in all three countries, in the twelfth century. (See MONASTIC ART and ROMANESQUE ARCHITECTURE.) With the growth of settled government and the development of the royal and episcopal authorities in France, the building of great abbeys ceased, and a new movement began in France in the building of cathedrals, in which the new Gothic style gradually superseded the round-arched Romanesque. For the bibliography of this subject, see under MONASTIC ART.

MONASTIC ART. The art peculiar to the monastic orders. In the development of Christian art monasticism was at times the determining cause. The *Basilian* and other groups of monks in the East during the entire Middle Ages; the *Benedictines* in the West from the eighth to the eleventh century, the *Cistercians* during the twelfth; the *Franciscans* and *Dominicans*, especially in Italy, during the thirteenth and fourteenth centuries, produced a large proportion of the works of art of those periods. The influence of these orders was seldom exercised on the material side of the various arts, but more generally and radically on the choice and treatment of subject.

Basilian Art. The monks of the Order of St. Basil were the best organized and most numerous of the monastic aggregations in the East, and their influence upon Christian art was the most important produced by Eastern monasticism. Oriental monasteries cannot compare with the largest in the West; but, on the other hand, study of them is more interesting, because so many more remain comparatively intact and are of so early a date. The groups in the Egyptian Desert, e.g., date mainly from the fourth and fifth centuries, and some of those in Old Cairo are not much later. The usual type is an immense inclosure surrounded by a high wall like that around an Egyptian temple. Within the court the monks' cells are built against the inner edge of this wall, leaving the central space free for two or three churches, a large refectory, and a strong watch tower which contains the treasury and library. Next in age come the monasteries of the cities of central Syria (fifth and sixth centuries), with a common cloister. Scattered over Syria and Palestine, beginning with Justinian's famous monastery of St. Laba, on Mount Sinai, are monastic establishments of the Syrian monks which rivaled those of Egypt. They have been very little studied. But the

period succeeding the Iconoclastic movement is represented by some monasteries at Constantinople (e.g., St. John Stoudios), Saloniki, Chios, Daphne, and St. Luke in Greece, and especially by those of the Holy Mountain, Mount Athos, the centre of Hellenic monasticism from the eleventh century to the present day. The general plan of the Mount Athos monasteries was similar to that of the Egyptians, with the difference that a better organization had brought. The separate monasteries were dotted over the mountain, each in its inclosing wall. Their churches, treasures, frescoes, and manuscripts have been carefully studied; they form one of the most interesting groups remaining from the Middle Ages. Some of the buildings are as early as the tenth and eleventh centuries, with mosaic pavements, decorative sculptures and mosaics, but the frescoes are all much later. The most interesting group in Thessaly are the famous monasteries of Meteora, which the visitor can reach only by being hauled in a basket to the top of a high precipitous rock. Here the buildings are not so old as those at Mount Athos. In the strong Byzantine revival under Basil the Macedonian and his successors (ninth and tenth centuries) the monks played an important part as colonists. Traces of their monasteries and hundreds of their anchoritic caves with Byzantine frescoes are found, e.g., in Calabria, Apulia, and other parts of southern Italy. Before then, in the eighth century, the Iconoclastic persecutions had driven to Italy many Basilian monks who as painters could no longer practice their art safely in the East. They gave the strongly Byzantine tinge to the art, especially the painting and decorative sculpture of the Roman school, which thence spread over the rest of Europe. There were over 20 Greek monasteries in Rome, large and small, before the eleventh century. That of Grotta-ferrata, near Rome, became the greatest representative of the Basilians in the West outside of southern Italy, and still has interesting early mosaics and sculptures.

While the monastic and lay artists of Europe developed their styles of architecture with but little reference to the East, the arts of ivory carving, enameling, goldsmith work, mosaic, tapestry, and embroidery were perpetuated in the Eastern monasteries and by them transmitted to the Western monks of the Carolingian age. To the Eastern monks also was due a dominant part in perfecting the system of Christian iconography which was, in part at least, adopted in the West, including the artistic types of Christ, the Virgin, John the Baptist, the Apostles, angels, and saints, as well as the arrangement of most of the subjects of the Old and New Testaments. This influence was supreme in Italian painting, e.g., up to the time of Giotto. With the name of the monk Panselinus will always be connected that written textbook of painters used until the present day by Neo-Byzantine artists.

Benedictine Art. The earliest establishments of the founder of the Order of St. Benedict at Subiaco and Monte Cassino have left no traces to show that they had any special artistic significance. Most of the Western monasteries of the seventh century were of wood, and the life was still largely anchoritic. It was in the eighth century, as the Carolingian era approaches, that Benedictine life became more highly organized, types of monastic buildings

were created for all time, and monasteries of great wealth and power arose, taking a leading part in art. Centula, Lorsch, Fontanella, and Fulda were followed by Nanantula, Monte Cassino, Cava, Saint-Gall, Tours, Reichenau, and many other great artistic centres. The cloister, a new architectural form adapted from the atrium of the early Christian basilica, became the centre around which the monastic buildings were grouped. For the general plan and organization of the monastery and its early artistic activity, consult the article **BENEDICTINES**.

In the tenth century the great Benedictine reform took place at Cluny, which henceforth was the leading monastery of the order, using the establishments of Hirsau and Farfa to further her artistic and other reforms in Germany and Italy. The plans used in rebuilding and reorganizing these two monasteries were borrowed from Cluny. The revival which ensued led to an immense increase in the number of establishments. In Italy alone art became partly enfranchised, with a notable increase of lay artists, due to the great prosperity of the fine communal cities.

The style of architecture practiced by the Benedictines during these centuries did not show much originality. It retained in the churches the old basilical type, with columns and wooden roof, though piers were occasionally used. The lack of close, organized union between the different monasteries of the order prevented the creation of a special Benedictine style. The work had local characteristics. In newly converted and civilized regions the monks were always the pioneers of art, and in this way, even without special style, became a paramount influence. But in fresco painting and in the minor and industrial arts the case was different. (See **BENEDICTINES**.) The monks partly introduced Byzantine methods and ideas, as in the school founded in the eleventh century by Desiderius at Monte Cassino, for nearly all branches of art, partly evolved a special style and iconography, as in Germany and France. The lay guilds of the late Romanesque and Gothic periods were merely offshoots from these monastic schools. The intellectual attainments of the monks peculiarly qualified them in developing systematically the themes of religious art, which they handed on to their lay successors, who had but to accept and vary them.

Cistercian Art. The Cistercian monasteries were not, like the Benedictine, centres of the industrial and minor arts, no provision was made for the practice of ivory carving, goldsmith work, enameling, illuminating manuscripts or fresco painting, mosaic work, and monumental sculpture. On the other hand, it was necessary to train a school of architects that should understand the special needs of the order and build according to its rules. This school originated in Burgundy, and as the order spread over the whole of Europe and part of the Orient during the twelfth century and became the most powerful of all monastic institutions, as well as the most perfectly organized, its architects carried the Burgundian Cistercian style over a large part of the then civilized world. Pontigny in France, Maulbronn in Germany, Fossanova in Italy, Veruela in Spain are typical establishments in good preservation of the twelfth and thirteenth centuries. The high walls, inclosing the entire establishment and insuring protection against raids, as well as

marking the cloistral limits, were entered through a monumental gateway, and contained large warehouses, barns, and stables, and often a mill, a hospital, and chapel, as well as the main quadrangle of buildings, flanked by a cemetery, garden, and orchard. Of this quadrangle the church usually occupied the left flank, facing the gateway, the dormitories being on the front and rear of the quadrangle around the cloister, on the second floor, the ground floor being occupied by a chapel and chapter house on the side near the church, a refectory and kitchen on the side opposite the church, and reception rooms, passageways, and staircases on the front.

The architectural style of these buildings was plain on principle. The church had a plain gable front without towers, and its material was of stone or brick, left undecorated by figured sculptures or frescoes. The practical element, being so strongly developed, led to a divorce of the decorative from the structural elements in architecture. Stress was laid upon forms of vaulting, and the order became associated with the substitution of tunnel, groin, and ribbed vaulting for wooden roofs throughout a large part of Europe. But the influence of the new Gothic constructive forms commenced in Burgundy towards 1160, and the Cistercian architects quickly adopted them as in harmony with their own ideas and propagated them throughout Europe. Nevertheless the order never developed the Gothic style in its entirety or to its ultimate forms, but rested satisfied with its elementary stage as more in harmony with the simple ideas of the order.

The monastic buildings of Fossanova in Italy are a good example of structures built by French Cistercian constructors imported from Burgundy; those of the neighboring Casamari exemplify the handiwork of the native artists taught by these Frenchmen. So it was everywhere, especially in Germany and England, where local peculiarities soon strongly modified the imported styles, and before the close of the thirteenth century the original strictness of the order was relaxed and, especially in France, the entire rich system of Gothic decoration adopted, with its tracery, floral sculpture, and stained glass. With the fourteenth century the decadence of the order, replaced in popularity by the Franciscans and Dominicans, removed it as a serious factor from the field of art.

Franciscan and Dominican Art. The monasteries of these orders were in or near the cities, so that the members could take part in the daily life of the people. There were ordinarily no high encircling cloistral walls, no arrangements for teaching the arts (except occasionally that of illuminating manuscripts or doing goldsmith work), no warehouses. The art of the mendicant orders was especially important in Italy. At the beginning the Cistercian style furnished models for church and cloistral architecture, but soon these borrowed traits dropped into insignificance when compared with the original features that were developed. The emphasis laid upon preaching in their churches to the masses and thus influencing public sentiment led to the creation of two new types of monastic church—that with lofty aisles and with widely spaced supports between nave and aisles and the hall-church type with no aisles. In both cases the object was to place large congregations within sight and hearing of the pulpit. San Francesco at Assisi, the mother

monastery, was the model for the hall-church type; San Francesco and San Domenico at Bologna for the three-aisled type. Of the greatest churches of the thirteenth century in Italy nearly all were built by monks of these two orders—Santa Maria Novella and Santa Croce at Florence, Santa Maria dei Frari and Santi Giovanni e Paolo at Venice, Santa Maria sopra Minerva in Rome, Sant' Anastasia at Verona, San Francesco at Assisi.

While the orders were less prominent in the architecture of the rest of Europe, they certainly popularized in Germany the use of the hall church, which became a very common type; but the predominance of cathedral architecture and the continued prosperity of the Cistercians limited their sphere.

Of even greater importance was the effect of the orders on sculpture and painting. The thought and feeling, the system and symbolism that lay behind the great schools of fresco painting of Florence, Siena, and other Italian centres, as well as the French schools of cathedral sculpture at Chartres, Rheims, Amiens, Bourges, Paris, are due to the influence of St. Francis, St. Dominic, and their successors, such as St. Bonaventura and Thomas Aquinas. The encyclopædic thinkers who furnished the ideas and directed the hand of sculptors and painters were the teachers of these orders, who also directed the thought of the universities of Europe. The frescoes in the church of San Francesco at Assisi, in the Spanish Chapel, Santa Maria Novella, Florence, the Palazzo Pubblico at Siena, and of Orvieto Cathedral, are their work, in symbolism, in teaching, in all their higher value. The bold attempt to represent the origin, character, and history of the universe in art, made by the decorators of the French Gothic cathedrals, had precisely the same source. The corresponding printed pages are to be found in Vincent of Beauvais's *Speculum Universale* and other similar literary encyclopædias. It is by reading the life and legends of St. Francis, by studying the important rôle of the preachers in the popular movements, by reading the sermons of the great preachers, that one can realize how clearly the mystic and allegorical art of the thirteenth and fourteenth centuries is a creation of these orders and merely a part of a great wave of social reform that was due largely to them. Giotto, the Gaddi, Orcagna, Andrea Pisano, and other artists, while not members of the orders, expressed their ideals.

Other Orders. Of all the Western orders only one returned in the Middle Ages to the anchoritic idea and expressed it in beautiful architectural movements. This was the Carthusian Order (Chartreux) of St. Bruno, founded in the eleventh century. The individual cell life of each member determined the form and character of the monastic buildings, which covered a great extent of ground, usually around two immense cloisters or open courts.

The secularizing of art, which began in the thirteenth century, was carried further forward by each century of the Renaissance. What the art guilds commenced humanism completed. The monastic orders exercised no influence in art after the fourteenth century, even though some individual members were prominent artists, such as Fra Angelico, Filippo Lippi, Bartolommeo, the painters; Fra Giocondo, the architect; etc.

Bibliography. The entire theme of monastic

art is so interwoven with the history of Christian art as a whole, as to have eluded treatment. Lenoir, *Architectures monastiques* (Paris, 1852-56), has given a very good summary of this part of the subject, for another excellent survey of French monastic architecture, consult Viollet-le-Duc, *Dictionnaire raisonné de l'architecture française*, s. v., *Architecture, Architecture monastique*. Other general works are: Wiese, *Ueber das Verhältniss der Kunst zur Religion* (Berlin, 1878), Springer, *Klosterleben und Klosterkunst* (Bonn, 1886), Schlosser, *Die abendländische Klosteranlage des früheren Mittelalters* (Vienna, 1889), Kraus, *Geschichte der christlichen Kunst* (Freiburg, 1896). For the Basilians, see Brockhaus, *Die Kunst in den Athos-Kloster* (Leipzig, 1890), Balhr, *Le monastère byzantin de Tebrassa* (Paris, 1897), Millet, *Le monastère de Daphné* (ib., 1899), Schultz and Bainsley, *The Monastery of St. Luke of Stiris in Phocis* (London, 1901), for the Benedictines, Kratzinger, *Die Benediktinerorden und die Kultur* (Heidelberg, 1876), for the Cistercians, Sharpe, *The Architecture of the Cistercians* (London, 1874), for the Dominicans and Franciscans, Enlart, *Origines françaises de l'architecture gothique en Italie* (Paris, 1894), Louis Gillet, *Histoire artistique des ordres mendiants* (Paris, 1912); for subjects often represented in monastic art, see Miss Jameson, *Legends of the Monastic Orders as Represented in the Fine Arts* (London, 1872); also the authorities referred to under CHRISTIAN ART; BENEDICTINES, CISTERCIANS.

MONASTICISM, mō-nās'ti-siz'm. The general term used to describe the system under which those men and women live who have abandoned the world for religious reasons and live, whether separately or in community, in the pursuit of spiritual perfection. The vows under which they live (for details, see Vow) are based upon what are known as the evangelical counsels (q.v.) or maxims to guide those who are desirous of attaining perfection in this life. From their being bound by such vows, these people are known as religious (Lat. *religare*, to bind). The term "monk" is correctly applied only to the members of the older or more strictly cloistered societies, and not to the mendicant orders, such as the Dominicans and Franciscans, whose members are termed friars. The word "nun" is, however, sometimes loosely applied to any who withdraw from the world to give themselves wholly to the service of God and their neighbor under the vows of poverty, chastity, and obedience.

Forms of monasticism existed among the so-called pagan nations long before Christ. Buddha found the institution a practically essential feature of Brahmanism when he began his work about the sixth century before Christ. Among the Hindus, the Laws of Manu provide that, after the rearing of a family, members of the three upper castes may retire to a hermit life and seek truth in contemplation. Buddha created a monastic order, for whom he drew up a set of rules that contain many analogies with the rules of Christian religious orders. Among the Greeks the members of the Orphic brotherhood and the followers of Pythagoras showed marked tendencies to monasticism. In Egypt the worship of Serapis was associated with the foundation of monasteries. The largest institution of the kind was that at Memphis, which flourished just after the Alexandrian

period. German antiquaries have pointed out many similarities between the old Egyptian monasticism and the later Christian monastic foundations in the same country. Among the Jews the Essenes (q.v.) seem to have had some of the characteristics of a religious order.

The first reference to the monastic life in Christian writers is considered by some to be a letter of St. Ignatius of Antioch, who in his letter to Polycarp mentions the vow of virginity. The first Christian hermits seem to have established themselves on the shores of the Red Sea, where in ante-Christian times the Therapeutæ, an order of pagan hermits, had been established. Not long afterward the desert regions of Upper Egypt became a favorite retreat for those who fled from the persecutions of the Christians so frequent during the third century, or who found the vices of the decadent Roman Empire intolerable. Among the earliest of these fathers of the desert was Paul of Thebes (q.v.), who lived for over 100 years (228-7340) on the fruit of the date tree and water, clothing himself in palm leaves. After Paul came Antony (q.v.), who was the first to gather together the scattered hermits in lauras. These first cenobites had then collections of cells in the deserts of the Thebaid. The life of St. Antony was written by Athanasius, at whose request he abandoned his solitude for a time during the troubles caused by the Arians. While the heresy was rampant, Antony established himself at Alexandria, and the fame of his sanctity, as well as his gentleness and learning, drew many disciples to him. Not a few of these new followers accompanied Antony when he again retired to the desert. His greatest disciple was Macarius of Alexandria, who died in 394 and whose reputation for wisdom and saintliness attracted many monks to the various hermitages over which he ruled. Apparently about the beginning of the fourth century monks began to live together under a common roof, and buildings began to be erected as monasteries instead of the separate cells in which the hermits had lived. Pachomius (q.v.) founded an immense monastery about 340 on the island of Tabennæ in the Nile. He drew up for his subjects a monastic rule, the first definite set of regulations of the kind on record. Many thousands of disciples flocked to him, and he founded several other monasteries for men, and one for women under the direction of his sister. All of these institutions recognized the authority of a single superior—an abbot or archimandrite. They constitute the original type of the religious order. St. Basil the Great (q.v.) made a visit to the Egyptian monasteries shortly after his student days at Athens, about the time that Pachomius was beginning his work. Basil, on his return to Asia, founded monasteries in Pontus and Cappadocia, thus acquiring the name of Father of Monasticism in the East. The Greek father drew up a set of rules, still extant, which has influenced subsequent founders of religious orders more than any other.

St. Jerome translated the rule of Pachomius into Latin for the use of his own monks at Bethlehem and of certain of the Latins in Italy. Dom Gasquet says that in the time of St. Jerome and St. Augustine the monastic life was well recognized as an integral part of the Church's system. There was no established code of rules, however, to which all the monks were bound to conform themselves; an individual

might pass from this or that house to any other in which the monastic life was led. Monasteries continued to spring up in many parts of the West during the fourth, fifth, and sixth centuries. One of the most famous of these was situated on the Iles de Lérins in the Mediterranean Sea, off the coast of France, near the present town of Cannes. Another was that founded by St. Martin of Tours at Poitiers, under the direction of St. Hilary, Bishop of that city. Many monasteries flourished in Ireland during these centuries and furnished missionary monks who spread not only Christianity, but also civilization and an awakening love for literature and the arts, among the barbarians who had overrun the continent of Europe. Columbanus, an Irish monk of the end of the sixth century, drew up a monastic rule that, because of its strictness, has been the model of many subsequent austere orders. Perpetual silence, complete abstinence from flesh meat, daily fasting, labor, reading, prayer, poverty, humility, and chastity are the essence of his prescriptions.

The monastic rule which had most influence in the West, however, was that of St. Benedict, who about 529, after a youth passed as a solitary, gathered some monks who had been attracted to his solitude at Subiaco and founded the monastery of Monte Cassino. This became the mother house of Western monasticism. Benedict founded seven other monasteries (among them one for women under the direction of his sister, St. Scholastica, at Piombiarole, about 5 miles from Monte Cassino) and deservedly bears the name of Patriarch of the Monks of the West. Benedict's rule is characterized by a wide and wise discretion. To secure the end more certainly, those who desired to walk in the path of the Gospel counsels under his guidance promised a lifelong obedience. "This was the first introduction of a *profession* for life according to the rule, and it was known to the monk who wished to fight under the law that as the rule says 'From that day it was not lawful for him to withdraw his neck from the yoke of the rule.' The result of this introduction was twofold: on the one hand it established firmly the perpetuity of the cloistral family life, that stability in the community which has since become the characteristic mark of monasticism; and on the other hand for the only will of the abbot or superior, it substituted a code of laws by which his government was to be guided" (Gasquet). Nevertheless the rule itself shows that, though St. Benedict required obedience to his code of regulations, he never intended to forbid other customs and practices. In fact, he expressly refers his followers to the rule of St. Basil and others for further guidance.

The immediately succeeding centuries saw a wonderful development of monasticism in the West. The monasteries became the home of learning. Monks were the teachers of the world and went forth as missionary preachers into England, Germany, and the nations of northern and central Europe. Agriculture as well as civilization became their care, and the first serious attempt to do away with serfdom was under their rule. Education for women developed first in the convents and then spread to their sisters in the world, until women were better educated than at any preceding period in history. In the monasteries and convents expert nursing of the sick and wounded and the

first germs of modern clinical medicine developed. Many members of royal families became monks and nuns, and the first glimmer of understanding between different orders of society appeared.

According to the rule of St. Benedict, each monastery was separate and wholly distinct, with an independent life of its own. The first serious attempt at union was made at a great assembly held at Aix-la-Chapelle in 817, under the guidance of St. Benedict of Aniane. Here rules for the better regulation of monastic life were passed. Benedict had great influence with the Emperor Louis the Pious, the son of Charlemagne. He planned to secure the most absolute uniformity among the monks of all monasteries and was seconded in his effort by the sovereign. Benedict was chosen as general. This assembly caused a reawakening of the monastic spirit throughout Europe and affected also England, where the *Concordia Regularis*, which prescribed one set of monastic customs for the whole of England, was adopted. In the next century occurs the greatest name in monastic history, that of Cluny. The ideal of Cluny was the existence of one great central monastery, with dependencies spread over many lands and forming a vast feudal hierarchy. The subordinate monasteries were dependents in the strictest sense. Their superiors were not called abbots, but priors. The superior of every house, however great, was the nominee of the abbot of Cluny, the profession of every member was made in the name and with the sanction of the abbot of Cluny. Cluny remains, in spite of the defects of its feudal character, one of the chief factors in the history of the eleventh century. The authority of Peter the Venerable, the contemporary of St. Bernard, was recognized by 2000 dependent monasteries. The Cistercian system of monasticism is the next feature of historical development. It was founded by St. Stephen Harding, an Englishman, who early left his own country to live in France. He adopted the rule of St. Benedict; the heads of other houses were abbots, but attached to the mother house by the obligation of yearly assembling at Cîteaux, while the abbot of Cîteaux had the right to visit all other monasteries and, while forbidden to interfere with the management of their temporalities without the consent of the community, could insist on reforms in discipline if he deemed them necessary. The greatest of the Cistercians was St. Bernard, who founded, with 32 young nobles, the monastery of Clairvaux.

During the Crusades came the organization of religious bodies for definite pious purposes whose members were bound by the usual obligations of monasticism, yet did not withdraw entirely from the world. The Knights of St. John (see SAINT JOHN OF JERUSALEM, KNIGHTS OF), the Knights Templars (qv), and the Teutonic Knights (qv) are the best known of these. Incited by their example, or as a result of the same spirit, many nonmilitary religious orders were founded during and just after the Crusades, with the purpose of definite work to be accomplished outside of the monasteries.

The fourth Lateran Council decreed that no further religious orders should be founded, yet the first quarter of the thirteenth century saw the rise of two great mendicant orders, those of St. Francis (see FRANCISCANS) and of St. Dominic (see DOMINICANS). The members of these orders, in spite of their vow of absolute

poverty, soon became prominent in the Church and in the universities and as poets, preachers, philosophers, writers, scientists, and teachers. The next great advance in monasticism was the foundation of the Jesuits (q.v.), a teaching, preaching missionary order with a special vow to go wherever they should be sent by the Pope. Their institute has proved the model on which most modern religious congregations have been based.

Monasticism has been, at least in the West, in constant development, always growing more closely in touch with the shifting environment in which it was placed in the course of time. The skeptical spirit of the eighteenth century was unfavorable to monastic evolution, but the nineteenth saw a reawakening. Persecution and confiscation for political and pecuniary reasons have reduced the numbers of religious communities, but under a system of true religious liberty, as in the United States, wide extension of the religious orders has come about. In the religious communities of the United States in 1915 there were 4415 brothers, 3788 priests, and 55,575 sisters. There were also many novices and postulants not included in these figures.

For further details of the monastic life, the general arrangement of monasteries, and the relation of the older orders to the development of European civilization, see the articles on the various orders, especially BENEDICTINES.

MONASTIR, mōn'â-stêr'. A fortified seaport on the east coast of Tunis, 65 miles southeast of the city of Tunis. It is surrounded by a strong wall crowned with towers and has a number of mosques and a normal school established by the French. The chief manufactures are soap and oil, but its trade is declining. Pop., about 6000. Monastir is the ancient Ruspina.

MONASTIR, or BITOLIA. An important city in the extreme southern part of Servia, 15 miles from the Greek frontier. It is located in a broad valley of the Nije Mountains, 85 miles northwest of Saloniki, with which it is connected by rail (Map Balkan Peninsula, C 4), and, of all Servian cities, ranks next to Belgrade in population. It is an important garrison town, with large barracks, military hospital, arsenal, etc. There are several mosques, a school of arts and sciences, and other educational institutions. The town carries on a large trade in wheat, tobacco, woollens, and skins, and makes gold and silver ware and carpets. Until the Balkan War (q.v.), Monastir was the capital of the Vlayet of Monastir in the Ottoman Empire. It surrendered to the Servians on Nov. 18, 1912, and was confirmed to them by the treaties of London and Bucharest (1913). Pop., 1905, about 60,000, of whom the majority are Mohammedans and Christian Bulgarians.

MONAUL, mō-nā'l'. The Anglo-Indian name for any of the gorgeously plumaged and crested pheasants of the genus *Lophophorus*, commonly known as Impeyans, which inhabit the forests of the Himalayas. The three species are objects of sport, and their skins were formerly in demand for millinery. Stringent game laws now protect the birds from wholesale slaughter and exportation for this purpose in all locations where the British have influence.

MON'AZITE (from Gk. μονάζειν, *monazein*, to be solitary, from *μόνος*, *monos*, single). A phosphate of the cerium group of metals, principally cerium, lanthanum, and didymium, with varying amounts of thorium and silica. It is yellow, red, or reddish brown in color. Has a resinous lustre, and crystallizes in the monoclinic system, the crystal individuals measuring only a fraction of an inch in length. Monazite is commercially valuable owing to its containing thorium, which is utilized in the form of oxide in the manufacture of Welsbach and other gas mantles. The cerium obtained from the separation of the metallic oxides is employed as cerium oxalate in pharmacy. Monazite occurs in association with the older crystalline rocks, especially granite and gneiss, in the southern Appalachians, Brazil, Norway, Silesia, and Russia, but the only important sources of the mineral are North Carolina and Brazil. The deposits in North Carolina are of placer nature and occur along the channels of the streams which have concentrated the heavier minerals in the lower layers of the sands and gravels. In Brazil the deposits are found along the seashore. The monazite is obtained by washing the sands and gravels in sluices, a process similar to gold washing. The concentrates thus obtained contain from 70 to 90 per cent of monazite, with 1587 per cent of thorium. The output of monazite in the United States in 1912 was 1272 pounds, valued at \$159. Importation in 1911, \$215,700; in 1913, \$87,000; chiefly from Brazil.

MONBODDO, JAMES BURNETT, LORD (so called, by Scottish custom, as Lord of Session) (1714-99). A Scottish judge and author, born at Monboddo, Kincardineshire. He was educated at Marischal College, Aberdeen, at Edinburgh, and, in civil law, at Groningen and was admitted a member of the Faculty of Advocates at Edinburgh in 1737. He prepared a collection of the *Decisions of the Lords of Council and Session* (1826, in Brown's *Supplement to the Dictionary of Decisions*). He was, however, far better known as a *littérateur*, in particular through his *Origin and Progress of Language* (6 vols., 1773-92) and *Ancient Metaphysics* (6 vols., 1779-99), in defense respectively of Greek literature and Greek philosophy, both erudite, formerly ridiculed for their eccentricities and paradoxes and now generally regarded as singularly acute in their observations and scientifically in advance of their time.

MONBUTTU, mōn-but'tōō, or MANGBATTU. A country in Central Africa, between lat 3° and 4° N and long. 28° and 29° E, containing about 4000 square miles, with a population once estimated at 1,500,000 (Map: Congo, E 2). It is an elevated table-land, 2500 feet above the sea, and through it the Kibaly and Gadda rivers flow to form the Welle. The soil (producing tobacco, sugar cane, sesame) is fruitful, needing little cultivation. The inhabitants are cannibals of chocolate color, practicing polygamy and circumcision and wearing garments made of bark cloth. They are skillful smiths. Since Schweinfurth visited their powerful and populous kingdom, it is said to have been almost depopulated by slave traders and Mahdists.

MONCADA, mōn-ká'dá, FRANCISCO DE, CONDE DE OSUNA, MARQUÉS DE AITONA (1586-1635). A Spanish diplomat, soldier, and historian, born at Valencia. At first Ambassador at the court of the Emperor Ferdinand II, he was in 1633 appointed generalissimo of the Spanish forces in the Netherlands and twice defeated the Prince of Orange. He published a work of considerable historical value entitled *Expedición de los Catalanes y Aragoneses contra Turcos y Griegos* (1623), which has frequently been reprinted (e.g., vol. XXI of the *Biblioteca de autores españoles*, edited and annotated by Gayetano Rosell, 1852). G Schlumberger published *Expédition des "Almugavares" ou Routiers catalans en Orient de l'an 1302 à l'an 1311* (Paris, 1903).

MONCALIERI, mōn-ká-lyá'rê. A town in the Province of Turin, Italy, situated on the right bank of the Po, 5 miles south of Turin. The Royal Palace, built in 1470, has a picture gallery. The town has many beautiful villas, a fourteenth-century church, a Gymnasium, a meteorological institute, a theatre, brick and lime kilns, and manufactures matches. Pop. (commune), 1901, 11,561. 1911, 12,925.

MONCEAUX, mōn'sá', PARC DE. A Paris park, attractively laid out in 1778 by the Duke of Orléans, afterward known as Philippe Egalité, which became a fashionable resort and a favorite place for fêtes and balls. It became national property during the Revolution, was restored to the Orléans family at the Restoration, and was finally purchased by the city of Paris and converted into a public park.

MONCEY, mōn'sá', BON ADRIEN JEANNOT DE, DUKE OF CONEGLIANO (1754-1842). A French soldier, born at Moncey (Doubs). He took an active part in the campaign of the Pyrenees in

1794 and was made a general in the same year. In the Italian campaign of 1800-01 he greatly distinguished himself, became marshal of the Empire in 1804, and after his return to France received the title of Duke of Conegliano (1808) and the grand cordon of the Legion of Honor. In the succeeding war with Spain he fought brilliantly, especially at Saragossa in 1809. Moncey advised against the invasion of Russia and did not accompany the army thither in 1812, but he was prominent in the defense of Paris against the allied forces in 1814. Louis XVIII made him a peer, and Moncey remained neutral during the events of the Hundred Days. His refusal of the presidency of the Council deputed to try Marshal Ney lost him all his honors, but a year later, after a brief imprisonment, these were returned to him. He made his last active campaign in Spain in 1823. In 1833 he was made governor of the Invalides.

MONCK, mōnk, CHARLES STANLEY, fourth VISCOUNT (1819-94). A British administrator, born at Templemore, County Tipperary, Ireland. He graduated at Trinity College, Dublin, in 1841 and was called to the Irish bar in the same year. He was elected to Parliament as a Liberal member for Portsmouth in 1852 and was reelected in 1855, but was unsuccessful in 1859. He was a Lord of the Treasury from 1855 to 1858 and was appointed Governor-General of Canada in 1861. At this time the legislative union of 1841 was breaking down, and in 1864 government was practically at a deadlock. Public men were looking to a confederation to solve the problems of Canadian politics. Monck's tactful management and conciliatory temper were an important factor in the crisis. Largely by his efforts the reform leader, George Brown (qv), was induced in 1864 to enter the famous coalition ministry which carried on the government while the plans for confederation were being put into effect. Monck had to a certain extent initiated and encouraged those plans and did much to bring them to completion. He was therefore reappointed Governor-General in 1867 on the confederation of the provinces into the Dominion, but resigned the next year. In 1871 he served on the Irish national education commission and on the commission to carry out the act for the disestablishment of the Irish church. In 1882 he was appointed on the commission for administering the Irish Land Act, but retired two years later. He succeeded his father as Viscount in the Irish peerage in 1849 and was made Viscount in the peerage of Great Britain in 1866.

MONCK, GEORGE. See MONK, GEORGE.

MONCKTON, RICHARD, BARON. See MILNES, RICHARD MONCKTON, BARON HOUGHTON.

MONCLOVA, mōn-klō'vá. A town of the State of Coahuila, Mexico, situated 103 miles northwest of the capital, Saltillo, on the National Railways of Mexico, and the terminus of a branch line to Cuatro Ciénegas (Map: Mexico, H 4). It is the centre of an agricultural and stock-raising district and contains some railroad shops and a big cotton factory. Monclova was settled during the last quarter of the seventeenth century and was important as the starting point for the early Spanish entradas into Texas. Under their rule it continued to be the seat of government for this portion of New Spain and during a brief period was the capital of the dual State of Coahuila and Texas. Pop., 1900, 6684; 1910, 6872.

MONCRIEFF, mŏn-křé', WILLIAM THOMAS (1794-1857). An English dramatist, born in London, son of a Strand tradesman named Thomas. The name Moncrieff he assumed for theatrical purposes. Moncrieff's first success was at Ashley's with *The Dandy Family*; and in 1820 *The Lear of Private Life*, with Junius Brutus Booth as hero, enjoyed a long run. But his most popular production was *Tom and Jerry* (1821), a dramatization of *Life in London* by Pierce Egan (qv), whose *Boriana* Moncrieff had begun to publish in 1818. He managed Vauxhall Gardens in 1827 and in 1833 leased the City Theatre. Soon afterward his sight failed, and in 1843 he became totally blind. The following year he entered the Charterhouse in London. Moncrieff's theatrical reminiscences were published in the *Sunday Times* in 1851. He edited *Selections from Dramatic Works* (London, 1850), containing 24 of his own plays.

MONCRIEFF PITS. Excavations used in the system of gun mounting originated by Sir Alexander Moncrieff (1829-1906) for the heavy ordnance of coast batteries, first introduced about 1868. This system utilizes the stored energy of the recoil of the gun to the loading position to return it to the firing position. The Crozier-Buffington disappearing gun carriage, used in the United States Coast Artillery, is the modern example of this type of gun mount. The return to firing position is accomplished by the fall of weights previously raised by the recoil of the gun. See ORDNANCE.

MONCTON, mŏn-k'tŏn. A town and port of entry in Westmoreland County, New Brunswick, Canada, on the Petitcodiac River, which flows into the Bay of Fundy, and the Intercolonial, National Transcontinental, and the Moncton and Buctouche railroads, 89 miles northeast of St. John (Map New Brunswick, E 2). It is at the head of river navigation and has a fine harbor. There is a difference of 30 feet between high and low tides. The town possesses two parks. It manufactures cotton, flour, planing-mill products, leather, underwear, hats and caps, builders' materials, aerated waters, biscuits, barrels, mattresses, wire fences, foundry and machine-shop products, and wooden ware. The general offices and principal shops of the Intercolonial Railroad, and also the railway yards and shops of the National Transcontinental, are located here, and there is a large trade in lumber and agricultural products. Oil and natural gas are found in the vicinity, 20 gas wells yielding over 50,000,000 feet of gas daily. The United States is represented by a commercial agent. Pop. 1901, 9026; 1911, 11,345.

MOND, mŏnd, *Ger* pron mŏnt, LUDWIG (1839-1909). A German chemist, born at Cassel, where he attended the Polytechnic School. He finished his education at the universities of Marburg and Heidelberg. In 1862 he went to England, where he was employed in a Leblanc soda manufactory, and in that connection worked out his method of recovering the sulphur that had been lost as calcium sulphide in the Leblanc soda process. Two years later he erected a similar manufactory at Utrecht. In 1867 he again returned to England, where he lived thenceforth. In 1873 he established, with Sir John Brunner as partner, a large manufactory of alkali, employing the Solvay process. He greatly improved the ammonia process of making bleaching powder and solved the problem of recovering chlorine lost in the form of chlor-

ide of calcium. (See SODA.) One use to which he put part of his great wealth was the founding in 1896 of the David Faraday Laboratory of the Royal Institution, London. He made a large collection of paintings, which are described in *The Mond Collection*, by J. P. Richter (2 vols., 1910).

MONDOÑEDO, mŏn'dŏ-nyā'dŏ. A town of northwest Spain, in the Province of Lugo, situated in a mountain valley 12 miles from the Biscayan coast (Map Spain, B 1). It was anciently an important town. It has a cathedral begun in the thirteenth century, with a baroque façade, and then restored in the seventeenth century. There are marble quarries in the neighborhood. The town manufactures cotton and linen fabrics. Pop. 1900, 10,619; 1910, 9725.

MONDOVÌ, mŏn'dŏ-vé'. An episcopal town in the Province of Cuneo, Italy, on the Ellero, a branch of the Po, 42 miles south of Turin (Map Italy, A 2). It had a university from 1560 to 1719. Among its notable structures are the cathedral of San Donato, dating from 1450, a citadel with a Gothic tower, erected in 1573, a royal lyceum, and a bishop's palace. There are three public libraries. Its educational institutions include an industrial school and a technical institute. Near by is a chapel built by Vittozzi, containing the remains of Charles Emmanuel I. There are manufactures of machinery, cloth, silk, paper, books, and earthenware. At the battle of Mondovì, on April 21, 1796, the Sardinians were totally defeated by the French. Pop. (commune), 1901, 19,255; 1911, 19,593.

MONEL (mŏn'el) **METAL.** See NICKEL.

MONER (from Neo-Lat. *moneron*, from Gk. *μονήρης*, *monērēs*, solitary, from *μόνος*, *monos*, single + *ἀραρίκειν*, *ararínkein*, to join). The simplest form of Protozoa and the nearest to what may have been the most primitive living being. The Monera of Haeckel differ from the rhizopods (*Amœba*, etc.) in wanting a nucleus and contractile vesicles. Their body substance is homogeneous throughout, not divided into a tenacious outer and soft inner mass, as in *Amœba*. They move by the contraction of the body and the irregular protrusion of portions of the body, forming either simple processes (*pseudopodia*) or a network of gelatinous threads. The food, as some diatom, desmid, or protozoan, is swallowed whole, being surrounded and engulfed by the body, and the protoplasmic matter then absorbed. The simplest form known, and supposed to be really a living being, is Haeckel's *Protamœba*. It is like an *amœba*, but is not known to have a nucleus and vacuoles. It reproduces by simple self-division, much as in *Amœba*. The individual moner—e.g., *Protamœba*—is simply a speck or drop of transparent, often colorless, viscid fluid. This drop of protoplasm has the power of absorbing the protoplasm of other living beings, and thus of increasing in size—i.e., growing; and in taking its food makes various movements, one or more parts of its body being more movable than others, the faculty of motion thus being for the moment specialized: it has apparently the power of selecting one kind of food in preference to another and, finally, of reproducing its kind by a process not only of simple self-division, but also of germ production. Consult Ernst Haeckel, *History of Creation*, revised by E. R. Lankester.

(4th ed., 2 vols., New York, 1906). See PROLISTA.

MONESSEN, mô-nēs'n. A borough in Westmoreland Co., Pa., 39 miles by rail south of Pittsburgh, on the Monongahela River, and on the Pennsylvania and the Pittsburgh and Lake Erie railroads (Map Pennsylvania, B 7). There are large steel and sheet and tin plate works, foundries and machine shops, a wire-fence factory, lumber yards, box factory, brewery, and brickworks, the products of which are shipped in large quantities. A bridge spans the river at this point. The growth of Monessen has been rapid. Pop., 1900, 2197, 1910, 11,775; 1914 (U. S. est.), 18,752.

MONESTIER, mô-nēs'tyā', JEAN (1855-). A French civil engineer, born at Saint-Rome (Lozère). He became president of the Council of Lozère and chief engineer of bridges and highways. For a time he was Minister of Public Works and engineer of the Seine department. He was made Officer of the Legion of Honor.

MONET, mô-nā', CLAUDE (1840-). A French landscape painter, the leader of the Impressionist school which gained its name from his painting "Impression, Rising Sun," exhibited in 1874. He was born in Paris, Nov. 14, 1840. When a youth he entered the atelier of the Classicist Gleyre, but lack of sympathy with the style of work executed there caused his withdrawal. In the beginning his fancy was strongly drawn to the work of Courbet and Corot, and certain mannerisms, which disappeared with increasing years, indicate the influence of the Barbizon school. To a certain extent he is indebted also to Manet and the Japanese. He, however, admitted no master and for the most part drew his inspiration directly from nature, apparently caring little for subject, detail, or composition. His aim is chiefly to reproduce the effects of light and air, to portray the fleeting aspect of things. To Monet the effects of complementary contrasts and color mixtures are so distinctive and certain that to those not similarly trained his representation of them appears affected and exaggerated, but when seen under subdued light and from the requisite point of distance, they show great excellence. For over 20 years he struggled against ridicule and hostile criticism before his artistic ideas were accepted. Part of that time he spent in Holland, England, and Italy before finally taking up his residence at Giverny, France. His earlier style may be studied in "The Breakfast" (Luxembourg), "Camille," "Fontainebleau Forest" (1866), "Vessels Leaving Havre" (1868), and many landscapes produced before 1875, nine of which are in the Moreau-Nelaton collection, Musée des Arts Decoratifs (Louvre). Among his later works may be mentioned, "Bordighera"—the town in the half distance, led up to by a foliaged foreground; "The Orchard"—a landscape, vibrating with light and showing well the possibilities of Monet's use of pure color, "The Sun in a Fog, Waterloo Bridge" (1904); "Palazzo Dario, Venice" (1908). "The Church of Vetheuil," "The Rocks of Belle Isle," "Saint-Lazare Station," and six other paintings are in the Luxembourg. Monet's art reached its fullest expression in his series of variations of the same theme, as in "Rouen Cathedral" (Luxembourg), "Water Lilies," and "Views of the Thames," which present a wonderful analysis of light. MONETA, mô-nā'tā, ERNESTO TEODORO (1833-). An Italian journalist and pacifist. He was born in Milan, where his father was a prominent patriot. As a boy he took part in the Milan uprising of 1848. He was a general-staff officer in Garibaldi's army and in 1861-67 served in the Italian army. He had been editor of *La Libera Parola*, a Turin journal, in 1860-61, and from 1867 to 1896 was director of the great Milan National-Democratic newspaper *Il Secolo*. About 1870 he became interested in the movement for international peace and formed peace societies in northern Italy, notably the Comice Internazionale di Milan in 1878 and the Unione Lombarda in 1887. He was an Italian delegate to several peace congresses and in 1906 was president of the International Congress held in Milan. The next year he received the Nobel peace prize in special recognition of his book *Le guerre, le insurrezioni, e la pace nel secolo XIX* (3 vols., 1903 et seq.). Moneta was made a member of the Carnegie Consultative Council. He edited *La Vita Internazionale* (1897 et seq.) and the *Almanaco pro pace*.

MONETARY COMMISSION OF THE UNITED STATES CONGRESS. The fall in the value of silver after 1873 was the source of much debate in the Forty-fourth Congress, and in August, 1876, a joint resolution was passed for the appointment of a commission of three Senators and three Representatives, together with experts chosen by the former, to inquire into: (1) the causes and economic effects of the decline in silver; (2) the policy of restoring the double standard; (3) the policy of retaining in circulation the legal-tender notes; and (4) the best means for resuming specie payments. The commission as organized consisted of Senators John P. Jones, Lewis V. Boggy, and George S. Boutwell; Representatives Randall L. Gibson, George Willard, and Richard P. Bland. William S. Groesbeck, of Ohio, and Prof. Francis Bowen, of Massachusetts, were the expert members of the commission, and George M. Weston, of Maine, was appointed its secretary. The meetings of the commission were held in New York and Washington in the winter of 1876-77. The majority report of the commission declared that the recent production of silver relatively to gold had not been greater than formerly, but that the decline in the value of silver had resulted mainly from the demonetization of silver in Germany, the United States, and the Scandinavian states, the closure of the mints of Europe to its coinage, the temporary diminution of the Asiatic demand, the exaggeration of the yield of the Nevada silver mines, and the fear of further action against silver coinage by the governments. The policy of adopting the gold standard was condemned in severe terms, and the unrestricted coinage of both metals was recommended. The report further stated that an attempt to introduce monometallism would result in a ruinous contest for a gold standard with the European nations, while, if silver were remonetized by the United States, the effect would be to attract that metal from other countries while it was cheap, in exchange for what the United States had to export; and that the

latter country would thus have the benefit of the rise which the commission believed would take place in its value when the temporary causes of its depression had passed. Boutwell made a minority report against remonetization of silver except on the basis of international agreement, and Prof. Francis Bowen dissented from the majority report, arguing in general for the gold basis, but declaring in favor of the remonetization of silver on adding to the quantity of pure silver in a dollar enough to make its bullion value equal to the then value of a gold dollar.

The government published a summary of this report, together with papers prepared for the commission on "Asiatic Trade and Flow of Silver to the East," "Constitutional Powers of Congress and the States with Respect to Metallic Money," "Legislation on Subsidiary Silver Coin," and "The Trade Dollar." In addition to these the government published a collection of valuable statistics gathered by the commission relating to the production, distribution, and relative value of the two metals and to the monetary systems of foreign countries.

MONETARY CONFERENCES, INTERNATIONAL. Conferences between representatives of the United States and various European Powers for the discussion of united action with reference to monetary matters were held in 1867, 1878, 1881, and 1892.

France, on completing the Latin Monetary Union (q.v.), indulged in the hope that other nations might join the union and brought the matter to the attention of other governments through diplomatic channels. France called the conference of 1867 during the exposition of that year with the thought of furthering this project. Nineteen states were represented at the conference. The first question debated was whether an existing system or a wholly new one was best adapted to secure international coinage. The answer was in favor of an existing system, and it was admitted that the system of the Latin Union would probably be best adapted to this purpose. A second question was "Is there a possibility of establishing at this time identities or partial coincidences of monetary types on a wide scale, on the basis and with the condition of the adoption of the silver standard exclusively?" A third question repeats this inquiry for the gold standard exclusively, and a fourth for the double standards with a common ratio. These questions were discussed together, but the debate was not properly one of standards. The conference declared unanimously in favor of the gold standard as a basis of an international coinage. But in this conference the whole question of standards was incidental. Whether a unit should be adopted for all the nations or whether coincidences in the value of the coins should be effected were the most important questions considered. Finally, a resolution was adopted that all gold coins which were multiples of five francs should have legal circulation in all the contracting states. The work seemed to be complete, and the conference adjourned with mutual congratulations; but there the matter ended, as no treaties to carry out the plans were contracted.

Quite different was the purpose of the conferences of 1878, 1881, and 1892. A fall in the value of silver as compared with gold had taken place, and the silver currency threatened to depreciate seriously and perhaps endanger the

monetary systems of those countries in which the double standard existed. In 1867 the ratio between silver and gold, which for many years had been below the French ratio of 1 to 15½, rose above it, and in 1874 rose above the American ratio of 1 to 16, and by 1878 had reached 1 to 17.94. In the meantime prices had begun to fall. The initiative for the conference of 1878 proceeded from the United States. The coinage law of February of that year authorized the President to invite "the governments of the countries composing the Latin Union so called, and of such other European nations as he may deem advisable, to join the United States in a conference to adopt a common ratio between gold and silver, for the purpose of establishing, internationally, the use of bimetallic money, and securing fixity of relative value between those metals." In response to the invitation of the United States the principal nations except Germany sent representatives to the conference, which met in Paris in August, 1878. Considerable solicitude was expressed at the conference lest silver should be wholly discarded, though no agreement could be reached on bimetalism. This in particular was the attitude of Great Britain, concerned as she was for the currency of India. The most bitter hostility to bimetalism was exhibited by Belgium and Switzerland, while France, their partner in the Latin Union, was distinctly in favor of it. In its advocacy of the principle the United States was handicapped by the fact that it was on a paper basis and that it was a producer of silver. The proposals of the United States were rejected, the European nations uniting in the declaration "that it is necessary to maintain in the world the monetary functions of silver as well as those of gold, but that the selection for use of one or of the other of the two metals, or of both simultaneously, should be governed by the special position of each state or of each group of states." The conference was thus without result.

In 1881 another conference was held at Paris. Events were rapidly proving that the alleged scarcity of gold was a fact. The United States began to import gold, and thus drew upon the European stock. The Bank of England saw its gold reserves diminish and seemed unable to check the outflow. In France the reserve of gold in the Bank declined, while silver increased. As the proportion of silver in the metallic reserve increased doubts began to be expressed whether gold payments would be maintained. Germany saw the completion of her monetary reform indefinitely postponed by her inability to sell her stock of silver coin except at a great sacrifice. In the United States the pressure for free silver continued. France was the prime mover in this conference, though the United States joined in issuing the invitations. Great Britain exhibited great reserve in the conference, and the delegates of other states declared themselves bound by strict instructions. The discussions were able and learned, but fruitless, and the conference adjourned without result.

It was not until 1892 that another effort was made to effect monetary reform by means of a conference. In 1891 the President was authorized to call a conference. Great Britain exhibited more interest than usual, and while she declined to join a conference whose only object was the discussion of bimetalism, consented to take part in a conference to discuss an enlarged

monetary use of silver. The British government appointed delegates in sympathy with bimetallic proposals and sanctioned the appointment of pronounced bimetallicists by the government of India.

The reception of the proposals of the United States on the continent of Europe was less cordial. France was especially lukewarm and did not accept the proposal that the conference should be held at Paris. Arrangements were finally made for a meeting at Brussels. Germany was noncommittal, but consented to be represented at the conference. England and the United States, as it appeared, were to be the moving forces in this conference. All was in readiness for a meeting in May, 1892, when the fear of cholera in Europe caused its postponement to November.

This delay was fatal, for in the meantime two political events had occurred which altered the attitude of the leading nations. In England the Conservative party was overthrown and gave place to the Liberals, who had little sympathy with bimetallicism. The new ministry added to the delegation two men who were avowed opponents of bimetallicism. In the United States the election of 1892 resulted in the defeat of the party in power. Under these circumstances the delegation from the United States could not make any binding promises for the incoming administration. Accordingly the conference had little promise of success. When it met it was proposed to discuss any plans for enlarging the use of silver, especially such as might be proposed in the conference before taking up the subject of bimetallicism. This was a programme of discussion rather than of action, and after some 12 sessions of fruitless debate the conference adjourned without any action.

Consult the reports of the conferences—that for 1867 being included in the appendix of that of 1878—issued by the United States government, and H. B. Russell, *International Monetary Conferences* (New York, 1898), in which the events leading up to the conferences are carefully portrayed. See also bibliography under MONEY.

MONETT, mō-nĕt'. A city in Barry Co., Mo., 44 miles west of Springfield, on the St. Louis and San Francisco Railroad (Map Missouri, C 5). The city is engaged in farming and stock raising. The commission form of government was adopted in March, 1914. Pop., 1900, 3115; 1910, 4177.

MONEY (OF. *monete*, *monete*, *monnoye*, Fr. *monnaie*, from Lat. *moneta*, money, mint, from *Moneta*, an epithet of Juno, in whose temple at Rome money was coined, from *monere*, to warn, connected with *meminisse*, to remember, Gk. *μήμνος*, *memimnos*, anxious, Skt. *smar*, to remember). The medium of exchange and measure of value. Whatever fills these functions, however crudely, is money. Of all the substances which have been used as money, gold and silver take the first place, and the discussion of money usually has these in view. It is well to remember, however, that some of the humbler functions of money are to-day performed by nickel and copper, and that in times past not only other metals, tin, lead, iron, and platinum, have been used as money, but also, especially among primitive peoples, a wide variety of other objects. Jevons enumerates, among other things, furs, skins, leather, sheep, cattle, wampum, cowries, grains, olive oil, tobacco, and salt, as

being in use at one time or another for this purpose. Primitive as these may be, the enumeration seems to emphasize the fact that it is not a substance per se that we designate as money, but a substance invested with a certain utility.

So important is this function in modern life that we cannot readily conceive of a society without some mechanism to perform it. And indeed from the earliest days of recorded history we find references to money, and there are few among the primitive peoples of our own time which do not possess it in rudimentary form. The difference between the highly civilized nations of modern Europe and America and their early progenitors or the savage tribes of Africa does not consist so much in the fact that we use money and they do not, as in the extent to which it is used. Even though money is recorded as known among the most primitive peoples, it is then of only occasional use, it does not penetrate into every relation of social life. Peoples whose social organization is based upon slavery and patriarchal conditions have little need for money, nor is the need great among a pastoral or agricultural people when there is little differentiation of occupation. On the other hand, among highly organized industrial peoples where nearly all produce not for individual needs but for sale in the market, money is in constant and universal demand.

The primary function of money is that of a medium of exchange; and if in the theory of money to-day this characteristic receives scant notice, it is not because it is not fundamentally important, but rather because it is comprehended with comparative ease. Other functions are all derived from the primary function, medium of exchange.

Whatever the substance used as money may be it becomes an object of universal desire. In primitive society the most widely desired object came to be used as money. The fact that an object is universally desired fits it in the first instance for use as money, but after it acquires that function it is desired not chiefly for its own sake but for its command over other things. At an early date the desire for personal adornment singled out the precious metals as money par excellence, but at the present time it is not because gold is beautiful that we desire it, but because as money it procures for us whatever we may desire.

In the second place, money is the measure of value. The acts of buying and selling fix upon the objects bought and sold relative values, and it was only a slight step to extend the conception of value to things not sold or bought, or which are not intended for sale. All things capable of sale can be valued in terms of money. All credit operations depend upon this fact. Since the value of the money in use in any society is insignificant as compared with its total wealth valued in terms of money, it has been argued that the function of money as a measure of value is far more important than its function as a medium of exchange. And in fact the further we get away from primitive conditions of trading, the more important does this derivative function become. When all wealth is valued in terms of money barter of a higher order becomes possible. In the new form of barter, however, the exchange of commodities is indirect. Modern commerce is largely based upon it, and while it is most ap-

parent in international trade, where balances only are settled by the transfer of money, it is no less widespread and fundamental in domestic trade. See BANK, BANKING, CREDIT.

From the function of a measure of value is derived a subordinate function of the greatest practical importance, viz., the function of money as a standard of value. A standard of value is simply a measure by which values at different periods are compared. The measure of value contemplates the estimation of commodities at the same time; the standard of value, their estimation at different times. The standard of value is often called the standard of deferred payments. Credit organization involves future payments. These payments are expressed in money and present goods are transferred for a promise to pay money in the future. In the ordinary transactions of mercantile life the futurity contemplated is not far distant, but in many operations, both public and private, a lapse of years is contemplated. In such contracts stability in the value of money is of the highest importance, and were it not that money has been subject to certain variations, it is quite possible that it would not have been found necessary to differentiate this function from that of a measure of value.

The substances which at various times in the world's history have fulfilled these several functions have not performed the office equally well, and gradually all except gold, silver, certain minor metals, and paper have been eliminated among advanced nations. The selection of the precious metals for this purpose is due in part to certain physical characteristics and in part to economic conditions. In the first place, they are durable, and while it is true that there is always some loss through abrasion, the process is a remarkably slow one. Secondly, they are homogeneous and divisible. If a given quantity be divided into parts, those parts will be absolutely alike, and the sum of the parts will equal the whole. Finally, they are portable, since relatively to their weight they are of high value. Other objects such as precious stones excel the metals in portability, but they do not present the other necessary qualities of divisibility and homogeneity. Furthermore, it should be remarked that the metals are relatively stable in value, a result of their durability, since the existing stock is always so much greater than the annual output that violent fluctuations in supply are avoided. Some writers have insisted that the money substance should itself possess value, and have gone so far as to speak of the necessity of intrinsic or inherent value. The use of the word intrinsic evidently indicates a confusion of thought. These writers mean that the money substance should possess a utility apart from that which it gains by virtue of its money function. It may be true that no substance without utility could have become established as money, but this initial primary utility is insignificant after it has acquired the greater utility which attaches to it as a medium of exchange and measure of value.

It has already been noted that besides the precious metals which possess in a high degree the qualities named, other substances, minor metals and paper, are used as money among advanced peoples. The rôle of the former is quite subordinate. For use in minor exchanges they are sufficiently portable and they possess the other physical qualities named. Since their

quantity is limited, and provision is usually made for convertibility into money made of the precious metals, their value is not less stable than that of gold and silver. The problems of paper money are more complicated, since it is used in far greater quantities and for large payments. In portability it excels the metals, and, while it is not literally indestructible or divisible, the ease of replacement of old notes by new, or one denomination by another, is a substitute for these qualities. Its intrinsic value, i.e., its utility for nonmonetary uses, is of course a negligible quantity. Far more important is the question of the stability of its value. This question we can answer only after an investigation of the laws which govern the value of money.

There are two explanations of the value of money, one that it is fixed by the law of supply and demand, the other that it is fixed by the costs of production. These are the general explanations of value and are complementary rather than antagonistic. The first is the law of market value, the second of normal value. In the case of freely reproducible goods, while market value may at a given moment vary from normal value, it cannot maintain such variation for any length of time. Money is in a less degree freely reproduced than most of the other goods with which it can be compared. We should, therefore, without neglecting the influence of the cost of production, expect to find that in the fixation of the value of money supply and demand are the dominant factors.

Before discussing what the supply of money and the demand for it are, it may be well to call attention to the way in which the value of money is expressed. The values of all commodities are expressed in money as prices. Conversely, the prices of commodities express the value of money. We speak of prices as high or low, but we might as well speak of money as cheap or dear. Money is cheap when prices are high, and is dear when prices are low. When wheat rises from 50 cents a bushel to \$1 a bushel, we say it has risen in value, but we might also say that the wheat price of money has fallen, because in the first instance it required two bushels of wheat to secure a dollar in exchange and in the second instance only one bushel. Wheat in our illustration stands for commodities in general, and, while the rise in price of one commodity does not mean that money has fallen in value, yet if all commodities rise in price we cannot escape the conclusion that it has so fallen. Prices and the value of money are therefore reciprocals.

The supply of money is the amount of money in existence. This has led some writers to say that the value of money depends upon its quantity. Other things being equal, this is true; but it does not in itself furnish an adequate explanation of the value of money. Assuming that no other influences are at work, it must be admitted that any increase in the quantity of money will lower its value and that any decrease will enhance it. There is a certain money work to be performed, a certain volume of exchanges to be transacted. If the units of money are numerous, each transaction will call for a larger number of units than when the money units are relatively few. Every increase in the world's money supply has been followed by a rising in prices or a fall in the value of money. If the fall is not commensurate with the increase in

amount, it is because the quantity of money is not the exclusive factor in fixing the value of money. Monetary legislation endeavors to adjust supply to demand by providing an automatic regulation of the quantity of money. Under a metallic-currency system we usually find provisions for the free coinage of the standard money metal. Should money increase in value, i.e., should prices fall and thus reveal an inadequate supply, free coinage will in a measure correct this by attracting to monetary use such supplies of the metal as are available for this purpose. So far as nations using the same standard are concerned there is a natural flow of the metals from one country to another which prevents any undue deficit or redundancy in any one of the countries involved. This adjustment takes place automatically through the course of trade. When currency is redundant in any country, prices will be high in that country and imports will be large relatively to exports. The settlement of the resulting unfavorable balances will diminish the currency of the country where it was formerly redundant and so diminish prices. If money is scarce in any country, prices will be low, exports large relatively to imports, and the resulting favorable balances will bring gold into the country. It is obvious, therefore, that international trade speedily corrects any local excess or deficit.

A general excess or deficit in the money supply carries with it a certain correction also, but the operation is slower. If prices rise, showing a fall in the value of money, mining enterprises become less profitable, and the additions to the volume of money will tend to grow less. On the other hand, if prices fall, showing a rise in the value of money, mining enterprises become correspondingly profitable and capital will seek employment in them. This is likely to increase the production of the metals and by increasing the supply to check the rise in value. These effects will not be immediate, as capital has great inertia, and its withdrawal from one line of activity and transfer to another cannot be instantaneous.

The value of money, as of any other commodity, is immediately dependent upon supply and demand. The supply of money admits of easy definition; but the demand for money cannot be so precisely stated. It has been paraphrased as the amount of money work to be done, but this money work cannot be expressed in statistical statements. The elements which enter into it can, however, be stated. The most important and the positive element in the case is the volume of exchanges to be accomplished. Whatever increases the volume of exchanges increases the demand for money; whatever diminishes the volume diminishes the demand. Division of labor and the evolution of a money economy are the most important factors in this increase of the money demand. Without a commensurate increase of supply, prices under such conditions must fall. A diminution in the world's demand for money is not likely, but a diminution in the local demand, effecting a temporary rise of prices before the correcting influence of international trade is felt, may and does occur.

But the volume of the exchanges is only one of several elements in determining the demand for money. The first of these is the rapidity of monetary circulation, the second the use of credit, both of which economize the use of money. It is obvious that all simultaneous cash

transactions require the use of different pieces of money. But the transactions of a day or a year are not simultaneous and the same piece of money may fill its functions as a medium of exchange many times. When the circulation is sluggish the demand for money for a given volume of exchanges is far greater than when it is rapid. Savings banks, e.g., serve to increase the rapidity of circulation. They gather up the savings of the poor which would otherwise be locked up, and restore this money to circulation. In countries where savings take the form of private hoards, as is largely the case in France, more money is required per capita than in Great Britain or the United States.

Far more important in its effect upon the money demand is the use of credit (q.v.), balances only being paid in money. The country storekeeper who takes from the farmer butter and eggs on account, paying in supplies as his customer's needs arise, furnishes a homely illustration of the way in which credit minimizes the demand for money. In the larger business world the trade relations are rarely of such great simplicity, but by the mechanism of centres of credit or banks the transactions of a town or of even larger areas are reduced to a mutual exchange of goods and debts are canceled without the intervention of money. Banks and clearing houses (see those articles) are the agencies by which credit is organized.

Supply and demand as affecting the value of money are not wholly unrelated phenomena, and the explanation of monetary changes cannot be found in one element without the other. An excess of supply stimulates demand and prevents prices from rising as high as they otherwise would. A diminution of supply slackens demand and prevents prices from falling as much as they otherwise would. This interaction of supply and demand prevents changes in the money supply from producing effects in the increase or decrease of prices commensurate with the changes in the volume of money. It modifies but does not obliterate the significance of such changes.

Having considered what fixes the value of metallic money, we are now ready for the question, what determines the value of paper money? Despite differences of detail, there are for the purpose of this discussion but two classes of paper money—convertible and inconvertible. The first is secondary money, representing metallic money and deriving its value from the latter, the second is itself primary money and, like all primary or standard money, derives its value from the relation of supply and demand.

Paper money in the first instance was purely secondary or representative money. It was practically a storage receipt for gold and silver. Such receipts calling for metallic money on demand could and did serve in lieu of the latter in making exchanges. Such money offers no theoretical difficulties. Its circulation is that of metallic money in another form. The advantage of such money is that it forms a convenient mode of avoiding the cumbersomeness of metallic money. This is the function of the gold and silver certificates issued by the United States government, each of which represents a corresponding quantity of metal in the United States Treasury, and whose presence in the monetary circulation does not in the slightest degree affect its volume.

But such certificates are not the only form of

representative paper money, nor the most important. The history of banking shows that the depositaries of metallic money soon learned that under normal conditions coin would not be demanded at any one time for the full amount of the outstanding notes or certificates, and that a considerably larger sum could be kept in circulation than the metallic reserve. They began, therefore, to issue notes in excess of the reserve without infringing upon the characteristics of convertibility in coin on demand. Such money is called by the economists bank money, and it is immaterial whether it is issued by banks or by the government. Such money derives its value from the metallic currency upon which it is based, but, unlike the certificates already described, it enlarges the volume of the monetary circulation. The issue of such money economizes the use of the metals, and, in so far as it substitutes an inexpensive for an expensive substance as money, is a saving of wealth to the community.

If the principle of convertibility is not maintained, bank money becomes paper money pure and simple. It has usually been by the failure of banks or of governments to maintain the promise of redemption that such money has arisen. When this takes place paper money falls in value, or, as it is usually expressed, coin is at a premium. This would not of itself cause a disappearance of coin, but it usually happens that paper money is so multiplied in volume that coin disappears and paper becomes the sole standard. This substitution takes place by virtue of Gresham's law (q.v.). Such changes from a metallic to a paper currency are not effected without violent convulsions and much suffering, but there can be no doubt that, however ill it does the work, paper money under such circumstances performs all the functions of a medium of exchange, a measure of value, and a standard of deferred payments. Its value, like that of other money, depends upon its quantity in relation to the demand for money. As its quantity is likely to be increased without reference to the demands of trade in response to the fiscal necessities of the government, its value is unstable and uncertain. But this is not inherent in the nature of paper money, and there may be conditions, as in Austria during the greater part of the nineteenth century, under which paper money maintains a relative stability in value.

The adjustment of the monetary circulation to the needs of trade has given rise to composite money systems, in which, whatever may be the standard, gold, silver, and paper are usually combined. Under a single gold standard paper is generally used for larger payments, while silver is used for the smaller. Both are representative money in such cases. Silver is issued as token coinage. A token coin is one whose bullion value is less than its face value and whose legal power to pay debts is limited. Such coins are issued by government authority only, and pass current at their nominal values by virtue of legal enactment. In a well-ordered system, provision is usually made for the redemption of such coins in standard money when presented in specified quantities. Of such nature are the fractional silver coins of the United States and the minor coinage.

Under a single silver standard there is no theoretical reason why gold tokens should not be used for larger payments, but there is the

practical reason that gold is expensive and that it is not absolutely necessary for such payments to be made in metal. Under such a standard as prevailed in Germany before 1873, paper is used for larger payments, and it was one of the objections to such a silver standard that it afforded so wide a scope for the issue of paper money.

Before the introduction of token coins nations had for centuries endeavored to secure the concurrent circulation of gold and silver under a system of bimetallism. Under such a system, if the market ratio between the two metals diverged from the legal ratio one of the metals was certain to be exported. When this occurred it always occasioned much distress if the silver were the metal exported, for it robbed the people of the small change of daily life. Hence we find among the nations which clung the longest to the bimetallic theory, that before it was abandoned measures had been taken to reduce the minor silver coins to the character of tokens in order that they might not be withdrawn from the country for export. With the introduction of token coinage and the adoption of the plan of issuing certificates to represent the larger coins the discussion of bimetallism assumed quite a different aspect. The arguments drawn from the difficulty of insuring the circulation of silver were almost entirely excluded from the discussion, which then centred upon the question whether gold alone or gold and silver in combination, provided the combination could be kept intact, furnished the better standard of value. See BIMETALLISM.

History of Money in the United States. The situation in which the early colonists in America found themselves was such that they could draw little from the monetary experience of the mother country. During the Colonial period they took from the mother country the designations pounds, shillings, and pence. Having no mines, their stock of money had to be imported, and since they drew more wealth from England than they could export to that country, it was quite impossible to accumulate a monetary stock in this way. The little that was brought over by the colonists soon found its way back to the mother country, and, in the early days especially, resort was had to various shifts to remedy the dearth of money. Various articles of food and produce were made receivable for taxes and other purposes. Of these the most widely known was the tobacco currency of Maryland and Virginia. In some of the Colonies resort was had to the wampum currency of the Indians. But far more important in their effects were the measures taken to prevent coin from leaving the country and the issue of paper money. One of the early devices resorted to was to give the English currency a higher nominal value than its face value. It was argued that, if in the Colonies a shilling piece circulated as one and a half shillings, it would not be exported. This process of rating coins had been used frequently in England for the gold coinage. The different Colonies acting independently rated the shilling at different values, and the result was a series of Colonial pounds differing from each other and from the English pound. In 1706 a proclamation of Queen Anne put a stop to this practice and fixed the nominal value of the pound in each of the Colonies at the existing rate. While the money of account was for each Colony a Colonial pound, the actual money in circulation was a motley collection of coins of

English, French, Portuguese, and Spanish origin. The Spanish dollar was the most widely known and circulated, and it thus became the term by which the currencies of the Colonies were most readily compared. In retail trade, locally in the United States, the shilling as a division of the dollar has persisted to our own day. Furthermore, as the Spanish dollar was common to all the Colonies, it was the term in which later the common obligations were expressed by the Continental Congress, and thus became the basis of our national coinage.

Of even greater importance in fixing the monetary habits of the people was the issue of paper money. The first issue was in 1690 in Massachusetts and was made to meet the expenses of an expedition against the French in Canada. The notes were received with reluctance by the people, and fell to a discount, which was removed by an act of the Colonial Legislature, which placed a premium on them, as compared with coin, in the payment of taxes. Then South Carolina issued bills in 1712, and in the first half of the eighteenth century all the Colonies followed these examples. Issued at first to meet extraordinary expenses of the governments, the public clamor for more money became so great that notes were issued later without any such plea in extenuation. In the situation of the Colonies the plea for more money to make trade easy was urged with peculiar force. In Massachusetts a series of issues had taken place, and in 1749 exchange upon London, which was normally 133 pounds Colonial for 100 pounds sterling, had risen to 1100 pounds for 100 pounds sterling. Parliament having voted £138,049 to reimburse the Colony for its share in the expedition against Louisburg, this sum was used by the Colony to redeem its paper issues at the rate of 11 to 1, and from that time onward Massachusetts was on a specie basis. Some of the Colonies, as, e.g., Rhode Island, North and South Carolina, had issued paper money far more extravagantly than Massachusetts; while others, notably Pennsylvania, had pursued a more conservative policy. In the latter Colony there were two kinds of bills—exchequer and loan bills. The first were issued by the Colonial Treasury in anticipation of taxes, but the amount outstanding is said not to have exceeded the probable receipts of two or three years. There were no sudden issues of large quantities and the amount of the issue was kept fairly uniform. The loan bills were issued to individuals on landed security, plate, or other valuable assets. With such security there was comparatively little danger of an overissue, and the records show that there were comparatively few bad debts.

In 1751 Parliament forbade the further issue of notes by the Colonies, and more or less successful efforts were made by them to redeem their outstanding notes. When, however, the Colonies united for their struggle with Great Britain the only fiscal resource which seemed open to them was the issue of paper money. The first issue was in August, 1775, for 300,000 Spanish dollars. Elaborate provision was made in the law for the redemption of this currency, and the amount fixed for which each Colony was held responsible. Other issues followed in rapid succession, and the pretense of redemption provisions was soon dropped. As much as nine millions was issued before any depreciation took place, but with the constantly expanding volume

of the currency this could not last long. The following figures tell the story of the rapid multiplication and depreciation of this money.

		Price of a Spanish silver dollar in Continental currency	
Issued 1776	20,064,464	January 1, 1777	1 1/4
Added 1777	26,426,333	" 1778	4
1778	66,965,269	" 1779	9
1779	149,703,856	" 1780	45
1780	82,908,320	" 1781	100
1781	11,408,095	" 1782	500
Total	357,476,337		

In the meantime every device known to the law was tried in vain to prevent the depreciation. The most stringent penalties enacted against those who refused to receive Continental money at its face value failed utterly to arrest the fall in value. Such enormous issues together with those of the several State governments practically destroyed the value of the paper money. As this paper was never redeemed, it was in effect a tax upon the people which caused much suffering and distress.

After the collapse of the Continental currency the circulation of the country consisted of specie, largely obtained through foreign loans, State notes, and, to a very limited extent, bank notes. In 1782 the Bank of North America, at Philadelphia, was chartered by the Continental Congress. It was a private institution with a large government subsidy and issued notes. It rendered important services to the nation, but its note issues amounted to only \$400,000. Before the Federal Constitution was adopted banks of like character had been chartered in Boston, New York, and Baltimore, and bank issues acquired a recognized place in our monetary circulation.

The Federal Constitution vested the power to coin money in the central government and forbade the States making anything but gold and silver a legal tender for the payment of debt. This eliminated State issues, and from this time until the Civil War the monetary circulation consisted of United States specie, foreign specie, and bank notes.

Among the first acts of Congress was to declare the values at which foreign coins should circulate and be received at the government offices. Of these foreign coins the most common was the Spanish dollar, which as late as 1857 was received in all payments at the post offices of the United States. In 1792 a law was passed establishing a national gold and silver coinage. In the history of money prior to the gold discoveries of California specie played a subordinate part, its chief function being for small change and as a reserve for banking operations. We may therefore glance at the history of bank-note issues before taking up that of metallic currency.

While the Constitution debarred the States from issuing money, it did not prevent them from establishing banks and giving to the latter the power to issue notes as they might see fit. After the adoption of the Constitution State banks multiplied rapidly. In 1791 the Bank of the United States was chartered with a capital of \$10,000,000. Its notes were received everywhere and were the natural medium of payments between different parts of the country. The bank acted as a controlling agent over the State banks, since by receiving or refusing to accept their notes it could make or mar their credit. When in 1811 its charter expired the

State banks were unrestrained in their issue of notes. In 1811 Gallatin estimated the note circulation of these banks at \$46,000,000, but in 1814 it had swelled to \$100,000,000, while trade was crippled by war and specie was drained from the country. Great embarrassment was felt by the government from the fact that as the only medium of exchange such State bank notes could hardly be refused in payments, while with the suspension of specie payments by the banks their value depended upon the vagaries of bank management. This state of affairs called loudly for a remedy, and the reorganization of the Bank of the United States was planned. It was eventually accomplished in 1816, and for 20 years it exercised on the whole a salutary influence upon the monetary circulation. When in 1836 its charter expired, State bank notes again ran riot and precipitated the disastrous panic of 1837. In the days of depression which followed the States generally put their banking systems in order. No long, however, as any State countenanced the loose methods which had formerly brought the whole system into disrepute, some were bound to suffer from such iniquity, but the mass of suffering was greatly reduced. This was in part due to the gold discoveries of California, which furnished the nation with a larger supply of metal than had ever been known and made it comparatively easy for the banks to maintain an adequate reserve. When the Civil War broke out the State bank system was at its best, and the agitation which culminated in 1863 in the national banking system had its origin more in the fiscal necessities of the government than in any immediate need of reform of the State banks.

The unit of value adopted in the Act of 1792 mentioned above was a dollar of 371½ grains of pure silver—practically the Spanish dollar then current—or a gold dollar of 24.75 grains, thus providing a bimetallic system with free coinage of the two metals at a ratio of 15 to 1. There had not been for many years any material change in the production of the precious metals, and the ratio adopted corresponded fairly well with the market ratio. While no great quantity of metal was coined in the mints of the United States for the first 20 years of our history, and as before the outbreak of the War of 1812 the tide of importation was in our favor, the system worked satisfactorily. With the war and the heavy importations of merchandise which followed an export of specie began and it was found that gold was favored. This change in the market ratio was largely due to the outbreak of the revolt against the Spanish domination in South America and the slackening of supplies of silver from that region. Agitation began for a new ratio, which did not culminate in legislation until 1834. At this epoch the United States mined no silver, while a certain amount of gold, considerable for that time, was being drawn from the Appalachian gold region. When, therefore, the new ratio was adopted it was deemed wise to be upon the side of favoring gold rather than silver. Laws of 1834 and 1835 changing the weight and fineness of the coins established the ratio of 15.988 to 1, familiarly 16 to 1, although the market ratio was 15.625 to 1. The divergence was, however, too slight to affect materially the supply of silver, but in 1849 gold was discovered in California, resulting in a decreased value of gold as compared with silver. Moreover, a metallic surplus appeared in

our own markets, and silver began to be exported. As all the silver in circulation was divisionary coin, it was feared that a dearth of small change would result. The exportation of silver had already seriously depleted the stock of half dollars, the largest silver coin in use, and had begun to threaten the quarter dollars when in 1853 Congress reduced the fineness of silver coins less than one dollar from 900 to 835 and made them tokens to be issued only on government account. In so doing it did not affect the status of the silver dollar, for which as before free coinage existed—an empty privilege, since the silver dollar had a higher bullion value than the gold dollar. From the establishment of the mint until 1850 the aggregate coinage of the United States was \$196,000,000, and in this total gold and silver were about equally represented. In the next 10 years, 1851-60, no less than \$403,000,000 were coined, of which less than \$48,000,000 were silver. Such a change denotes not only that gold predominated in the metallic circulation of the period, but also that the metallic circulation itself became a thing of moment in the community.

The Civil War introduced new elements into our monetary circulation—paper money and the national bank note. Soon after the outbreak of hostilities specie payments were suspended. The government seemed to have exhausted every device of borrowing when it grasped the dangerous expedient of paper issues. Treasury notes bearing interest had several times in the history of the nation been resorted to, but it was not until the Act of Feb. 25, 1862, was passed that non-interest-bearing notes were issued. One hundred and fifty million dollars of notes were authorized and they were declared a legal tender for all debts, public and private, except duties upon imports and interest upon the public debt. Subsequent issues in July, 1862, and March, 1863, brought up the aggregate amount authorized to \$450,000,000. This flood of paper money drove gold to a premium and swept away the silver subsidiary coinage. It became necessary to supply the place of the latter, and small notes called postage and later fractional currency were authorized in 1862 to the extent of \$50,000,000. From the highest denominations down to three cents the monetary circulation of the nation was paper only, the issues of the United States government and the issues of the banks. In 1863 the national banking system was organized, but few banks availed themselves of the privilege of a national charter until after March 31, 1865, when a tax of 10 per cent on the circulation of State banks outstanding after Aug. 1, 1866, was enacted. This doomed the State bank notes, and banks which clung to the note-issuing privilege organized under the national law.

When peace had been declared the condition of the currency received attention. The volume of paper outstanding was reduced to \$356,000,000 before 1868. In that year the fear of a monetary stringency due to contraction of the currency caused Congress to abandon this policy, and this postponed the day of redemption. In 1873 additional issues were made and the amount outstanding raised to \$382,000,000, which limit was fixed as a maximum. In 1875 the Resumption Act was passed providing for a return to specie payments Jan. 1, 1879. Some slight progress towards a metallic basis had already been made by calling in the fractional

currency. The Resumption Act authorized the Secretary of the Treasury to sell bonds for the purpose of providing a gold supply sufficient to redeem the notes. It also removed the restriction which had previously rested on the volume of the national bank currency and provided that when additional bank notes were issued an amount of legal-tender notes equal to 80 per cent of such issues should be retired. The fear of contraction which had dictated a bill to repeal the entire Resumption Act, which failed only through the President's veto, succeeded in May, 1878, in abolishing this retirement provision, but not before the volume of notes had been reduced to \$346,681,016, at which point the issue has remained. Much trepidation was felt lest resumption should not succeed and lest the applications for the redemption of notes should exhaust the reserve provided. But these fears proved groundless, and resumption was effected quietly and without difficulty. From 1879 the notes have been convertible into gold upon demand. No fixed reserve of gold for this purpose was prescribed by law, but the practice of the Treasury has been to keep on hand nominally at least \$100,000,000 for this purpose. Whenever the reserve fell below this limit, grave concern was felt, and more than once resort was had to the issue of bonds to sustain the reserve. The Law of 1900 provides a reserve of \$150,000,000 for the redemption of these notes, and provides more effective and more expeditious means for its replenishment.

Before 1862 the centre of interest and discussion in our monetary circulation lay in the notes of banks. It was then transferred to the paper issues of the government, and after 1876 to silver. During the Civil War period the United States began to produce silver as well as gold in considerable quantities, but as all our money was paper this did not affect the monetary circulation. In 1870 a revision of the coinage laws was undertaken with the purpose of codifying existing law. One of the features of the codification was the omission of the silver dollar from the list of coins. The measure was an executive one and there was considerable difficulty in securing for it the attention of Congress, which listened impatiently while its provisions were being explained. Between 1870 and 1873, when it became a law, it had been thoroughly discussed in Congress and should have been well understood. The omission of the silver dollar made the United States theoretically a gold-standard country. This law which effected the demonetization of silver was the famous "crime of 1873," concerning the passage of which the wildest statements were current at a later date. The simple fact is that at the time no one was aware of the significance of the demonetization of silver.

The agitation for the resumption of specie payment brought forward the contest between contractionists and inflationists. The latter failed in their efforts to balk the resumption policy, but the general feeling on which their argument rested, that a healthy currency must expand with the needs of the country, had to be reckoned with. This led in 1876 to the appointment of the Monetary Commission (qv), whose report presented in 1877 favored the free coinage of silver and thus began the long battle for that ideal. Germany had adopted the gold standard and was selling silver, the mines of the United States continued to increase their out-

put, and silver was falling in the market below the legal ratios established by long usage in bimetallic countries. A bill for the free coinage of silver passed the House of Representatives in 1878. The Senate, however, was unwilling to accept for the United States alone the whole burden of the rehabilitation of silver, and a compromise resulted in the Bland-Allison Act, which was passed over the President's veto, Feb. 28, 1878. It provided that not less than \$2,000,000 worth of silver nor more than \$4,000,000 worth should be purchased monthly and coined into standard silver dollars (412½ grains of silver 900 fine), which should be a full legal tender for all debts, public and private, without exception. It also authorized the President to call an international conference for the adoption of international bimetalism at a common ratio to be agreed upon. It also permitted the issue of silver certificates in sums of \$10 and upward for standard silver dollars deposited in the Treasury. No relief came from the international conference, and the coinage went on increasing in volume as the price of silver fell. Soon embarrassment was caused by the tendency of these dollars to return to the Treasury, as less than \$60,000,000 were absorbed by the circulation. There was no difficulty, however, after a Law of 1886 permitted the issue of certificates in denominations of \$1, \$2, and \$5. While the number of dollars in circulation is not large, there is no obstacle to the circulation of silver certificates.

Under the Law of 1878, which continued in force until 1890, \$378,000,000 were coined. The price of silver continued to fall and with it the price of other commodities. International bimetalism as a remedy for falling prices continued to gain favor among economists, and the agitation for free silver coinage in the United States grew in strength. In 1890 again the House of Representatives passed a free-coinage bill, but a compromise worked out in the Senate was finally accepted and became law. This provided for the purchase of 4,500,000 ounces of silver monthly and the issue of Treasury notes for the cost price thereof. These notes were a legal tender, and the privilege was given to the Treasury Department to coin the silver thus purchased and replace the notes with silver certificates. The embarrassments of the Treasury and the difficulty of keeping the growing mass of silver money at a parity with gold led in 1893 to the repeal of the compulsory silver purchase provision. Under this law 168,000,000 ounces of silver had been purchased and Treasury notes to the amount of \$155,000,000 issued. The repeal of the act in 1893 took place only after a severe struggle, and the friends of silver did not give up the fight. The presidential contest of 1896 was fought out on the free-coinage question and resulted in the signal defeat of the Silver party. In 1900 a new currency law was passed which squarely defined the gold dollar as the standard of value in the United States. It provided, as already stated, a larger reserve for the redemption of the legal-tender notes. The attempt to make silver dollars redeemable in gold was, however, unsuccessful. The same measure favored the expansion of the national bank note issues by permitting note issues to the amount of the par value of the bonds deposited and by reducing the tax upon the circulation of banks.

MONEY ORDER. See POST OFFICE.

MONEYWORT. A popular name for various plants of the genus *Lysimachia* (q.v.).

MONFORTE DE LEMOS, môn-fôr-tâ dâ lâ-môs. A town of northwest Spain, in the Province of Lugo, situated in a fertile valley, 35 miles south of Lugo, with which it has railroad connection (Map Spain, B 1). Near by is a hill on which are the ruins of a castle of the lords of Lemos. The town has a secondary school installed in an attractive old Jesuit convent. The chief industry is cattle raising, and there are some manufactures of cloth, soap, and chocolate. Pop, 1900, 12,999; 1910, 13,838.

MONGE, môn-zh, GASPARD (1746-1818). A French mathematician, born at Beaune. He was educated at Beaune and at Lyons and when only 16 years old obtained a position to teach physics and mathematics at the latter place. From there he went, in 1765, to the school of engineering at Mézières as designer. He was soon made

assistant and in 1768 professor of mathematics in the military school itself. In 1780 he became a member of the Academy of Sciences at Paris, and in 1783 was appointed examiner of the naval pupils. In 1792 he was appointed Minister of Marine and the next year he took an active part in organizing the national defense. He was also active in the organization of public education, was one of the first professors in the Ecole Normale, and was one of the founders of the Ecole Polytechnique. He went with Bonaparte to Egypt in 1798, undertook the direction of the Egyptian Institute, and conducted the search for Egyptian antiquities. In 1805 he was appointed Senator, and in 1806 received the title of Comte de Péluse. After the Restoration he lost his offices and at this time he fell into a state of melancholy from which he never recovered. He is famous chiefly as the founder of descriptive geometry (see GEOMETRY), a science long kept as a government secret. But he made important contributions to other branches of mathematics as well. The development of modern geometry dates from him, he introduced into analytic geometry of three dimensions a thorough treatment of linear equations, completed the study of surfaces of the second degree which had been begun by Euler, and established the principles of the integration of partial differential equations in connection with the theory of surfaces. Following are his principal publications: *Traité élémentaire de statique* (1788, 8th ed., 1846); *Géométrie descriptive* (1795, 7th ed., 1847; new German ed., 1900); *Application de l'analyse à la géométrie des surfaces du premier et deuxième degré* (1795, 5th ed., 1850). Consult. Brissot, *Notice historique sur Monge* (Paris, 1818); Dupin, *Essai historique sur les services et les travaux scientifiques de Monge* (ib., 1819); Obenrauch, *Monge, der Begründer der darstellenden Geometrie als Wissenschaft* (Brunn, 1893-94).

MONGHYR, môn-gôr', or **MUNGHIR.** The capital of a district in Bengal, British India, on the south bank of the Ganges, 34 miles northwest of Bhagalpur (Map: India, F 4). The city proper, extending picturesquely for 6 miles along the river bank, is dominated by a fort containing the district offices and headquarters. During the eighteenth and nineteenth centuries Monghyr was noted for its manufactures of firearms, swords, and ironware, which are still in local demand. Cotton, cloth, shoes, furniture, and soap are manufactured, and there is a large trade in agricultural produce, especially butter. Pop., 1901, 35,880; 1911, 46,913.

MONGIBELLO, môn-jê-bê'lô. The Sicilian name for Etna (q.v.).

MÔNG NAI, mông ni. An eastern state of the feudatory southern Shan States, British Burma (Map: Burma, C 2). Area, 2717 square miles. It has many mountains alternating with fertile valleys in which are raised rice, tobacco, sugar cane, and tropical fruits. There are manufactures of Shan paper. Pop., 1901, 44,252; 1911, 35,623. Capital, Mông Nai.

MONGOL DYNASTIES (Mongol. probably from *mong*, brave). From the earliest times the tribes that became known as Mongols about the twelfth century dwelt in eastern Asia, in and about the modern Mongolia. They were organized and made a great conquering power by Genghis Khan (1162-1227). The great Asiatic Empire which was made his by conquest was divided among his sons, of whom Ogotai received

northern China and Mongolia and succeeded his father as Great Khan. Under Kublai Khan, the grandson of Genghis, who became Great Khan in 1259, the Empire was practically divided into four parts. The first, which was actually ruled by the Great Khan, included China, Korea, Mongolia, Manchuria, and Tibet, with its capital at Peking (See CHINA; KUBLAI KHAN). The second, the Middle Tatar Empire, given by Genghis to his son Tchagatai, included Sungaria, Transoxiana, Afghanistan, and a part of Chinese Turkestan. Its history differs in no way from that of other Asiatic states until, under a weak descendant of Tchagatai, the real power fell into the hands of the ruthless Tamerlane or Timur (q.v.), who made Samarkand the capital of his Empire. The third division of the Empire of Genghis Khan, the Empire of Kiptchak (q.v.), or the Golden Horde, was assigned to Batu, a grandson of Genghis by his eldest son Juyi. In 1237 a vast Mongol horde entered Russia (q.v.) and, after carrying destruction through that country with fire and sword and forcing the princes to do homage, pressed into Poland and Germany and on the field known as the Wahlstatt, near Liegnitz, in Silesia, defeated an army of Poles, Silesians, and Teutonic Knights in April, 1241, suffering such heavy losses, however, as to be compelled to retreat. In the same year another army under Batu Khan overwhelmed the Hungarians under their King, Béla IV. In 1242 Batu Khan was recalled to Asia by the news of the death of Ögötaï. As long as the house of Batu continued the Kiptchak Mongols or Tatars held Russia in vassalage and kept eastern Europe in constant terror. They met their first defeat at the hands of the Russians in 1380; but their strength was most seriously undermined by the new Tatar invasion under Timur (q.v.) in 1389. The Empire dissolved into the separate khanates of Kazan, Astrakhan, and the Crimea. In 1480 the Russians emancipated themselves from the overlordship of the Mongols. The khans of the Crimea became vassals of the Turkish sultans in 1475. Kazan was taken into possession by Ivan the Terrible of Russia in 1552, and Astrakhan in 1554.

The fourth division included Persia, Georgia, Armenia, Khorasan, and part of Asia Minor. In 1253 Mangu, the fourth Great Khan, a grandson of Genghis, sent his brother Hulaku to govern this part of the Empire and to complete the conquest begun by Genghis. Hulaku crossed the Oxus, destroyed the sect of the Assassins (q.v.), took Bagdad, and put an end to the Abbasside caliphate (1258). He reduced Persia to complete subjection and added Mosul, Mesopotamia, Syria, and a large part of Asia Minor to the Mongol conquests. He became the founder of a dynasty known as the Ilkhans, which ruled over Persia till 1335. His religion was the pure theism of his house, and he was broadly tolerant towards both Christian and Moslem. His wife was a Christian. He established his capital at Maraghalah in Azerbaijan, and there maintained a court where science and the arts were liberally cultivated. Hulaku assumed independent sovereignty upon the death of Mangu Khan. He died in 1265, and was succeeded by his son Abaka, whose ability and virtues excelled those of his father, and who had the advantage of being able to treat the country as an organizer rather than as a conqueror. The son of a Christian mother, he married a daughter

of the Greek Emperor, Michael Palæologus, and is thought to have been himself a Christian. He was a devoted patron of learning. His reign was for the most part peaceful, but he expelled from his realms a Tatar army, defeating the invaders near Herat. He died in 1282. Abaka Khan was succeeded by his brother, baptized under the Christian name of Nicholas (Mongol Nikudân), who became a Mohammedan and persecuted the Christians and Mongols until he was warned to desist by his powerful uncle, Kublai Khan. When he apostatized he took the name of Ahmed. He was put to death in 1284 by Argun, the son of Abaka, who then ascended the throne. Argun followed the liberal and pro-Christian traditions of his father and grandfather. He opened diplomatic relations with Europe, whither he sent a Genoese, Buscarelli, as his agent. He proposed to make an alliance with the Pope, England, and France against the Mohammedan power. Marco Polo, the famous Venetian traveler, conducted a Mongol bride from the court of Kublai to Argun, but the latter died before their arrival, in 1291. A successor, Kai Katu, died in 1294, and the direct succession was restored by Ghazan Khan, the son of Argun. He waged a successful war with the Egyptian Sultan, and continued the friendly intercourse with Europe which his father had begun. In his later years he adopted Mohammedanism. He was a patron of literature, like his predecessors, and caused a history of the Mongols to be written by one of the scholars at his court. He made many improvements, especially in the administration of justice, and built roads and established post routes. He died in 1303. His brother and successor, Mohammed Kudah Bundah, made Es-Sultaniyeh his capital, attached himself to the Moslem sect of Ali, and died in 1316. The son of the last prince, Abu Said, was a mere child, and the common experience of absolute monarchies, a struggle for power between leading chiefs, followed his accession and introduced the seeds of weakness into the Mongol dominion. Juban, who was successful in this rivalry, married the young Khan's sister; but when Abu Said became of age he showed the spirit of his race and defeated and killed his aspiring vassal in 1327. His death in 1335 was the practical end of the Mongol monarchy in Persia. His successors until 1344 were mere puppets in the hands of ambitious chiefs, and anarchy made easy the conquests of Timur. Timur was likewise of Mongol origin and akin to the family of Genghis. The Mogul (or Mongol) dynasty in India (q.v.) was founded by one of his descendants, Baber, in 1526. Markham, *History of Persia* (ib., 1874); H. H. Howorth, *History of the Mongols* (4 vols., ib., 1876-78).

MONGOLIA. The land of the Mongols; a Chinese colonial possession, which stretches through Central Asia from Eastern Turkestan, Sungaria, and the Altai Mountains on the west to Manchuria on the east, and northward from China proper to the four Siberian provinces of Tomsk, Yeniseisk, Irkutsk, and Transbaikalia. The term is sometimes stretched to include Sungaria on the west, where many Mongols dwell, and Kokonor, which lies north of Tibet, but is separated from Mongolia proper by the Chinese

province of Kansu. The area is estimated at about 1,367,900 square miles.

Physical Features. Three physically distinct regions are recognizable: 1. A central elevated plateau known as the Desert of Gobi, 2500 to 3000 feet above the level of the sea, 500 miles or more in breadth, and extending from southwest to northeast for 1000 miles. It can hardly be described in general terms because of its diversified character. The area may be divided into a series of deserts having their own special characteristics. The Lop desert, with little break in its general level, the Kum-tagh, with a surface broken by undulations; the Hami, with a few mountain ranges, the Ordos, similar to the Lop, and Eastern Gobi, with great diversifications, are some of the areas. Extreme elevations reach in Eastern Gobi to 8000 feet; while in the Hami region a number of depressions exist, one reaching to 925 feet below sea level. Towards the west and southwest are parts overblown with loose sands, which fill the bottoms of the smaller valleys, or form fantastic, ever-changing ridges and hillocks, presenting a weird and dreary aspect, and traversable only by camels. Elsewhere, however, especially towards the Hurku Hills in the west, and in the northeastern section, are found many wide grassy plains with patches of scrub and furze and clumps of parched flowers, merging in the north into the rich pasture land and fairly wooded hill country south and east of the Kentei continuations of the Yablonoi Mountains of Siberia. 2. A still more elevated plateau from 3000 to 5000 feet above the level of the sea, lying to the northwest of this so-called desert plateau and bounded towards Sungaria and Siberia by the Altai and the Sayan Mountains. This is the region sometimes called Outer Mongolia. It is a mountainous country, clad with forests and intersected with numerous streams. The chief mountains are the Tannu, the Keutai, the Ektagh Altai, the Khangai, and the Chamur, with a general northwest to southeast trend. 3. The fertile, undulating, and well-wooded region usually called Eastern or Inner Mongolia, lying to the south and southeast of the Gobi, and intersected by the greater Khingan Mountains and their southwestern continuations. It lies along the Manchurian provinces of Kirin and Shingking, and stretches westward along the Great Wall as far as Kweichow (Kukuhoto). Large tracts of the Gobi desert in Inner Mongolia are being reclaimed by Chinese settlers through the simple process of irrigation.

Hydrography. With the exception of the southwest parts of the Gobi plateau, the country is fairly well watered, affording good pasturage, and even in those regions numerous rills are encountered, which, however, speedily lose themselves in the sand. Water, however, may be found almost everywhere by digging a few feet. Many lakes are scattered over most of the area; the largest, Kosogol, lies at an altitude of 5320 feet. These are drying up and from some of them thousands of tons of salt are obtained. On the extreme east, partly in Manchuria, is the Dalai-nor, and there are many lakes of less extent in southeast Mongolia. Unfortunately, these regions are so frequently wind-swept that the water holes are soon covered over or hidden by the fine dust with which the winds are laden. The drainage of the country is partly to the north, into Lake Baikal by the Eder, the Orkhon, and other tributaries of the Selengha, and partly

to the northeast and east by the Onon, through the Shilka, and by the Kerulen, through the Dalai-nor and the Argun into the Amur. The extreme eastern part of Mongolia drains partly into the Amur through the Nonni and the Sungari of Manchuria, and partly to the sea by the Shira-muren, which finds its way into the Gulf of Pechili by the Liao. Many streams flow down the mountain slopes and are lost in the desert sands.

Geology and Minerals. The geology of Mongolia is only imperfectly known. The country seems to be built up of granites, gneisses, and crystalline schists of Archaean age, and there are indications of its being rich in minerals. In the Sayan Mountains immense beds and boulders of nephrite have been found, and in the Kitoi Alps, near Lake Baikal, are great deposits of serpentine and graphite. Silver ores and graphite have also been found on the Mongolian side, and coal, apparently of Jurassic age, has been found in the Tannu Mountains and the Yenisei basin, as well as near Kukuhoto (Kweichow), near the great bend of the Yellow River. In the lower or central plateau red and brown conglomerates, sandstones, and clays are common, and both crystalline and mountain limestone abound in the Khingan Range.

Soil, Climate, and Vegetation. Except in the vicinity of the lakes and rivers, along the rich alluvial borderlands of the Khingan Range, and the loess deposits north of Shansi and Chihli, the soil is poor and little agriculture is possible. Authorities differ concerning the origin of the Gobi sands and they have been ascribed to lacustrine, marine, and aerial denudation. In southeast Mongolia, where the average summer temperature is 77° F., indigo, cotton, opium, and rice are produced, as well as the usual cereals, while in central Mongolia only small quantities of wheat, oats, buckwheat, and millet are grown. In the northwest agriculture is attempted only in the vicinity of the lakes and along the lower courses of the rivers. Winter lasts for from six to eight months, and in December the mercury falls in some places to 44° F. below zero. The air is dry, during the winter the cold winds from the interior prevail, while during the summer the south and southeast winds bring some moisture. At Uiga, the capital, in lat 48° 20' N., long. 107° 30' E., 600 miles north-northwest of Kalgan, the annual rainfall is only 9½ inches, and the mean summer temperature 64° F., and at Uliassutai, in the northwest, 5400 feet above sea level, the July temperature is 66° F. The snowfall is never great, but the icy sandstorms and snowstorms of the spring are disagreeable.

Fauna. The fauna resembles that of Siberia, in the north where the Siberian types penetrate up the valleys of the Selenga basin, and is not extensive. It is richest in fur-bearing animals, as hares, foxes, sables, and squirrels, and there are deer, marmots, black bears, kiang or mountain goats, ounces, and wolves. The wolves never run in packs, seldom attack men, and are far from brave. Drovers of wild camels, ponies, asses, and mules are found, and their young are sometimes captured. Among game birds is the partridge. Except in the settled regions near China, cats and chickens are seldom seen. No encampment is complete, however, without a pack of barking, curish dogs. The camel is two-humped, but does not possess the water cells of the camels of the Arabian desert.

Industries. Mongolia has practically no manufactures. The chief industries are the rearing of flocks and herds and the breeding of horses. In the northwest, and to a less extent elsewhere, hunting is engaged in, and furs, skins, deers' horns, etc., form important articles of trade. Felt and certain kinds of woolen goods are produced, and two kinds of silk are woven in the rich agricultural districts occupied by the Chinese and the sedentary Mongols (i.e., the region between the desert and the Great Wall), whose trade is with north China. Trade centres chiefly in Urga, Kobdo, Uhas-sutai, and Maimaichin, opposite the Russian town of Kiakhta (840 miles north-northwest of Kalgan, q.v., also an important trade centre), and Kukuhotu or Kweihwaching, a walled Chinese town near the great bend of the Yellow River and an important point of departure for the trade with East Turkestan and Ili. Other cities are Jehol (q.v.), Lamamiao, 150 miles northeast of Peking; Pa-K'ow, 60 miles east by south of Jehol, Chi-fung-huen, 150 miles north-east of Jehol, and Hada, situated in lat 42° 10' N. and long 119° E. Trade is carried on mostly by barter, furs, woolen stuffs, skins, sheep, camels, horses, etc., being exchanged for salt, timber, tea, silk, cottons, sugar candy, etc. Brick tea is the chief medium of exchange. No regular currency exists in Mongolia. Chinese lump silver is in use everywhere and Chinese coins where the Chinese are found, while Russian coins and notes are accepted in outer Mongolia.

Chinese imports into Mongolia are mainly cotton sheetings and piece goods, mostly of British origin, and silks, brick tea, all sorts of metal utensils, religious articles, flour, paper, tobacco, combs, and boots. Goods from Russia include felt and cotton manufactured goods for clothing, metal and enamel ware, dressed skins, sugar, groceries, iron, tobacco, spirits, and wines. As the Mongolian has very simple tastes he is easily satisfied with inferior goods and his demands are few. The Urga government imposed a tax of 5 per cent ad valorem on imports by Chinese and 10 per cent on Chinese tobacco, wines, etc., while Russian goods are admitted free. Owing to the disturbed conditions there has been little trade recently between China and the Khalkha territory.

A very extensive and important transit trade, interrupted more or less at present, passes through Mongolia from Peking, through Kalgan and Urga to Kiakhta in Siberia, tea being the chief commodity from China. This gives considerable employment to several of the tribes as conductors of the caravans, particularly the Sunids, who occupy the central portion of the Gobi, and thousands of camels are employed. Roads—i.e., well-beaten tracks—abound, and run in all directions, except in the sandy parts, and there are usually two or more to every important place, camels going one way and ox carts another, depending on the pasturage and the water. There are few cities or towns, the Mongols being for the most part tent dwellers who usually camp on one spot all winter, but move occasionally during summer to some suitable pasturage within their own tribal limits.

Population. The population of Mongolia has been estimated at from 2,000,000 to 5,000,000. The latter number seems excessive, but it probably includes the inhabitants of Sungaria and Kokonor, as well as the very large number of

Chinese who have taken up their abode here as merchants and farmers. Officially Mongolia is credited with 2,580,000 inhabitants, which makes about 2 to the square mile. Little estimates the number as low as 2,000,000, or about 1½ to the square mile.

Government. Originally the Mongolians were nomads, but at the present day they are such only in a partial sense, as each tribe now resides in a certain locality, and families change abode only twice a year, in summer and winter, and usually return to the same places.

Over each hoshun, or fief (Chin., banner), is a hereditary prince known as the jassak, whose power over his people is practically unlimited. An aimak is a group of one or more of these hoshuns, or fiefs, under the control of the senior prince of any related princely families. The Chinese call the aimak a *pu*, which means, loosely, a tribe. The league (Chin. *meng*) is a creation of the Manchu emperors to break up the Mongol tribal organization. In Khalkha the leagues are equal to the existing aimaks, in inner Mongolia the 24 aimaks form six leagues.

In 1911 the administrative divisions of Mongolia were composed as follows:

Inner Mongolia

The six leagues of inner Mongols

The Chahars

The Kukuhotu Tumets (Kuihuacheng Tumets)

The Alashan Mongols (Eleuts)

The Etsingol Old Torguts (Eleuts).

Outer Mongolia.

The four leagues of Khalkhas

The Kobdo district

The Altai district

The Tannu-Urianhai lands

The following Mongols live outside of what is generally known as Mongolia: 1 Twenty-nine hoshuns of Kokonor Mongols in the newly formed (in 1911) Chinese administrative division of Chinghai. 2 Various tribes of Mongol origin in Barga or Kulunber (the Hailar district in the northernmost Manchurian Province of Heilungkiang). 3 Mongol leagues of Unen-Sutuktu and Batu-Setkhiltu in the Province of Sinkiang. These are Old Torguts and Hoshuts, both Eleuts. They number 13 hoshuns. 4 Some Chahars in Sinkiang, north of Ili.

The office of darga, or daruga (Chin. *meng chang*), means practically the president of a league. This office is filled by one of the jassaks and is elective. The entire number of jassaks meet periodically in a sort of diet, to settle any outstanding questions of civil, political, or economic nature which concern the league.

The jassak inherits his office as head of the hoshun, and was formerly confirmed by the Chinese Emperor. Most of the jassaks claim descent from Temu-jin (Genghis Khan) or his family. There are seven orders of nobility among these jassaks, and each prince of the inner Mongolian hoshuns had to appear once in three years at Peking for the New Year court celebrations. Theoretically the power of the jassak is unlimited over their serfs, but practically, owing to the unsatisfactory results of the system of primogeniture, they have little to do with the affairs of administration. Therefore they have the following assistants: a tusalakchi taiji (Chin. *hsieh li taiji*), a civil assistant, who administers the hoshun during

the jassak's absence, death, or minority, or until a new prince is confirmed. Generally there are two of these officials—a *tzahirakchi* or military assistant (Chin *kuan chi chang ohng*), who is a nontaiji chosen for his knowledge and ability, other officials for tax collecting, police duties, catching criminals, and the ordinary routine work. In the jassak's yamen all business and civil and criminal cases are decided, and records of affairs and expenditures are kept. Each jassak's hoshun is divided into a varying number of somons or sumuns, supposed to supply nominally 150 cavalymen. Each somon is under an official called the *tzangin*, or *tsu lung*.

The Mongols are very fond of titles, and in addition to the hoshun jassaks there are the *taiji*, of whom there are four classes, who are hereditary nobles who had not received any Manchu titles. Then there are some "sealless" princes, those who are Mongolian princes with Manchu titles but have no hoshun to administer.

Owing to the situation created by the *coup d'état* of Dec. 1, 1911, outer Mongolia is an autonomous state governed by a "sovereign" called the *jebtsum dampa hutukhta* (venerable sacred saint). The seat of his government is at Urga. He is assisted by a cabinet composed of the Premier and the Ministers of the Interior, Finance, Justice, War, and Foreign Affairs. The rest of Mongolia is governed from Peking by the Bureau of Mongolian and Tibetan Affairs (formerly the *Li Fan Yuen*, or Colonial Department), which sends resident officials, or ambans, as administrators to various Mongolian points.

Religion. Buddhism was introduced by Kublai Khan, and the Mongols are now strongly devoted to Lamaism (qv). Several males of each family become lamas or priests, and in this they are encouraged by the Chinese government. However, so many of the Mongols have entered the priestly ranks that the vitality of the race has been seriously diminished and it is even in danger of dying out. There are numerous great lamaseries in Mongolia—e.g., in the vicinity of Jehol (qv)—and temples are found well scattered over the country. The spiritual head of Mongolian Buddhism is the *Kutukhta*, or Living Buddha—next in importance to the Grand Lama of Tibet—who resides at Urga.

Social Life. The Mongols are a cheerful, good-natured, and hospitable people. They live in tents (*yurts*) of a very close-grained dark fabric, lined with felt, with a hole in the roof for escaping smoke, its occupants squatting on the felt-covered floor, supporting their backs against the boxes and chests which line the "wall." There is no furniture beyond small tables. Though Buddhists, they are not averse to flesh eating; but few except princes and nobles, or specially wealthy persons, can afford such a luxury. Their ordinary food consists of preparations of milk and millet, buckwheat flour, oatmeal, and the like. Mutton, however, is kept in the houses of the well-to-do for festive occasions, for the entertainment of guests, or to be used when prescribed medicinally. Except among princes and the agricultural Mongols bordering on China, chopsticks are not used—the fingers or a spoon suffice. Women are not secluded as in China, and in their marriage customs a semblance of the primitive fashion of wiving by "capture" is retained.

Language. Mongolian is an agglutinative

language, belonging to the Ural-Altaic family. It is closely allied to the Manchu, and in its grammatical procedures it greatly resembles Korean. Throughout Mongolia proper it is free from dialectal differences, but slight differences exist in Kalmuck (as in Sungaria) and among the Bunatic Mongols of Siberia. It was reduced to writing in the time of Genghis Khan, the alphabet then introduced being borrowed from that of the Uighur Turks of Kashgar, who had at an earlier period borrowed theirs from the old Syriac, which had been introduced by the Nestorian missionaries. It consists of seventeen consonants, seven vowels, and five diphthongs. These are grouped on the left of a vertical stem, forming syllables which are arranged in columns read downward and from left to right. As in Korean, case is indicated by appended particles, the plural is formed by separable affixes; there is no grammatical gender, there are no relatives, and very few true conjunctions; the verb is very elaborate, the adjective uninflected, prepositions become postpositions, the governed word precedes that which governs it, and, as in China, the book language differs somewhat from the spoken. The literature is not extensive. It comprises Buddhist scriptures and some translations from the Chinese, some folklore and fairy tales, and the great history of the Eastern Mongols, written in the seventeenth century by Sanag Setsen. Both the Old and New Testaments were done into Mongolian by Stallybrass and Swan in 1836-46.

History. Little is known of the origin and early history of the Mongols. They belong to the Turko-Scythian branch of the Tatars, known in Chinese chronicles as the *Hiung-nu*, and are of the same stock as the Turks. Both branches of the Tatars, the *Hiung-nu* and the *Tungusic*, occupied that part of Asia now comprised in Mongolia, Manchuria, Sinkiang, and the bordering parts of Siberia and Turkestan. The Mongols are referred to in the history of the Tang dynasty (seventh century), but their early history is mythical and unreliable. In the ninth century they seem to be distinctly separated as a people from the rest of the *Hiung-nu* tribes. They emerge into world history with the appearance of Temu-jin, later known as Genghis Khan (qv). This leader united all of the nomadic Mongol tribes under his rule in 1206 A.D., and before his death in 1227 he had led his people in that great wave of bloodshed and conquest which overspread Asia and struck terror into Europe, building up an empire which included northern China, Turkestan, Mongolia, the Caucasus, and southern Russia. By 1263 the Mongols had conquered Syria, Mesopotamia, Tibet, and Indo-China. The next great figure in Mongolian history is Kublai Khan, who made Peking his capital in 1267, declared himself Emperor of China in 1280, and died in 1295. His dynasty, the Yuen, lasted in China until 1368. Driven out of China in that year by the founder of the Ming dynasty, the contemporary of Timur, the Mongolian Khalkhas retired to their former home north of the Gobi, still hoping for an opportunity to reconquer their lost territory, but a great leader did not arise. Mongolia was thus again separated from China and ruled by its own khans. Dayan Khan united all of the Mongolian territory under his rule in 1470, but when he died, in 1544, the country was divided among his 11

sons. The death of this prince is memorable, as it marks the breach between Khalkha and inner Mongolia, which hitherto had been united against the common enemy of both, the Eleuts. In 1616 the Manchus of Manchuria were united under Nurhachu, who declared war on China two years later. During this time the princes of inner Mongolia began to acknowledge the Manchurian leader as their own ruler. In 1644 the Manchus succeeded to the throne of China, with the help of certain Mongol tribes whose seats lay near the Manchurian frontier. In 1688 war broke out between the Eleuts of Sungaria and the Khalkhas, and the latter, being defeated in 1690, sought the aid and protection of China, after considering for a while whether Russian help would be more advisable. The whole of Khalkha now acknowledged the rule of China, and seven years later the operations of the Imperial armies, led in person by the Emperor Kang-hi, resulted in the utter defeat of the Eleuts and the death of their leader, Galdan Sungaria became a Chinese possession, and all the tribes of Mongolia became vassals of the Emperor. In 1724 Kokonor was conquered by the Manchus, and the final subjugation of the Eleuts took place 30 years later. Valuable presents from time to time, the softening influence of Buddhism, the spread of Monachism, and the personal influence of the Dalai Lama of Tibet managed to preserve peace in Mongolia up to the Chinese revolution of 1911.

The opposition of the Mongols to the Chinese at the present day is due to the ever-increasing Chinese colonization of Mongolia and to the presence of Chinese military forces in that territory, which tend to destroy the autonomy of Mongolia as guaranteed by the Manchu emperors. More important, however, is the attitude of Russia. Russia desires to establish a buffer state between Siberia and China and thus prevent the flow of Chinese into her own sparsely settled territory. Her fear of the Chinese is largely economic. Neither does Russia wish to see Chinese soldiers in outer Mongolia, which would mean the proximity of a modern military force capable of threatening the Siberian Railway. In addition, there is a strong desire at present for a unity of all the Mongol races, and a legend has it that Amursana, one of the last of the Eleut princes to oppose the Manchus in 1754, will reappear and bring victory to the Mongols as in the days of Kublai Khan.

These phases of opposition to Chinese rule came to a head in 1911. The Chinese amban at Urga in that year put up barracks at Urga for the Chinese soldiers and also actively promoted Chinese immigration. These acts increased the ill-feeling between Mongol and Chinese. In July, 1911, a deputation of Mongolians went to Petrograd to solicit the assistance of the Russians in preserving Mongolian autonomy and, if possible, to establish Mongolian independence. Then the revolution in China broke out, and the Mongols took advantage of the chaotic conditions throughout the Empire to carry out a successful *coup d'état* at Urga, December, 1911. The Chinese amban, officials, and troops were forced to leave the Khalkhan district and return home, while the Mongolian hutukhta of Urga was proclaimed as ruler. January, 1912, the territory of Barga joined Khalkha in rebellion against China, for practically the same reasons, viz., fear of Chi-

nese immigration and economic and military domination. Though the Chinese authorities of Barga peacefully withdrew, so as to give no cause for complaint, yet the territory set up a government dependent to Khalkha, and a *bargut* was installed at Hailar as amban, and to act as the viceroy of the hutukhta at Urga. Later the districts of Kobdo and Uliassutai also joined Khalkha in rebellion. President Yuan Shih-kai made efforts to conciliate the Mongols, but did not succeed in accomplishing much. Russia on her side encouraged the rebellious elements, and the fighting in 1913 resulted generally in favor of the Mongolian Russian-trained bands, aided by the Manchurian bandits and others.

There are three important agreements regarding the present unsettled state of Mongolian affairs. The Russo-Mongolian agreement of Nov. 3, 1912, comprises four articles, in which Russia engages to give aid towards Mongolian independence and to prevent Chinese troops or colonists from coming into Mongolia. Russian subjects and traders are given extensive privileges defined in an accompanying protocol. If Mongolia enters into any treaty with China or any other power, the present treaty cannot be altered or infringed without first obtaining the consent of Russia. In the protocol the Russians are granted the most complete freedom of trade, but no monopoly, and they may live, travel, and conduct business and manufactures in Mongolia. They may import and export all products and manufactures of Russia, Mongolia, and China duty free. Russian banks, post offices, and consulates may be established and land bought or leased. The use of rivers and roads for transport purposes is freely conceded. Disputes shall be submitted to arbitration, and a mixed tribunal shall be permanent wherever a Russian consulate is established.

In the agreement of Mongolia with Tibet, Jan. 11, 1913, the Dalai Lama, "Sovereign of Tibet," approves of the formation of an independent Mongolian state, and the "Sovereign of Mongolia" likewise approves of Tibet as an independent state. It is agreed that Buddhism is to be established on a firm footing, and mutual protection and assistance are promised by each of the new states to the other.

In the Russo-Chinese agreement of Nov. 5, 1913, China recognized the autonomy of outer Mongolia (Khalkha, the Kobdo district, and Urianghai), while Russia recognized Chinese suzerainty, and also that outer Mongolia is a part of China. The district of Barga, being in reality a part of the Manchurian Province of Heilungkiang, was not mentioned, for obvious reasons. China agreed not to send troops into outer Mongolia. Russia agreed likewise, with the exception of consular guards, and also agreed not to intervene in the administration nor to attempt colonization. China is to have representatives stationed at various places in the autonomous state.

An additional complication regarding Mongolian affairs arose in February, 1915. In the 21 demands made upon China by Japan in that year the Japanese government pressed for exclusive mining rights in eastern Mongolia, also that in the region named no railways shall be constructed without the consent of Japan, and that Japanese be given the right to settle, farm, trade, and purchase land.

The entire situation to-day is in a transitory

stage. There is a certain reaction of feeling against the Russians by the Mongols, who realize that they have not been successful in their hopes for a united Mongolia. Russia has succeeded for the time being in establishing an autonomous state in outer Mongolia, but it is certain that in the future China will attempt again to place all of Mongolia in the situation which existed during the Empire period.

MONGOLIAN IDIOT. See MENTAL DEFECTIVES.

MONGOLIAN RACE. That division of mankind which is characteristically Asiatic and had its primitive home on the continent of Asia, whence it has sent out branches into Europe, Africa, the islands of the Pacific, and, in the opinion of some authorities, even to the continent of America. Brinton, who termed this the Asian race, included in it the Sinitic peoples (Chinese, Tibetans, Indo-Chinese) and the Sibiric peoples (Tungusic, Mongolic, Tataric, Finnic, Arctic, and Japanese-Korean groups), while he regarded the Malayo-Polynesian peoples as a branch descended from some ancestral tribe in Asia. Keane modifies this view and regards the Malay type as distinctly Mongolic, and also has an Oceanic Mongol group (including all the peoples of Malaysia and Polynesia who are not of Indonesian, Negritic, Australasian, Papuan, or Melanesian stocks), one of the divisions of his *Homo mongolicus*. Both these scholars reject the theory which would derive the American aborigines from a Mongolian stock. Some of the earlier ethnologists saw a large Mongolian (Turanian) element in western Asia and Europe, of which fragments were to be seen in Sumerians and Hittites, Pelasgians and Etruscans, Iberians and Basques, Picts, and other isolated peoples. Abundant evidence, however, is now forthcoming that Europe and western Asia have from prehistoric times been in the possession of peoples belonging to the Mediterranean branch of the white race and their more northern and southern congeners. The view of other authorities that the Celts are largely Mongolian lacks proof, as do also the views of those archaeologists who explain certain industrial and social phenomena of later prehistoric Europe by invasions of Mongolian or Mongolized peoples from Asia. Outside of the Finno-Ugrian or Ural-Altaic peoples of north-eastern Europe and the later Mongol and Turkic-Tataric peoples of southeastern Russia, the Magyars of Hungary, the Turks of the Balkan Peninsula, and the Huns, Avars, and Bulgars, who came in the wake of the great migration of Germanic peoples (the last named still surviving to some extent in the Slavicized Bulgarians), the Mongolian population of Europe has probably never amounted to much at any epoch, the greatest invasions having taken place in historical times during the Middle Ages. Western Asia, Europe, and northern Africa have been as characteristically the environment of the white as the great mass of the Asiatic continent has been that of the yellow race.

The members of the Mongolian race possess, as a rule, straight, coarse hair (abundant on the head, less on the face, very scanty on the body), yellowish skin, a brachycephalous (or mesocephalous) head form, prominent cheek bones, a roundish face, a small nose, and small black

eyes, with slight elevation of outer angle and vertical fold of skin over the inner canthus. Their stature is medium or below the average. The "Mongolian spots" (q.v.) are also considered by some ethnologists a differentiating characteristic of this race. Certain bodily characteristics, as the relative proportion of trunk, limbs, and head of the typical Mongolian, have led many authorities to consider this the most childlike of all the human races. Color of skin, stature, and other peculiarities of a somatic nature account for the opinion of some that the Mongolian race is nearest to the original human stock, while the white, black, brown, and red races are held to represent greater divergences from the primitive type. That the Mongolian type should be the nearest to the original race and at the same time the closest to the child, who best represents the general human type, is very probable. Physically, then, the Mongolian race is of peculiar interest. Intellectually it runs a gamut equal to that of the white race, from the lowest tribes of Siberia, through the half-civilized peoples of Central Asia and the borders of China, to the great, ancient, and almost stagnant civilization of China, and beyond that to the rapidly advancing and progressive Japanese.

Ein Beitrag zur somatischen Ethnologie der Mongolen* (Jena, 1902).

MONGOLIAN SPOTS. A term applied by anatomical anthropologists to certain temporary pigment spots, bluish, gray, or blackish in color, found particularly in the sacrolumbar region and on the buttocks of newborn children, so frequently as to be regarded as a characteristic of the Mongolian races. These spots usually disappear between the ages of two and five, although they not infrequently last until the seventh year, and are occasionally found even in adults. Some anthropologists regard these spots as the most important distinctive race characteristic of the Mongolians. They have been reported from Chinese, Japanese, Koreans, Indo-Chinese, Malays and Polynesians, Malagasy, Ainu, Tungus, Kalmucks, Mongols, as well as among Eskimos, Mexican Indians, and even in full-blooded Europeans. It has been suggested that they may be rather a mark of the Indonesian than of the Mongolian race, but at all events, in view of the fact that they are by no means confined to the Mongolian race, and

may possibly turn out to be quite common even in the white race, for the present their value as a real race characteristic is very doubtful. Consult Wardle, "Evanescient Congenital Pigmentation in the Sacro-Lumbar Region," in the *American Anthropologist*, vol. iv (New York, 1901).

MONGOLIAN SUBREGION. In zoögeography, a subdivision of the Palearctic region, which includes the table-lands of Central Asia, from the Caspian Sea to Japan. Its separation from other Asiatic faunal regions is mainly on ornithological grounds, and is neither distinct nor important.

MONGOOSE, mōn'gōos, or **MUNGOOS** (Telugu *mangisu*). The mongoose (*Herpestes griscus*) is a species of ichneumon (q.v.), a native of India, but introduced into other countries, notably Jamaica, for the purpose of destroying rats and other vermin, upon which it feeds. In India it is often kept about the houses to reduce the number of lizards, mice, rats, and snakes. It kills and eats the most poisonous snakes, such as the cobra, the bite of which is either avoided by the animal's agility or else is not fatal to it.

The mongoose was introduced into Jamaica in 1872, when nine specimens were imported to destroy the rats on a sugar plantation. At first they were highly beneficial, reducing the stated annual loss from rats from \$500,000 to one-half that, but in less than 20 years the island was almost overrun with them. Not only did they kill rats and mice, however, but snakes, lizards, ground birds, and even poultry. At one time snakes had become so rare that they were regarded as practically exterminated, but since 1896 they are apparently on the increase. The ground doves and other terrestrial birds, partly at least by change of habit, are also adapting themselves to this new enemy and their extermination is no longer to be feared. At the present time the mongoose is common and very tame in most parts of the island and in many other islands, and is generally looked on with favor.

The mongoose is from 15 to 18 inches long and has a tail 14 to 15 inches in length, very thick at the base and tapering to a point. The fur is rather long and grizzled reddish gray. A very full account of its habits is given in the *Royal Natural History*, edited by Richard Lydekker (London, 1893-96). For the details of its history in the West Indies, consult Morris, *The Mongoose on Sugar Estates in the West Indies* (London, 1882), and *The Field* (London, July 13, 1895).

MÖNG PAI, mōng pa'ê. A state in the central division of the southern Shan States of British Burma. The land is generally hilly, particularly in the west and south. Rice is raised on irrigated land, and there are crops of tobacco, sugar cane, cotton, and fruit. Area, 660 square miles. Pop., 1901, 19,351; 1911, 20,287. Capital, Mong Pai.

MÖNG PAN, mōng pān. An eastern state of the southern Shan States, British Burma (Map Burma, C 2). The centre of the state is a level plain, surrounded by hills which rise to a maximum of 5000 feet. The north part is a dense jungle which produces teak. The main habitations are in the valley of the Nam Ton. Area, 2299 square miles. Pop., 1901, 16,629; 1911, 18,554.

MONIER-WILLIAMS, mō'nī-ēr-wī'l'yūmz,

SIR MONIER (1819-99). An English Sanskrit scholar, born at Bombay. He entered Oxford University in 1837, but soon obtained an Indian writership and studied at the East India College, Haileybury, where he gained the first prize in all the Oriental subjects. He resigned his Indian appointment, however, returned to Oxford, and graduated in 1844. He taught Oriental languages at Haileybury and at Cheltenham and in 1860 became Boden professor of Sanskrit at Oxford. His main work while at Oxford was the foundation of the Indian Institute, begun in 1875 and completed in 1896, of which he was curator till his death and to which he gave a valuable manuscript collection. Among his works are: *A Practical Grammar of the Sanskrit Language* (4th ed., 1877), *An English and Sanskrit Dictionary* (1851, 1888), *Practical Hindustānī Grammar* (London, 1859, 2d ed., 1868); *Indian Epic Poetry* (1863), an edition of *Sakuntalā* (2d ed., 1876) and a translation of this drama (1853, 6th ed., 1890), *A Sanskrit and English Dictionary* (1872, 2d ed., with Lemmann, Cappellu, and others, 1899), *Indian Wisdom* (4th ed., 1893), an anthology of Sanskrit literature, *Modern India and the Indians* (4th ed., 1887), *Buddhism* (1889); *Brāhmanism and Hinduism* (1883; 4th ed., 1891).

MOÑINO Y REDONDO, mō-nyé'nó ē rā-dōn'ōd, JOSÉ. See FLORENDA-BLANCA, COUNT OF.

MONIS, mō-nēs' (ANTOINE EMMANUEL) ERNEST (1846-) A French statesman, born at Chateaufort-sur-Charente. A wine manufacturer by business, he made a particularly well-known brand of cognac. He was a deputy from 1885 to 1889. After becoming Senator in 1891 he was a prominent member of the Radical Socialist party. He held the portfolio of Justice in 1899-1902 in the Waldeck-Rousseau cabinet, and, after serving as Vice President of the Senate, became Premier in March, 1911, his party having contributed largely to the defeat of the second Briand ministry. He was seriously hurt (May 21) by an aeroplane which killed his Minister of War, Berteaux. The cabinet was forced to resign June 23, 1911, when the Chamber failed to vote confidence, and Monis was succeeded by Caillaux (qv). In December, 1913, he became Minister of Marine in the Doumergue cabinet, from which he resigned in March, 1914, after the *Figaro* had charged that in 1911 Caillaux induced Monis to postpone the trial of Henri Rochette (for fraud in promoting) until the charge was outlawed. The committee that investigated the Rochette affair censured the actions of Monis and Caillaux, but the Chamber refused to prosecute them.

MONISM (Gk. *mōnos*, *monos*, single) A philosophical term, in its broadest sense designating all systems of philosophy which define the sum total of reality as unitary, either in organization or in substance. It is thus opposed to dualism and pluralism (qq.v).

In this broad sense, as indicating merely the final unity of all reality, monism represents the ideal of nearly every system of philosophy, and indeed by some thinkers it is considered to be the only legitimate philosophical ideal. In the history of philosophy the first conscious effort to attain a monistic system appears in the Eleatic teachings (See ELEATIC SCHOOL). Among the Ionians there had been philosophers who derived all phenomena from a single primal element, but the Eleatics were the earliest to assert

the immutable unity of all that is real. They did not, however, definitely fix the nature of the unitary being. That nature might be of two sorts—material or spiritual. The ancient Atomists (see ATOMISM) advanced the doctrine of a material being, while Anaxagoras (qv) and Plato (qv), although in neither case attaining a pure monism, clearly pointed the way of modern idealism.

The first thoroughgoing monism, in a more exact and restricted sense, appears in the philosophy of Spinoza (qv.), after scholastic controversies had crystallized the conception of substance and attribute. Spinoza taught that both material and ideal phenomena are attributes of one underlying substance which forms the monistic reality. His doctrine is thus analogous to the "mind-stuff" theory (qv), which teaches that matter and mind are diverse aspects of one reality, and is generally identified as the modern "scientific monism." But the great difference between Spinoza's monism and the doctrine of "mind stuff" is that for the former there is only one substance, all-inclusive; for the latter atoms of mind stuff are innumerable, being one only in kind, not in number. Materialism is also monistic, while idealism, denying the reality of matter, represents the opposing, complementary form of the doctrine. Idealistic monism is itself of two types, however. On the one hand there is that type which identifies the monistic reality with the will (Schopenhauerian voluntarism), on the other there is that type which finds the nature of reality in intellect. There is still a third type in which ultimate spiritual reality is regarded as having both intellectual and volitional character. Perhaps the most famous monism is the Hegelian, which expresses the unification in logical terminology, as the reconciliation of opposites in a higher synthesis.

The term "monism" is relatively recent, having been first used by Christian Wolf (1679-1754) to designate types of thought which endeavored to do away with the dualism of body and mind. For a considerable period it was used with explicit reference to relations involved in the epistemological problem (see KNOWLEDGE, THEORY OF), but in contemporary thought it has been extended to the senses indicated above. Consult E. H. Haeckel, *Monism as Connecting Religion and Science* (New York, 1895), id., *Riddle of the Universe at the Close of the Nineteenth Century* (ib., 1900), G. J. Romanes, *Mind and Motion and Monism* (ib., 1895), W. L. Walker, *Christian Theism and Spiritual Monism* (ib., 1906), Arthington Worsley, *Concepts of Monism* (London, 1907); and bibliographies given under IDEALISM; MATERIALISM.

MONITA SECRETA SOCIETATIS JE'SU (Lat., secret instructions of the Society of Jesus). The title of a book purporting to contain private instructions for the members of the Society of Jesus, first published at Cracow in 1614 without any author's name. It was attributed by the enemies of the Jesuits to Claudio Acquaviva, the fifth general of the order, and, though it was condemned by the Congregation of the Index in 1616 as "falsely ascribed to the society, calumnious, and full of defamatory matter," it was for a long time received as authentic by these same enemies. Its genuineness has long ceased to be defended by scholars, whatever their point of view.

Recent investigations of the Cracow Academy have made it practically certain that it was written by the man whom the Bishop of Cracow names as its suspected author in the year following its publication—Jerome Zahorowski, a former Jesuit, who had been dismissed from the order for ill conduct in 1611 and took this means of revenging himself. Consult Huber, *Der Jesuitenorden* (Berlin, 1873), and Duhr, *Jesuiten-Fabeln* (Freiburg, 1891).

MONITEUR, mō'nē'tēr, Le (Fr., the monitor). A French journal founded May 5, 1789, by C. J. Panckoucke under the title *Gazette Nationale, ou le Moniteur Universel*. Its great importance as a register of events begins with the crisis of Aug. 10, 1792. Its issues for the years 1789-99 were reprinted in 32 volumes by Gallois, *L'Ancien Moniteur* (Paris, 1840-45). In Nivôse of the year VIII (1800) the *Moniteur* began to publish officially the *Actes du gouvernement*. In 1811 it took as its sole title *Moniteur Universel*. From July, 1814, to February, 1815, the official part of the journal was suspended, the government issuing irregularly a *Journal Officiel*. After this the *Moniteur* was again recognized as the government organ and so continued until 1868, when the official part was separated from the *Moniteur* and took the title *Journal Officiel*.

MONITOR (Lat. *monitor*, one who warns, from *monere*, to warn, so called because the lizard was supposed to give warning of the presence of the crocodile). A large, semi-aquatic pleurodont lizard of the Old World, of the family Varanidae, characterized by a long, deeply cleft, smooth tongue. The neck is relatively long and the skin is almost smooth; the tail is very long, often laterally compressed, forming a powerful swimming organ, and the teeth are large and pointed. There are nearly 30 species, all in the single genus *Varanus*, inhabiting Africa, southern Asia, and thence to Australia, but absent from Madagascar. Some species reach a length of 6 or 7 feet, and all are rapacious, seizing whatever animals they can master. Although most of them live in or around the water, others occur in dry inland regions or in the woods. The most familiar is the Nile monitor (*Varanus niloticus*), which inhabits all of Africa except the northwestern part. It is greenish gray, more or less mottled. This species spends most of its time in the water and is of service in keeping down the crocodiles, for whose eggs it searches and whose young it captures in the water. A well-known species of the East, found from northern India to the Philippines, is *Varanus salvator*, called in Ceylon *kabaragoya*. It is amphibious, but wanders widely in the forests and climbs trees with great agility. Consult. Tennent, *Natural History of Ceylon* (London, 1861); Mason and Theobald, *Burma: Its People and Productions* (ib., 1882); Hans Gadow, "Amphibia and Reptiles," in *Cambridge Natural History*, vol. viii (Cambridge, 1901). See Plate of LIZARDS.

MONITOR, THE. One of the most famous vessels, and the first successful ironclad, in the history of the United States navy. It was built at Greenpoint, L. I., from designs by and under the direction of John Ericsson (q.v.), was launched on Jan. 30, 1862, and on March 6, 1862, under the command of Lieut. John L. Worden, started for Hampton Roads, Va., where it arrived on the night of March 8. During this day the Confederate ironclad vessel, the

Virginia (commonly known as the *Merrimac*, its name prior to its capture at Norfolk by the Confederates), had destroyed or disabled a large part of the Federal fleet in the harbor. On Sunday, the 9th, the *Monitor* engaged the *Virginia* in a somewhat indecisive battle lasting several hours, the *Virginia* finally withdrawing up the Elizabeth River. While the action was not fully conclusive as regards determining the relative fighting capacities of the two ships, it was tactically and practically a complete victory for the *Monitor*, as she forced her opponent to retreat in a disabled condition and fully protected the ships of the Federal fleet from her attacks. Neither vessel was very seriously injured, and only a few men were wounded on either side, Lieutenant Worden, however, being seriously injured on the *Monitor*. On May 15, 1862, in company with the *Galena*, the *Naugatuck*, *Port Royal*, and *Aroostook*, the *Monitor* participated in an unsuccessful attempt to capture Richmond, and on Dec. 31, 1862, while en route to Beaufort, N. C., she foundered in stormy weather off Hatteras, four officers and 17 men being drowned. The engagement between the *Monitor* and the *Virginia* (or *Merrimac*) was one of the most important and significant in the naval history of the world, demonstrating as it did the value of armored vessels and large guns, while the events of the day before showed the impotence of wooden ships and guns of average (at that time) size against armor-clads. The successful issue of the *Monitor's* one naval action greatly relieved the minds of the people of the North, whose fears of the possible depredations of the *Merrimac* had almost become panic. Thereafter to them the *Monitor* type represented all that was efficient, powerful, and perfect in naval construction and it was a long time before a just estimate of her defects as well as her good qualities was admitted except by naval officers. Consult Bennett, *The Monitor and the Navy under Steam* (Boston, 1900); Johnson and Buel (eds.), *Battles and Leaders of the Civil War*, vol. 1 (New York, 1887); Wilson, *Ironclads in Action* (London, 1896); Hill, *Twenty-six Historic Ships* (New York, 1903). See the article SHIP, ARMORED.

MONITOR BUG. A local name in California for the bloodsucking cone-nose (*Conorhinus sanguisuga*). See CONE-NOSE.

MONITORIAL SYSTEM OF MUTUAL INSTRUCTION. A term applied to a system of school organization and instruction popular during the first half of the nineteenth century in Great Britain and to a less degree in some continental countries and in America. The practice is to be found frequently in educational history, but in its specialized sense it was employed in 1795 by Dr. Andrew Bell, superintendent of the Orphan Asylum at Madras, who made use of the more advanced boys in the school to instruct the younger pupils. In 1797, after his return to England, Bell described the practice in a work which attracted little attention. At about the same period the idea seems to have occurred, according to his own account, quite independently to Joseph Lancaster (q.v.), who improved and popularized the method. The question of priority led to long and acrimonious disputes. Hence the system is often called the Bell or the Lancastrian system of instruction. The supporters of Lancaster established the British and Foreign School So-

society and those of Bell the National Society, both of which may be said to have laid in the extension of the monitorial schools the foundations of the English elementary school system.

The monitorial system was at once effectual and economical. By the employment of clever boys under the direction of the master, both for the purpose of keeping order and for giving instruction, the school might be made self-operative and several hundred boys taught with the employment of only one adult superintendent. The pedagogical idea upon which the system was based was that the school life of the child is divided into two periods: in the first the child should receive all the aid that the teacher can give him consistent with the development of self-helpfulness, in the second he should be taught to apply what he has acquired to the study of other branches and to the teaching of others, when he should be thrown as much as possible upon his own resources. The original organization of such schools was: (1) the master, who was the ultimate and absolute authority, (2) the usher, who was a sort of superintendent of management and discipline; (3) the subushers, who had charge of school-room materials, (4) the teachers, who had general oversight of two or three classes or groups, (5) the assistants, who had charge of each group or class; (6) the tutors, who assisted each child in the preparation of his lesson. In general, all these officials under the master were pupils, the pupils of one class becoming in turn the tutors of the one below. Lancaster's improvement upon the general scheme was the division of classes into small groups and the formulation of detailed methods of instruction in the elementary branches.

Consult Lancaster, *Improvements in Education* (London, 1805); Bell, *Elements of Tuition* (ib., 1805); Meiklejohn, *An Old Educational Reformer* (ib., 1881); Gill, *Systems of Education* (Boston, 1889); Sharpless, *English Education* (New York, 1892); David Salmon, *Joseph Lancaster, Biography* (London, 1904), containing a bibliography. See LANCASTER.

MONIUSZKO, mō-nyush'kō, STANISLAW (1820-72). A Polish composer, born in Ubel, Government of Minsk, Russia. He perfected his musical education under Rungenhagen of Berlin, in which city he also taught for a livelihood, but subsequently settled in Vilna. He was a prolific composer. He became director of the Warsaw Opera and held a faculty position at the Warsaw Conservatory. His works include numerous songs, church music, chamber music, orchestral and instrumental pieces, and 15 national Polish operas.

MONK. See MONASTICISM.

MONK, FREDERICK DE BARTZCH (1856-1914). A Canadian lawyer and statesman, born at Montreal and educated at McGill University. He was called to the bar in 1878, became prominent in the practice of his profession in Montreal, and was elected a Conservative member of the House of Commons in 1896 and leader of the Conservative party in Quebec Province in 1900. In the House of Commons he became known as a forceful speaker both in English and in French. When the Laurier administration brought forward its naval policy for the assistance of Britain, Monk vigorously opposed it unless it was to be ratified by further and direct reference to popular vote. He also opposed the reciprocity proposals made by Sir Wilfrid

Laurier and embodied in the Taft-Fielding agreement of 1911. On the defeat of the Liberals and the accession of the Conservative leader, Robert Laird Borden (q.v.), to power, Monk was appointed Minister of Public Works. He resigned in 1912.

MONK, or MONCK, GEORGE, first DUKE OF ALBEMARLE (1608-70). An English general who directed the national demand for the Stuart Restoration. He was born at Potheridge, Devonshire, Dec. 6, 1608. Coming under the ban of the law for thrashing a civil officer who illegally attempted to arrest his father, he volunteered for service in Spain, where he distinguished himself on secret service. In 1629 he entered the Dutch army and acquitted himself gallantly at Breda. In 1639, at the outbreak of the Scottish troubles, he was appointed lieutenant colonel and won additional renown by saving the English guns in the rout at Newburn. In 1642-43 he commanded a regiment against the Irish rebels, gained several victories, and was appointed Governor of Dublin. In the early part of the Civil War he fought as a volunteer for the King, and in the Royalist defeat at Nantwich was taken prisoner by Fairfax. Charged with high treason, he was committed to the Tower, where he remained for two years. He regained his freedom by consenting to serve in Ireland. His conduct commended itself to Cromwell, who made him lieutenant general and chief of artillery. Parliament appointed him Governor of Carrickfergus and gave him a gratuity of £500. In 1650 Cromwell took him to Scotland, and, on account of his brilliant conduct at Dunbar, left him as commander in chief to complete the subjection of that country. In 1653 he became conspicuous in a new capacity as a sea fighter and, associated with Blake and Deane, won two great naval battles over the Dutch Admiral Tromp. He took part in the commission to arrange the union of Scotland and England, and went to the former country as Governor in 1654, with much difficulty maintaining his rule against the Presbyterians. Charles II tried to secure his support, but Monk sent the letter to Cromwell. After the Protector's death Monk declared in favor of Richard Cromwell and assumed the defense of public order when Lambert's insurrection threatened a military despotism. On Jan. 1, 1660, Monk crossed the border with 6000 men, joined Fairfax at York, and entered London, February 3, without opposition. His intentions were not known until February 28, when, owing to the unsettled condition of affairs and knowing of the national wish to bring back the Stuarts, he called together the Presbyterian members expelled from Parliament in 1648 and created a majority for the King. Charles II was formally declared King on May 8. He made Monk Duke of Albemarle, Privy Councillor, Chamberlain, and Lord Lieutenant of Devon and Middlesex. In 1665, as Governor of London during the plague, Monk remained at his post when every one else had fled who could. The King then employed him against the Dutch at sea. In June, 1666, De Ruyter with an overwhelming force defeated him in a three days' battle off Dunkirk. In the month following Albemarle gained a complete and sanguinary victory over De Ruyter off the North Foreland. During the last years of his life Monk lived in a measure retired from political and social life. He died at Newhall, Essex, Jan. 3, 1670.

Bibliography. Gumble, *Life of General Monk* (London, 1671), of special importance since the author was chaplain to Monk in 1659-60 and had special opportunities for obtaining information; Thomas Skinner, *The Life of General Monk* (ib., 1724); *Thurloc State Papers* (ib., 1742); *Clarendon State Papers* (Oxford, 1786); *Clarendon, Life* (ib., 1827); F. P. G. Guizot, *Monk, or the Fall of the Republic and the Restoration of the Monarchy*, translated by Scoble (London, 1851); *Calendar of Domestic State Papers, 1649-60* (ib., 1875-86); *Clarendon, History of the Rebellion* (Oxford, 1888); Julian Corbett, *Monk* (New York, 1889), in "English Men of Action Series"; Samuel Pepys, *Diary* (London, 1893-96); C. H. Firth, *Scotland and the Commonwealth, 1751-53* (Edinburgh, 1895); S. R. Gardiner, *History of the Great Civil War* (New York, 1897); Firth, *Scotland and the Protectorate, 1654-59* (Edinburgh, 1899).

MONK, MARIA (c.1817-50) A Canadian impostor. In 1835 she claimed to have escaped from the nunnery of the Hôtel Dieu in Montreal, and told of many revolting practices alleged to have been carried on within the walls. She came to New York, and so impressed many people of standing that they continued to believe her after she was proved to be of bad character and her story to be a clumsy invention. Her tale was printed in *Awful Disclosures by Maria Monk* (1836) and *Further Disclosures* (1836). More than 200,000 copies were sold and a violent anti-Catholic agitation resulted. William L. Stone, of the New York *Commercial Advertiser*, visited Montreal and exposed her in *Maria Monk and the Nunnery of the Hôtel Dieu* (1836). For this he was abused by the Know-Nothings, who made much capital of the story.

MONK BAT. A bulldog or mastiff bat (q.v.).

MONK BIRD. The friar bird (q.v.).

MONKEY (with double diminutive ending *-cy*, from OF. *monne*, from It. *monna*, OIt. *mona*, she-monkey, old woman, contraction of *madonna*, lady, from *mia donna*, my lady, from *mia*, from Lat. *meus*, mine, and *donna*, from Lat. *domina*, lady, apparently so called from the resemblance of a monkey's face to that of an old crone). A popular name for a large number of mammals of the order Primates. In the broadest sense a monkey is any primate except a man or a lemur. Many of these, however, are better known under more particular names, as the marmosets, apes, gibbons, etc., and it will be proper here to consider monkey as including only the members of the two families Cebidae and Cercopithecidae (or better, Lasiopygidae), further excepting baboons and macaques (qq.v.), which have short tails, limbs nearly equal and not specially adapted to an arboreal life, and the muzzle projecting so that the face is more or less doglike. We may, therefore, regard the monkeys in a strict sense as including all of the Cebidae and, of the Lasiopygidae, all except six genera, including the baboons, geladas, black apes, macaques, and their nearest allies.

New World Monkeys. The Cebidae are exclusively American and include not less than 9 genera and about 85 species. They are readily distinguished from the monkeys of the Old World by the presence of 36 teeth, the absence of a bony external auditory meatus, the absence of ischiatic callosities, and the presence of a broad intermarial septum. On account of the latter characteristic they were at one time grouped

as a suborder, the Platyrrhini, while the Old World monkeys, since they have a narrow septum, were called Catarrhini; but these terms have now largely passed out of use. The principal kinds of American monkeys are the howlers, sakis, ouakaris, titis, squirrel monkeys, spider monkeys, barrigudos, and sapajous, or capuchins. The howlers (genus *Myocetes*, or *Alouatta*) are remarkable for the extraordinary cries which they are capable of emitting, owing to the enormous enlargement of the hollow hyoid bone and vocal apparatus. The face is supplied with a long beard, the tail is long and very prehensile, and the color is very variable, though usually dark. In intelligence the howlers are ranked among the lowest of the American monkeys, although in size among the largest. The sakis are long-tailed monkeys of the genus *Pithecia*, having a well-developed thumb and the lower incisors inclined forward, they also have the ramus of the mandible expanded, though not so much so as in the howlers. A number of species are known, all South American, but varying greatly in the character of the hairy coat, the beard, and the bushiness of the tail; all are arboreal, have powerful voices, and make interesting pets, some species showing great attachment to their masters. The ouakaris differ from all the other American monkeys in having a short baboon-like tail, in spite of which they are exclusively arboreal. They are limited in their range and die soon after being sent away from their own home. There are three species, of the genus *Uacaria*, or *Cacaqao*. The titis are small Brazilian monkeys with vertical lower incisors and a long nonprehensile tail, distinguished from the squirrel monkeys (*Chrysomys*) by the small canine teeth and the bushy tail. These are both grouped by some authors in the genus *Samuri*. About seven species of squirrel monkeys are known from northern South America, they have very large eyes and disproportionately long hind limbs and tail. The spider monkeys, comprising the genus *Ateles* and the aberrant woolly monkeys (*Brachyteles*), are the most celebrated of the Cebidae. *Ateles*, of which a dozen or more species are known, lacks a thumb and the coat is not woolly, while the members of the latter genus have a rudimentary thumb and a woolly coat. All these monkeys have the form slender, the limbs very long, and the tail extremely prehensile and naked beneath at the tip. Although so perfectly adapted to an arboreal life, they are not specially active, and the power of grasping by the hand is very imperfect, owing to the lack of a thumb. They range from southern Mexico and Central America southward to southeastern Brazil. The six species of barrigudos or true woolly monkeys (*Lagothrix*) are similar to the spider monkeys, but have a thumb and are much heavier. They rank with the howlers as the largest American monkeys. The sapajous are somewhat smaller and stouter than the spider monkeys and are the favorite species in captivity, which they bear very well. They have a thumb, and the undersurface of the tail is hairy; more than 20 species have been described, all of the genus *Cebus*.

These monkeys are all active animals, chiefly diurnal, though a few of the smaller forms are nocturnal. They live almost wholly in trees and feed upon fruits and insects chiefly, though eggs, young birds, and even some reptiles may vary the diet. They are themselves constantly

MONKEYS OF THE OLD WORLD

1. GUEREZA (*Colobus abyssinicus*).
2. PROBOSCIS MONKEY (*Nasalis larvatus*).
3. HANUMAN or SACRED MONKEY (*Pygathrix entellus*).

4. DIANA MONKEY (*Lasiopyga diana*).
5. PIG-TAILED MONKEY (*Pithecus nemestrinus*).
6. SOOTY MANGABEY (*Cercocebus aethiops*).

hunted by the Indians, who use them for food, and also use or sell the skins. The flesh of monkeys is said to be good eating, and some travelers speak in the highest terms of the meat of some of the spider monkeys. The Cebidæ are not only inferior to the Old World monkeys in size, but in intelligence do not compare with them. The sapajous are perhaps the most intelligent of the American species and in captivity make very interesting pets. Most of the monkeys seen in the United States with organ grinders are of this kind. The South American Indians shoot them with arrows, the tips of which are slightly poisoned with curare, and when the animal thus wounded has been captured, it is fed with salt, which is an antidote to the poison. The habits of monkeys are so well known that the verb "to monkey" has passed into current use as an unmistakable expression for meddling activity.

Old World Monkeys. Turning now to the Old World monkeys, which have 32 teeth, an external, bony auditory meatus, ischiatic callosities, and a narrow interanarial septum, and leaving out of account the baboons and macaques, we face an assemblage of 10 genera and something like 185 species. Six of the genera are confined to Africa and four to Asia and the East Indies. *Cercocebus* is an African genus of four species, with teeth like a macaque, but with a long tail. *Cercopithecus*, or *Lasiopyga*, is a large African genus of over 70 species, of rather slender, long-tailed monkeys, including some of the best-known species. They are often called guenons. The thumb is of large size, both hands and feet are adapted for running as well as climbing, and the stomach is simple and not sacculated. They live in troops and make pillaging expeditions into cultivated grounds under the leadership of an old male. Of the various species of this genus which are in the market as pets, the mangabeys (q.v.) are favorites; they are usually blackish, with more or less white. The best known of African monkeys

DENTITION OF A MONKEY.

Upper and lower series of teeth, left side, of the green monkey: *i*, incisors; *c*, canines; *p*, premolars; *m*, molars. (Cf. LANGUR.)

is the common green monkey (*Cercopithecus*, or *Lasiopyga*, *callitrichus*), which is of medium size and olive green in color. It is widely distributed in Africa and over 200 years ago was introduced into St. Kitts, Grenada, and some others of the Lesser Antilles, where it has been quite destructive to crops. In identifying the various less-known species of *Cercopithecus*, or *Lasiopyga*, one of the most important points is the color of the nose. *Nasalis*

is a notable genus containing a single species, the proboscis monkey (q.v.) of Borneo, in which the nose is greatly prolonged into a real proboscis. This species bears captivity poorly, and few living specimens have been seen in Europe or America. *Semnopithecus*, or *Pygathrix*, includes over 50 Asiatic species, such as the well-known hanuman and the langurs (qq.v.). The last genus, *Colobus* (see GUEREZA; KING MONKEY), includes about 30 African monkeys with the thumb rudimentary or wanting. Many of them are handsomely decorated with long, silky hair, and the pelts have considerable commercial value, being used for the manufacture of women's boas, muffs, etc. The Old World monkeys do not differ essentially from the Cebidæ, but they are not so exclusively arboreal and the tail is not prehensile. In many species cheek pouches are present, in which food may be stored, and such forms have the stomach simple; but in those forms where there are no cheek pouches the stomach is sacculated in an extraordinary manner. The latter monkeys are exclusively herbivorous and live largely on shoots and leaves. Monkeys breed usually but once a year and produce only one or two young ones at a birth.

The fossil remains of monkeys have been found in the Pleistocene deposits of Brazil and as far back as the Middle Miocene of Europe.

MONK HOUSE, WILLIAM COSMO (1840-1901). An English art critic and poet, born in London. He was educated at St. Paul's School. In 1857 he became a clerk in the Board of Trade and in 1893 Assistant Secretary of Finance. His verse comprises: *A Dream of Idleness and Other Poems* (1865); *Corn and Poppies* (1890); *The Christ upon the Hill* (1895). Among his publications on art are: *The Italian Pre-Raphaelites* (1887); *The Earlier English Water-Colour Painters* (1890); *In the National Gallery* (1895); *British Contemporary Artists* (1899). He also wrote *Lives of Turner* (1879) and Leigh Hunt (1893) and contributed many articles to the *Dictionary of National Biography*.

MONK SEAL. The West Indian seal (*Monachus*). See SEAL.

MONKS HOOD. See ACONITE.

MONKS OF SAINT BASIL. See BASILIAN MONKS.

MONK'S TALE, THE. One of Chaucer's Canterbury Tales, a miniature reproduction of Boccaccio's *Falls of Illustrious Men*.

MONKSWELL, mŭnks'wĕl, ROBERT PORRETT COLLIER, first BARON (1817-86). An English judge. He was born at Plymouth and was edu-

ated at Trinity College, Cambridge. Admitted to the bar at the Inner Temple in 1843, he established his reputation as a lawyer by his brilliant defense of the Brazilian pirates in 1845. He was elected a Liberal member of Parliament for Plymouth in 1852. While counsel to the Admiralty and Judge Advocate to the fleet he gave an opinion that would have prevented the Confederate vessel *Alabama* from going to sea if it had been acted upon. (See ALABAMA CLAIMS.) He became Solicitor-General in 1863 and Attorney-General in 1868. He was made a judge of common pleas for a few days in 1871 to enable him to qualify as a member of the judicial committee of the Privy Council. This action brought popular opprobrium upon the Gladstone government, but he served in that office until his death. He was made a peer in 1885.

MONLUC, or **MONTLUC**, mōn'luk', BLAISE DE (1502-77). A French warrior, historian, and autobiographer, born in Armagnac, near Condon, now in the Department of Gers. For 50 years he was abroad, always doing something, and he remembered what he had done. He shared in the campaigns of Francis I and got leave from him for the Duke d'Enghien to start the fight at Cérisoles (1544). Under Henry II in 1555 he held off the Emperor's troops at Siena. He fought the Huguenots in Guienne. A slash in the face caused him to withdraw for two years (1570-72), and in this forced repose he wrote his *Commentaires*. He detested letters, but the example of Cæsar set him to writing of what he had done and seen. Monluc wrote admirably, with the fire of a glory-loving Gascon. He was not in the least a philosopher, though he meant his *Commentaires* to be useful to posterity. Without understanding the movements of his time, he saw distinctly what went on about him. Monluc gives an extraordinarily vivid series of pictures of his adventures in France and Italy. His *Commentaires* are highly valuable to the historians, and their style makes them delightful reading to those who are simply looking for a man. Monluc died in Estilla, near Agen. Consult *Commentaires et lettres de Blaise de Monluc*, edited by Ruble (Paris, 1864-72), Normand, *Les mémorialistes, Monluc* (ib., 1892), Paul Courteault, *Blaise de Monluc, historien* (ib., 1908), containing a bibliography.

MONMOUTH, mōn'mūth. A municipal borough and market town, the capital of Monmouthshire, England, situated amid beautiful scenery, at the confluence of the Monnow and the Wye, 18 miles south of Hereford (Map: England, D 5). It has ruins of former walls with a well-preserved gateway, and its fourteenth-century church is surmounted by a lofty spire. Of its castle, the favorite residence of John of Gaunt and the birthplace of Henry V, little remains. A building said to be the study of Geoffrey of Monmouth is all that exists of the Benedictine monastery. There is a seventeenth-century grammar school. Manufactures include tin plate, lumber, and chemicals. Pop., 1901, 5095; 1911, 5269.

MONMOUTH. A city and the county seat of Warren Co., Ill., 27 miles east by north of Burlington, Iowa, on the Chicago, Burlington, and Quincy, the Minneapolis and St. Louis, and the Rock Island Southern railroads (Map: Illinois, C 4). It is the seat of Monmouth College (United Presbyterian), founded in 1856, and has the Warren County Library and fine court-

house, Federal, city hall, and high-school buildings. There are farming, coal-mining, horse breeding, and commercial interests, controlling a large trade in grain, produce, live stock, and in the principal manufactured products, which include agricultural implements, sewer pipe, pottery, oil cans, stoneware, soap, stump pullers, gloves, boxes, and cigars. Settled in 1836, Monmouth was incorporated first in 1852. The government, under a charter of 1874, is vested in a mayor, elected biennially, and a unicameral council. The city owns and operates the water works. Pop., 1900, 7450, 1910, 9128, 1914 (U. S. est.), 9839.

MONMOUTH, BATTLE OF. A battle fought June 28, 1778, during the American Revolution, near Monmouth Courthouse, in the town of Freehold, Monmouth, Co., N. J., between an American army under General Washington and an English army under Sir Henry Clinton. The latter, evacuating Philadelphia on June 18, retreated across New Jersey and on the twenty-sixth reached Freehold, whence on the twenty-seventh he started for Sandy Hook. Washington, following closely, resolved to attack Clinton's left wing, 8000 strong, marching in the rear, and detailed Gen. Charles Lee with 6000 troops to assail its flank until he could come up with the main division. Lee advanced accordingly, but, instead of attacking, intentionally wasted time in feinting and executing futile maneuvers and, after a little skirmishing, ordered a general retreat. Washington rapidly pushed forward, rebuked Lee with great severity, and, rallying the demoralized troops, checked the advance of the British, who made determined but unsuccessful attacks on the American left under Stirling and the American right under Wayne and Greene. The English then fell back and took up a strong position, but during the night withdrew to the heights of Middletown. Though usually claimed as a victory for the Americans, the battle was strategically drawn, neither side gaining any decisive advantage. The Americans lost 362 in killed, wounded, and missing, the British 416, among whom was Lieut. Col. Henry Monckton, many on each side were prostrated by the intense heat (96° in the shade). Lee was shortly afterward tried by court-martial for his conduct, was found guilty of disobeying orders and of making a shameful retreat, and was accordingly suspended from command for a year. Consult Dawson, *Battles of the United States* (New York, 1856), and Carrington, *Battles of the American Revolution* (ib., 1876).

MONMOUTH, GEOFFREY OF. See GEOFFREY OF MONMOUTH.

MONMOUTH, JAMES, DUKE OF (1649-85). A claimant to the English throne and a leader of the Monmouth insurrection. He was the son of either Charles II or Robert Sidney by Lucy Walters, and was born at Rotterdam, April 9, 1649. Charles, who recognized the boy as his son, committed him to the care of Lord Crofts, who gave him his own name. On the Restoration, Monmouth, then Mr. James Crofts, came to England with the Queen Dowager and was lodged at the royal palaces of Hampton Court and Whitehall. He was married in 1663 to Anne, daughter of the Earl of Buccleuch, and was created Duke of Monmouth, assuming as family name his wife's name of Scott. At the period of Titus Oates's plot (1678), rumors that the Protestant Duke was the King's legiti-

mate son spread far and wide, but the King declared solemnly before the Privy Council that he had never married Lucy Walters. Monmouth was sent into Scotland in 1679 for the purpose of quelling the rebellion of the radical Presbyterians. He defeated the Covenanters at Bothwell Bridge, but his humanity to the fleeing and wounded was so conspicuous and his recommendations to pardon the prisoners were so urgent as to bring upon him the violent censure of the King and Lauderdale. He thus became the idol of the English Nonconformists. The return of the Duke of York and the exile of Monmouth soon followed. In Holland he allied himself to the leaders of the Nonconformist party, exiled like himself, and when he returned to London he was received with such demonstrations of joy as to convince him that he was the people's choice as successor to his father. In 1680 he made a quasi-royal progress through the west of England with the design probably of courting the Nonconformists, and two years afterward he traversed some of the northern counties. The King and his brother were alarmed, and Monmouth was placed for a short time under arrest. In 1684 Monmouth went to the Netherlands and remained abroad until the death of Charles, whereupon he returned to England. Landing in 1685, he assumed the title of James II and headed a rebellion against the government. News of the defeat of Argyle, who at the head of the Scottish exiles had attempted an insurrection in Scotland, made Monmouth despondent. Nevertheless on July 6 he attacked a superior royal force which, under the command of the Earl of Feversham, was encamped at Sedgemoor, near Bridgewater. When his ammunition failed the Duke fled and his troops were massacred. Monmouth was found concealed in a ditch and was brought to London. Gaining an interview with the King, he made the most humiliating submission, but in vain, even the shortest respite being refused. On July 15, 1685, he was beheaded on Tower Hill. In the Bloody Assizes under Judge Jeffreys (q.v.), Monmouth's adherents paid a fearful penalty for their participation in his rash rebellion. Consult: Grey, *Secret History of the Rye-House Plot, and of Monmouth's Rebellion in 1685* (London, 1754); Collins, *Peage of England*, vol. iii (5th ed., ib., 1779); Roberts, *Life, Progress, and Rebellion of James, Duke of Monmouth* (ib., 1844); Fergusson, *Robert Fergusson, the Plotter, or the Secret of the Rye-House Conspiracy and the Story of a Strange Career* (Edinburgh, 1887); Hyde, *Correspondence of Henry of Clarendon and James, Earl of Abingdon, Chiefly Relating to the Monmouth Insurrection, 1683-85* (Oxford, 1896); Allan Fea, *King Monmouth* (New York, 1902).

MONMOUTH COLLEGE. A coeducational institution, opened in 1856 at Monmouth, Ill., under the control of the United Presbyterian church. The college courses are arranged in nine groups, all leading to the degree of A.B. or S.B. There are preparatory and graduate departments and schools of music and art, with a total registration in 1913-14 of 438. The library contained about 10,000 volumes. The faculty numbered 26. The campus occupies 13 acres and with the buildings is valued at about \$285,000. The endowment is \$284,000 and the income \$345,000. The president in 1915 was T. H. McMichael, A.M., D.D.

MONMOUTHSHIRE, mōn'mūth-shēr. A

maritime county in west England, bounded south by the estuary of the Severn, northeast by Herefordshire, east by Gloucestershire, and west by Glamorganshire (Map: England, D 5). It has a coast line of 22 miles and an area of 546.2 square miles. The surface is elevated in the north and northwest, culminating in the Sugarloaf (1955 feet). The coast districts are low and fertile, being protected by sea walls, and in the valleys of the Usk, Monnow, and Wye wheat, bailey, and oats are grown. The county is celebrated for its mineral wealth and abounds in collieries and ironworks. The scenery is unusually varied and beautiful, and its picturesqueness is enhanced by numerous Roman antiquities and the feudal remains of Raglan, Caldecot, and Chepstow castles and Llanthony and Tintern abbeys. Until the reign of Henry VIII, Monmouth was part of the Kingdom of Gwent, South Wales, and the Welsh language is still spoken very widely. Chief towns, Newport, Abertillery, Ebbw Vale, Tredegar, and Nantyglo and Blaينا. Capital, Monmouth. Pop., 1901, 298,076; 1911, 395,778.

MONNA VANNA, mōn'a vān'a. An opera by Février, first produced in Paris, Jan. 13, 1909; in the United States, Dec. 4, 1913 (Boston).

MONNIER, mō'nyā', HENRI BONAVENTURE (1805-77). A French caricaturist and author, born in Paris. He first won attention by pen sketches and lithographic illustrations of Béranger (1828), which revealed his power of catching typical traits. Thus he was led to write and illustrate such comic yet faithful records of Paris street life as *Scènes populaires* (1830) or the *Mémoires de M. Joseph Prudhomme* (1857). In 1831 he became an actor, excelling in plays of his own writing; but he soon abandoned the stage. Many of his later pictured stories have been adapted for dramatic presentation, e.g., *Un voyage en Hollande, Les bourgeois de Paris*, and *Le bonheur de vivre aux champs*. Consult Champfleury, *Henri Monnier, sa vie, son œuvre* (Paris, 1889), and Beraldi, *Les graveurs du XIX^{ème} siècle*, vol. x (ib., 1890).

MONNIER, JEAN MARIE ALBERT MARCEL (1853-). A French explorer and author, born in Paris and educated at the Lycée Condorcet. In 1886-87 he explored the Andes and the Amazon. In 1891-92 he went with Captain Binger's African expedition to the Ivory Coast, and in 1894, as correspondent of the *Temps*, he began a three years' journey to French Indo-China, Japan, Korea, and China, returning from Peking to Bassora. Among his writings are: *Un printemps sur le Pacifique* (1885); *Des Andes au Pará* (1889); *Mission Binger; France nous* (1893); *Le tour d'Asie* (2 vols., 1899-1900), which received a prize from the French Academy; *Le drame chinois, juillet-août, 1900* (1900); *Itinéraires à travers l'Asie* (1901).

MONNIER, MARC (1827-85). A French writer, known mostly for his studies of Italy. He was born in Florence and passed the greater part of his life in Geneva, where he was professor at the university. His works include: *Etude historique de la conquête de la Sicile par les Sarrasins* (1847); *Lucioles* (1853), in verse; *Les amours permises* (1861); *Histoire du brigandage dans l'Italie méridionale* (1862); *La Camorra, mystères de Naples* (1863); *Pompéi et les Pompeiens* (1864); *La vie de Jésus* (1873), in verse; *Contes populaires en Italie* (1880); *Le charmeur* (1882); *Un aventurier du siècle dernier, Le comte Joseph Gorani* (1884),

Histoire de la littérature moderne; La renaissance de Dante à Luther (1884), followed by *La réforme de Luther à Shakespeare* (1885)

MO'NO. A general term used in southern California for the Shoshonean tribes.

MONOCACY, BATTLE OF. A battle fought at Monocacy Junction, Md., about 5 miles from Frederick, on July 9, 1864, during the Civil War, between about 6000 Federals under Gen. Lew Wallace and about 20,000 Confederates under General Early. The Federal force was defeated, but succeeded in delaying Early's march upon Washington, and thus rendered a valuable service. General Grant, in his *Memours*, says: "General Wallace contributed on this occasion, by the defeat of the troops under him, a greater benefit to the cause than often falls to the lot of a commander of an equal force to render by means of a victory."

MONOCEROS, mō-nōs'ēr-ōs (Lat *monoceros*, Gk. μονόκερως, unicorn, from μόνος, *monos*, single + κέρας *keras*, horn), or the **UNICORN**. A constellation lying on the celestial equator directly south of Canis Minor and east of Orion. It contains no stars brighter than the fourth magnitude, but is rich in nebulae, clusters, and multiple stars. RW Monocerotis is an Algol variable, with a period of 1.9 days.

MONOCEROS. A gastropod. See **GASTROPODA**

MON' OCHORD (Lat *monochordos*, *monochordon*, from Gk. μονόχορδον, *monochord*, neut. sing. of μονόχορδος, *monochordos*, having a single chord, from μόνος, *monos*, single + χορδή *chordē*, string). A very ancient musical instrument used to determine the mathematical proportions of intervals. It consists of a single string stretched over a sounding board. Any division of this string is obtained by means of a movable bridge sliding on a graduated scale. In this manner every interval can be produced with absolute acoustic purity. During the Middle Ages the monochord was used to illustrate intervals sounding simultaneously, and for this purpose several strings, each with a separate bridge, were added. In this form it became the precursor of the clavichord (q.v.). See **PLATE OF MUSICAL INSTRUMENTS**.

MON' OCHROME (ML. *monochroma*, from Gk. μονόχρωμος, *monochrōmos*, having a single color, from μόνος, *monos*, single + χρώμα, *chrōma*, color). A painting done in the various shades of a single color. See **CAMAIEU**.

MON' OCLINE (from Gk. μόνος, *monos*, single + κλίνειν, *klínein*, to incline). A geological term applied to an abrupt inclination of strata connecting the same beds lying at different levels. A monocline may be regarded as a modified form of the anticline (q.v.). Folds of this character are developed on a grand scale in the Rocky Mountain region.

MONOCLINIC (mōn'ō-klīn'ik) **SYSTEM.** See **CRYSTALLOGRAPHY**, and **PLATE OF CRYSTAL FORMS**.

MON' OCOTYLE'DONS (from Gk. μόνος, *monos*, single + κοτυλῆδών, *kotylēdōn*, cup-shaped cavity, from κοτύλη, *kotylē*, socket). One of the two primary divisions of angiosperms, the other division being called dicotyledons. The two groups are distinguished from each other by the following four prominent characters: (1) the embryo of a monocotyledon has a single and apparently terminal cotyledon, while the embryo of a dicotyledon has two well-developed lateral cotyledons; (2) in the mature

stem of most monocotyledons the vascular bundles are scattered, while in dicotyledons they are arranged so as to form a vascular cylinder inclosing pith; (3) the leaves of monocotyledons have a closed venation (i.e., veinlets do not end freely in the margin, which is usually entire), while the leaves of dicotyledons have an open venation, veinlets ending freely in the margin, which is often toothed or lobed; (4) the flowers of monocotyledons usually have their members in sets of three, while those of dicotyledons more commonly have their members in sets of five or four. These characters are by no means of equal value, the character of the embryo being the only one without numerous exceptions. There are monocotyledons with regular vascular cylinders, with open venation, and with flowers not in threes, and there are dicotyledons with scattered vascular bundles, with closed venation, and with flowers in threes. It is not so much a single character, therefore, that distinguishes a monocotyledon from a dicotyledon, as a combination of characters. Formerly monocotyledons were called endogens, but the name has been abandoned in this connection, having been given upon a misconception, and is now applied in a totally different way. Until recently the monocotyledons were supposed to represent the primitive stock of the angiosperms. This idea arose from the fact that certain leaves with parallel veins which occurred in the Mesozoic and Paleozoic formations were thought to be the leaves of monocotyledons. These have now proved to be the leaves of gymnosperms, and there is no evidence of the monocotyledons until comparatively late in the Mesozoic. In fact, it has now been proved that the dicotyledons were the primitive angiosperms and that the monocotyledons have been derived from them as a specialized branch. The principal evidence has come from the study of the vascular anatomy of the two groups. It is now known that seedling monocotyledons contain the vascular cylinder of dicotyledons; that this cylinder is retained by some adults, but that in most cases the dicotyledonous cylinder becomes gradually transformed into the cylinder of scattered bundles, which is characteristic of the adult stems of monocotyledons. The monocotyledons comprise about 20,000 species, which are grouped into 10 orders. The first six orders constitute the more primitive spiral series, in which the parts of the flower are indefinite in number, although occasionally the characteristic number three emerges. The remaining four orders constitute the cyclic series, the highly specialized monocotyledons, in which the parts of the flower are definitely in threes. The most prominent orders of the spiral series are the Pandanales, which include the screw pines and cat-tails, the Helobiales, a very characteristic aquatic or marsh line, including the pondweeds; the Glumales, or grasses and sedges, the greatest order of monocotyledons in point of numbers, the Palmales, or palms; and the Arales, or aroids, which are peculiar among monocotyledons in often having leaves resembling those of the dicotyledons. The chief cyclic orders are the Liliales, including not only lilies but also the species of the amaryllis and iris families; also Scitaminales, to which banana, ginger, and canna belong; and, finally, Orchidales, or orchids. See **DISTRIBUTION OF PLANTS**.

MONOCYCLIC (mōn'ō-sīk'lik, -sī'k'lik) **PLANTS.** See **ANNUALS**.

TYPES OF MONOCOTYLEDONS

1 AN ORCHID (Lady's-slipper)

3 A GRASS (Sugar-cane)
4 A PALM (Date-palm).

MONOD, mó'nó', ADOLPHE (1802-56). A French Protestant minister. He was born at Copenhagen, his father having been a Reformed clergyman from Geneva. He studied in Paris and Geneva and was pastor of a small Protestant congregation at Naples (1825-27). In 1828 he became pastor at Lyons, where he remained till 1831 and founded the Free Evangelical church. In 1836 he was appointed professor of theology at Montauban and held this position for 11 years. During this time he traveled in southern France, preaching and instructing the people who were attracted by the power of his discourses. In 1847 he became pastor at Paris, where he drew large crowds by his eloquent preaching. His literary works were chiefly sermons (4th ed., Paris, 1866) and *A. Monod's Farewell to his Friends and to the Church* (Eng trans, London, 1857). Consult S. M. (a daughter), *Life and Letters of A. Monod* (London, 1885).

MONOD, FRÉDÉRIC (1794-1863). A French Protestant, brother of Adolphe Monod. He was born in Monnaz, Canton of Vaud, Switzerland, was educated at Geneva, entered the ministry in 1820 and the same year succeeded his father as pastor of the National Protestant Church of France in Paris. He established in 1824 the *Archives du Christianisme*, the chief organ of the Evangelical French Protestants, and continued its editor until his death. After officiating 12 years as pastor of the oratoire, he united with Count Gasparin and others in an attempt to restore a rule of faith in the Reformed church which would exclude rationalists by making an acknowledgment of the divinity of Christ essential to membership. Failing in this, they left the National Protestant church in 1849 and organized independent congregations, which resulted in the formation of the Free Evangelical Church of France (consult G. Monod, *La famille Monod* (Paris, 1890)).

MONOD, GABRIEL (1844-1912). A French historian, born at Havre. He studied at the Ecole Normale and in Italy and Germany and in 1869 began to teach at the Ecole des Hautes Etudes, where he became director of the historical-philological section and president, and from 1905 to 1910 was professor at the Collège de France. His literary output was not great, but his influence as a conscientious research scholar was wide. Monod was an editor of the *Revue Critique* and founded (1876) with Fagniez the *Revue Historique*. Of the latter journal he had entire charge after 1885. He wrote *Allemands et Français* (1871), *Etudes critiques sur les sources de l'histoire mérovingienne* (1878-85); *Jules Michelet* (1875), a very important *Bibliographie de l'histoire de France* (1888); *Les maîtres de l'histoire*, Renan, Taine, Michelet (1894); *Portraits et souvenirs* (1897), *Souvenirs d'adolescence* (1903), *Jules Michelet, études sur sa vie et ses œuvres* (1905). He also contributed largely to the reviews.

MONODELPHIA (Neo-Lat., from Gk. *μόνος*, *monos*, single + *δελφύς*, *delphys*, womb). The largest and highest of the subclasses or infraclass of mammals, equivalent to Eutheria (q.v.). This term, now passing into disuse, refers to the fact that the vagina and uterus in the female are always single. Compare ORNITHODELPHIA, DIDELPHIA.

MON'ODY (Lat. *monodia*, from Gk. *μονῳδία*, solo, lament, from *μόνος*, *monos*, single + *ὠδή*, *ōdē*, song, ode, from *ἀδεν*, *adein*, to sing). Orig-

nally a name for an ode sung by a single actor in a Greek tragedy, and hence its connotation of sadness, as of the dirge. In later Greek usage it became also a name for a funeral oration. In English literature it is a name for an elegy or dirge in which a single mourner expresses grief over the dead. Examples of it are Milton's *Lycidas*, Shelley's *Adonais*, Arnold's *Thyrsis*. In music it is a name for a composition in the homophonic style.

MONODY. A style of music which first was cultivated in Italy about 1600. Up to that time serious composers had always used polyphony (q.v.). The Renaissance awakened a deep interest in the works of the ancient Greek dramatists, and in Florence a number of learned musicians and literary men attempted to reconstruct the music of those plays. It was felt that the polyphonic style, employing a number of voices, was not suited to accompany the words of a drama, where distinct enunciation of every word was the prime consideration. Attempts were made to write for a solo voice with instrumental accompaniment. For this purpose famous madrigals (see MADRIGAL) were arranged so that one part was assigned to the voice, while the others were played on some instrument. The inadequacy of this soon made itself felt, and composers began to write original compositions for a solo voice. This new style, employing only one voice, was called *monody*, as against polyphony, a style with many voices. The instrumental part of the earliest of these compositions is exceedingly primitive, consisting of scarcely more than a figured bass (q.v.). But with the establishment of the opera the progress of monody was very rapid. Monody must not be confounded with *homophony* (q.v.), which is a later development, and which does not exclude elaborate contrapuntal work in the accompanying parts. See ARIA.

MONŒCISM (from Gk. *μόνος*, *monos*, single + *οἶκος*, *oikos*, house). The word means primarily the condition of a single household in plants, which means that the male and the female organs occur upon the same individual. In its original application, however, it referred to the fact that in many seed plants the stamens and pistils occur upon the same individual, but this application arose from the mistaken idea that stamens and pistils are sex organs. The contrasting term is *diœcism*, referring to the condition in plants in which the male and female organs occur upon different individuals. The application of the term to a nonsexual condition in the flowering plants is unfortunate, for it means that monœcism in mosses and ferns refers to one fact and in flowering plants to quite a different one. Among the mosses the monœcious habit is very usual, the same sexual plant (gametophyte) bearing both sex organs (antheridium and archegonium). Among the true ferns monœcism is almost universal, the characteristic small gametophyte (prothallium) bearing both antheridium and archegonium. With the introduction of heterospory (q.v.), however, the sexual plants are absolutely differentiated, one individual being male and another female. Since all the flowering plants are heterosporous, it follows that they are essentially not monœcious in the sense of the term as used among mosses and ferns. In the application of the term to stamens and pistils, however, rather than to sex organs, the majority of flowering plants are found to be monœcious, i.e., with

the stamens and pistils not only upon the same plant, but in the same flower.

MON'OGRAM (Lat. *monogramma*, from Gk. *μονογράμματος*, *monogrammatos*, consisting of a single letter, from Gk. *μόνος*, *monos*, single + *γράμμα*, *gramma*, letter, from *γράφειν*, *graphein*, to write). A character composed of two or more letters of the alphabet, often interlaced with other lines, and used as a cipher or abbreviation of a name. A perfect monogram is one in which all the letters of the word are to be traced. The use of monograms began at a very early date. They are found on Greek coins, medals, and seals, and are particularly numerous on the coins of Macedonia and Sicily. Both on coins and in manuscripts it was the practice to present the names of states and cities by monograms, of which above 500 are known, but some have not been deciphered. Monograms occur on the family coins of Rome, but not on the coins of the earlier Roman emperors. Constantine placed on his coins one of the

earliest of Christian monograms which is to be traced in the recesses of the catacombs, composed of the first and second letters of *ΧΡΙΣΤΟΣ* (Christus), a monogram which also appeared on the Labarum (qv) and was continued on the coins of the succeeding emperors of the East down to Alexander Comnenus and Theodorus Lascaris. We often find it combined with the first and last letters of the Greek alphabet (Rev i 8). Another well-known monogram is that of the name of Jesus, *IHS*, from the first three letters of *ΙΗΣΟΥΣ*, though sometimes explained as standing for the three Latin words *Iesus Hominum Salvator* (Jesus, Saviour of Men).

Popes, emperors, and kings of France during the Middle Ages were in the practice of using a monogram instead of signing their names. Almost all the coins of the French kings of the Carolingian race bear their respective monograms, as also do those of Alfred and some of the other Saxon kings of England.

Painters and engravers in Germany and Italy have used monograms to a large extent as a means of distinguishing their works. In these the initial letters of their names were often interwoven with figures of a symbolical character, so as to form a rebus on the artist's name. The first typographers distinguished their publications by woodcut vignettes, whose invention is ascribed to the elder Aldus, but besides these each made use of a monogram or cipher, a series of which, well known to the bibliographer, fixes the identity of the ancient editions, German, Italian, and English, from the invention of printing down to the middle or end of the sixteenth century. For a detailed account of the monograms of early printers and others, consult Herbert and Ames, *Typographical Antiquities* (London, 1749); Horne, *Introduction to Bibliography*, vol. ii (ib., 1814); Brulliot, *Dictionnaire des Monogrammes* (Munich, 1832-34); Duplessis and Bouchot, *Dictionnaire des marques et monogrammes de graveurs* (Paris, 1886-87); Leutsch, *Universal Monogram-Work* (Gera, 1893); A. Schiller, *Monogramme* (Ravensburg, 1897 et seq.); F. H. Rees, *Art of Monogram Designing and Engraving* (Rochester, N. Y., 1911).

MON'OGRAPTUS (Neo-Lat., from Gk. *μόνος*, *monos*, single + *γραπτός*, *grapτος*, marked with letters, from *γράφειν*, *graphein*, to write). A genus of extinct graptolites found in and char-

acteristic of rocks of Silurian age. See GRAPTOLITE.

MO'NO LAKE. A lake in Mono Co., east central California. It lies in the Sierra Nevada and, like all inclosed lakes, is subject to changes in its water level, which, e.g., was 6380 feet in 1883, 6412 feet in 1899, and 6426 feet in 1909. It is surrounded by mountains rising 6000 to 7000 feet above its surface (Map: California, F 4). It is roughly circular in contour, its east-west axis measuring 14 miles and the north-south 10 miles, its area, including islands, is about 87 square miles. Its maximum depth is 152 feet, the average being about 61 feet. It has no outlet, and its waters are so salty that neither fish nor mollusks can live in them. Sodium carbonate and bicarbonate constitute nearly one-half of the salts held in solution, and these are therefore of considerable commercial value.

MON'OLITH (Lat. *monolithus*, from Gk. *μονόλιθος*, consisting of a single stone, from *μόνος*, *monos*, single + *λίθος*, *lithos*, stone). A monument, statue, obelisk, column, shaft, or other architectural object formed of a single stone. The obelisks of the Egyptians furnish early examples of monoliths (see OBELISK), and the Romans of the Imperial age habitually employed monolithic columnar shafts of large size and highly colored marbles and granites (see COLUMN). In India there are examples of monolithic temples, e.g., the Kylvas at Ellora and some smaller temples at Dhumnai and other places. A monolithic block at Baalbek in Syria measures 70 by 21 by 14 feet. One of the most remarkable monoliths is the dome of the Mausoleum of Theodoric at Ravenna in Italy, 36 feet in diameter, while among modern examples may be mentioned the colossal porphyry sarcophagus of Napoleon beneath the dome of the Invalides, Paris. Monolithic tombs abounded in Lycia, two of these have been removed to the British Museum. See MEGALITHIC MONUMENTS.

MON'OMA'NIA (Neo-Lat., from Gk. *μόνος*, *monos*, single + *μανία*, *mania*, madness). A form of insanity in which there is one systematized delusion which dominates, while it does not impair the intellect of the lunatic. The central delusion may be replaced in part by minor related delusions, and it may be concealed upon occasions or for a long period of time. Ability is not incompatible with this form of insanity. It is now termed *paranoia* (qv).

MON'OMET'ALLISM. See BIMETALLISM, MONEY.

MON'ONA, LAKE. One of the so-called Four Lakes (qv.) of Wisconsin.

MONONGAHELA, mō-nōn'ga-hē'la. A city in Washington Co., Pa., on the Monongahela River, 31 miles south of Pittsburgh, on the Pennsylvania and the Pittsburgh and Lake Erie railroads (Map: Pennsylvania, B 7). It is in a productive coal region and is engaged largely in coal mining. The industrial establishments include glass and lamp factories, automobile-parts works, coke ovens, iron and steel works, machine shops, foundries, planing mills, paper mills, flour mills, etc. Settled as early as 1792, Monongahela was incorporated in 1873. The city has adopted the commission form of government. Pop., 1900, 5173; 1910, 7598.

MONONGAHELA, BATTLE OF THE. See BRADDOCK, EDWARD, FRENCH AND INDIAN WAR. **MONONGAHELA RIVER**. One of the

head streams of the Ohio River. It is formed in the east-central part of Marion Co., W. Va., by the confluence at Fairmont of the Tygart and West Forks rivers, flows northeast across the Pennsylvania boundary to the mouth of the Cheat River, and thence north to its union at Pittsburgh, Pa., with the Allegheny, to form the Ohio River (Map: Pennsylvania, B 8). The main stream is 125 miles long, drains an area of about 7350 square miles, and is navigable throughout its length by means of dams and locks. The Tygart rises in the southern part of Randolph Co., W. Va., flows in a northerly direction, is about 100 miles long, and drains an area of about 1420 square miles. The West Fork rises in Upshur Co., W. Va., and flows northwest and then northeast to its junction with the Tygart. It is about 70 miles long. The principal tributaries of the Monongahela are the Cheat and Youghiogheny rivers. On the banks of the Monongahela, a few miles from Fort Duquesne (now Pittsburgh), the Anglo-American army of Braddock was defeated by the French and Indians on July 9, 1755.

MONO-PAVIOTSO. See SHOSHONEAN STOCK.

MONOPHYSTES (Gk. *μονοφύσις*, *monophysites*, one who affirms the single nature of God, from *μόνος*, *monos*, single + *φύσις*, *physis*, nature). The name applied to a large number of Christians in the fifth and sixth centuries who maintained that Christ had only one nature, as against the orthodox doctrine that in him humanity and divinity were perfectly united without detriment to either. The Monophysites called the orthodox, by analogy, Dyophysites, i.e., believers in two natures (Gk. *δύο*, two, and *φύσις*). The controversy sprang out of the fourth-century discussions respecting the Trinity (q.v.), and the connecting link may be found in the speculations of Apollinaris of Laodicea (died 392), who held that, while the body and the lower or animal soul in Christ were those of a man, the rational soul was displaced by the divine Logos.

The Monophysite controversy passed through several preliminary stages. One of these is marked by the name of Nestorius, Patriarch of Constantinople, who held that there was a co-operation of the two natures of Christ, the human and the divine, and who was condemned by the Council of Ephesus (431), under the leadership of Cyril of Alexandria. (See NESTORIUS; EPHESUS, COUNCIL OF.) Another stage is connected with the monk Eutyches (q.v.), who held that Christ was from two natures which, after incarnation, united into one. He, too, was adjudged heretical (448), and although he was received back into fellowship by the "Robber Synod" of Ephesus (449), his vindication did not stand. Meanwhile Pope Leo I (440-461) had written to the Bishop of Constantinople his celebrated "Tome," or letter, in which he defined the Catholic doctrine of the two natures. This document was brought into requisition at the Council of Chalcedon (451), and upon it was based the official decree which set forth the orthodox Christology. According to this definition, Christ is "perfect in deity and perfect in humanity, truly God, and truly man, . . . one and the same Christ, in two natures without confusion, change, division, or separation." The adoption of the Chalcedonian decree may be regarded as terminating the theological and introducing the political period of the Monophysite controversy.

The problem at that time confronting the Empire was that of harmonizing the theologically discordant elements of the population. Christianity being the state religion, it was necessary for all to accept whatever doctrinal decisions might be reached by the proper authorities. But a large part of the Eastern church was strongly Monophysite and would not surrender its convictions in spite of the Council. The emperors themselves did not all think alike, although they all sought, if possible, to unify the opinions of their subjects. A usurper in the East, Basiliscus by name, issued a decree condemning the definition of Chalcedon (476), and while many of the Eastern clergy accepted his decree, a storm of opposition was aroused. A later Emperor, Zeno, endeavored to reach a compromise by his *Henoticon*, or instrument of union (482), which practically ignored what had been accomplished at Chalcedon and reverted to the Niceno-Constantinopolitan creed as the sole standard of orthodoxy. Pope Felix condemned the *Henoticon*, and the result was a schism between East and West, lasting for about 35 years (484-519). Before the close of the fifth century several national churches had been formed in the East, independent of Constantinople, yet patriarchal in their organization, and all professing the Monophysite faith, e.g., the Jacobites, Maronites, Armenians, Copts, Abyssinians, etc. (q.v.). In Egypt some of the most extreme Monophysites separated from the Patriarch of Alexandria and formed a sect of their own. They were called Acephali, i.e., "without a head." Justinian (527-565), a champion of orthodoxy, attempted to induce his subjects to unite on the basis of the Chalcedonian decree, and partially succeeded, chiefly by forcing his will upon the Fifth Ecumenical Council (553). But his most important utterances on the subject pleased neither party, and by a sort of irony of fate at the close of his life he was said himself to have fallen into a heresy akin to Monophysitism. (Cf. Evagrius, *Hist. Eccles.*, iv, 39.) Only after the separation of the schismatic churches of the East, and, still more, after the rise of Mohammedanism, which forced Oriental Christians, in self-defense, to seek closer relations with Rome, did the long Monophysite struggle come to an end in the Orthodox church. The Monophysite churches continue their independent existence to the present day. The two-nature doctrine, as defined at Chalcedon, triumphed, in spite of its inherent difficulties, and remained the orthodox faith of Christendom.

MON'OPLANE. See AERONAUTICS.

MONOPLEGIA, mōn'ō-plē'jī-ā. A term applied to paralysis of a single limb or set of muscles. See PARALYSIS.

MON'OPNEUMONA (Neo-Lat. nom. pl., from Gk. *μόνος*, *monos*, single + *πνεῦμα*, *pneu-*

mōn, lung). An order of fishes, so called from the simple, unified condition of the lung sac. It comprises a single family, *Ceratodidae*, and genus, *Ceratodus*, in which the lateral jointed rays of the archipterygium are well developed. It represents a very ancient stock, of which only the barramunda (q.v.) of Australia now exists. Cf. *DIPOLO*.

MONOPODIAL BRANCHING (from Gk. *μονόπους*, *monopous*, single-footed, from *μόνος*, *monos*, single + *πούς*, *pous*, foot). The method of branching in which the axis of a plant develops continuously and the branches arise laterally. This method is in sharp contrast with dichotomous branching, in which branches arise by the forking of the apex. See **BRANCHING**.

MONOPOLI, mō-nōp'ō-lē. An episcopal town in the Province of Bari delle Puglie, Italy, situated on the Adriatic Sea, 25 miles southeast of Bari (Map. Italy, F 4). It is surrounded by walls and has a fortress constructed in 1552 by Charles V and a twelfth-century cathedral. It also has a Gymnasium and a technical school. Along the coast near by are curious tombs hewn out of the rock and the ruins of an ancient city. Weaving and dyeing are the principal industries. There are also manufactures of oil and soap and trade in olive oil and wine. Pop. (commune). 1901, 22,545; 1911, 24,104.

MONOPOLY (Lat. *monopolium*, from Gk. *μονοπωλίον*, right of exclusive sale, *μονοπωλία*, *monopolia*, exclusive sale, from *μόνος*, *monos*, single + *πωλεῖν*, *pōlein*, to sell). In the strictest sense, a grant of the crown or state to a private individual or corporation of an exclusive right to carry on a certain class of business or traffic. In a general and more modern sense it signifies such control of a given class of articles or of the traffic in them as will make it possible to raise their price higher than the level of prices fixed by free competition. A typical example of a monopoly of the first class is the grant of a patent right, which in effect gives the grantee an exclusive control over the production of and traffic in the patented article, a common example of monopolies of the second class is the exclusive control of mineral or other special products of land by virtue of ownership of the land. Monopolies may be classified as public or private according as they are vested in and exercisable by the government or by private individuals, associations, or corporations.

Private monopolies may be classified as (1) legal monopolies, resting upon a grant from the government of exclusive privileges for manufacture or sale, (2) natural monopolies, which are based upon the control of a limited natural product through the ownership of land or other natural resources, or of exclusive natural facilities for transportation, and (3) capitalistic monopolies, which hold their power over prices by virtue of the fact that an enormous capital is required in certain industries, so that an established plant always has a great advantage over a new competitor. This last form of monopoly is discussed at length under **TRUSTS**.

Legal monopolies have generally been granted to private persons for some real or ostensible service to the commonwealth. Sometimes such a grant was made primarily for fiscal purposes. Thus, the monopoly of the issue of bank notes in England, granted in the early part of the eighteenth century to the Bank of England, was a reward for the considerable services of that corporation to the national exchequer. In early

times the exclusive right of sale or production of a commodity was frequently granted to individuals in return for a fixed sum paid into the public treasury. The danger, however, of such monopolies lay in the fact that the probable profits were as a rule underestimated through the influence of favoritism, with the result that the sums secured by the treasury were not commensurate with the vexation to the public. Too frequently these exclusive privileges were granted to court favorites whose actual services to the commonwealth merited no such reward. Monopolies by grant first acquired prominence in the reign of Elizabeth, when her frequent grants of monopolies in articles of common use were regarded as a great abuse and brought forth the protests of Parliament. Such articles as salt, leather, coal, soap, cards, beer, and wine were thus monopolized, and indeed there was hardly any article of common necessity of which the sale was not thus restricted for the benefit of the great. The practice was continued until the statute 21 James I, c 3, known as the Statute of Monopolies, was enacted by Parliament in 1623. This statute abolished all existing monopolies with certain exceptions, as patents and manufactures of war supplies and materials, and forbade the creation of monopolies except by grant made by authority of act of Parliament.

Somewhat similar in character were the special prerogatives granted about this time to the East India and other trading companies. The monopoly of trade which was a characteristic of these companies was held by many to be a feature essential to their success. It may be remarked that monopoly privileges did not prevent failure on the part of the many companies which from time to time were established by France, though they may have been a valuable adjunct to the more vigorous administration of the English and Dutch companies.

The limited monopoly for a term of years which at the present time is granted to the holders of patents and copyrights is somewhat akin in principle to those just discussed, but is justified by other considerations of public policy. It differs from them in that the objects to which such rights pertain are essentially new creations, and the exclusive privileges which they convey act as a stimulus to productions which are of public benefit. While copyright aims to secure to writers a reward for their labors, there are, in general, few restrictions upon the use of these privileges. On the other hand, the aim of patent legislation is in some countries not only to stimulate invention, but to secure the widest utilization of improved processes. The monopoly which the patent right confers cannot be used, therefore, for the exclusive benefit of its possessor. Persons who fail to provide for the commercial utilization of their patents forfeit their rights. German law, e.g., provides for an annual fee for the issuing of patents which grows larger as time progresses, and under this law ineffective patents or those which are not commercially profitable lapse and cease to be a bar to further applications of the principle upon which they are based.

In the United States power of granting monopolies is subject to restrictions of both the United States and the various State constitutions. The question as to how far a State may grant exclusive privileges to conduct a business depends primarily upon the constitution of the State, and

hence is a question of constitutional law outside the scope of this article. The Fourteenth Amendment of the United States Constitution, which provides that "No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States, nor shall any State deprive any person of life, liberty, or property without due process of law," is a direct limitation upon the powers of a State to grant monopolies indiscriminately. It does not, however, prevent a State from giving exclusive privileges to conduct public callings upon the theory that power to regulate and control public callings was an essential right of the State, recognized at common law and not intended to be destroyed by the Fourteenth Amendment. Thus, the State may grant the exclusive right to operate public ferries, turnpikes, railroads, grain elevators, etc. Nor does the Fourteenth Amendment preclude a State from granting exclusive privileges in the proper exercise of its police power. The State may thus grant monopolies for the sale of liquor, or the erection of a slaughterhouse, or the conduct of a slaughtering business within a city. See CONSTITUTIONAL LAW; POLICE POWER; PUBLIC CALLING.

The United States Constitution expressly confers upon Congress the power of granting copyrights and patents to authors and to the originators of useful inventions. No other power to create monopoly is expressly vested in Congress, and it is probable that it is without such power, except when incidental to the exercise of powers expressly granted by the Constitution, as, e.g., the power to regulate commerce, borrow money, or collect duties and imports.

Natural monopolies exist where the conditions of the enterprise are such as to preclude competition. In a general way, economists sometimes speak of the possession of land as constituting a natural monopoly. As monopoly implies a lack of competition as well as special privilege, the term strictly applies only to cases in which the ownership of the privileges is centred in one person, or at least a very few persons capable of acting in harmony. Land and other natural resources, such as water power and mineral wealth, are so widely diffused that monopoly in a strict sense rarely arises from their ownership. The most important instances of the so-called natural monopolies arise in connection with certain public services, particularly in cities, and are usually connected with the right of way through public highways. Such services are the furnishing of gas, water, transportation, and communication in cities. As the right to make use of the city streets to lay gas and water pipes, electric conduits, or to build tramways cannot be granted to all, competition in furnishing such services is practically excluded. In some respects, particularly as concerns the right of way through municipalities, steam railroads belong in the same class. Competition among them is possible on a larger scale than among street railways, but they undoubtedly possess some elements of natural monopoly.

As the policy of the law has eliminated from our economic life legal monopolies which do not conform to the principle of public interest, so there is a growing demand that these natural monopolies shall be administered in the public interest. In its extreme form it calls for the municipalization of such enterprises, while many

who are unwilling to accept this solution demand far greater caution in the granting of franchises and a much stricter supervision of the manner in which such franchises are used than has heretofore been common in American municipalities.

It can hardly be said that the price of the commodities or services controlled by a public monopoly is subject to any general law. The government may fix prices below cost of service, or it may purposely make them so high as to discourage consumption. Private monopolies, on the other hand, naturally aim to secure the greatest net profit; and the price which will yield the greatest surplus above cost may be termed monopoly price. The determination of such a price is a difficult matter in practice, since a large number of factors have to be taken into account. If the monopolized commodity is a necessity of life, as, e.g., salt, the price may be fixed very high, since high prices would not greatly diminish consumption. If, on the other hand, the commodity is an article of luxury, or one out of a group of commodities which satisfy the same want, a material rise in price will greatly limit consumption, so that while a large profit may be made on each unit sold, small sales will reduce total profits. Again, it may be that an increase in the quantity of service performed or goods produced will by no means demand a proportional outlay. In that case the monopoly may best subserve its own interests by keeping prices low. Thus, a street railway company can generally double the number of passengers carried without doubling the cost of service, and may therefore find it profitable to lower fares. See COPYRIGHT; PATENT, TRUSTS.

Clark, *Problem of Monopoly* (ib., 1904); John Lawton, *Monopoly and Trade Restriction Cases* (2 vols., Chicago, 1908); Hermann Levy, *Monopoly and Competition* (New York, 1911); O. W. Knauth, *Policy of the United States towards Industrial Monopoly* (ib., 1913). For a concise discussion of monopoly price, consult Marshall, *Principles of Economics* (London, 1895). A scholarly discussion of the theory of monopoly is Schaffle's *Theorie der ausschliessenden Absatzverhältnisse* (Tübingen, 1867). An interesting discussion of a fiscal monopoly is Wicksett, *Studien über das österreichische Tabaksmonopol* (Stuttgart, 1897); also, King, "Alcohol Monopoly in Switzerland," in *Economic Review* (New York, 1893), and Raffalovich, "State Monopoly of Spirits in Russia," in *Journal of the Statistical Society of London* (1901). See bibliography under TRUSTS.

MONOPTERAL (from Lat. *monopteros*, from Gk *μονόπτερος*, having a single row of columns, from *μόνος*, *monos*, single + *πτερόν*, *pteron*, wing, row of columns). A circular building in Græco-Roman architecture in which a single row of columns surrounds the central space without any wall. The term is Vitruvian and not in frequent use.

MON'ORAIL. A form of track and car or carriage designed to secure economy in rails and rail support, to permit of conformity to the surface of the ground, to allow curves of small radius, and usually with the object of securing high speed of transportation. The distinguishing feature of a monorail system is that the cars are supported on a single rail, though there may

e other rails or surfaces against which auxiliary or guiding wheels may bear. The possibilities of such a system have long been realized and the idea is said to date back to 1826, when it first was suggested by an English engineer, Robinson Palmer. Nevertheless, few of the many monorail systems devised by inventors have been reduced to successful practice, except over limited distances, and usually under temporary conditions or where their novelty was a paramount consideration, as at great expositions

TYPICAL MONORAIL SYSTEMS

G, centre of gravity of car, W, carrying wheel, g, guide heels, S, spring

at amusement parks. The accompanying diagram shows the principles of the more important systems embraced in the above-mentioned groups.

The first monorail system to find practical application was that of Charles Lartigue, who in 1882 constructed in Algeria a line where a single monorail was carried on A-shaped supports. In 1886, in Ireland, the Listowel-Ballyvaughan railway, about 9¼ miles in length, was constructed, being operated for many years as a passenger and tourist line. This railway employs steam locomotives of unique pattern with duplex boilers, one boiler arranged on either side of the main driving wheel and rail. In France in the Ria mines in the Department of Pyrénées-Orientales, a line on the Lartigue system, about 6¼ miles in length, for the transportation of ore, was electrically operated with some success, while a recent application of this general principle was a monorail line at the Biennale, Italy, Exposition of 1914.

Perhaps the most practical of all the monorail systems has proved the Barmen-Elberfeld line, built on the Lungen system, 13.3 kilometers in length, with 19 stations and carrying full-sized suspended cars. This line, operated by electricity, has been able to maintain satisfactory speeds and has proved distinctly useful for maintaining high speeds. The Mahl system, which is also of the suspended type, was carefully worked out in 1914, but did not find immediate application. In this design a track single or double, at a height of from 20 to 25 feet above the ground, is carried from well-anchored steel towers and from connecting cables in the fashion of a suspension bridge. The French engineer inventor in his specifications

claimed that speeds up to 180 miles per hour were possible with high-speed electric motors, each car carrying a number of independent tractor elements. Various other monorail systems have been designed and have been operated on more or less experimental lines for short distances. Some of these, as at City Island, near New York City, were abandoned after a limited period of use, while others involving novel ideas have been shown at amusement parks or experimentally without any great practical or permanent success.

Distinct from such devices, where guide wheels on auxiliary rails or surfaces are used, are monorail systems in which gyroscopic appliances are employed to secure stability, as in the case of the automobile torpedo and the aeroplane See TORPEDO.

The principle of the gyroscope (see GYROSCOPE) has found many ingenious applications which have shown extraordinary mechanical and mathematical reasoning. Three monorail systems based on this principle stand out with distinction as having realized a certain amount of experimental success and as having been developed further than the mere model stage.

The earliest practical device of this nature was that of Louis Brennan, the inventor of the Brennan torpedo, exhibited before the Royal Society of Great Britain in the spring of 1907. It was of course not strange that an inventor of torpedoes should turn his attention to transportation problems on land, and in 1907 he showed a model car 6 feet in length running along a single rail or cableway, able to maintain its position and equilibrium notwithstanding the shifting of the load. This car was supported on a single track by a bearing wheel, and electricity was applied to operate the driving motor and to revolve the flywheels of the gyroscope at a speed of 7500 revolutions per minute. The gyroscopic apparatus amounted to but 5 per cent of the total weight of the locomotive. On November 14, 1909, there was exhibited before the Royal Society a larger car, 14 feet in length, 13 feet high, and 10 feet wide, running on a single rail and carrying 40 passengers. This car weighed 22 tons and was driven by a gasoline engine which in addition supplied power to the gyroscopes. There were two of these, each weighing three-quarters of a ton and revolving at a speed of 3000 revolutions per minute. Friction losses were cut down as far as possible, and the wheels were encased so that they revolved in a vacuum. A circular track 220 yards in circumference was used, and the car was able to maintain its equilibrium while in motion, despite the efforts of its 40 passengers to destroy the balance by shifting their positions.

Another monorail or gyroscopic car, which differed from that of Brennan in having a so-called "precession motor," carried at the rear of the gyroscopes and operated by hydraulic pressure produced by an electrically driven oil pump, was brought out about the same time by a German capitalist named Scherl, by whose name it was known, although invented by Paul Froelich in 1909. A model locomotive car 18 feet in length and 4 feet in width, mounted on two two-wheel trucks, each carrying a ¾-horsepower motor, was tested both in Germany and in the United States. In this car there were two gyroscopes whose wheels normally rotated on a vertical axis in a horizontal plane. These flywheels weighed but 125 pounds each, and

were operated by electric motors at the speed of 8000 revolutions per minute. The motors were placed at the lower end of the shaft and, as in the Brennan machine, the wheels and shafts were mounted in air-tight casings and run in a vacuum, the casings themselves being mounted on transverse axes journaled into the frame of the car so that they could be moved fore and aft in a vertical plane. These motors revolved in opposite directions, but were connected by bell-crank levers and toothed quadrants, as the working of the gyroscope is always in opposite directions.

In the Schlowsky monorail system, developed in England by a Russian inventor, the gyro wheel has its plane of rotation above the axis of the pivots on which the containing cage is mounted. By a pendulum system any lurching of the car can be controlled through the gyroscope. This system up to 1915 had not been developed beyond the experimental stage, but an automobile equipped with such gyroscopic stabilizer of this inventor, though not employing a supporting rail, was found to work with considerable success. For those interested in mathematical and mechanical discussions the monorail system with its gyroscopic control presents considerable fascination. The reader so interested can with profit consult various papers in *Engineering* (London), the *Engineer* (ib.), *Le Génie Civil* (Paris), the *Journal of the Franklin Institute* (Philadelphia), particularly volumes CLIX and CLXIV, and current issues of the *Scientific American* (New York), in all of which journals progress in this field is fully recorded from time to time.

MONOTHEISM (from Gk *μόνος*, *monos*, single + *θεός*, *theos*, god). The belief in, and worship of, one God only. It is usually contrasted with polytheism, the belief in many gods, but it also contrasts with dualism (qv) and monolatry, the belief in many gods but the worship of one only. While, strictly speaking, pantheism (qv) is a form of monotheism, the word monotheism is used to denote a belief in a single personal or quasi-personal power. There is no satisfactory evidence of monotheism in a savage tribe, still less that monotheism was the first form of worship. Where a savage tribe has a "supreme" god, investigation shows him to be only the highest, or the closest in relation to the tribe, of many spirits. His worship is usually monolatry rather than monotheism. Monotheism always arises out of some form of polytheism. Many steps in the history of religion mark the way towards monotheism, but often the journey stopped short of the goal. The mere arrangement of gods in a hierarchy starts a movement towards monotheism; for if one becomes king, like the Greek Zeus, he may go on to absorb all divinity into himself. The growth of a single tribe or city with its one tutelary deity moves towards monotheism, as is illustrated by the Assyrian Ashur. The abstraction of the idea of deity may open the way for personification of that abstraction into a single god, some suppose Allah to have originated thus. A synthesis of gods, recognizing that they all represent a single divine force, made in Egypt and later Babylonia a movement which might, carried farther, have issued in a true monotheism. Philosophy, searching for a single cause of the world, approached a monotheism in Plato, arrived at it in Neoplatonism (qv.), and led to the most complete pantheistic monism in Hindu

philosophy. An ethical monotheism arose among the Hebrews, on the basis of monolatry, through the prophetic conception that Jehovah governed the world in the interests of moral righteousness. The Hebrews were not monotheists till the triumph of the prophetic system in the sixth century B.C. There are a few cases of a temporary monotheism, like the unsuccessful attempt of Amenophis IV (Khuen-aten) to impose his God Aten on Egypt, but the great systems of monotheism belong only to the higher religions. Christian monotheism is taken over from the Hebrew, Mohammedan monotheism was strongly influenced by Hebrew thought, though the germs of it, in the worship of Allah, seem to be Arabic. Sikhism (qv) and the modern reforming sects of India borrow their monotheism from Islam and Christianity. Zoroastrianism (qv), however dualistic it may have been in antiquity, now claims to be purely monotheistic and regards Ahriman, the evil power, as the personified name for abstract evil and in no sense a god.

Consult R. Flint, *Theism* (Edinburgh, 1877); Harald Höffding, *The Philosophy of Religion* (New York, 1906); Irving King, *The Development of Religion* (ib., 1910); Andrew Lang, *The Making of Religion* (ib., 3d ed., 1910); C. H. Toy, *Introduction to the History of Religion* (Boston, 1913). See DUALISM; HENOtheism, THEISM.

MONOTHELITISM, more correctly **MONOTHELETISM** (from Lat *monothelita*, from Gk. *μονοθεληται*, *monothelētai*, from *μόνος*, *monos*, single + *θελητής*, *thelētēs*, one who wills, from *θέλειν*, *thelēin*, to will). The name of a seventh-century heresy which asserted the existence of one will in Christ instead of two. It was a direct outgrowth of the Monophysite heresy (see MONOPHYSITES), for if Christ had only one nature, of course he had also only one will. Orthodoxy, however, drew the logical conclusion from its two-nature doctrine, which had been formulated at Chalcedon (451), and maintained that there were two wills in Christ, corresponding to his divine and human natures respectively. The controversy over this question involved most of the Eastern church, and its influence was felt in Rome. The Emperor Heraclius (610-641), threatened by the advances of Mohammedanism and by danger from the Persians, strove to reunite his Christian subjects, who had been sadly divided over the Monophysite question and had formed schismatic churches, e.g., Armenians, Jacobites, etc. He propounded the theory of one will in Christ as a compromise, and Pope Honorius accepted it, holding two natures with one will. Sergius, Patriarch of Constantinople, and Cyrus, Patriarch of Alexandria, were also anxious to interpret the decree of Chalcedon in such a way as to persuade the Monophysites to accept it. But a monk named Sophronius, who visited Alexandria and learned what was going on, denounced the movement as a relapse into the heresy of Apollinaris, whose views had long before this period been condemned. Honorius tried to allay this strife by seeking to quiet Sophronius, thus taking a dangerously temporizing stand. But Sophronius was soon elevated to the patriarchate of Jerusalem (634), and his continued opposition to the measures of Sergius and Heraclius was now more serious. The Western church, as a whole, shared the views of Sophronius. This appeared in the action of a Roman synod in 649, which asserted the doctrine

of the two wills. After some 30 years the Eastern church was brought to the same position, and the Sixth Ecumenical Council (Constantinople, 680) adopted dyothelitism (two wills) as a Catholic dogma. The same council condemned the Monothelite leaders, Sergius and Cyrus, and long with them Pope Honorius, for not promptly suppressing the incipient heresy. This properly ends the Christological controversies which for 100 years had agitated the Church. Monothelism found a home among the Maronites of Mount Lebanon, and their name was long synonymous in the East with Monothelites. In the twelfth century the Maronites entered the Roman communion.

J. von Hefele, *History of the Christian Councils*, vol. v (Edinburgh, 1896); G. Owsepian, *Die Entstehungsgeschichte des Monothelitismus* (Leipzig, 1897); J. P. Fisher, *History of Christian Doctrine* (New York, 1896); Adolf Harnack, *History of Dogma*, vol. iv (Boston, 1899); Edward Gibbon, *Decline and Fall of the Roman Empire*, edited by J. B. Bury (London, 1912).

MON'OTREME (Neo-Lat. nom. pl., from Gk. *monos*, *monos*, single + *trēma*, *trēma*, perforation). A mammal of the order Monotremata, which is coextensive with the subclass Prototheria and embraces the low egg-laying mammals (Ornithodelphia) duckbill and echidna (qq.v). The term connotes the fact that in the reproductive organs of this group the orifices of the urinary canal, the intestinal canal, and the generative canal open, as in birds, into a common cloaca. See PROTOTHERIA, for fossil forms, see MAMMALIA.

MONÓVAR, mō-nō'vār. A town of southeast Spain, in the Province of Alicante, situated among the mountains, 18 miles northwest of Alicante (Map Spain, E 3). It has a number of good buildings, a large and handsome church, and a casino with a beautiful park. Great quantities of wine are produced in the vicinity, and the town manufactures woolen and cotton textiles, leather, soap, and spirits. In the neighborhood are quarries of marble, gypsum, and building stone. Nothing is known of its history previous to 1258, when James I. rescued it from the Mohammedans. Pop., 1900, 10,573, 1910, 11,243.

MONRAD, mōn'rad, DITLEV GOTHARD (1811-7). A Danish statesman and ecclesiastic, born in Copenhagen, the son of a Norwegian. He studied theology and Oriental philology at the University of Copenhagen, spent a year in Paris, and after the death of Frederik VI. entered political journalism as author of *Flyvende politiske Blade* (1840-42). In 1846 he had settled as pastor of a parish in Laaland. He took a prominent part in the rising of 1848, and was Minister of Education in the March ministry of that year. In 1849 he was made Bishop of Laaland-Alster; but in 1854, because of his continued opposition to Orsted's ministry, he was removed. In Hall's cabinet Monrad held various posts in the Department of Education and became Minister again (1859). Hall resigned in 1863. Monrad formed a new cabinet, in which he took the portfolio of Finance. But the war with Russia forced him from power (1864), and with his family he went to New Zealand (1865), not to return until 1869, when his property there had been destroyed in the Maori campaigns. He

received his old bishopric in 1871, and from 1882 to 1886 was a member of the opposition party of the Danish Parliament. Consult the biography by Graae (Copenhagen, 1887).

MONREALE, mōn'rā-i'lā. A city in the Province of Palermo, Sicily, 5 miles southwest of Palermo, with which it has electric-railway connection (Map Italy, D 5). It is built on the side of a mountain above a fertile valley, and is the seat of an archbishop. Its metropolitan cathedral, dating from the twelfth century, is the finest example of the Norman-Sicilian style extant. The bronze doors are beautifully ornamented and the walls are almost completely covered with mosaics representing biblical scenes. The Benedictine monastery, with its beautiful cloisters, is now used as a school building, and has a library of 17,000 volumes. There is a trade in oil, corn, fruit, and almonds. Pop. (commune), 1901, 23,778, 1911, 20,103.

MONREALE, FRA. See MONTREAL D'ALBANO.

MONRO, mōn-rō, ALEXANDER (PRIMUS) (1697-1767). An eminent Scottish anatomist, born in London. He graduated at Edinburgh University, to which, after studying under Cheselden and Boerhaave, he returned as first professor of anatomy. He published *Osteology: A Treatise of the Anatomy of the Human Bones* (1726, 6th ed., 1758). Consult the memoir by his son, Dr. Donald Monro, prefixed to the collected edition of his *Works* (Edinburgh, 1781).

MONRO, ALEXANDER (SECUNDUS) (1733-1817). A Scottish anatomist, younger son of Alexander Monro (Primus), whom, in 1764, he succeeded as professor of anatomy in the University of Edinburgh. He continued to lecture there until 1808, when he was succeeded by his son, Alexander Monro (Tertius). His most important work is his *Observations on the Structure and Functions of the Nervous System* (1783), in which he describes the "foramen of Monro." Consult Andrew Duncan, *Account of the Life, Writings, and Character of the Late Dr. Alexander Monro Secundus* (Edinburgh, 1818).

MONRO, DAVID BINNING (1836-1905). An English classical scholar, born at Edinburgh. He was educated at the University of Glasgow and at Brasenose and Balliol colleges, Oxford. From 1882 to his death he was provost of Oriel College, Oxford. His works include *A Grammar of the Homeric Dialect* (2d ed., 1891), a standard work, *Modes of Ancient Greek Music* (1894); an edition of the *Odyssey*, xiii-xxiv (1901), with valuable appendices, especially on aspects of the Homer Question and on the Cyclic Poets, *Homeri Opera et Reliquae*, a critical text of the Homer (1896); and the article "Homer" in the eleventh edition of the *Encyclopædia Britannica*. Consult J. C. Wilson, *Memoir of D. B. Monro* (Oxford, 1907).

MONROE. A city and the county seat of Walton Co., Ga., 62 miles by rail east of Atlanta, on the Gainesville Midland, the Greene County, and the Monroe railroads (Map Georgia, C 2). There are two large cotton mills and a cottonseed-oil mill. The surrounding region is adapted to the growing of cotton, corn, oats, peaches, and vegetables. Monroe owns its water works and electric-light plant. Pop., 1900, 1846, 1910, 3029.

MONROE. A city and the parish seat of Ouachita Parish, La., 76 miles west of Vicksburg, Miss., on the Ouachita River, and on the Arkansas, Louisiana, and Gulf, the Vicks-

burg, Shreveport, and Pacific, and the St. Louis, Iron Mountain, and Southern railroads (Map: Louisiana, E 1). The Federal government building, courthouse, the St. Francis Sanitarium, city hall, city park, high schools, and salt-water natatorium are noteworthy features. A considerable cotton trade is carried on and there are large cotton compresses, cottonseed-oil mills, and extensive manufactures of automobile and wagon materials, and other lumber products, bricks, etc. The city owns and operates its water works, street railways, sewage system, markets, and electric-light plant. Monroe is one of the oldest towns in the State. During the Spanish and French domination of this territory it was known as Fort Miro, its first commander being Don Juan Fulliol, many of whose descendants still live here. The city was first incorporated in 1820. Pop., 1900, 5428, 1910, 10,209, 1914 (U. S. est.), 12,246.

MONROE. A city and the county seat of Monroe Co., Mich., 35 miles south-southwest of Detroit, on the river Raisin, and the Michigan Central, the Pere Marquette, the Lake Shore and Michigan Southern, and the Detroit and Toledo Shore railroads (Map Michigan, F 7). It has a home for the aged, a public library, St. Mary's Academy and College, and a fine courthouse. In Monroe is the mother house of the Sisters of the Immaculate Heart of Mary, who own valuable property here. The city is in a fertile region and is an important depot for shipment of grain and fruit. It has extensive nurseries, fisheries, and, among the industrial plants, a large box-board factory, stove and furnace works, flour, lumber, and paper mills, canning factories, agricultural-implement works, furniture factories, etc. Monroe was chartered as a city in 1836. The commission form of government was adopted in 1914. The city owns its electric-light plant. Pop., 1900, 5043, 1910, 6893.

Monroe was settled as Frenchtown by a company of Canadians in 1784, and received its present name, in honor of James Monroe, in 1815. It was the scene of the battle of the river Raisin, Jan. 22-23, 1813, in which 397 of the American force were killed and 537 captured, only 33 escaping, while of the British 24 were killed and 158 wounded. A number of the prisoners wounded and unable to march were left here under inadequate protection and were subsequently massacred by the Indians. This gave rise to the battle cry, "Remember the river Raisin."

MONROE. A city and the county seat of Union Co., N. C., 24 miles southeast of Charlotte, on the Seaboard Air Line Railroad (Map: North Carolina, B 3). It has gold mines of some value and the manufactures include large cotton and knitting mills, tile factory, flour and oil mills, wagon factory, lumber mills, and a buggy factory. The water works and electric-light plant are owned by the city. Pop., 1900, 2427, 1910, 4082.

MONROE. A city and the county seat of Green Co., Wis., 37 miles south by west of Madison, on the Illinois Central and the Chicago, Milwaukee, and St. Paul railroads (Map: Wisconsin, D 6). It has extensive manufactures of Swiss, Limburger, and brick cheese and also of condensed milk, lumber, carriages, foundry and machine-shop products, boilers, etc., and enjoys considerable trade in the products of the adjacent region, which is interested chiefly in farming, stock raising, and dairying. The city main-

tains a public library, county courthouse, and a park. Monroe was incorporated as a village in 1859 and in 1882 was chartered as a city. The water works are owned by the municipality. Pop., 1900, 3927, 1910, 4410.

MONROE, FORT. See FORT MONROE.

MONROE, HARRIET (1860-). An American poet and editor, born in Chicago. She graduated from the Visitation Academy at Georgetown, D. C., in 1879, wrote the text for the cantata for opening the Chicago Auditorium in 1891, and on Oct. 21, 1892, her *Columbian Ode* (published 1893) was read and sung at the dedication ceremonies of the World's Fair at Chicago. In 1912 she founded and became editor of *Poetry*, an endowed magazine of verse. Miss Monroe is author of *Valeria, and Other Poems* (1892), *John Wellborn Root—A Memoir* (1896); *The Passing Show—Five Modern Plays in Verse* (1903), *The Dance of the Seasons* (1911), *You and I—Poems* (1914).

MONROE, JAMES (1758-1831). The fifth President of the United States. He was born in Westmoreland Co., Va., April 28, 1758. In 1774 he was sent to William and Mary College to be educated, but his studies were interrupted by the outbreak of the Revolutionary War, and in 1776 he left college to join the Third Virginia Regiment near New York with the rank of lieutenant. He took part in the battles of Harlem Heights, White Plains, and Trenton, in the last of which he was wounded. During the campaigns of 1777-78 he served on the staff of the Earl of Stirling (William Alexander), ranking as major and taking part in the battles of Brandywine, Germantown, and Monmouth. Although his services were highly commended by the commander in chief, Monroe was disappointed in the way in which they were rewarded, and his career in the army after 1778, when with the rank of lieutenant colonel he was commissioned to raise a new regiment in Virginia, was unimportant. It was at this time that he formed an acquaintance with Jefferson, who was then Governor of Virginia, and the event marks the beginning of an intimacy that lasted during the remainder of their lives and was destined to have a decisive influence upon the career of Monroe. In 1782, at the age of 24, he was elected to a seat in the Legislature of Virginia and became a member of the Virginia Executive Council. His next legislative service was in the Congress of the Confederation, of which he was an influential member for three successive terms from 1783 to 1786. He took a prominent part in the deliberations upon the vital questions of the period, contending vigorously for the right of Congress to regulate commerce, for the right of free navigation of the Mississippi by the United States, and for other measures designed to promote the development of the West. To inform himself of conditions in the West, he twice crossed the Alleghenies, and the information which he acquired had a marked influence upon his course in Congress. Upon his retirement from Congress in 1786 he was again chosen to a seat in the Legislature and in 1788 became a member of the State convention called to ratify the Federal Constitution. In this body he supported Patrick Henry in his futile opposition to the Constitution, making several lengthy arguments against ratification. In 1790 he was elected to a seat in the United States Senate, where he served until 1794. In the Senate he acted with the Anti-Federalists, opposing vigorously the administration

of Washington. He was nevertheless, in 1794, appointed Minister to France as the successor of Gouverneur Morris, the probable explanation of the appointment being his friendly attitude towards France and the desire of the President to offset the appointment of Jay, a staunch Federalist, as Minister to England. He arrived in France just after the fall of Robespierre and was received by the Convention, Aug. 15, 1794. In an address to the Convention he used expressions which, in view of the strained relations between the United States and France, did not meet with the approval of the administration, and, considering Jay's Treaty with England "as the most shameful transaction I have ever known of the kind," he did nothing to remedy France's attitude towards it as of the nature of a *casus belli*. He was accordingly recalled in 1796, and Charles C. Pinckney was appointed as his successor. Upon his return the reasons and propriety of his recall became the subject of a spirited controversy and caused party feeling to run high. For a time Monroe retired to private life, from which he was called to assume the governorship of Virginia in 1799, a position which he held until 1802. The accession of Jefferson to the presidency in 1801 insured Monroe's return to national politics, and in the following year he was again sent to France as an additional plenipotentiary to aid Robert R. Livingston in the negotiations already begun for the purchase of New Orleans and a district at the mouth of the Mississippi, and at the same time was instructed to negotiate with Spain for the purchase of the Floridas. After the conclusion of the treaty by which France sold Louisiana to the United States (1803), Monroe was sent as Minister to England and subsequently to Spain. A treaty was finally concluded with England, but, not being satisfactory to the President on the question of impressment and indemnity, it was never laid before the Senate. The negotiations with Spain for the cession of the Floridas were likewise unsuccessful. In 1807 Monroe returned to the United States, and his course was again the subject of controversy. Again he served in the Virginia Assembly and in 1811 was chosen a second time Governor of Virginia, but held the office only a short time, being called to the cabinet of President Madison as Secretary of State in the same year. He held this office until his elevation to the presidency in 1817 and for a time in 1814 and 1815 also acted as Secretary of War. As head of the War Department he took precautions for the defense of Washington against an attack from the British forces and won popularity by the vigorous measures which he adopted in the prosecution of military operations. In the year 1816, while in his fifty-ninth year, he was elected President of the United States, having received 183 electoral votes, against 34 cast for the Federalist candidate, Rufus King. Four years later he was re-elected, receiving every vote in the electoral college except one. This was due to the passing of the Federalist party, or, more correctly, to the breaking down of party lines, so that there were no longer Federalists or Republicans. The principal subjects which occupied the attention of the government during the eight years of Monroe's administration were the defense of the Atlantic seaboard, the encouragement of internal improvements, the Seminole War, the acquisition of Florida, the Missouri Compromise, and the relations with Europe in regard to South

American affairs, which resulted in the announcement of the permanent policy of the government known as the Monroe Doctrine (q.v.). Noteworthy events of a spectacular character during his term were the tour of the President through the East and the West and the visit of Lafayette. The period of his administration was known as the "era of good feeling," on account of the general prosperity of the country and the absence of party strife. Vast internal improvements were undertaken, and the westward movement of the population was marked. Five new States—Mississippi, Illinois, Alabama, Missouri, and Maine—were admitted to the Union.

At the close of his second term Monroe retired to private life, residing in Virginia and in New York, where he died July 4, 1831. During the year preceding his death he served as a member of the Virginia Constitutional Convention, thus being his last public service.

Bibliography. Monroe's *Writings* (7 vols., New York, 1898-1903) have been edited by S. M. Hamilton, librarian of the Department of State in Washington, a calendar of his *Correspondence* was published in *Bulletin No. 2* (1893) of the Bureau of Rolls and Library, State Department, also *Papers of James Monroe*, listed in chronological order by W. R. Leech (Washington, 1904). Consult also: Henry Adams, *History of the United States of America* (New York, 1889-1891); D. C. Gilman, *James Monroe*, in "American Statesmen Series" (Boston, 1909), containing a bibliography, "Monroe," in J. G. Wilson (ed.), *Presidents of the United States, 1789-1914*, vol. 1 (New York, 1914).

MONROE, PAUL (1869-). An American educator, born at North Madison, Ind. He graduated at Franklin College, Indiana, in 1890 and from 1895 to 1897 was fellow in sociology at the University of Chicago, where he took his Ph.D. in 1897. After two years as instructor in history at Teachers College, Columbia University, he became professor of the history of education at that institution (1899). He served as president of the education section of the American Social Science Association and as president of the Society of the College Teachers of Education. By the Bureau of Insular Affairs of the United States War Department he was appointed commissioner to report on the condition of the Philippine school system (1912-13). In the latter year he received the honorary degree of LL.D. from the University of Peking. His contributions to the study of the history of education gave Dr. Monroe an international reputation, and his textbooks have helped to give the subject a position of great importance in the training of teachers in the United States. To the whole field of education, however, his greatest contribution was as editor in chief of the *Cyclopedia of Education* (5 vols., 1910-13), a work dealing with every phase of education and its related subjects. In addition he published *Source Book in the History of Education for the Greek and Roman Period* (1901); *A Text-Book in the History of Education* (1905); *Brief Course in the History of Education* (1907); *Principles of Secondary Education* (1914), as editor; and educational articles in the NEW INTERNATIONAL ENCYCLOPÆDIA.

MONROE, WILL SEYMOUR (1863-). An American educator and author, born at Hunlock, Pa. After teaching and serving as principal and superintendent of schools, he graduated from Stanford in 1894 and then studied

abroad at German and French universities. In 1896 he became professor of psychology at the Massachusetts State Normal School, Westfield, and in 1909 accepted a similar position at the New Jersey State Normal School, Montclair. He traveled extensively in Europe and wrote various books on European countries, including *Turkey and the Turks* (1907), *In Viking Land* (1908), *Sicily, the Garden of the Mediterranean* (1909), *Bohemia and the Czechs* (1910), *Bulgaria and her People* (1914). In the educational field he is the author of several works in psychology and also on the history of education: *Child Study Outlines* (1898), *Die Entwicklung des sozialen Bewusstseins des Kindes* (1899, also in Swedish, Flemish, and Bulgarian), *The Educational Labors of Henry Barnard* (1893); *Bibliography of Education* (1897); *History of the Pestalozzian Movement in the United States* (1905). He was associate editor of *Monroe's Cyclopaedia of Education* (1911).

MONROE DOCTRINE. The term applied to the policy of the United States regarding foreign interference in American affairs. It takes its name from President Monroe, who in his message to Congress in 1823 first gave it formal announcement. It is properly considered the corollary of the Washington and Jefferson policy of neutrality towards all European affairs. In modern conception it is the policy of the United States to regard any attempt on the part of a European Power to gain a foothold in this hemisphere by conquest, or to acquire any new establishment in North or South America by whatever means, as an act hostile to the United States. Although the phrase "America for the Americans" was not employed in the message, it well expresses the philosophy which Monroe assumed as a fundamental postulate. Yet it does not contravene the right of any nation to enforce indemnity for injuries to its subjects, physical or financial, however jealously the United States would view such a proceeding, but applies only to territorial aggression by foreign Powers whether temporary or permanent, and to any attempt to establish or alter governments in America whereby outside Powers might secure predominance or control. The conception of the policy is one of gradual growth, and so far as it has authority in international law it rests upon the principle of the right of a sovereign state to protect its own interests from dangerous aggression. With the wide and complex development of modern American interests, appeal to this argument is strengthened, yet the assertion of the doctrine in its extreme form is always attended with the danger of grave international complications.

The doctrine is based upon two passages in Monroe's message and has a twofold relation—a noncolonization and a nonintervention feature. The first passage referred to the boundary dispute in the Northwest, then in issue between Russia, Great Britain, and the United States, Russia having attempted to exclude foreigners from commerce and fishing in disputed territory and waters extending to the fifty-first parallel of latitude. President Monroe said: "The occasion has been judged proper for asserting as a principle in which the rights and interests of the United States are involved that the American continents, by the free and independent conditions which they have assumed and maintained are henceforth not to be considered as subjects for future colonization by any Euro-

pean Powers." Both the conditions which inspired the passage and its language prove that it related to an acquisition of territory by original occupation or settlement; that it did not include acquisition by gift, purchase, or like voluntary transfer, or by conquest. Further, while the application of the principle was made only to territory immediately in dispute in the Northwest, in prospective consideration it involved the vast tracts of unclaimed land on the continent still unexplored and unoccupied, upon which the establishment of a European colony with the exclusive trade policies then professed by all continental governments could not fail to prejudice the trade relations of the United States. The controversy in question was settled by the Treaty of 1825 with Russia, but the doctrine formulated was again asserted in 1826 by President J. Q. Adams in the proposed instruction of the United States delegates to the Panama Congress (q.v.), its application, however, being limited to its adoption by each separate State as a protection of the territory claimed by that State, and not committing the Powers concerned as a body to a "joint resistance against any future attempt to plant a colony." The question, however, was not considered by the Panama Congress, owing to the non-arrival of the United States delegates, and this phase of the doctrine remained in abeyance for 20 years.

The second part of the Monroe message related to the proposed action of the Holy Alliance, or, more accurately, the European Concert, as announced by the resolutions of the Congress of Verona (November, 1822), directed against the system of representative government in Europe and aiming at the reimposition of the Spanish yoke upon the South American colonies, then in a state of revolt, the independence of which the United States had already recognized. This action of the Powers threatened English commercial interests already established with these States, and England, through George Canning, promptly proposed to the United States a joint declaration by the two governments against their action; but without awaiting a reply from this government, on Oct. 9, 1823, she gave notice to the French Ambassador, Prince de Polignac, of her unfriendly attitude. There are some who contend, on the other hand, that Canning had little or nothing to do with the announcement of the doctrine and who refer to such explanation as the Canning Myth, but this idea has found little acceptance among scholars. Thus, followed by President Monroe's declaration, summarily checked the Powers. "We owe it, therefore," said Monroe, "to candor and the amicable relations existing between the United States and those Powers, to declare that we should consider any attempt on their part to extend their system to any portion of this hemisphere as dangerous to our peace and safety. With the existing colonies and dependencies of any European Power we have not interfered and shall not interfere. But with the governments who have declared their independence and maintained it, and whose independence we have, on great consideration and just principles, acknowledged, we could not view any interposition for the purpose of oppressing them, or controlling in any other manner their destiny, by any European Power, in any other light than a manifestation of an unfriendly disposition towards the United States." While Monroe's

declaration was intended to meet the exigencies of the time, the principle was no novel one, but rather the embodiment of an idea that had developed with the growth of nationality and had been expressed in various forms in previous papers and correspondence of Monroe, Adams, and Jefferson. Two months before the publication of the message Jefferson had written: "Our first and fundamental maxim should be never to entangle ourselves in the broils of Europe, our second, never to suffer Europe to intermeddle with cisatlantic affairs." The declaration, having accomplished its purpose, practically disappeared in its application with respect to the Holy Alliance, and the development of the policy for the next generation was the outgrowth of the colonization feature.

It is supposed that the South American states, being in fear of European intervention in behalf of Spain, generally welcomed the announcement of the Monroe Doctrine, certainly its reception was cordial in Colombia, Brazil, and Buenos Aires. Colombia, in 1824, invited the armed assistance of the United States, but the cautious reply was given that, under the Constitution, the government could take such action only with the consent and by the authority of Congress. In Europe the doctrine was received with widely differing sentiments. In so far as the message was construed to interdict future colonization, it was generally opposed, even by Canning. Chateaubriand, Minister of Foreign Affairs in France, stated that the Powers should oppose the American policy.

In the time immediately succeeding the Monroe-Adams period the doctrine fell into disuse and disrepute in American politics, for the "Jackson men" held it as anathema because it had been championed by Adams. It was not invoked, despite the fact that there were European interventions in Uruguay and Paraguay. The doctrine was not announced with approval again until the administration of Polk, who adverted to it as the "Monroe Doctrine," and in 1845 he took the first step towards extension of the principle. The northwest boundary was again in issue, this time with Great Britain, and the administration was committed to the annexation of Texas. "It should be distinctly announced to the world," said Polk, "as our settled policy, that no future European colony or dominion shall, with our consent, be planted or established on any part of the North American continent." The doctrine was thus made to include acquisition by voluntary transfer or conquest of occupied territory, and a virtual guarantee of the status quo with reference to the territory of other American states in its application was announced, though limited to North America. Again in 1848, when the question of the occupation of Yucatan arose, Polk issued a second manifesto against the acquisition of such territory by voluntary transfer or cession. In 1853, when the Cuban annexation discussion was at its height, a resolution was introduced into the Senate combining the doctrines of Monroe and Polk; but it failed of passage. It is not a part of the statutory law of the land, though with the predominance of the interests of the United States the policy in relation to both North and South America has been generally accepted by both political parties and the people, and its principles have been given repeated recognition during the past half century in our foreign policy. President

Grant, in the Santo Domingo episode of 1870, declared that, in accordance with the doctrine, there was no land on this continent subject to transfer to a European Power. The interference of the United States in Mexico, resulting in the withdrawal of the French in 1866, and President Cleveland's declaration to Great Britain in connection with the Venezuelan boundary dispute in 1895 are the notable examples of such recognition. Notwithstanding the protests of the United States government, during the progress of the Civil War, the French had secured a foothold in Mexico and attempted to install Maximilian, an Austrian prince, on a Mexican throne. With the conclusion of peace a formal demand for withdrawal was made, and General Sherman was sent to the Mexican frontier with a large force. After some delay in negotiations the French Emperor withdrew his troops, and Maximilian was left to his fate. Although Secretary Seward did not refer to the Monroe Doctrine by name, it was generally recognized that his action was based upon it. He admitted that France might wage war with Mexico, but not that she might raise up an anti-American government. In the Venezuelan affair, representations having been made by our government that the action of Great Britain was a violation of the Monroe Doctrine, the latter yielded to the suggestion of the United States and consented to an arbitration, thus effecting an amicable settlement. President Cleveland and Secretary Olney unquestionably gave the Monroe Doctrine a broader interpretation. After affirming that the United States would not relieve any American state of its obligations as fixed by international law, Olney stated his government would allow no European Power to "forcibly deprive an American state of the right and power of self-government and of shaping for itself its own political fortunes and destinies." In addition he declared that "to-day the United States is practically sovereign on this continent, and its fiat is law upon the subjects to which it confines its interposition." Despite this extension of interpretation, the most important results of the Venezuelan incident were the official adoption of the Monroe Doctrine by Congress, in its indorsement of the executive policy, and its acceptance by Great Britain. In 1901 the doctrine was defined again by President Roosevelt, and, after stating the accepted prohibition against territorial and political aggrandizement, he said: "This doctrine has nothing to do with the commercial relations of any American Power, save that it in truth allows each of them to form such as it desires." In 1904 he said "Brutal wrongdoing, or impotence which results in the general loosening of the ties of civilized society, may finally require intervention by some civilized nation, and in the Western Hemisphere the United States cannot ignore its duty." This statement, made with respect to conditions in Santo Domingo, was understood to mean that in case the social, political, or industrial demoralization in any American state was sufficient to warrant intervention, the Monroe Doctrine imposed that duty upon the United States. At his urgency a treaty was negotiated with Santo Domingo whereby the United States assumed management and administration of her tariffs. Since the announcement of the Roosevelt extension it has been thought necessary to intervene frequently in the affairs of the smaller

Latin American states President Wilson, in 1913, felt it expedient to issue the warning that the United States respects only "the orderly processes of just government based upon law and not upon arbitrary or irregular force." At Mobile, in the same year, he said "I want to take this occasion to say that the United States will never again seek one additional foot of territory by conquest." Intervention, if permitted at all, it was presumed, should be in support of "true constitutional liberty" rather than for territorial, political, or economic advantage. In this speech he also stated that the United States would oppose the granting of economic concessions by Latin-American countries to outside interests which might have influence upon the political destiny of any such country.

The Monroe Doctrine is sometimes held to commit the United States to a protectorate over other American states, requiring this country to espouse their quarrels, though unable to control their actions. It has never been within its intent to forbid European nations to employ force in the settlement of their just demands upon this continent, provided that no acquisition of territory was contemplated. In 1842 Great Britain blockaded San Juan de Nicaragua; in 1851 she laid an embargo on the western coast of Salvador, in 1894 she occupied the Nicaraguan port of Corinto, and in 1903 the combined German and English fleets, after both governments had given assurances concerning the nonpolitical character of their designs, maintained a blockade of the Venezuelan coast to secure the collection of their claims for indemnity. The requirements of the Monroe Doctrine as a national policy were fully met with the assurance to the United States of good faith on the part of the Powers concerned and that no Venezuelan territory would be taken in settlement of the indemnity. It may be noted that the United States delegates at the first Hague Conference in 1899 stated distinctly that the Monroe Doctrine was a cardinal policy of their country, a declaration which was opposed by none of the delegates present. While the building of an interoceanic canal and the position which the United States has had as a world power since the close of the war with Spain have rendered the problems attending the application of the doctrine more complex, the increased respect which it has insured our demands has greatly decreased the difficulties of its enforcement.

The attitude of Latin America to the Monroe Doctrine has in the course of time undergone many changes, the respect for it being in many cases demonstrably due to the threat of outside danger. Among certain states, such as Argentina, Brazil, and Chile, there has developed a feeling of independence of it. In 1913 Señor Zavallos, rector of the University of Buenos Aires, in a speech of welcome to ex-President Roosevelt which was widely circulated and commended in South America, asserted that certain states had acquired sufficient stability and power as no longer to require the guarantees of the doctrine. In 1906, also, President Díaz, of Mexico, declared that the doctrine belonged to no one Power, but that it was Pan-American.

Although many have expressed doubts as to the existence and utility of a Monroe Doctrine, deeming its principles obsolete and considering the imperialistic policy of the United States to

be so inconsistent with such doctrine as to be destructive of it, still, regarded as a limitation upon the extension of European power and influence in the Western Hemisphere, it must be acknowledged as the settled and recognized principle of American policy.

Kraus, *Die Monroe Doktrin in ihren Beziehungen zur amerikanischen Diplomatie und zum Völkerrecht* (Berlin, 1913). See INTERNATIONAL LAW.

MONROVIA. The capital of the negro Republic of Liberia, west Africa, situated at the mouth of the St. Paul River, on the coast (Map Africa, C 4). It has an unhealthy climate. There is a government college with about 200 students and another conducted by Methodist missionaries. The city is the seat of a Protestant Episcopal bishop and of an American and a Roman Catholic mission. It is also a station of the German and the South American cable companies. Its exports are palm oil and kernels, coffee, ginger, fibre, cocoa, dyewoods, and rubber, the total trade in 1912 amounting to \$2,634,375, chiefly with Germany and Great Britain. Pop., including the suburb of Kru-town, about 6000, including some 120 Europeans.

MONS, mōns. The capital of the Province of Hainaut, Belgium, situated on the Trouille, 35 miles southwest of Brussels (Map Belgium, B 4). It was formerly encircled by a line of fortifications, but their site is now occupied by promenades. The most interesting building in Mons is the late Gothic cathedral of St. Waltrudis (1450-1589), with reliefs, stained-glass windows, and relics of the saint. The hôtel de ville is a late Gothic building of the fifteenth century, with a façade adorned with statuettes and a baroque tower. The educational institutions comprise a military engineering college of the Belgian army, a school of mines, a normal school, a seminary for teachers, a fine library with 80,000 volumes, and an archaeological museum and picture gallery. Mons lies in one of the most important coal-mining districts of Belgium, known as Borinage, and manufactures woolen and cotton goods, iron products, cloth, lace, and sugar. The trade, mostly in grain and coal, is facilitated by the Canal de Conde, which connects with the Scheldt.

Mons occupies the site of a Roman fort built by Julius Caesar. It attained some importance in the Middle Ages and owed not a little of its prosperity to Baldwin VI, Count of Flanders, later Emperor of Constantinople, from whom it

received a charter in 1200. It was repeatedly taken during the wars of Louis XIV. Mons was captured by the Germans in the European War which broke out in 1914. It was from here that the allied Anglo-French army began its slow, steady retreat which was not stopped until the battle of the Marne (see MARNE) was fought, in sight of the outer fortifications of Paris. (See WAR IN EUROPE.) Near by are the battlefields of Malplaquet and Jemappes. Pop., 1900, 25,483, 1910, 27,828.

MONS, or **TALAING**. The inhabitants of the unhealthy delta regions of the rivers Irrawaddy, Sittong, and Salween in Indo-China. They consider themselves the aborigines of the whole of Lower Burma. Their former habitat is now largely occupied by Burmese-Mon half-breeds. They are probably one of the eight groups of aborigines of Indo-China. Their language seems to belong in the same class with the Khmer, and perhaps the Khasia. See INDO-CHINESE.

MONS BRISI'ACUS. See BREISACH.

MONSEIGNEUR, mōn'sā'nyēr' (Fr., my lord, pl. *monseigneurs*). Originally a French title applicable to royal or Imperial princes, cardinals, archbishops, and bishops of France and accorded in courtesy to the high officers of court or government and persons generally of high rank. The title was not applied to bishops until about the close of the seventeenth century, when they acquired it by concerted action in addressing each other in that way. Their title previously was simply *monsieur*. A law of the French Convention in 1801 interdicted the use of the title for bishops and archbishops and required them to confine their signature titles and their addresses to each other to the words *citoyen* or *monsieur*. Among English-speaking Roman Catholics the title is applied in its Italian form, *monsignore*, not only to bishops, but to priests who are distinguished by the honorary appointment as domestic prelates to the Pope.

MON'SELL, JOHN SAMUEL BEWLEY (1811-75). A Church of England divine and hymn writer. He was born in Londonderry, Ireland, March 2, 1811, and graduated at Trinity College, Dublin, in 1832. He was ordained priest in 1835 and died as rector of Guildford, England, April 9, 1875. He was a popular hymn writer, Julian's *Dictionary of Hymnology* gives a list of 73 of his hymns which are in current use. Aside from collections of hymns, he published various books of prose and verse. One of his prose works, *Our New Vicar* (1867, 13th ed., 1890), has had a large sale.

MONSEL'S SOLUTION. An aqueous solution of basic ferric sulphate, corresponding to about 13.6 per cent of metallic iron. It is a dark reddish-brown liquid, odorless, and strongly styptic. It is used externally as a local astringent in cases of bleeding from the nose or other mucous cavities or from superficial skin wounds. The solution promotes clotting of the blood, but the clot is very disagreeable, readily decomposes, and may give rise to septic infection. It has therefore been largely superseded as a hæmostatic by adrenalin (q.v.), but is still applied to the inflamed pharynx or tonsils. See IRON.

MONSERRAT, mōn'sēr-rāt' (*mons serratus*). A mountain and a monastery of Spain, situated 30 miles northwest of Barcelona, near Ministrol, a village on the Barcelona and Lerida Railway. The mountain, 4070 feet high, is strongly

eroded, and the many deep ravines and steep precipices, together with its serrated summit, give it a very ragged appearance. The monastery, located at a height of 2910 feet, owes its origin to an image of the Virgin which was hidden in one of the mountain caves when the Moors invaded Spain. The popular belief asserts that the monastery was built during 880 as a home for the Virgin when, after the invaders had withdrawn and safety was again assured, the image refused to leave her mountain refuge. The mountain is rich in legendary lore, and in the mediæval German story it was believed to be the site of the castle of the Holy Grail.

MONSIEUR, mō-syē'. A French title formerly addressed to persons of medium rank, now universally employed in French by all gentlemen in addressing each other. It is also used as a prefix to titles of rank and as a form of respect in mentioning a third person. In the Middle Ages the title was given to saints and as a prefix to the names of popes and of members of the royal family when alluded to in the third person. Later *Monsieur*, used without a proper name, was the special title of the oldest brother of the French King.

MONSIGNY, mōn'sē'nyē', PIERRE ALEXANDRE DE (1729-1817). A French composer, born at Fauquembergue, Pas-de-Calais. He received some instruction in harmony from Gianotte, in Paris, and in 1759 produced his first opera, *Les aveux indiscrets*. Its success was immediate, and Monsigny followed it up with *Le cadu dupé* (1761). From this time he had the poet Sedaine as collaborator. Together they wrote: *On ne s'amuse jamais de tout* (1761), *Le roi et le fermier* (1762), *Rosc et Colas* (1766), *Le déserteur* (1769), *Le faucon* (1772). After *Félix, ou l'enfant trouvé* (1777, text by Sedaine), Monsigny ceased to write. In 1813 he succeeded Grétry (q.v.) as member of the Academy. Together with the latter and Philidor (q.v.), Monsigny must be regarded as the founder of the opéra comique. Even to-day some of his works are occasionally heard in France. Consult A. Pougin, *Monsigny et son temps* (PARIS, 1908).

MONS JANICULUS. See JANICULUM.

MONSON, mūn'sūn. A town in Hampden Co., Mass., 20 miles east of Springfield, on the Central Vermont Railroad (Map Massachusetts, C 4). It contains the Monson Academy. Monson is essentially an agricultural community, but has granite quarries, woolen mills, and manufactories of ladies' hats. The water works are owned by the town. Pop., 1900, 3402, 1910, 4758.

MONSON, SIR EDMUND JOHN, first BARONET (1834-1909). A British diplomatist, born at Chart Lodge, Kent. He was educated at Eton and at Balliol College, Oxford, and became a fellow of All Souls in 1858. Until his resignation in 1865 he was connected with the British legations at Paris, Florence, Washington, Hanover, and Brussels. He reentered the government service in 1869 as Consul in the Azores, became Consul General in Hungary in 1871, and during the Turkish War in 1876-77 was on special duty in Dalmatia and Montenegro. After 1879 he was successively Minister to Uruguay, Argentine and Paraguay, Denmark, Greece, and Belgium, and Ambassador to Austria (1893-96) and to France (1896-1904). In 1888 he became arbitrator of the Butterfield

claim between the United States and Denmark, which claim grew out of the treatment of two vessels belonging to the American firm of Butterfield & Co by the Danish authorities at the island of St. Thomas in 1854-55. Monson gave his decision in favor of the Danish government in 1900. He received the G C V.O. in 1903 and in 1905 was made Baronet.

MONSOON' (from Fr. *monson*, *monçon*, *mousson*, It. *monsonc*, Sp. *monzón*, Portug. *monção*, from Malay *mūsīm*, season, year, monsoon, from Hind. *mausim*, from Ar. *mausim*, monsoon, from *masama*, to mark). In general, any wind or system of winds that changes regularly with the months or seasons. This term was brought to England from the East Indies by the Portuguese, Spanish, and Italian navigators. Its use in English first occurs in *Hakluyt's Voyages*. In India, Siam, and the East Indies there is a very regular change of the winds with the seasons. They blow from southwest or south from April to October and from northeast or north from October to April. The existence of these winds in India was first made known to the Europeans by the expeditions of Alexander the Great. Modern knowledge of the corresponding winds in Siam and the Philippines dates from the middle of the sixteenth century, similar regular seasonal changes in the wind direction characterize many portions of the globe, so that Australia, Texas, Brazil, Africa, and Europe have prevailing winds at each season of the year; yet the contrast is nowhere so strongly marked as on the south and southeast coasts of Asia and the neighboring islands. During the winter season the cool air from the interior of the continent, flowing outward and keeping near the ground, becomes a north or northeast wind as it flows southward over the China Sea into the Bay of Bengal and into the Arabian Sea. This wind even passes beyond the equator to lat. 10° S., by which time it has been deflected into a west wind and flows eastward over the northwestern coast of Australia. South of this zone of north winds are the southeast trade winds of the Southern Hemisphere. By reason of the change from winter to summer the Asiatic continent becomes heated, consequently the northeast monsoon ceases and a strong indraft takes place, and eventually, in July and August, the greater part of the air over the south Indian Ocean responds to this indraft, so that from lat. 25° S. to lat. 5° S. a strong southeast trade wind prevails. Between lat. 5° S. and 5° N. this southeast trade crosses the equator as a southerly wind and, turning towards the right, becomes the southwest monsoon wind of India, Siam, and the adjacent seas. It was for a long time considered doubtful whether the winds of the Southern Hemisphere could thus cross the equator and enter the Northern Hemisphere, but the monsoon charts published daily for many years by the government of India leave us no room to doubt this remarkable change. In the midst of the southeast trades of the south Indian Ocean occur violent typhoons, which move from the neighborhood of Java and northern Australia westward and away from the equator, turning in their course before they reach Madagascar and moving southeastward until they are lost. These typhoons generally develop in the south Indian Ocean when the northeast monsoon is at its maximum in India.

The southwest monsoon is usually accompanied by rain in portions of India and in the

adjacent East Indies. The northeast monsoon brings rain to the west coast of the Bay of Bengal. In general, the locations of the rain areas vary with the direction of the wind in accordance with the rule that a wind that is forced to ascend over a hilly coast brings rain to it. Through this interchange between the seasons of northeast and southwest monsoons, all of India has an opportunity of being well watered and of raising annual crops of grain. Nevertheless it occasionally happens that the southwest monsoon fails to bring much rain; this may indeed happen for several successive years (as in 1895 and 1896 and again in 1899), by reason of which distressing famines and great loss of life are caused. Since 1880 the government meteorologists of India, H. F. Blandford and John Eliot, have devoted a great deal of attention to methods of predicting the probable character of the monsoon rains. These predictions are generally issued in the month of April and relate to the coming months of July and August. A remarkably large percentage of these predictions have been successful, but the failure of the forecasts for 1899 indicated that abnormal conditions prevailed in some distant region and has greatly stimulated the study of the relation between the Indian monsoon and the condition of the atmosphere over the whole globe.

The general statement of the conditions that bring about monsoons is discussed at length by Prof. William Ferrel in *A Treatise on the Winds* (New York, 1889). He has emphasized the important rule that monsoons are stronger in proportion as the heated interior land surface is elevated above sea level. On the coast of Jamaica, West Indies, the diurnal sea breeze is remarkably strong, owing to the steep gradient of the land as it ascends from sea level to the tops of mountains. In India the southwest monsoon develops on a grand scale because of the average elevation of the Himalayas, which stretch east and west for 1300 miles at an average altitude of 18,000 feet, and also because of the mountains and plateaus behind the Himalayas in the interior of Asia. The monsoon, like the daily land and sea breeze, depends for its intensity ultimately on the heat produced by solar radiation. Any change in the radiation will produce corresponding effects on the monsoon. E. D. Archibald, in *Nature* (June 22, 1893, London), has maintained that there are systematic monsoon variations parallel to the variations of the spots on the sun. But these changes are barely appreciable, and further investigation may modify his results.

MONS SA'CER (Lat., sacred mount). A hill near Rome, made famous by the secession thither of the Plebs in 494 B.C. It is conjecturally identified with an eminence near the Ponte Nomentano, about 3 miles from the Porta Pia, at the modern Torre di Specchia. Consult Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

MONSONI, mōn-sō'nē, **MONSO'NEE**, or **MOOSE INDIANS**. A division of the Cree (q.v.).

MON'STER. See **MONSTROSITY**.

MON'STRANCE (OF. *monstrance*, from ML. *monstrantia*, monstrance, from Lat. *monstrare*, to show, from *monstrum*, portent, monster, from *monere*, to warn, admonish), or **OSTENSORY**. The sacred utensil employed in the Roman Catholic church for the purpose of presenting

the consecrated Host for the adoration of the people, as well while it is carried in procession as when it is exposed upon the altar on occasions of special solemnity and prayer. The use of the monstrance probably dates from the establishment of the festival of Corpus Christi in the thirteenth century. It consists of two parts, the foot or stand upon which it rests and the repository or case in which the Host is exhibited. The latter contains a small semicircular holder called the *lunula*, or crescent, in which the Host is fixed.

MONSTRELET, mōn'stre-lâ', ENGUERRAND DE (1390-1453). A French chronicler, probably born in Picardy. Of his life practically nothing is known. According to his own testimony, he was present at the interview between Jeanne d'Arc and the Duke of Bourgogne. In 1430 he had a civil and military office in Compiègne, later he was provost at Cambrai and bailiff at Walincourt. His *Chronique*, which covers the years 1400-44 and continues the narratives of Froissart, is a clear and exact narrative of the time, written with little charm of style. The latest edition is that of Douet d'Arcq (1857-62). There is an English translation by Thomas Johnes (1810).

MONSTROSITY (Lat. *monstrositas*, from *monstrosus*, *monstruosus*, monstrous, from *monstrum*, monster, portent), IN ANATOMY All departures from the normal development of the human fœtus or of the young of the higher animals are now considered under the subject of teratology. These deviations from the normal may vary from the comparatively slight and common anomalies (such as harelip and supernumerary digits) to forms which are so strange and hideous that they merit beyond question the name of monsters. Although the system of Saint-Hilaire is by no means perfect and is not based on embryonic laws, yet it has the advantage of a familiar nomenclature and groups together forms which present similar external characteristics. His classification, somewhat modified by Hirst and Piersol, is the one generally accepted. Under his classification we have four general groups: *Hemiterata*, *Heterotaxies*, *Hermaphrodites*, *Monsters*.

Hemiterata. In this group are included all forms of anomalies which show unusual development, but which are not exaggerated enough to be regarded as monsters nor specific enough to be considered members of the second or third class.

This group is subdivided into:

1. *Anomalies of volume*, with general diminution or increase, as in dwarfs and giants. This abnormal development may affect only a part of the body, as the extremities, or the breasts, or the muscular system.

2. *Anomalies of form*, resulting in deformities of the head, of the stomach, or of the pelvis.

3. *Anomalies of color*, presenting the interesting condition of albinism or abnormal melanism.

4. *Anomalies of structure*, as represented by the persistent cartilaginous condition of bones or the ossification of parts that normally should consist of cartilage.

5. *Anomalies of disposition* include hernia, clubfoot, extrophy of the bladder, and curvature of the spine.

6. *Anomalies of connection* are especially varied. Bones have unusual articulations;

muscles have abnormal attachments; and arteries and veins give off branches in violation of anatomical regularity.

7. *Anomalies of continuity* show an imperforate condition of vagina, rectum, or œsophagus, or a union of the kidneys, of the digits, or of the teeth.

8. *Anomalies of closure and disjunction* are illustrated by a vaginal septum and by cleft palate and harelip.

9. *Anomalies of number* embrace many varieties represented by an increase or decrease in the number of digits, teeth, breasts, or other parts.

Heterotaxies include those forms which show transposition of the internal viscera, either of the thorax or of the abdomen. Rarely we find only a single organ transposed, often all are in an abnormal position, but this change is accompanied by no interference of nutrition or of function. So at times the heart will be found on the right side or the liver on the left, and yet the individual is unconscious of any irregularity.

Hermaphrodites. Ahlfeld defines a true hermaphrodite as an individual possessing functionally active glands of both sexes, with excreting ducts and external genitals, so that the offices of both sexes can be fulfilled. Indisputable evidence of such a case has not been adduced, although there are numerous instances where glands presenting the histological characteristics of both sexes have been present in one person. False hermaphrodites present typical glands of one sex and others of a more or less mixed or modified type. They are usually masculine in sex. There are all degrees of abnormality in development, from a slight enlargement of the vesicula prostatica (the masculine uterus of Weber), without any alteration in the external genitals, to a fully developed uterus with tubes and vagina complete in a male subject. The penis in these cases is rudimentary, and a condition of hypospadias (a malformation of the penis, in which the orifice of the urethra is underneath or behind the glans) exists. The scrotum is ill developed, and the testicles remain in the abdomen. The absence of ovaries is not detected, so that the mistake in sex may naturally persist until a post-mortem examination reveals their absence and the true sexual nature of the individual is apparent.

Monsters. In this class we will first consider autositic single monsters which are capable of independent existence in the womb and are the result of an arrest in development, of fusion, or of displacement of important parts. 1. *Ectromelus*.—This group includes aborted or imperfectly formed extremities which present various degrees of shortening or else are entirely absent. Some cases show rudimentary limbs, but perfectly formed hands and feet which appear to come immediately from the trunk. 2. *Symmelus*.—The pelvis and lower extremities in the individuals of this group are imperfectly developed, and the two lower limbs are more or less fused. Sometimes this fusion is complete and the feet are wholly lacking. 3. *Celostoma*.—The individuals in this class show a varying degree of cleft in the walls of the abdomen or of the thorax and consequent eversion. Anomalies of the intestinal tracts and of the urinary and genital apparatus are frequent accompaniments. Malformations of the head are classified under the next three groups:

(4) exencephalus, (5) pseudencephalus, and (6) anencephalus. In group (4) a malformed brain exists, situated in part at least within a cranial cavity of which the walls are imperfect. In group (5) the cranium is even more rudimentary and the brain tissue is but poorly represented, while in the anencephalus the true nerve elements are wholly lacking in the mass of tissue lying within the shallow and imperfect cranial cavity. These brainless monsters are almost always feminine. In (7), the cyclocephali, the eyes approach the mid-line and more or less closely unite. These organs are poorly developed or rudimentary, and the nose is atrophied, although in certain instances a hypertrophied proboscis may arise from above the fused sockets. The lower jaw is poorly developed or wanting in (8), the octocephalic, and the ears approach each other and frequently become fused below. The mouth is, of course, distorted to an exceptional degree.

Omphalositic single monsters are embryos dependent on other embryos within the womb for their own imperfect development. The primary fetus is usually well formed and supplies both itself and the parasite with blood by means of an extensive anastomosis of placental and umbilical vessels.

When the heart is present in omphalositic it is incomplete. The circulation is sluggish and an overgrowth of connective tissue results, with the formation of lacunæ and cysts and frequently marked œdema. The highest development of these monsters is reached in the paracephalus. In this anomaly the extremities are more or less definitely present, the head has an imperfect cranium and imperfect face, the cervical vertebrae are rudimentary, the diaphragm is defective, and the lungs are absent or else incomplete. There is, of course, no sign of life in these forms after birth.

Composite Monsters embrace all forms in which there is a reduplication of the principal parts of the body. There may be two distinct faces and heads closely fused together, or the duplicity may be only slightly suggested (diprosopus). In other cases (dicephalus) the heads may be quite distinct, and even the upper parts of the body are double, with three or four arms present. The internal organs are duplicated according to the amount of division. Although specimens of this group are seldom born alive, and still more rarely live, yet we have a well-marked instance of this class recorded in the case of the Tocci brothers (1877), who grew up and thrived for many years. In the third class (ischiopagus) two separate distinct bodies are present which are joined by the coccygeal and sacral bones. Only one case is recorded which lived beyond the third year. The pyopagi are very rare. In these, two separate bodies are so joined together in the sacral region that the two individuals stand back to back. The dipygi are cases which show a reduplication of the pelvis, of the genitals, and of the extremities. If four legs are present, they are not all equally well developed, but the two inner legs are much smaller. This division of the body from below may be carried still further (syncephalus), and if the union is simply confined to the heads, these specimens are included in the cranopagi.

In some instances the reduplication is almost complete and the union is comparatively slight, occurring at some point between the umbilicus and the lower thorax. The most famous case is

that of the Siamese twins, who lived to be 63 years old. In February, 1902, the Hindu twins Rodica and Doodica, who had been joined in a fashion similar to the Siamese twins, were divided by operation in Paris, France. Rodica survived, but her sister died of tuberculosis.

Double Parasitic Monsters. In this class a more or less perfectly formed body is attached to a well-formed individual, but it has no separate existence, receiving its nourishment wholly from the other.

Triple Monsters are rare, and we know of but one case of a three-headed child—that recorded by Saint-Hilaire, born in 1832 in Catania. Consult Saint-Hilaire, *Histoire des anomalies de l'organisation* (Paris, 1832-36). Hirst and Piersol, *Human Monstrosities* (Philadelphia, 1892), also Gould and Pyle, *Anomalies and Curiosities of Medicine* (ib., 1897). See DEFORMITIES.

MONSTROSITY. A botanical term applied to a peculiar or unusual form of an organ or of the whole body; better designated by the term "malformation" (q.v.).

MONT, MENT, or MENTU. An Egyptian deity, originally the local god of Hermonthis (q.v.), where he had an ancient temple. His chief characteristics were strength and valor, and "strong as Mont" and "brave as Mont" were favorite epithets of the Egyptian kings. Under the New Empire Mont became the national god of war, who fought for the armies of Egypt and gave might and victory to the King. In inscriptions of this period he is styled "Lord of Thebes, dwelling in Hermonthis." In the later theological system he was identified with the sun god under the name of Mont-Rê. With the decline of Thebes and the rise of Hermonthis to supremacy over the surrounding district, Mont gained correspondingly in importance and usurped in some measure the devotion formerly paid to Amon. Magnificent temples were dedicated to him at Karnak and at Medamut, near Thebes, by the Pharaohs of the eighteenth dynasty, and at Tud, the ancient Tophium, are the remains of a small temple of the god built in Ptolemaic times. Mont is usually represented as a hawk-headed deity wearing upon his head the solar disk and two tall plumes. At his ancient seat of worship, Hermonthis, his sacred animal was the bull Bakh, called Bacis by the Greeks. Consult Wiedemann, *Religion of the Ancient Egyptians* (New York, 1897), and E. A. T. Wallis Budge, *The Gods of the Egyptians* (London, 1904).

MONT, KABEL MARIE POLYDOOR DE. See POL DE MONT.

MONTAGNA, mōn-ta'nyā, BARTOLOMMEO (c.1450-1523). An Italian painter of the Renaissance, founder of the school of Vicenza. He was born at Orzinuovi, near Brescia, and was influenced in his art by the Vivarini, the Bellini, and especially by Andrea Mantegna. He was active chiefly at Vicenza, and later was employed in Bassano, Verona, and Padua. His works are severe in design and ample in color after the manner of the earlier Venetians. They include the partly destroyed frescoes illustrating the life of St. Blasius, in the church of San Nazaro at Verona, a fine "Pietà" at Monte Berico, near Vicenza; "Madonna with Saints," Johnson collection, Philadelphia; "Madonna and Child" and "A Lady of Rank as Santa Bibiana," Metropolitan Museum, New York; and an altarpiece in the Brera, Milan. Others are in the

Venice Academy, the National Gallery, London, the Louvre, the Berlin Gallery, and, especially, in the gallery and churches of Vicenza

MONTAGNAIS, mōn'ta'nyā' (Fr., mountaineers). A name applied to a group of closely cognate Algonquian tribes in Quebec Province and Labrador, Canada, extending along the northern shore of the St. Lawrence River from near the entrance of the St. Maurice nearly to the Gulf and inland to the main divide. They have greatly decreased in number from sickness and starvation resulting from the destruction of their former game supply. No separate census is kept, as they are officially grouped with the Nascapi, Têtes-de-Boule, and other tribes and bands. So far as can be learned from the reports, they appear to make their principal living by hunting, fishing, making bark canoes, snowshoes, and moccasins, and acting as guides to tourists. Consult Chamberlain in Geological Survey of Canada, *Annual Archaeological Report* (Ontario, 1905).

MONTAGNANA, mōn'tā-nyā'nā. A town in the Province of Padua, Italy, 22 miles southwest of Padua. It is surrounded by walls and towers and has a Gothic cathedral and a sixteenth-century town hall with paintings. Its chief trade is in spun silk, wool, hemp, flax, and coarse cotton textures. It manufactures leather. Pop. (commune), 1901, 10,364, 1911, 11,176.

MONTAGNARDS, mōn'tā'nyar' (Fr., mountaineers). The name first applied in France in 1790 to the more radical members of the National Assembly, who occupied the high seats in the rear of the amphitheatre where the Assembly met. In the Convention (q.v.) it was applied to the entire Radical Left, composed of Jacobins (q.v.) and Cordeliers (q.v.), in distinction from the more moderate Girondists (q.v.), who occupied the lower seats in the hall. The history of the Convention till June, 1793, is almost entirely the history of the struggle between the Gironde and the Mountain. The former, comprising the philosophers, statesmen, orators, scientists, and men of letters in the Convention, were republicans and liberals of the idealistic type, middle class in their sympathies and out of touch with the more revolutionary aspirations of the masses, while the Mountain was composed to a large extent of the uncompromising leaders of the Parisian groups. The Montagnards themselves, however, were filled with the vague radicalism of the philosophers of the Enlightenment, were unable to construct or unite upon any definite practical program of social amelioration, and gave way before the Thermidorian reaction. Upon the question of Louis XVI's fate, the issue between the two parties was practically fought out. Then, as in the crisis brought on by foreign invasion and internal disorder, the Girondists showed themselves irresolute. The Montagnards in condemning the King challenged all Europe, took the guidance of the Revolution into their own hands, and some time after (June 2, 1793) destroyed all opposition by arresting the leaders of the Gironde and sending them to the guillotine. The subsequent acts of the Convention were the acts of the Montagnards, under their leaders Danton, Marat, Robespierre, and Collot d'Herbois. In 1848 the Radicals under Louis Blanc and Ledru Rollin called themselves Montagnards. Consult Jules Claretie, *Les derniers Montagnards* (Paris, 1874); Shailer Mathews, *French Revolu-*

lution (New York, 1901); Lichtenberger, *Le socialisme dans la révolution française* (Paris, 1901); also *Cambridge Modern History*, vol. viii, p. 807 (New York, 1904), for a bibliography. See DANTON, FRENCH REVOLUTION, MARAT; ROBESPIERRE, SAINT-JUST.

MONTAGU, mūn'tā-gū or mōn', BASIL (1770-1851). A British lawyer and author, natural son of John Montagu, fourth Earl of Sandwich. He was educated at the Charterhouse and at Christ's College, Cambridge, where he graduated M.A. in 1793. In 1795 he went to London, where he studied for the bar, to which he was admitted three years later, and soon afterward he began to publish works dealing with legal subjects. He interested himself particularly in relieving the conditions of the debtor class and succeeded in securing the abolition of the death penalty for certain crimes. Among his writings are: *An Enquiry Respecting the Expediency of Limiting the Creditor's Power to Refuse a Bankrupt's Certificate* (1809), *The Opinions of Different Authors upon the Punishment of Death* (1809), *An Enquiry Respecting the Mode of Issuing Commissions in Bankruptcy* (1810), *Enquiries Respecting the Insolvent Debtors' Bill, with the Opinions of Dr Paley, Mr Burke, and Dr Johnson upon Imprisonment for Debt* (1816); *The Law and Practice in Bankruptcy as Altered by the New Statutes, Orders, and Decisions*, with Serope Ayrton (2 vols, 1837, 2d ed, 1844). His edition of Bacon's works occasioned Macaulay's well-known essay in the *Edinburgh Review* (1837).

MONTAGU, CHARLES, first EARL OF HALIFAX. An English poet and statesman. See HALIFAX, CHARLES MONTAGU, EARL OF.

MONTAGU, EDWARD, first EARL OF SANDWICH. See SANDWICH.

MONTAGU, ELIZABETH (ROBINSON) (1720-1800). An English writer and society leader, born at York. In 1742 she married Edward Montagu, grandson of the first Earl of Sandwich, who on his death left her a large fortune. With abundance of wealth and possessing literary talent, she became a leader in London society, and numbered among her regular visitors Lord Lyttleton, Horace Walpole, Dr Johnson, Burke, Garrick, and Sir Joshua Reynolds. The epithet of "bluestocking" was first applied to her gatherings. In 1760 she wrote three *Dialogues of the Dead*, published in Lord Lyttleton's work by that name, and in 1769 an *Essay on the Writings and Genius of Shakespeare, Compared with the Greek and French Dramatic Poets*, that received high praise from her contemporaries. Her correspondence in great part was published in 1809-13. Consult Doran, *A Lady of the Last Century* (London, 1873), *Elizabeth Montagu, the Queen of the Bluestockings: Her Correspondence from 1720 to 1761* (2 vols., New York, 1906), René Huchon, *Mrs. Montagu and her Friends* (ib., 1907).

MONTAGU, JOHN, fourth EARL OF SANDWICH. See SANDWICH.

MONTAGU, LADY MARY WORTLEY (1689-1762). An English poet and letter writer, eldest daughter of Evelyn Pierrepont (afterward Duke of Kingston). She was baptized in London, May 26, 1689. From her brother's tutor or by herself she learned Latin, and read widely in English drama and romance. When a mere girl she was toasted by her father at the Kit-Cat Club, and on her appearing there was ad-

mitted a member by acclamation. Without the approval of her family she privately married (Aug. 12, 1712) Edward Wortley Montagu, a Whig member of Parliament, with whom she lived for a time in retirement. On the accession of George I she went to London with her husband. There her beauty and wit attracted unusual attention at court, and she was much admired by the wits, especially by Pope. In 1716 appeared surreptitiously her *Court Poems*, afterward called *Town Eclogues*. The same year she set out with her husband on his embassy to Constantinople. At Adrianople she became interested in inoculation for smallpox (1717) and on her return introduced the practice into England. During her travels in the East she wrote her well-known *Letters* (posthumously published), delightful in themselves and valuable for the light they throw upon the manners and customs of the time. Returning to England (1718), the Montagus soon settled near Pope at Twickenham, and Lady Mary became one of the best-known women in London society. Pope had addressed verses to her and had kept up a correspondence during her absence. The friendship was now renewed on more intimate terms, but by 1722 they quarreled. Pope seems to have made a declaration of love, which was met with a burst of laughter. Pope afterward satirized her as Sappho in various poems. Swift lampooned her in *The Capon's Tale* (1726). In the *Epilogue to the Satires* (1738) she is accused by Pope of starving a sister and forswearing a debt, and in the *Imitations of Horace* (1733) a worse charge is brought against her (first satire, 2d book, i, 84). For unknown cause she left her husband in 1739 and lived abroad for many years, chiefly in Italy. Her husband died in 1761, and the next year she returned to England, at the request of her daughter, Lady Bute. She died Aug. 21, 1762. Consult her *Works*, edited by her great-grandson, Lord Wharnccliffe (London, 1837, new eds., 1887, 1893), and E. M. Symonds, *Lady M. W. Montagu and her Times* (New York, 1907). See INOCULATION.

MONTAGU, RALPH, first DUKE OF (c. 1638–1709). An English diplomat. In 1665 he became master of horse to Queen Catharine and in 1669–72 and 1676–78 was Ambassador to Louis XV of France. He was married to Elizabeth Wriothesley (died 1690), the wealthy widow of the Earl of Northumberland, in 1673, succeeded his brother as Baron Montagu in 1684, and throughout all this period he was continuously active in various court intrigues. Although he enjoyed the favor of James II, he was one of the first to take the oath to William and Mary, and he was rewarded by being made Viscount Monthermer and Earl of Montagu in 1689. In 1692 he increased his favor at court by marriage to the insane but very rich Elizabeth Cavendish, widow of the Duke of Albemarle, and in 1705 he was elevated to be Marquis of Monthermer and Duke of Montagu.

MONTAGUE, mōn'tā-gū. A town, including several villages, Turners Falls being industrially the most important, in Franklin Co., Mass., separated from Greenfield by the Connecticut River, and on the Boston and Maine, the New York, New Haven, and Hartford, and the Central Vermont railroads (Map Massachusetts, B 2). It has three public libraries, the Farnen Hospital, and extensive manufactures of cotton goods, paper, pulp, cutlery, hardware,

water wheels and pumps, toilet articles, bricks, silk, and fishing rods. The government is administered by town meetings. The water works are the property of the municipality. There is a large power plant at Turners Falls which furnishes current to towns at considerable distances away. Montague was settled about 1716 and was incorporated as a district in 1753. Pop., 1900, 6150, 1910, 6866.

MONTAGUE, FRANCIS CHARLES (1858–). An English historian, born in London. He was educated at University College, London, and at Balliol, Oxford, was fellow of Oriel College, Oxford, and in 1884 was called to the bar. In 1893 he became Astor professor of European history at University College, London, and from 1900 on was curator of the Indian Institute at Oxford. He wrote *Limits of Individual Liberty* (1885), *Technical Education* (1887), a *Life of Sir Robert Peel* (1888), and *Elements of English Constitutional History* (1894), contributed to the *Cambridge Modern History* (vol. viii, 1904) and Longmans' *Political History of England* (vol. vii, James I to Restoration, 1907), and edited Bentham's *Fragment on Government* (1891) and Macaulay's *Essays* (1903).

MONTAGUE HOUSE. 1. A former London mansion built for the first Duke of Montague. It was bought by the government at the time of the purchase of the Sloane collection, which, with the Harleian manuscripts and the Cottonian library, was deposited in it, forming the nucleus of the British Museum. The expansion of the museum in the early part of the nineteenth century made the addition of a wing necessary, and the building was finally replaced by the present British Museum between 1823 and 1852. 2. A building in Whitehall, London, residence of the Duke of Buccleuch, containing a large collection of pictures and miniatures.

MONTAGUES. See CAPEULETS AND MONTAGUES.

MONTAIGLON, mōn'tā'glōn', ANATOLE DE COURDE DE (1824–95). A French bibliographer and paleographer, born in Paris. A student at the Ecole des Chartes, he obtained his diploma as archivist in 1850, and held positions successively at the Museum of the Louvre, the Arsenal Library, and that of St. Geneviève, until he became professor of bibliography at the Ecole des Chartes. His numerous works, which deal chiefly with the origin of French art and literature, include *Mémoires pour servir à l'histoire de l'académie royale de peinture* (1853), *Catalogue raisonné de l'œuvre de Claude Mellan d'Abbeville* (1858), *Notice historique et bibliographique sur Jean Pélerin, dit le Vateux* (1861), *Recueil général et complet des fabliaux des XIII^{ème} et XIV^{ème} siècles* (9 vols., 1872–90), *Un voyageur anglais à Lyon sous Henri IV* (1881), *Procès-verbaux de l'Académie royale de peinture et de sculpture* (1888–89, 1892), *Correspondance des directeurs de l'Académie de France à Rome, etc.* (1893–99), *Bibliographie chronologique des ouvrages de Benjamin Filon* (1895), *L'Advocacie Notre-Dame; Poème normand du XIV^{ème} siècle* (1896).

MONTAIGNE, mōn-tān', Fr. pron mōn'tā'-ny', MICHEL EYQUEM DE (1533–92). A great French essayist and moralist. Montaigne got his name from the Château Montaigne, near the Dordogne, in Périgord, where he was born Feb. 28, 1533. The family fortune was begun by Michel's great-grandfather, a merchant and

citizen of Bordeaux. The essayist's father turned him over to a nurse, who reared him in a hamlet on his father's estate. As he tells us himself, he was awakened in the morning with music, and his father had him so well drilled in Latin that when he went to the Collège de Guyenne at Bordeaux he astounded every one by his Latinity, though he was but six years old. The boy's mother was Antoinette de Loupes (i.e., Lopez), of a Jewish family, which had come from Spain. To judge by Saint-Aubin's engraving after the original portrait at the Château Montaigne, the essayist had an oval face, a good-sized nose, a wrinkled forehead, high cheek bones, and a smallish chin. He wore a short beard, with a moustache, and his mouth hardly suggests the sweetness of temper so apparent in his essays.

After eight years under the famous André de Govea, master of the Collège de Guyenne, then the best school in France, Montaigne seems to have studied law in Bordeaux and Toulouse till 1554. His essays, however, are scarcely the work of a lawyer, but rather of a genial, ever-inquisitive, and usually whimsical humorist. Sooner or later Montaigne skirted most of the hills of knowledge, rarely exerting himself to climb to their tops, but seeing very clearly from the level. At the Collège de Guyenne he had continued his studies in the language, literature, and history of Rome, and had taken part in the Latin plays written for him and his mates by Buchanan and Muret. This we know from Montaigne's own words, but we also learn from him that he was lazy and careless and that in reading he followed his whims. At 21, as a younger son, he was cared for by being made a member of the Cour des Aides at Périgueux, and three years later he was appointed counselor of Parliament at Bordeaux. Thus he met Etienne de la Boétie (qv), and there sprang up between them a friendship that lasted till La Boétie's death in 1563. At 33 Montaigne wedded Françoise de la Chassaigne, yielding to convention, for he declares he "would not have married Wisdom herself" for his own pleasure. He tells us that he lost "two or three" children in babyhood, but a daughter survived him. Montaigne had done his first literary work in 1568 by translating the *Theologia Naturalis* of Raimond Sebond, a Spaniard who had been a professor at Toulouse in the fifteenth century. This book was the text for Montaigne's most famous essay in skepticism, the *Apologie de Raimond Sebond*. In 1570 Montaigne edited the literary remains of La Boétie. After this he seldom left his estate, except for visits to Paris and an 18 months' visit to Germany, Switzerland, and Italy in 1580. Of this voyage he left an interesting diary, partly in French and partly in Italian, first published in 1774, and edited by A d'Ancona (Città di Castello, 1889). He was elected (1581) and reelected mayor of Bordeaux. His last years were brightened by the Platonic affection of an adopted daughter, Mademoiselle de Gournay, a Parisian, who at 19 had been attracted by his essays, of which she later prepared a valuable edition (1597). Montaigne suffered much towards the close of his life from gravel and stone. In 1592 he died of quinsy, receiving devoutly the last offices of the Church, though his mottoes *Que sais-je?* (What do I know?) and *Qu'importe?* (What matters it?) are those of an easy-going skeptic.

The essays, of which the first were written in 1572, beginning in self-analysis, finally came to take for their field the knowledge of man in general. Wholly unsystematic though they are, they show an insatiable curiosity, which seeks rather its own stimulation than the satisfaction of a definite conclusion. Montaigne drew the material for his reflections not so much from his own surroundings as from Seneca, Lucretius, and the historians, from Plutarch, Xenophon, and the anthology of Stobæus, and from the biographies of Diogenes Laertius, as well as from Italian letter writers and historians. Behind their thoughts he often sheltered his own, preferring rather to suggest that others had doubted than that he himself was other than a royalist and a Catholic. Suspended judgment, contented detachment, and a practical epicureanism are the teachings of Montaigne, who observes that "men are tormented by what they think about things, not by the things themselves." "However specious novelty may be," says he, "I change not easily, for I fear to lose by the change. . . . So I have, by God's grace, kept without worry and turmoil of conscience the old beliefs of our religion through all the sects and divisions that our century has brought forth." His attitude was not heroic, but it proved contagious, for the anti-Christian or simply non-Christian current which can be noted in the seventeenth century, passing through Molière or through Descartes and finally reaching Voltaire, seems to have its source in Montaigne. Rationalism, Epicurean or Cartesian, is already by implication in the essays. In his own day Montaigne stood almost alone among men who were hasty in thought and quick to act. Few French works have exercised so great and lasting an influence on the writing and thought of the world as the essays of Montaigne. He stands alone and secure among the world's writers. Through Florio (qv), who published his admirable translation in 1603, Montaigne was known to Shakespeare, and he very slightly influenced Francis Bacon, 10 of whose essays appeared in 1597. He has fascinated great men in every civilized country and in every generation—never, perhaps, more than now.

Editions of the essays appeared in 1580, 1582, and 1588, each containing changes as well as new material. In 1595 his family, aided by Mademoiselle de Gournay and Pierre de Brach, published what they called "a new edition found after the author's death and augmented by him by a third more than was in preceding impressions." The text of 1595 forms the base of Courbet and Royer's edition (Paris, 1872-91), which has also Montaigne's letters. There is in the municipal library of Bordeaux a copy of the edition of 1588, with many autograph notes by Montaigne, differing, often considerably, from the changes in the editions of 1595. These notes were used in the not very accurate editions of Naigeon (Paris, 1802), of Desoer de l'Aulnaye (ib, 1818), and of Amaury-Duval (ib, 1820). Convenient for general use are the edition of Leclerc (ib, 1865) and, in English, that of the second William Hazlitt (4 vols., Boston, 1887). Fortunat Strowski edited *Les essais de Michel de Montaigne* (2 vols., Bordeaux, 1906-09). The essays had been translated into English by John Florio (1603) in time to be used by Shakespeare and, as it seems, by Ben Jonson also. Florio's rendering was reëdited by C. Cotton (3 vols., London, 1711),

Percival Chubb (ib., 1891), W. C. Hazlitt (with *Letters*, 4 vols., 1902), Adolphe Cohn (New York, 1907), Thomas Seecombe (London, 1908).

Bibliography. Grün, *La vie publique de Montaigne* (Paris, 1855); Malvezin, *M. de Montaigne: Son origine, sa famille* (ib., 1875); Bonnefon, *Montaigne, l'homme et l'auteur* (ib., 1893), reprinted in the same author's *Les amis de Montaigne* (ib., 1898); Stapfer, *Montaigne* (ib., 1894); id., *La famille et les amis de Montaigne* (ib., 1896); also Nerlet, *Études littéraires* (ib., 1882); Champion, *Introduction aux essais de Montaigne* (ib., 1899); V. Giraud, *Les époques de la pensée de Montaigne* (ib., 1909); Villey, *L'influence de Montaigne sur Locke et Rousseau* (ib., 1911). Works in English are the *Lives* of Montaigne by St. John (London, 1858) and M. E. Lowndes (ib., 1898); R. W. Emerson, "Montaigne," in *Representative Men* (Boston, 1850); Pattison, in *Essays* (ib., 1889); H. D. Sedgwick, *Essays on Great Writers* (ib., 1903); E. Dowden, *Michel de Montaigne* (Philadelphia, 1905); G. E. Woodberry, *Great Writers* (Garden City, N. Y., 1907); Grace Norton, *The Influence of Montaigne* (Boston, 1908); id., *The Spirit of Montaigne* (ib., 1908); J. M. Robertson, *Montaigne and Shakespeare* (New York, 1909); Edith Sichel, *Michel de Montaigne* (ib., 1911). A specially luminous treatment of the man and his attitude towards life is in Walter Pater, *Gaston de Latour* (London, 1896). There is a good bibliography appended to Bonnefon, "Montaigne," in Petit de Julleville, *Histoire de la langue et de la littérature française*, vol. iii (Paris, 1897).

MONTALEMBERT, mōn'tā'län'bār', CHARLES FORBES DE TYRON, COUNT (1810-70). A French historian and publicist. He was born in London, May 29, 1810, of an ancient noble family, his father, who had been driven out by the Revolution, having entered the English service. His mother was of the Scottish family of Forbes, to which circumstance may be ascribed Montalembert's knowledge of, and strong admiration for, English social and political institutions. He began his studies at Fulham, near London, and finally, after some time spent in Stockholm with his father, who was Ambassador to Sweden, completed them in Paris. At 20, already an ardent champion of Catholicism and of popular freedom, which he hoped to see united, he joined Lamennais (q.v.) on the staff of the *Avenir* and cooperated with him in the establishment of free schools. He accompanied Lamennais on his unhappy journey to Rome, and then to Munich, and remained in close sympathy with his views, even after his master had gone further away from orthodoxy in *Paroles d'un croyant* (1834). At the end of that year, however, he broke with Lamennais and definitely submitted to the papal decisions. He still maintained his ardent desire to demonstrate the close relations of his faith and popular liberty, and took great delight in the study of mediæval history, the first fruit of which was his *Histoire de Sainte Elisabeth d'Hongrie* (1836). Three years later appeared a collection of his studies in mediæval art, which he vigorously exalted over corrupt modern standards under the title *Du vandalisme et du catholicisme*. In 1835, having now attained the required age, he took his seat in the House of Peers, where, young as he was, he stood out at once as a champion of religion. After the revolution of 1848 he was elected a member of the Constituent

Assembly, and took his seat on the Right, though acting occasionally with the Left. He had a decisive influence in bringing about French intervention in Italy and the restoration of Pius IX to Rome. He was elected to the Legislative Assembly also, and for a time contrived, while he continued the same line of policy as regarded Church interests, to give a general support to the government of Louis Napoleon. His first break with that government was on the question of the proposed confiscation of the Orléans property, and after the coup d'état of Dec. 2, 1851, the breach became irreconcilable. From that time he continued to be the implacable assailant of the arbitrary repression of public opinion which characterized the measures of Napoleon III. Failing of reelection in 1857, he devoted himself to literature, in which his eminence had been recognized by election to the Academy in 1851. In a political prosecution in 1858 he was ably defended by Berryer (q.v.). A devoted son of the Church, he clung to his early passion for freedom of thought, and took a pronounced position in favor of the view that the papal syllabus of 1864 and the declaration of infallibility were both inopportune. He died March 13, 1870. Besides a large number of articles, he left many books of great interest, of which the following have been translated into English: *Catholic Interests in the Nineteenth Century* (1852); *The Political Future of England* (1856); *Constitutional Liberty* (1858); *Pius IX and France in 1849 and 1859* (1861); *Pius IX and Lord Palmerston* (1863); *Memoir of the Abbé Lacordaire* (1863). Of these and other works a collected edition in French appeared in eight volumes (Paris, 1860-68). But to English readers he is best known by his brilliant series of historical studies, *Les moines d'occident* (5th ed., 1847-77), translated as *The Monks of the West, from St. Benedict to St. Bernard* (new ed. by Gasquet, London, 1895). Consult his *Life* by Mrs. Oliphant (London, 1872) and by De Meaux (Paris, 1897); also Lecanuet, *Montalembert d'après ses papiers et sa correspondance* (3 vols., ib., 1895-1905); Follioley, *Montalembert et Monseigneur Paris* (Paris, 1906); Paul Thureau-Dangin, *English Catholic Revival in the Nineteenth Century* (2 vols., London, 1914).

MONTALEMBERT, MARC RENÉ, MARQUIS DE (1714-1800). A French general. He was born at Angoulême, entered the army at 18, and served in Germany (1733) and in Italy and Bohemia (1742). He wrote much on fortification after his election to the Academy of Sciences (1747), and, in spite of opposition to his novel theories, was intrusted with the fortification of the island of Aix in 1779. He recognized the defects of the bastion system (Vauban, q.v.) of defense in fortifications, and advocated the employment of casemates for protected gunfire. His theories were first adopted by Prussia, and formed the basis of what afterward became known as the polygonal system of defense. He is also famous for his work, *La fortification perpendiculaire* (1776-86), resëdited under the title *L'Art défensif supérieur à l'offensif* (1793). See FORTIFICATION.

MONTALVÁN, mōn'tāl-vän', JUAN PÉREZ DE (1602-38). A Spanish dramatist and novelist. With the degree of doctor of theology, he joined the priestly congregation of St. Peter at Madrid. Already a successful dramatist at 17, he passed under the influence of Lope de Vega, who urged him to the composition of his *Orfeo en lengua*

castellana (1624), a work produced in competition with Jáuregui's *Orfeo*. In the same year he produced some eight tales, *Sucesos y prodigios de amor*, which were translated into French and published at Paris as early as 1644. A prose work, the *Vida y purgatorio de San Patricio* (1627), deals with the familiar legend of St. Patrick's Purgatory, and afforded the material whence Calderón was to derive his play on the subject. A collection containing tales and other compositions more or less dramatic in form is the *Para todos* (1632). It is as a playwright that Montalván stands highest, ranking as one of the more important of the dramatists next in consequence to Lope, Calderón, Alarcón, Tirso de Molina, and Moreto. He himself prepared two editions of his pieces, published in 1638 and 1639 and reprinted in 1652. The favorite among the dramas is the *Amantes de Teruel*. Selected plays of Montalván may be found in vol. xlv of the *Biblioteca de autores españoles*. Consult G. W. Bacon, "The Life and Dramatic Works of Dr. J. P. de Montalván," in the *Revue Hispanique*, vol. xvi (Paris, 1912), and James Fitzmaurice-Kelly, *Bibliographie de l'histoire de la littérature espagnole* (ib., 1913).

MONTALVO, GARCÍA ORDÓÑEZ DE. See ORDÓÑEZ DE MONTALVO, GARCÍA.

MONTANA, mōn-tā'ná (Lat., mountainous). A northwestern State of the American Union, lying between lat 44° 26' and 49° N. (the international boundary) and long 104° and 116° W. It is bounded on the north by the Canadian provinces of British Columbia, Alberta, and Saskatchewan, on the east by the Dakotas, and on the south by Wyoming and Idaho, and on the west by Idaho. Montana ranks third in size among the States of the Union. Its greatest length from east to west is along the forty-eighth parallel, 540 miles, and its average width from north to south is 275 miles. Its area is 146,997 square miles, of which 796 square miles are water. Glacier National Park, in northwestern Montana, has an area of 915,000 acres, 80 glaciers ranging from 5 square miles down to a few acres, and over 250 lakes. By means of good trails some of the best alpine scenery of the United States has been made available to thousands of tourists.

Topography. The eastern three-fifths of the State consist of rolling plains, lying at an elevation of from 2800 feet in the northeast to about 4000 to 5000 feet among the foothills of the Rocky Mountains, which take up the western portion. The main continental divide runs from Yellowstone Park for some distance along the southwest boundary, after which it turns eastward, and then crosses the State obliquely in a northwest direction. The general elevation of its crest is about 6500 feet, and the peaks rise from 8000 to 12,834 feet, Granite Peak representing the highest elevation. Thus, the range is considerably lower here and also less rugged than farther south in Wyoming and Colorado. A great longitudinal basin separates the Main Divide from the Bitter Root Mountains, which form the west boundary, and whose crest lies throughout between 7000 and 8000 feet above the sea. The mountain region is diversified by numerous spurs, valleys, and outlying ranges. It has been estimated that there are 30,000,000 acres of land level enough to be farmed, but much of it can be used only for dry farming.

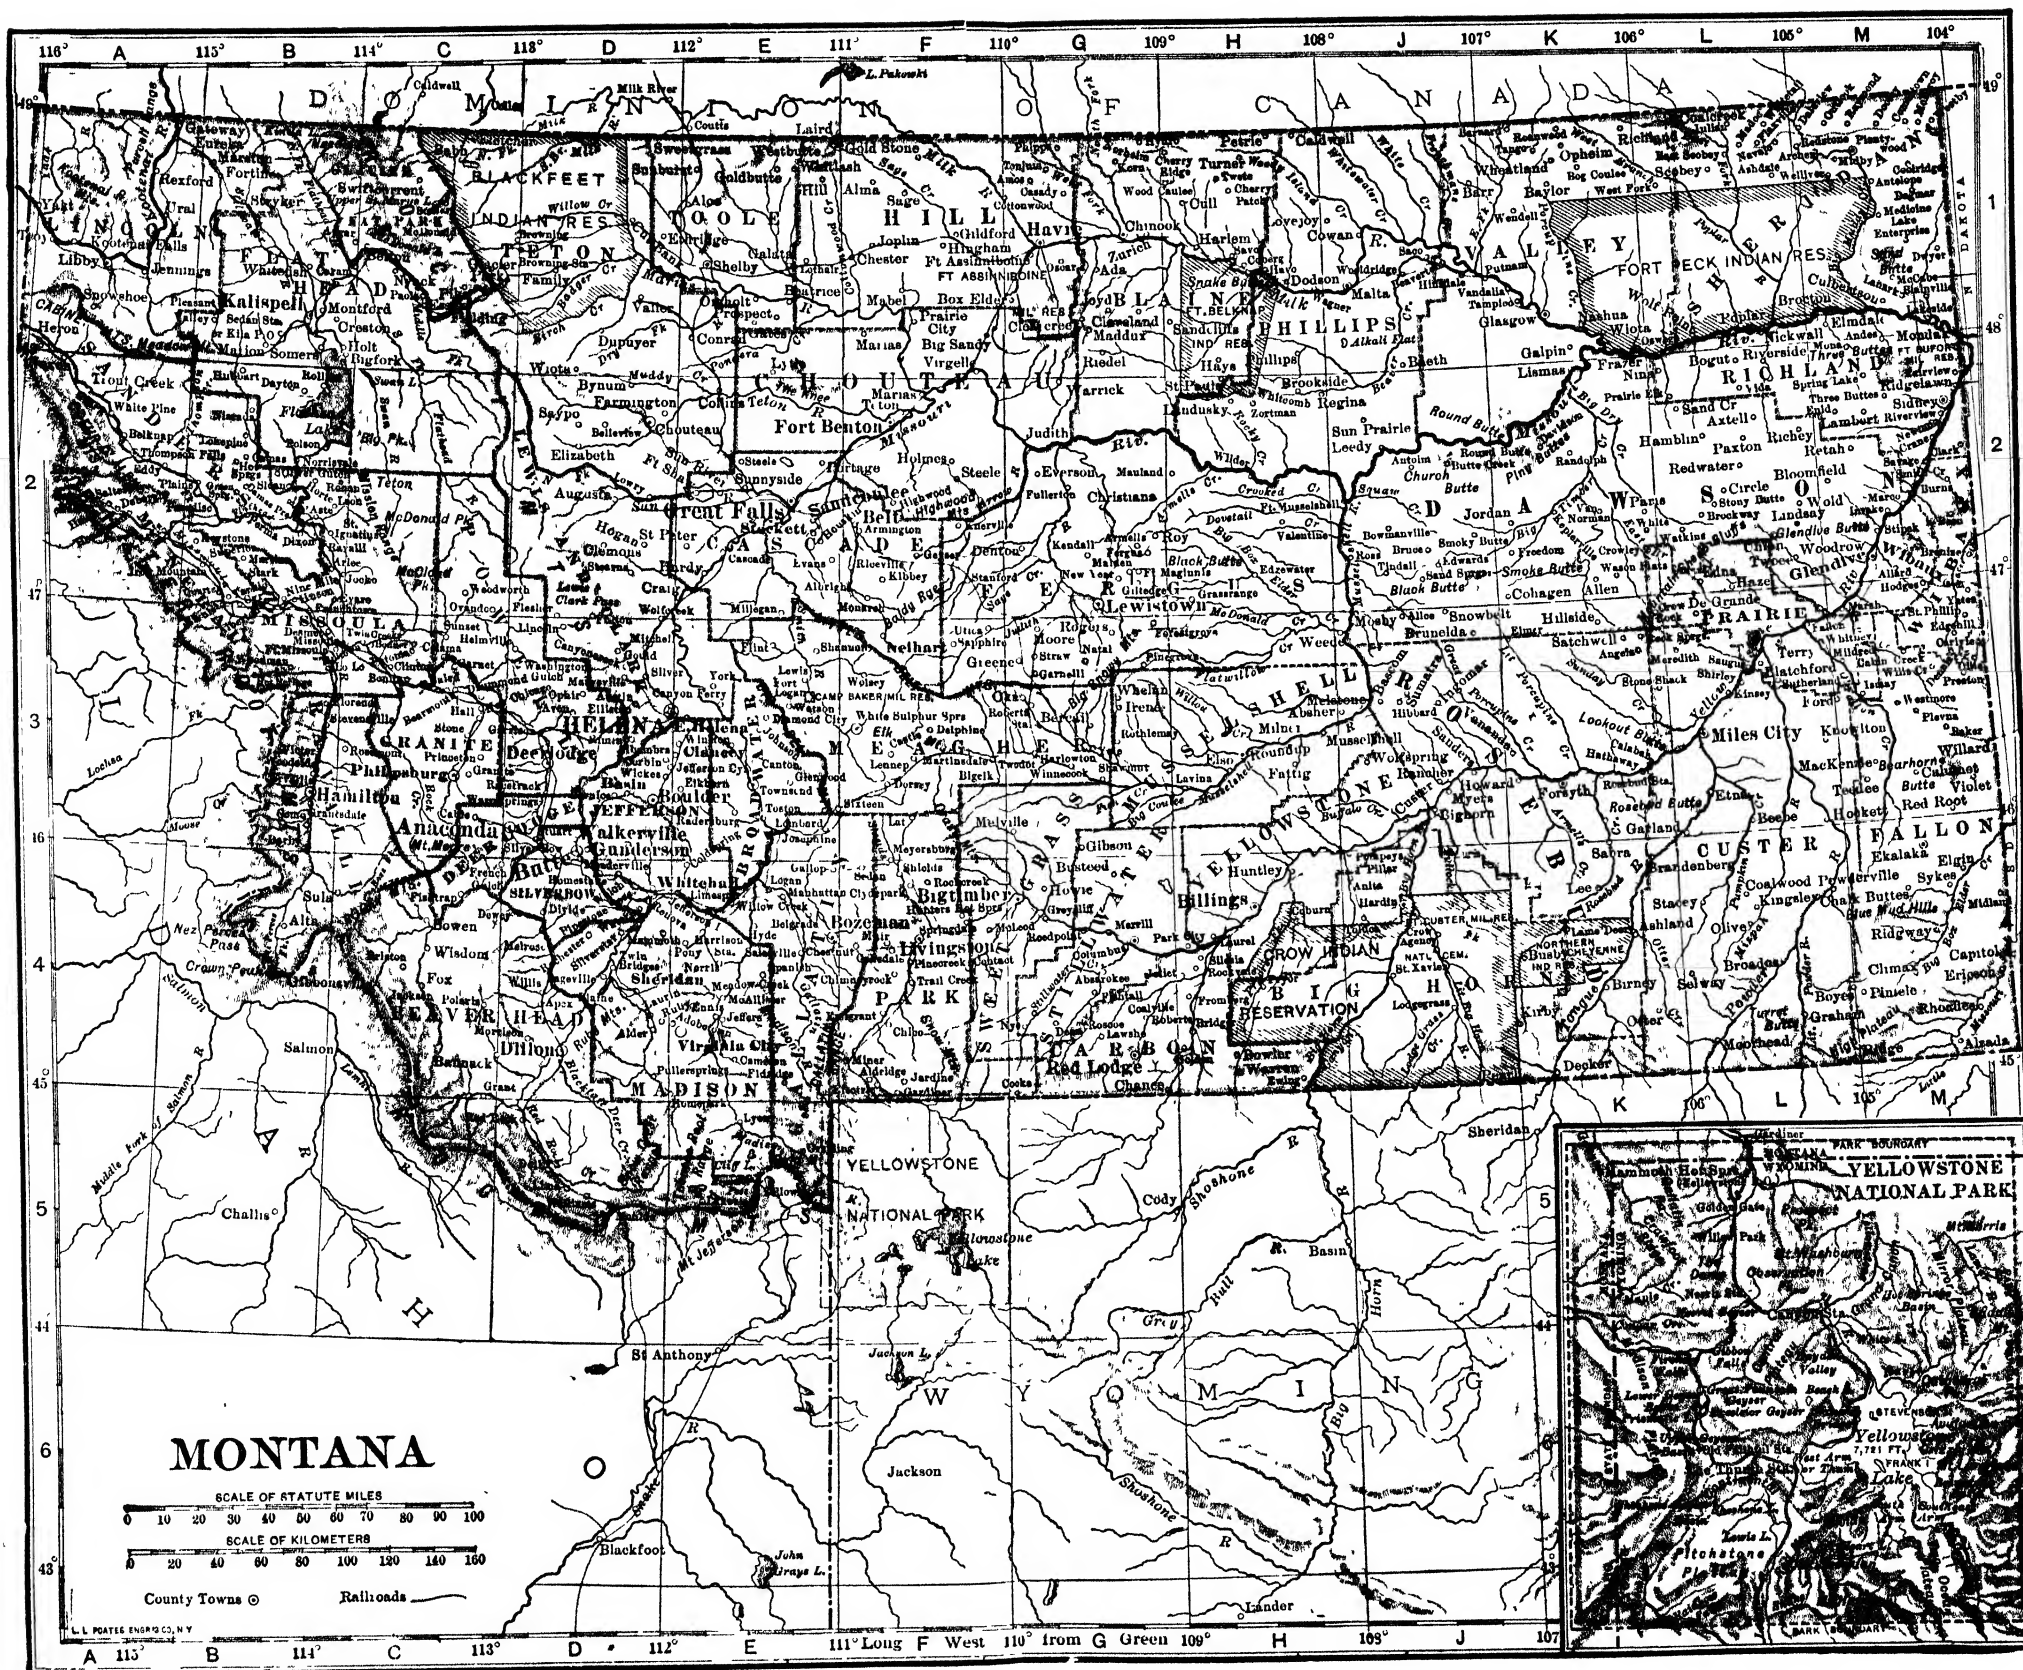

Hydrography. The Main Divide separates

the Missouri system from the Columbia River system, these two receiving the drainage of the State. The Missouri River springs from three main head streams in the extreme southwestern portion and in Yellowstone Park. It flows first northward along the eastern base of the mountains, then eastward through the great plains to the east boundary, just beyond which it receives its first large tributary, the Yellowstone, which drains the southeastern quarter. The Clark Fork of the Columbia River, with its two main branches, the Missoula and the Flathead, drains the great western basin, the latter branch flowing through Flathead Lake, the only lake of considerable size, with a length of 26 miles, an average width of 6 miles, an area of 191.8 square miles, at least 300 feet deep, at an elevation of about 2900 feet above the sea, and formed by the damming of the valley by a large Glacial moraine. Congress set aside 160 acres in this lake for a biological station, where the University of Montana conducts teaching and investigation. Both the Missouri and the Yellowstone are navigable for small boats more than 300 miles from the boundary, and the Clark Fork is also navigable for some distance into Montana. The railroads, however, have supplanted the rivers as means of communication.

Climate. The climate is in general very dry, healthful, and exhilarating. There is a great annual range of temperature, extending from 30° to 45° F. below zero to 110° F. above. At some stations the temperature has been more than 60° below zero, while the same locality may have an annual range of over 150°. The average mean temperature for the State ranges from 37° F. in the extreme northeastern part to 47° F. in certain sheltered valleys. The extreme cold winter is often tempered by the warm and dry chinook (qv.), which blows in a northeasterly direction from the mountain ranges and absorbs a large amount of moisture from the snow it melts. Blizzards occur only in the eastern plains, and tornadoes are unknown. The rainfall is generally insufficient to support agriculture without irrigation. The western mountainous part receives from 15 to 25 inches, east of the mountains from 10 to 15 inches, most of this during the growing season.

Soil and Vegetation. The principal valleys are characterized by fine level meadows with a rich loamy soil and are occupied by extensive cattle ranges. The eastern plains are almost treeless prairies, the river courses alone being fringed with willow, cottonwood, and similar trees. There are extensive forests of conifers in the mountain region of the western half, amounting in 1908 to about 28,000 square miles, or 20 per cent of the State's area. A considerable portion of this, however, has been burned over. The national government has reserved forest areas within the State amounting (1912) to 25,200 square miles. Yellow pine, red fir, Douglas spruce, and tamarack are the principal varieties.

Fauna. Before the advent of the white man the fauna east of the mountains was representative of the great plains in general and characterized by such animals as the jack rabbit, pocket gopher, prairie dog, badger, bison, coyote, sage and short-tailed grouse, and great numbers of grasshoppers. The fauna of the western forested part includes black and grizzly bear, elk, moose, mule and white-tailed deer, marten, beaver, lynx, mountain lion, coyote, wolf, porcu-

pine, rabbit, hare, woodchuck, squirrel, chipmunk, mountain sheep, and mountain goat. The fishes are very few in kind and include trout, grayling, and whitefish. In western Montana, particularly in the Bitter Root valley, part of the ticks (*Dermacentor venustus*) are infected with a germ disease which is communicated to man by the bite of the tick and a disease, known as spotted fever, results which is fatal in a large number of cases.

Geology and Minerals. The eastern and western halves of the State differ widely in their geological structure. The eastern plains consist mainly of undisturbed strata of Cretaceous and Tertiary rocks, the latter forming the extreme eastern portion. Narrow belts of Jurassic and Carboniferous rocks skirt the Cretaceous formation on the west along the base of the mountains. The mountainous half has a complex structure, with much folding and faulting. In the south the Archean granite cores and outpourings of Tertiary lava predominate on the surface, while north of the Missouri the main range is synclinal, the peaks being of Paleozoic formation.

Building materials such as limestone, sandstone, slate, granite, sands, and clay are abundant, and there are large deposits of marble of various hues. Bituminous coal is found along the eastern base of the mountains, and extensive beds of lignite exist in the east along the Missouri and Yellowstone rivers, but only in patches farther west, while petroleum is also found. Copper is very abundant, and lead, iron, and silver ores also exist, the silver generally in conjunction with the copper. Gold has also been found in great quantities in many parts. Around the headwaters of the Missouri and Yellowstone there are numerous hot springs and geysers.

Mining. Montana is an important mineral-producing State, ranking tenth in the value of its products in 1913. In the production of copper it is surpassed only by Arizona, and in the value of the silver produced only by Nevada. The first record of the production of copper was in 1868, but Montana did not become an important contributor of this metal until 1880, since when there has been a steady and rapid increase in the output. Towards the close of 1913 the State had yielded nearly 6,200,000,000 pounds, or more than one-third of the total output for the United States since 1845, ranking first among the States. The entire output is furnished by the Butte district. The presence of copper minerals in this district had been known since the discovery of gold in 1864, and attempts were made to treat the ores as early as 1866. It was not, however, until the late seventies that Butte began to attract attention as a copper camp, and large productions did not begin until a railroad reached the district in 1881. The production of copper in 1913 was 287,828,699 pounds, valued at \$44,613,448.

Silver is second in importance and is obtained chiefly as a by-product in the mining of copper. In 1913, out of a total production of 13,819,201 ounces, 10,326,364 fine ounces were from copper and copper-lead ores. The value of the production was \$8,346,797. The gold output of Montana from deep mines has been steadily falling off, but the placer output is increasing. The gold output in 1913 was valued at \$3,493,432. The lead production in 1913 was 5468 short tons, valued at \$481,176. The production

of zinc is more important than that of lead, and in 1913 this amounted to 44,337 short tons, valued at \$4,965,693. There are still large tonnages of zinc undeveloped, and Montana promises to rival the most important States in the production of this metal.

The coal areas are also important. The coal fields are widely scattered and range in the quality of their output from lignite to a fair grade of bituminous coal. In point of production the most important field is in Carbon County. The production in 1913 was the largest ever made, 3,240,973 short tons, valued at \$5,653,539. The number of men employed in the coal mines in 1913 was 3630.

Montana leads in the production of precious stones, this supremacy being due to the mining of sapphire, one of the few instances of gem mining carried on in the United States. The total value of the gems produced in 1913 was \$244,935. Other mineral products are cement, clay manufactures, grimestones, gypsum, iron ore, lead, lime, mineral waters, sand and gravel, sand-lime brick, and stone. The total value of the mineral products in 1913 was \$69,307,056.

Agriculture. The total number of farms in 1910 was 26,214, representing an aggregate area of 13,545,003 acres, about one-seventh of the entire State. The improved land in farms in 1910 was 3,640,309 acres; the average acres per farm were 516.7, and the total value of farm property, including land buildings, implements and machinery, domestic animals, poultry, and bees, in 1910 was \$347,828,770. The average value of all property per farm was \$13,269 in 1910, and the average value of land per acre was \$16.74.

One striking characteristic of Montana is the great area of semiarid land utilized for grazing purposes only, or left unutilized. Upon this land are located many very large farms or ranches, frequently exceeding 100,000 acres in extent. Of the total number of farms in 1910 (26,214), 23,870 were operated by owners and managers and 2344 by tenants. The great majority of farms have been acquired by their owners or operators from the government or from private corporations in the form of homesteads, Carey Act entries, desert-land entries, or entries on irrigated lands. Most of these have been acquired at a small price or on long-time credit, which has made it possible for farmers of small means to become owners. This fact accounts in the main for the small proportion of tenants. The native white farmers in 1910 numbered 18,163, foreign-born farmers 6853, and the negro and other nonwhite farmers 1196. Of the foreign-born white farmers 1320 were born in Canada and 1146 in Germany. The greater part of the remainder were born in the British Isles or the Scandinavian countries.

The following table gives the acreage, value,

PRODUCTS	Acreage	Prod bu	Value
Wheat	910,000	18,356,000	\$16,704,000
Oats	530,000	18,550,000	7,234,000
Potatoes	37,000	5,180,000	3,315,000
Flaxseed	320,000	2,560,000	3,072,000
Hay	700,000	*1,750,000	15,225,000
Rye	10,000	210,000	147,000
Barley	70,000	2,135,000	1,132,000
Corn	50,000	1,400,000	1,064,000

* Tons.

and production of the principal crops in 1914. The figures are estimates of the United States Department of Agriculture. The total value of crops in 1909 was \$29,715,000, and the combined acreage was 1,848,113, representing 50.8 per cent of the total improved land in farms. About two-fifths of the total value of crops in 1909 were contributed by the cereals and another two-fifths by hay and forage. The remainder, representing 17.3 per cent of the total, consisted chiefly of potatoes and other vegetables, grains and seeds other than cereals, fruits, forest products, and sugar crops. In that year the leading crops in the order of their importance were hay and forage, oats, wheat, and potatoes. The acreage of hay and forage in 1909 was 1,135,376, and their production amounted to 1,692,656 tons, valued at \$12,344,606. Oats had an acreage of 333,195 and a value of \$6,148,021 for the production of 13,805,735 bushels. Wheat was not greatly below oats in its acreage, amounting to 258,377. The production was 6,251,945 bushels, valued at \$5,329,389. The total acreage of potatoes and other vegetables in 1909 was 28,010 and their value \$2,227,736. Excluding potatoes, the acreage of vegetables was 7300 and their value \$929,000.

The principal orchard fruit produced is apples, of which there were grown, in 1909, 567,054 bushels, valued at \$566,938. Other fruits grown in smaller quantities are pears, plums, prunes, and cherries. The total value of the orchard fruits in 1909 was \$609,078. Strawberries are by far the most important of the small fruits. There were produced, in 1909, 406,038 quarts of strawberries, valued at \$46,870. Other important small fruits are blackberries and dewberries, raspberries and loganberries, currants, gooseberries, and cranberries. The total value of small fruits in 1909 was \$86,586. The growing of sugar beets is an industry of considerable importance. There were

portance than formerly. It is one of the leading States in the raising of sheep and the production of wool. While the herds of cattle are not as large as formerly, they are improved in breed and are more numerous. Considerable attention is also given to the raising of horses for the Eastern market. The total value of domestic animals on the farms in 1910 was \$84,999,659. On Jan 1, 1915, it was estimated that there were 791,000 cattle other than milch cows, valued at \$38,759,000; milch cows numbered 114,000, valued at \$8,550,000; horses 391,000, valued at \$33,626,000, mules 4000, valued at \$392,000, sheep 4,379,000, valued at \$19,268,000. In the quantity of sheep in 1914 Montana was exceeded only by Wyoming.

The total value of milk, cream, and butter fat sold and butter and cheese made in 1909 was \$2,093,594. There were sold 3,584,689 gallons of milk and 1,234,263 pounds of butter. The total number of fowls on the farms in April, 1910, was 966,690, valued at \$628,436.

Irrigation. Conditions in Montana make it necessary for a large proportion of its farm land to be irrigated before crops can be grown. Montana ranked second in 1909 in the total acreage of its land irrigated. There were in that year 8970 farms in which irrigation in some form was practiced, and the total acreage irrigated was 1,679,084, or about 45 per cent of the improved land in farms. The acreage included in irrigation projects in that year was 3,515,602. The length of irrigating ditches in 1909 was 18,934 miles. There were in 1914 three important irrigation projects in the course of construction by the United States government. These were the Huntley, the Milk River, and the Sun River projects. There was also the lower Yellowstone project, of which part is in Montana and part in North Dakota. The total investment in these projects exceeds \$5,000,000.

COMPARATIVE SUMMARY FOR 1909 AND 1904

THE STATE — FIVE LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manufacture
			Total	Wage earners (average number)				
			Expressed in thousands					
All industries	1909 1904	677 382	13,694 10,196	11 655 8,957	\$44,588 52,590	\$10,901 8,632	\$73,272 66,415	\$24,092 25,485
Cars and general shop construction and repairs by steam-railroad companies	1909 1904	12 10	2,084 1,115	1,913 1,039	2,912 1,055	1,538 799	2,811 1,572	1,725 902
Flour-mill and gristmill products	1909 1904	12 12	152 109	105 67	2,559 991	105 57	2,175 2,003	482 411

produced, in 1909, 109,434 tons, valued at \$546,832.

Live Stock and Dairy Products. In its early history stock raising largely monopolized the agricultural industry. Montana still remains one of the most important stock-raising States, but the industry is of less relative im-

Forest Products. The area of forest land in 1914 was 18,977,580 acres, about 19 per cent of the gross area. The commercial forest covered about 7,882,000 acres and consisted of yellow pine, lodge pole, larch, red fir, hemlock, white fir, white pine, and cedar. The estimated stand for 1914 was 65,600,000 M feet B. M. There

were cut, in 1913, 357,974 M feet of rough lumber, most of which was soft wood. Most of the timber milled was Western pine and larch. In the production of the latter Montana is the leading State. There were 109 active mills in 1913. In addition to the lumber sawed in mills there were produced on the farms in 1909 forest products valued at \$541,800.

Manufactures. Montana is a mining and agricultural State, and its principal manufacturing industries are those supplementary to its mining interests.

Copper mining and smelting form by far the most important manufacturing industry, but statistics for this are not shown because to do so would tend to disclose the operations of individual establishments. General information in regard to this industry will be found in the section on *Mining*. The most important industry for which figures can be shown is that connected with the manufacture of lumber and timber products. (See *FOREST PRODUCTS*.) Third in importance are industries connected with the manufacture and repair of cars, and fourth the manufacture of malt liquors.

The average number of wage earners in 1909 was 11,655, of whom 11,436 were males. The wage earners 16 years of age or under numbered only 30, of whom 29 were males. For the great majority of wage earners the hours of labor ranged from 54 to 60 a week in 1909. The State has six cities with a population over 10,000: Butte, Missoula, Helena, Anaconda, Great Falls, and Billings. In 1909 only 9.2 per cent of the total value of products in the State and only 15.7 per cent of the average number of wage earners were reported from these cities. Great Falls, with its large copper smelters, is the only one of the six cities in which is located a distinctively important industry.

Transportation. The eastern part is a high plateau devoted mainly to stock raising and is very sparsely settled. It has no large cities and very limited railway facilities. The western part, more largely a mining and manufacturing community, with several cities of commercial importance, has better transportation. There are no navigable rivers of any account. Colorado alone of the Rocky Mountain States excels Montana in railway mileage. Three lines, the Great Northern, the Northern Pacific, and the Chicago, Milwaukee, and St. Paul, cross the State from east to west. Each of these has a number of branch lines or feeders. There are also other lines. The total railway mileage on Nov. 1, 1914, was 4783, including main line and branches. Of this, the Great Northern had 1628 miles, the Northern Pacific 1459, the Chicago, Milwaukee, and St. Paul 1049, the Chicago, Burlington, and Quincy 135, and the Oregon Short Line 135. In many sections stages are the only means of conveyance, and in mountain regions saddle horses and pack mules are largely used. The regulation of railroad rates is in the hands of a State Railroad and Public Service Commission.

Banks. The organization of all banks is under the supervision of the State Auditor, and is controlled by stringent legislation. The first national bank was organized in 1867. On Sept. 12, 1914, there were 61 national banks, of which the aggregate capital was \$5,370,000, surplus, \$2,687,750; loans, \$30,800,819; cash, etc., \$1,057,225, and deposits, \$38,577,144. The State banks on June 30, 1914, numbered 190, and their

combined capital was \$6,000,000; surplus, \$1,101,438, cash, etc., \$180,180,000, loans, \$23,575,749, and deposits, \$23,455,935. There were 11 loan and trust companies and 21 private banks.

Government. The present constitution was adopted by a constitutional convention on Aug. 17, 1889, and was ratified by the people the following October first. The State was admitted to the Union, Nov. 8, 1889.

Legislative.—The legislative authority is vested in a Legislative Assembly, consisting of a Senate and a House of Representatives. The House of Representatives, in 1915, consisted of 93 and the Senate of 39 members. Members of both Houses must have resided for at least 12 months prior to their election in the county or the district from which they are elected. Representatives serve for two years and Senators for four years. Sessions of the Legislature must not exceed 60 days in length. The Assembly meets every two years on the first Monday in January. The sole power of impeachment is vested in the House of Representatives and all impeachments are tried by the Senate. An amendment providing for the initiative and referendum was adopted in 1906.

Executive.—The executive department consists of the Governor, Lieutenant Governor, Secretary of State, Attorney-General, State Treasurer, State Auditor, and the Superintendent of Public Instruction, each of whom holds office for four years. The Governor, Lieutenant Governor, and Superintendent of Public Instruction must be at least 30 years of age at the time of their election. The supreme executive power is vested in the Governor. The executive machinery operates, except for the functions peculiar to each office, through a system of boards composed of the executive officers.

Judiciary.—The judicial power is vested in a supreme court, in district courts, justices of the peace, and inferior courts for incorporated towns or cities. The supreme court consists of three justices. Justices of the supreme court are elected for a term of six years. The State is divided into judicial districts, in each of which there is elected one judge of the district court, whose term is four years. The number of districts may be increased or decreased by the Assembly.

Suffrage and Elections.—Every person of the age of 21 years or over who is a citizen of the United States and has resided in the State one year immediately preceding the election at which he offers to vote is entitled to vote. There is a primary law providing for party nominations by direct vote. It is modeled on the Wisconsin law. Primaries are held 70 days preceding any general election. Nominations are made by petition. Candidates for Senator and Representative may include in their petitions statements pledging their votes for that candidate for United States Senator who shall have received the highest number of votes for that position at the general election next preceding the election of a Senator in Congress, or they may declare that such vote is considered by them as merely a recommendation and not binding. During presidential primaries voters have the opportunity to express their preference, on their party nominating ballot, for their choice for President and Vice President. A candidate's expenses are limited to 15 per cent of one year's salary of the office for which he is a candidate.

Local and Municipal Government.—In each county there are elected three commissioners for a term of six years, a county clerk, sheriff, treasurer, and other necessary officers. The primary law described above applies to the nomination of candidates for municipal officers in all cities and towns having a population of 2000 and upward. Cities and towns have the right to adopt a commission form of government.

Other Constitutional and Statutory Provisions.—The legal rate of interest is 6 per cent. It is unlawful for an employer to employ children under the age of 16 years in underground mines. A period of eight hours constitutes a day's work in all works or undertakings carried on or aided by municipal, county, or State individuals, and on all contracts by them, and in mills and smelters for the treatment of ores and in underground mines. There are acts imposing liability upon railroads for injuries sustained by employees, and a measure fixing the rate of interest which may be charged to wage earners. The granting of injunctions in suits growing out of labor disputes is prohibited. There is a blue-sky law modeled after the Kansas statute. There is provision for county local option. No city or county may issue more than one license for every 500 inhabitants, except that two saloons may be licensed in any city or town.

Finance. Previous to its admission as a State the yearly budget of Montana ranged from \$30,000 to \$50,000. The funded debt on Nov 30, 1912, was \$1,200,000, which consisted of four series of bonds. Three of these were for the erection of the State capitol. One is an old issue—that of \$350,000—and the remaining are \$500,000 issued in 1909 and \$150,000 issued in 1911. The capitol-building bonds are not a direct obligation of the State, but are secured by 182,000 acres of land on which the timber is valued at more than \$3,000,000. The fourth issue outstanding is that of State bonds to the amount of \$200,000, issued in 1909, bearing interest at the rate of 4 per cent and redeemable at the option of the State, \$75,000 of these were redeemed on Jan. 1, 1913. The floating debt is made up of outstanding warrants, amounting at the end of the fiscal year 1912 to \$547,910. The per capita debt, which in 1880 was \$1.79, had increased in 1912 to \$3.73. The receipts during the fiscal year 1913 amounted to \$4,446,953 and the disbursements to \$4,808,845. There was a balance on hand at the beginning of the year of \$1,401,641 and at the end of \$1,039,749. The chief source of revenue is taxation, and the chief expenditures are for the State educational and charitable institutions.

Militia. The total number of males of militia age in 1910 was 23,232. The organized militia consisted of a regiment of infantry and two detachments of sanitary troops. The total strength of enlisted men was 557 and of officers 53.

Population. The population at various periods is shown by the following figures: 1870, 20,595; 1880, 39,159; 1890, 132,159; 1900, 243,329; 1910, 376,053. The estimated population in 1914 was 432,614. The greater part of the population is found in the western or mining section. The population per square mile in 1910 was 2.6. The urban population in places of 2500 or more in 1910 was 133,420, and the rural population was 242,633. The foreign-born population in 1910 was 91,644, and the native-born whites numbered 162,127. The largest number

of foreign-born whites come from Canada, but almost equally large numbers come from Austria, Germany, Ireland, and Sweden. There is an unusually large preponderance of male population. The males in 1910 numbered 226,872 and the females 149,181. The males of voting age numbered 155,017. The largest city is Butte, which in 1910 had a population of 39,165. The other large cities with their populations in 1910 are as follows: Great Falls, 13,948; Missoula, 12,869; Helena, 12,515; Anaconda, 10,134; Billings, 10,031.

Indians. The Indians, numbering about 11,000, are chiefly Blackfeet, Chippewas, Assinibons, Gros Ventres, Sioux, and Pend d'Oreilles. They are located on reservations which embrace about 15,000 square miles of agricultural and grazing lands and have schools at Crow, Fort Belknap, Fort Peck, and Tongue River. The average attendance at these schools in 1913 was 1140. The reservations are the Blackfeet, Crow, Flathead, Fort Belknap, Fort Peck, and Tongue River. The value of the lands exclusive of timber on these reservations in 1913 was \$26,971,600, and the total tribal and individual property of the Indians on the reservations was \$54,468,131.

Education. The percentage of illiteracy in 1910 was 4.8. The total number of illiterates 10 years of age or over was 14,457. Among foreign-born whites the illiterates numbered 8445, or 4.9 per cent. According to the thirteenth census there were, in 1910, 93,771 persons of school age, 6 to 20 years, and of these, 60,678 attended school in that year. The report of the State Superintendent of Public Instruction for 1914 showed a total school population in that year of 114,032. Of this number there were 85,782 enrolled in the schools during the year. The total number of teachers employed was 3878, of whom 3352 were females and 526 were males. The average salary of male teachers per month was \$93.29, and of female teachers \$75.55. The total disbursements for school purposes in 1914 amounted to \$6,954,903.

The administration of the public-school system is in the hands of State, county, and district officers. A board of trustees has supervision of the common schools of each district. Candidates for teachers' certificates are examined by the County Board of Education. This board also examines pupils applying to enter high schools. The school districts are required to keep schools open at least three months during the year, and all children between the ages of 8 and 14 are required to attend school for the full term, and children up to 16 years of age if they are unemployed. Manual and industrial training was made a part of the curriculum in 1911. The school districts having a population of more than 5000 must establish a manual-training school. In 1914 there were 55 high schools accredited for the full course and 11 others accredited for from one to three years' work. The total attendance in these higher-grade schools was 6824.

The Montana State Normal School is at Dillon. The institutions of collegiate rank include the University of Montana at Missoula, which is a part of the educational system of the State; the Montana State School of Mines at Butte; and the Montana College of Agriculture and Mechanic Arts at Bozeman. These institutions are all coeducational and under the control of the State.

Charities and Corrections. The correctional and charitable institutions are under the supervision of the State Board of Charities and Reform, which consists of three members. The institutions include the State Prison at Deer Lodge, the State Industrial School at Miles City, a home for orphans, foundlings, and destitute children at Twin Bridges, a soldiers' home at Columbia Falls, the State Hospital for the Insane at Warm Springs, and the State School for the Deaf, Blind, and Feeble-Minded at Boulder. At the State Orphans Home the State provides generously for the maintenance and education of the children confined there. The State Industrial School at Miles City is correctional and receives children, upon commitment by the district courts, between the ages of 8 and 18 years. It is very well equipped for industrial and manual training. On Jan. 1, 1914, there were 618 prisoners in the State Prison. The Legislature of 1911 passed a law giving the district courts jurisdiction as juvenile courts. In the same year was established a State tuberculosis sanitarium, especially for miners' consumption, and there was provided at the State Insane Asylum at Warm Springs an institution for the cure of persons who are suffering from mental affliction caused by the use of drugs or intoxicants.

Religion. The majority of the Church population belong to the Roman Catholic church. Other denominations having a following are the Methodists, Presbyterians, and Episcopalians.

History. The *Sieur de la Verendrye* is said to have traversed the region now included in the State of Montana in 1742. In 1804 the Lewis and Clark expedition crossed Montana from the northeast to the extreme southwest, and the following year, on their return journey from the Pacific coast, descended the Missouri and the Yellowstone in two parties, meeting at the junction of the rivers near the present eastern boundary of Montana. Trading posts were erected on the Yellowstone River by Manuel Lisa in 1809, William H. Ashley in 1822, and the American Fur Company in 1829. In 1840 Father Peter John de Smet of the Society of Jesus began mission work among the Flathead Indians, and this was followed by the establishment of a permanent mission among the Indians of Bitter Root valley in September, 1841. Fort Benton was founded by the American Fur Company in 1846. Gold was discovered as early as 1852 by Francois Finlay, a half-breed, near the Hellgate River, but the discovery aroused little attention till 1857, when John Silverthorn appeared at Fort Benton with a large quantity of gold dust which he had obtained in the mountains. In the winter of 1860 James and Granville Stuart settled on Gold Creek in the Deer Lodge valley, attracted by the rumors of gold in that region, and in the following year they commenced mining on a small scale, having been joined in the meanwhile by three other pioneers. Rich placers were soon discovered at various points in the mountains and an active immigration set in, mining settlements springing up at Bannack City, on Grasshopper Creek, on the Big Hole River, and on North Boulder Creek. In May, 1863, gold was discovered at Fairweather Gulch, near Alder Creek. The town of Virginia City sprang up near the spot, and within a year it had a population of 4000. In 1863 the Territory of Idaho, including the present Montana, was set off from Washington and Dakota, and

on May 22, 1864, the Territory of Montana was erected from land taken from Idaho. The early settlers were naturally of a reckless and lawless character and, as a result, for a considerable length of time life and property were in jeopardy. The existing state of affairs was, however, remedied by the stern administration introduced by the establishment of vigilance committees. The *Montana Post*, the first newspaper in the Territory, was published at Virginia City in 1865. In 1874 the seat of government was removed from Virginia City and established at Helena. On June 25, 1876, occurred the disastrous fight between General Custer and the Sioux Indians under Sitting Bull on the Little Big Horn River.

The prosperity of the Territory was increased by the completion of the Northern Pacific Railroad in 1883, surveys for the route having been made as early as 1853 by Isaac I. Stevens under authority of Congress. In January and February, 1884, a constitutional convention framed a constitution which was ratified by the people in November, and application was made to Congress for admission into the Union. No action was taken, however, until February, 1889, when an enabling Act was passed by Congress. On Nov. 8, 1889, Montana was admitted into the Union by proclamation of the President after a State constitution had been framed and State officers elected. In national elections Montana was Republican in 1892, fusion of Democrats and Populists in 1896 and 1900, Republican again in the campaigns of 1904, 1908, and 1912. From 1907 up to and including 1914 the State suffered from industrial troubles which centred about strikes in Butte and other cities. In the former year all industries in Butte were practically at a standstill as a result of the strike of nearly all classes of labor. In the presidential election of 1908 Taft received 32,333 votes, Bryan 29,326, and Debs 5855. The Democrats succeeded in electing their candidate for Governor, Edwin L. Morris, but all the other State officers elected were Republicans. On March 30, 1909, the last spike in a new transcontinental railway, the Chicago, Milwaukee, and Puget Sound, was driven at Missoula. In 1910 the Flathead Indian reservation was thrown open for settlement. In 1911 the Legislature was in deadlock from January 1 to March 2 over the election of a United States Senator to succeed Thomas H. Carter, Republican. Although the Legislature was Democratic by six votes, Senator Carter's influence was so strong that he was able to prevent the election of the Democratic Senator during this period. Henry L. Meyers, formerly a district judge, was finally elected. In the election of November 5 of that year Wilson received 27,941 votes, Roosevelt 22,456, Taft 18,512, and Debs 10,885. For Governor, Stewart, Democratic, carried the State. A Democratic Legislature was also elected. The Socialists have for many years been increasing in political power, and in 1911 succeeded in electing a mayor in Butte. On Jan. 4, 1913, the Legislature elected Thomas J. Walsh as United States Senator to succeed Joseph M. Dixon. The most important official elected on Nov. 3, 1914, was the representative at large. The Democrats were successful in electing their candidate. An amendment providing for woman suffrage was carried in this election. The Governors of the Territory and State of Montana have been as follows:

TERRITORIAL

Sidney Edgerton	1861-65
Thomas F. Meagher (acting)	1865-66
Green Clay Smith	1866-69
James M. Ashley	1869-70
Benjamin F. Potts	1870-83
John S. Crosby	1883-84
B. Platt Carpenter	1884-85
Samuel T. Hauser	1885-86
H. P. Leslie	1886-89
Benjamin F. White	1889

STATE

Joseph K. Toole	Democrat	1889-93
John E. Rickards	Republican	1893-97
Robert B. Smith	Democrat and Populist	1897-1901
Joseph K. Toole		1901-1909
Edwin L. Norris	Democrat	1909-1913
Samuel V. Stewart		1913-

MONTANA, UNIVERSITY OF A coeducational State institution at Missoula, Mont., founded in 1895. It maintains departments of literature, science, and the arts, schools of law, pharmacy, forestry, journalism, music, domestic science, commerce and accounting, and education, departments of correspondence study and university extension, and a bureau of public information. It offers graduate courses and grants the degrees of B. A., B. S., M. A., and M. S. There are also a summer school and a biological station. Tuition is free. The university had, in 1914-15, 80 instructors and a student enrollment of 861. The library contained 20,000 volumes. The endowment consists of 72 sections of land given by Congress in 1892. The income fund arises from the rental of lands unsold, from licenses to cut trees, and from the interest on the proceeds of the sales of lands invested in the permanent university fund, which is applied to the payment of bonds issued in 1897 for the construction and equipment of buildings. The income for maintenance amounted in 1914-15 to \$191,290. The value of the property was \$350,000, including a campus of 40 acres and buildings valued at \$200,000. The president in 1915 was Edwin B. Craighead, LL. D.

MONTANA STATE COLLEGE OF AGRICULTURE AND MECHANIC ARTS. A State institution for agricultural and scientific education, founded at Bozeman, Mont., in 1893. There are courses in agriculture, engineering, home economics, and science. The college has a campus of 60 acres, and also owns two farms of 160 acres each and a dry farm of 640 acres.

There was originally granted to the college for its support 140,000 acres of land. Of this, 25,928 acres have been sold, 114,072 remaining unsold, and 95,075 are under lease. The receipts from the sale of land in 1913-14 amounted to \$208,965 and from the sale of timber \$155,890. Appropriations from the State amount to about \$80,000 annually. The students in all courses in 1915 numbered about 500, and there were 50 instructors. The library contains about 14,000 volumes and 1000 unbound documents. The buildings are valued at \$305,000 and the equipment at \$180,400. The president in 1915 was James M. Hamilton, M. S.

MONTANELLI, mōn'tā-něll'ē, GIUSEPPE (1813-62). An Italian author and statesman, born at Puceccchio, Jan. 21, 1813. He studied law at Pisa and began to practice there, composing meanwhile verses which appeared at Florence in 1837. He became professor of commercial law in the University of Pisa, identified himself with the Liberal party there, and with two coöperators founded *L'Italia*, a periodical. After the rising of 1849 he became one of a triumvirate, with Guerrazzi and Mazzini. When Guerrazzi became dictator, Montanelli went on a mission to Paris, where he remained for 10 years. During this period he wrote a number of his works: a dramatic poem, *La tentazione*, interesting in connection with Corderici's *Satan*, and in which George Washington figures as an interlocutor, a tragedy, *Camilla*; and a few political and historical treatises, the *Schiarimenti nel processo politico contro il ministero democratico* (1852), the *Appunti storici sulla rivoluzione italiana* (1859), and the most noteworthy of his writings, the *Memorie sull'Italia e specialmente sulla Toscana dal 1814 al 1849* (1853). He returned to Italy in 1859 and advocated the formation of a central Italian kingdom. He was a deputy to the Tuscan Assembly, but there he accomplished little, for all parties looked upon him with distrust and he found himself with hardly any adherents. In *L'Impero, il papato e la democrazia in Italia* (1859) he defended his own standpoint. Having founded the short-lived *Nuova Europa*, he entered the Italian Parliament in 1861, and died June 17, 1862. Consult Provençal, *Alla cara memoria di Giuseppe Montanelli* (Leghorn, 1862), Redi, *Ricordo biografico di Giuseppe Montanelli* (Florence, 1883). Orlando, "Il Montanelli poeta," in *Marzocco* (ib., 1910).

MONTAÑÉS, mōn-tā-nyās', JUAN MARTÍNEZ (c. 1580-1649). A Spanish sculptor in wood, born probably at Alcalá la Real. He was a pupil of Pablo de Rojas in Granada and afterward worked in Seville. His sculptures there include a "Conception," in the cathedral, an altar with figures of saints and a life-size "Christ on the Cross," and some statues in the gallery of the city. These are fine examples of his art, which is notable for purity of style and beauty of expression. In 1635 he went to Madrid, where he made a model for an equestrian statue of Philip IV, and where Velazquez painted his portrait, which is now in the Prado Museum. Consult F. Gómez, *Historia de la escultura en España* (Madrid, 1885), and B. Haendke, *Studien zur Geschichte der spanischen Plastik* (Strassburg, 1900).

MONTANIST. See MONTANUS.

MONTANUS (Lat., from Gk. Μοντάβος, *Montanos*). A Phrygian convert to Christianity about 156. He is said to have been formerly a

priest of Cybele (q.v.) He undertook to restore the faith and practice of the primitive Church, but was finally excluded from fellowship as a heretic. Montanus taught that direct divine revelation still continued, and that he himself was the mouthpiece of the Paraclete, promised in John xiv. 16. Hence his movement is often called the new prophecy. He revived the primitive conception of the speedy return of Christ to earth, and the elect were summoned to gather at the Phrygian village of Pepuza, there to await their Lord. In view of the immediate end of the present age, asceticism was their rule of life, and martyrdom was courted. Montanus insisted upon strict ecclesiastical discipline, thus rebuking the alleged laxity and worldliness in the Church at large. He declared it wrong to grant forgiveness of mortal sin, and believed that the holiness of the Church demanded the exclusion of all offenders from membership. He denied that the hierarchy possessed any right or power to restore holiness when it had been forfeited through sin, and thus he took his stand against the theory of sacramental grace. Closely associated with Montanus were two women, Prisca (or Priscilla) and Maximilla, supposed to be endowed like himself with the spirit of ecstatic prophecy. Like the "spiritual gifts" of the apostolic age (cf. 1 Cor. xii), the prophetic spirit might rest upon any one, and this divine equipment marked out the leaders of the Church. Revelation was imparted without any activity on the prophet's part, he was passive like the lyre when struck with the plectrum. Maximilla was held to be the last of the prophets. She died in 179. Montanus' death was earlier, but the exact year is unknown. The Montanists spread rapidly, and Asiatic synods were early held against them. They were known in Rome as early as the time of Soter (165-174), who pronounced an adverse judgment upon their claims, as did several of his successors. They were excluded from the Catholic church and organized as a separate body. Their most distinguished convert was Tertullian (q.v.), whose later writings are the chief literary monuments of the Montanist movement. Excluded from the Catholic church, the Montanists did not long survive in the West, but in the East they are found as late as the sixth century, when Justinian finally suppressed them. The movement was the last protest of the ancient belief in direct inspiration against the growing ecclesiasticism of the Church, but it was largely discredited because of its extreme positions.

Consult the later writings of Tertullian, translated into English in *The Ante-Nicene Fathers*, edited by Roberts and Donaldson, vols. iii and iv (Edinburgh, 1868). Smith and Wace, *Dictionary of Christian Biography*, article "Montanus" (London, 1877-87). J. de Soveres, *Montanism and the Primitive Church* (Cambridge, 1878). Bonwetsch, *Geschichte des Montanismus* (Erlangen, 1881). Adolf Harnack, *History of Dogma*, vol. ii (Boston, 1896). Robert Rainy, *The Ancient Catholic Church* (New York, 1902).

MONTARGIS, mōn'tai'zhé'. A town in the Department of Loiret, France, at the confluence of the Loing and the Vernisson, and at the junction of three canals connecting the Seine and the Loire, 47 miles east-northeast of Orléans (Map. France, N. H. 5). Among its chief buildings are the thirteenth-century church of

La Madeleine with a fine choir, the town hall containing an art gallery, and the remains of the former imposing twelfth-century castle, which was formerly a royal residence, and the modern town hall, library, and museum. A bronze monumental group commemorates the "Dog of Montargis," who is said to have revealed his master's murderer by constantly following him (See AUBRY DE MONTDIDIER). There are considerable manufactures of paper, cotton goods, asphalt, rubber, tar, chemicals, leather, shoes, and cutlery, and a good trade in sheep, grain, wax, and honey. Anciently Montargis was the capital of Gâtinais. During the English occupation it was attacked on several occasions, and successfully resisted a siege in 1427. Until the palace at Fontainebleau was built, the castle at Montargis was a favorite royal residence and became known as "the Cradle of the Children of France." It is the birthplace of Mirabeau. Pop., 1901, 12,351. 1911, 12,927.

MONTAUBAN, mōn'tō'bān'. The capital of the Department of Tarn-et-Garonne, France, situated on an elevation above the confluence of the Tarn and Tescou, in a rich and beautiful country, 31 miles north of Toulouse (Map. France, S. F. 4). It is a handsome, well-built town, has a Renaissance cathedral finished in 1739, a Protestant theological college, a public library, a seventeenth-century town hall with a splendid museum containing many paintings by the artist Ingres, and the ancient castle of the counts of Toulouse. The cathedral contains Ingres's famous "Vow of Louis XIII." The town is the seat of a bishop. Cloth, sugar, lumber, furniture, hats, and metal ware are manufactured, but the chief activity of the town is its trade in horses, poultry, grain, oil, and wine. Its institutions include a school of commerce, a training college, a lyceum, and a theological faculty. Montauban originated in the abbey of St. Théodard or Montanoul, built in the eighth century on the site of the Roman Mons Albanus. The town's growth dates from its founding in 1144 by Count Alphonse of Toulouse as a refuge for serfs. It suffered severely during the Albigensian wars of the thirteenth century. It was an episcopal see from 1317 to 1560, when the inhabitants who had embraced the Protestant faith destroyed the cathedral. As one of the Huguenot strongholds it was a frequent object of attack. In 1621 it was unsuccessfully besieged by the forces of Louis XIII for 86 days, but the fall of La Rochelle in 1629 entailed its submission and the destruction of its fortifications. Ingres, the artist, was born at Montauban. Pop., 1901, 30,506. 1911, 29,778.

MONTAUK, mōn-tāk'. An Algonquian tribe formerly inhabiting the eastern end of Long Island and claiming sovereignty over most of the other tribes of the island. Their principal village was near Montauk Point. When first known they were a numerous people, but having been reduced by a pestilence in 1658 to about 500 souls, they were invaded by the Narragansett from the mainland and forced to seek shelter among the white settlers at Easthampton. A century later only 162 remained. Many of these joined a kindred band in New York about 1788, and in 1829 only about 30 were left on Long Island and these are now extinct. In 1914, 29 of this tribe were living with the Stock bridge in Wisconsin.

MONTAUK POINT. A promontory at the eastern end of Long Island, in Suffolk Co. N. Y. (Map: New York, D 2). On it are located a stone lighthouse 168 feet high, equipped with a flashing white light visible 19 (nautical) miles, a Daboll fog trumpet, and a United States life-saving station. United States and State troops had an encampment here, called Camp Wyckoff, after the Spanish-American War. The point was named from the Montauk Indians.

MONTAUSIER, mōn'tō'zyā', CHARLES DE SAINTE-MAURE, MARQUIS DE (1610-90). A French soldier. He was educated at Sedan, rose rapidly in the army, and in 1645 became Governor of Saintonge and Angoumois. Although reared a Huguenot he supported the crown during the Fronde (q.v.). Wounded at Martangais in 1652, he returned to Paris. In 1663 he became Governor of Normandy, was created Duke in 1665, and served as guardian of the Dauphin from 1668 to 1679. At his direction the edition of the Latin work *Ad Usum Delphini* was published. He was a patron of Boileau and Racine and was famed for his brusque manners and his austere piety. It is supposed that he was the original of Molière's *Misanthrope*. He was the long-time suitor of Mademoiselle Julie de Rambouillet, first dame d'honneur, whom he married and for whom he prepared the *Garlande de Julie*, a book of unpublished autograph verse by various authors.

MONTBÉLIARD, mōn'bā'lyar'. A town in the Department of Doubs, France, 9 miles southwest of Belfort (Map France, N, M 5). It lies in a valley between the Vosges and Jura mountains, at the confluence of the Allaine and the Lisaine, and on the Rhone-Rhine Canal. The strikingly situated fifteenth-century castle was an important German post during the battle of Héricourt in 1871. It forms one of a chain of fortifications extending from Belfort to Besançon. Among several public statues there is one to Cuvier, the naturalist, born here in 1769. The principal industries are watch-making and the manufacture of hardware, machinery, tools, silk and cotton goods, agricultural instruments, lace, and timber. Wine, leather, cheese, and the famous Montbéliard cows are exported. Montbéliard belonged to Württemberg intermittently from the close of the fourteenth century to the French Revolution. Pop., 1901, 10,034. 1911, 10,392, chiefly Protestants.

MONT BLANC, mōn blan (Fr., white mountain). The highest mountain in Europe outside of the Caucasus. It forms with the bordering heights an independent elongated ridge of the western Alps, on the boundary between France (Savoy) and Italy (Piedmont) (Map France, S., L 3). It is situated a short distance west of the Pennine Alps and north of the Graian Alps, about 40 miles south of Lake Geneva. It is composed of crystalline rocks bordered by Jurassic and Triassic strata which exhibit the fan-shaped arrangement characteristic of Alpine peaks. The highest point (15,781 feet), generally known as Mont Blanc, is in France, 7 miles south of the Swiss boundary. It is covered by an immense cap of ice more than 75 feet thick, from which glaciers extend downward in all directions, feeding the tributaries of the Rhone on the north and of the Po on the south. The largest glaciers run northward into the valley of Chamonix, the chief being the Glacier du Géant, which extends almost to the bottom of

the valley and is known in its lower course as the Mer de Glace. The line of perpetual snow is at an altitude of 8600 feet. The summit is surrounded by a series of lower, steep, and needle-like crags (*aiguilles*), and the ascent is dangerous and fatiguing, many persons having perished in the attempt. The first ascent was made in 1786 by the guide Balmat, induced by a prize offered by the scientist Saussure, who himself accomplished the ascent the following year and made some of the earliest scientific observations in high altitudes. The summit is ascended by large numbers of tourists every year. French engineers have projected a railway to the summit and have already constructed it as far as Mont Lachat, 7000 feet. Two meteorological and astronomical observatories are located on Mont Blanc, one built in 1890 at an altitude of 14,324 feet, the other built in 1893 on the summit.

Bibliography. Dobhoff, *Der Montblanc* (Vienna, 1880); Gussfeldt, *Der Montblanc* (Berlin, 1894); Duparc, *Le Montblanc, au point de vue géologique et pétrographique* (Geneva, 1896); Duier, *Le Montblanc* (4th ed., Paris, 1897); Mathews, *The Annals of Mont Blanc* (London, 1898); Whymper, *Chamonix and the Range of Montblanc* (7th ed., London, 1902); and the authorities referred to under MOUNTAIN CLIMBING.

MONT BLANC RUBY. See RUBASSE.

MONTCALM DE SAINT-VÉRAN, mōn'kalm' de sǎn-vā'tan', in English commonly called mōnt-kām', LOUIS JOSEPH, MARQUIS DE (1712-59). A distinguished French general. He was born at Candiac, near Nîmes, Feb. 29, 1712, entered the army in 1721, and became a captain in 1728. He served in Italy and Germany for many years and was wounded five times at the battle of Piacenza in 1746. In May, 1756, he was sent to Canada to command the French forces. He captured Fort Ontario at Oswego in August of the same year. The next year he forced the capitulation of Fort William Henry at the head of Lake George, with an English garrison of 2500 men, capturing 42 guns and a large amount of stores. In 1758 he defended Fort Ticonderoga with 3600 Canadians against General Abercromby at the head of 15,000 English, repulsing the latter after a determined attack (July 8). The loss of this battle would have meant the complete downfall of French power in America. Lack of troops, ammunition, and provisions, and the large reinforcements of the English, obliged Montcalm to retire all his forces the following year to Quebec, which was menaced by a powerful army under General Wolfe. Ill supported by the French government and forced to cope with disaffection among the authorities in Canada, Montcalm prepared to meet the inevitable outcome with a heroic determination which has lent so much romantic interest to his last days. The struggle around Quebec began July 31, 1759, and the siege continued for six weeks, until Wolfe's scaling of the Heights of Abraham above the city tempted the French to a battle in the field, in which the English were victorious, Sept. 13, 1759. Wolfe fell dead in the moment of victory, and Montcalm was borne from the field mortally wounded and died the following day. The city was surrendered a few days after his death, and its fall signaled the end of the French power in Canada. In 1827 Governor Dalhousie, of Canada, caused a monument to be erected in Quebec to

the joint honor of the two brave generals. The best work on Montcalm is by Parkman, "Montcalm and Wolfe," in *France and England in North America*, part vii (2 vols., Boston, 1885). Consult also: Bonnechese, *Montcalm et le Canada française* (Paris, 1877); Falgairolle, *Montcalm devant la postérité* (ib., 1886); Doughty, *The Siege of Quebec and the Battle of the Plains of Abraham* (Quebec, 1901).

MONTCEAU-LES-MINES, mōn'sō'-lā'-mēn'.

A town of east France, in the Department of Saône-et-Loire, on the Canal du Centre, 31 miles northwest of Mâcon (Map France, N, K 6). It is the centre of the Blanzay coal-mining region and has iron and copper foundries, machine shops, tile and textile factories. Pop., 1901, 28,779; 1911, 26,880.

MONT CENIS, mōn se-né'. See CENIS, MONT

MONTCHRESTIEN, mōn'krā'tyān'. ANTOINE DE (c1576-1621). A French playwright and economist. His father was an apothecary. Having left his birthplace, Falaise, the lad went to the College of Caen. In 1598 he published the tragedy of *Sophonisbe*, which was followed by *L'Ecoissaise*, ou *Marie Stuart*; *Les Lacènes*, *David*; *Aman*; a revision of *Sophonisbe* called *La Carthaginoise*, and *Hector* (1604). Meanwhile Montchrestien was working on a history of Normandy, which was never printed and is now lost. A duel caused him to flee to England, whence he returned with a head full of economic theories. He started a steel mill at Aussonne-sur-Loire with a store in Paris. His *Traité d'économie politique* appeared in 1615. Our expression "political economy" is merely a translation of the phrase coined by Montchrestien. He was slain during a Huguenot stir near Falaise, Oct. 8, 1621. Consult: Duval, *Mémoires sur Antoine de Montchrestien* (Paris, 1868); Funck-Brentano, *Montchrestien, sa vie et son œuvre* (ib., 1889); Louis Petit de Julleville, *Les tragédies de Montchrestien* (ib., 1891); Sporleder, *Ueber Montchrestiens "Ecoissaise"* (Marburg, 1892); Lauson, *Hommes et livres* (1895); Paul Lavalley, *L'Œuvre économique d'Antoine de Montchrestien* (Caen, 1903).

MONTCLAIR. A town in Essex Co., N. J., 5 miles north by west of Newark, on the Morris Canal and on the Lackawanna and the Erie railroads (Map: New Jersey, D 2). It is picturesquely situated on the slope of one of the ranges of the Orange Mountains, its highest point having an elevation of about 650 feet, the average elevation being about 300 feet, and is chiefly a residential town, though of some reputation as a summer resort. The heights command a fine view of New York and its harbor. The town has a hospital, two orphan asylums, a State normal school, art museum, fine high-school building, a public library, and the Montclair Military Academy. There are also a few manufactories, including paper mills and hosiery mills. Pop., 1890, 8656; 1900, 13,962; 1910, 21,550; 1914 (U. S. est.), 24,782.

Until separately incorporated in 1868, Montclair was a part first of Newark and then of Bloomfield. The upper section was settled by Dutchmen from Hackensack and called Speertown, the lower by Englishmen from Newark and called successively Cranetown and West Bloomfield. The present name was not adopted until 1865. Consult Harris, *An Historical Sketch of Montclair* (Montclair, 1881).

MONT-DE-MARSAN, mōn'-de'-mār'sān'

Capital of the Department of Landes, southwest

France, situated at the junction of the Midou and the Douze, 64 miles south of Bordeaux (Map: France, S, D 5). It has a normal school, a library, a lycée, an old castle, and fine public gardens. The chief manufactures are resins, turpentine, iron goods, lumber, and machinery, which, together with wine and live stock, are the chief exports. Pop. (commune), 1901, 11,604; 1911, 12,091.

MONT DE PIÉTÉ. See MONTIS DE PIÉTÉ.

MONTDIDIER, AUBRY DE. See AUBRY DE MONTDIDIER.

MONT DORE. See DORE

MONTEAGLE, mōnt-ā'g'l, WILLIAM PARKER, fourth BARON, and eleventh BARON MORFEY (1575-1622). An English adventurer. He was intimate with the chief Roman Catholic families of England, showed great enthusiasm for their cause, and for participating in Essex's rebellion in London in 1601 he was imprisoned for a short time and fined £8000. But when James I. ascended the throne in 1603 Parker swore allegiance to him and helped the new King to get control of the Tower of London. In 1605 he was called to Parliament as Lord Monteaagle. On October 26 of that year he received a letter, probably from his wife's brother, Francis Thresham, telling him of the Gunpowder Plot (q.v.) and warning him not to attend Parliament, and he was thus enabled to avert the threatened disaster. In 1609 he became a subscriber to and a member of the council of the Virginia Company.

MONTE ALBAN, mōn'tā al'ban. A picturesque ridge rising 2000 feet above the city of Oaxaca, on the summit of which is situated one of the largest ruins in Mexico. For a distance of 2 miles the crest has been leveled, terraced, and laid out in rectangular courts whose sides run towards the four directions. Around these courts are pyramids which were once crowned with temples. Only the bottoms of walls remain in place, disclosing a cement construction. In some of the mounds are narrow, stone-lined vaults. A number of sculptured slabs, some standing erect like the stelæ of the Maya cities to the south and some built against the bases of mounds, occur at Monte Alban. In addition to representing human and grotesque figures in low relief these slabs contain columns of hieroglyphs with bar at dot numerals. These inscriptions suggest those of the Maya, but it has so far been impossible to decipher any of the dates. Monte Alban was one of the early Zapotecan capitals and had apparently been abandoned for many centuries before the coming of the Spaniards. Consult Holmes, *Archaeological Studies among the Ancient Cities of Mexico*, in Field Museum Publications (Chicago, 1895-97), and Batras, *Exploraciones de Monte Alban* (Mexico, 1902).

MONTEBELLO, mōn'tā-bē'lō. A village in the Province of Pavia, Italy 12 miles southwest of Pavia. There on June 9, 1800, the French under Lannes defeated the Austrians. The engagement is sometimes called the battle of Casteggio, after a neighboring town. In May, 1859, the Austrians were again defeated here by the united armies of the French and the Piedmontese. Pop., 1901, 2119; 1911, 2183.

MONTEBELLO, DUKE OF. See LANNES, JEAN

MONTE CARLO, kār'lō. A town in the Principality of Monaco (q.v.), picturesquely situated on a beautiful and isolated elevation

rising above a bay of the Mediterranean, a little over one mile northeast of Monaco, the capital of the principality (Map France, S, M 5). The climate is celebrated for its salubrity and mildness. The town is most attractively laid out as a pleasure resort and its scenic surroundings are celebrated. The Casino, containing the gaming rooms to which Monte Carlo owes its fame and the principality its welfare, is a splendid building amid beautiful gardens, and contains besides the *salles de jeu*, a luxuriously appointed *salle des fêtes*, a reading room, etc. The chief games played are roulette and trente-et-quarante, with stakes ranging from 5 to 6000 and from 20 to 12,000 francs respectively. The gaming tables of Monte Carlo are patronized by people from all over the world, but are forbidden to the natives of the principality. The town was founded in 1856 and has been used as a gambling resort since its foundation. In 1861 the Casino was leased for 50 years to M. François Blanc, after whose death the control of the concern passed to a joint-stock company, capitalized at 30,000,000 francs. In 1898 the company obtained an extension of its concession to 1947. The company engaged to pay to the Prince of Monaco £400,000 in 1899 and £600,000 in 1913, and to increase its annual tribute from £50,000 to £70,000 in 1907, to £80,000 in 1917, to £90,000 in 1927, and to £100,000 in 1937. The town had, in 1913, 9627 inhabitants.

MONTE CASSINO, kas-sé'nó. A monastery situated on a hill overlooking Cassino (qv) in the Province of Caserta, Italy, 45 miles northwest of Naples. It was founded by St. Benedict about 529 on the site of a temple of Apollo, and was the original home of the Benedictine Order. It was destroyed and rebuilt several times and the present buildings were erected from 1637 to 1727, they are remarkable for their noble architecture and beautiful situation. The library and archives, containing 50,000 printed books and 30,000 manuscripts, are historically famous. In 1866 the monastery was enrolled as a "national monument."

Bibliography. Tosti, *Storia della badia di Montecassino* (Rome, 1889-1890). Taggi, *Paleografia artistica di Montecassino* (Monte Cassino, 1876 et seq.). Rickenbach, *Montecassino von seiner Gründung bis zu seiner höchsten Blüte unter Abt Desiderius* (Einsiedeln, 1884-85). Clausse, *Les origines bénédictines* (Paris, 1899).

MONTECATINI DI VAL DI NIEVOLE, môn'tá-ká-té'ne dé vâl dé nyá'vô-lá. A town in the Province of Lucca, Italy, 1180 feet above the sea, 24 miles northwest of Florence. The warm baths below the town (*Bagni di Montecatini*, pop. (commune), 1911, 5526), dating from the fourteenth century, are much frequented by invalids. Pop. (commune), 1911, 3355.

MONTE CENISIO, môn'tá chà-né'zyô. See CENIS, MONT.

MONTE CIRCEO. See CIRCEI.

MONTE CORVINO, môn'tá kór-vé'nó, GIOVANNI DI (c 1247-c 1328). A Franciscan missionary and traveler. In 1289 he was sent by the Pope as legate to the Great Khan of Persia. From thence he went to the Coromandel coast of India about 1291-92. He was next heard of in Peking, where he arrived before 1305. Pope Clement V created him Archbishop of Peking in 1307, and in the following year three bishops arrived to assist him. He estab-

lished three mission stations in Peking and one near Amoy harbor, and enjoyed considerable success. Monte Corvino's letters were published in the *Munchner gelehrte Anzeigen*, no. 22, part iii (1855).

MONTE CRISTI, kris'té. A seaport of the Dominican Republic, situated on the north coast near the Haitian frontier (Map West Indies, E 2). The town has a large harbor 7 miles in circumference and carries on an active export trade in hides, molasses, coffee, and tobacco. It is the station of a United States consular agent. Pop., 5000.

MONTE CRISTO, kris'tó. A small island off the west coast of Italy, 28 miles south of the island of Elba (Map Italy, C 3). It consists largely of a mountain of granite, rising 2000 feet above the sea, and was made a penal colony in 1874. Monte Cristo acquired fame through Dumas's novel *The Count of Monte Cristo*.

MONTE CRISTO, THE COUNT OF. The most famous romance of Alexandre Dumas (1844-45), founded on Penchot's *A Diamond and a Vengeance*. The hero, Edmond Dantès, is unjustly imprisoned in the Château d'If (see IF), escapes, and after discovering a fabulous treasure on the island of Monte Cristo, pursues with his vengeance those to whom his sufferings were due.

MONTECUCCOLI, môn'tá-kóo'kô-lé, or **MONTECUCULI**, môn'tá-kóo'ky-lé, RAIMONDO, COUNT (1609-80). An Austrian general. He was born near Modena and entered the Austrian artillery as a volunteer under his uncle, Ernesto, Count Montecuccoli, in 1625. During the Thirty Years' War he was employed in various services, military and diplomatic. In 1657 he was sent to support John Casimir of Poland against the Swedes and Prince Rákóczy of Transylvania, and compelled Rákóczy to make peace with Poland and to break his alliance with the Swedes. In the following year he was made a field marshal and was sent to aid the Danes against the Swedes, in which also he was eminently successful. In 1660 he commanded the army sent to oppose the Turks, who had broken into Transylvania, and after an indecisive warfare of three years he won the great battle of St. Gotthard, on the banks of the Raab, Aug. 1, 1664, defeating Kiuprili and forcing the Turks to sign a twenty years' peace. In the war between France and Holland, in which the Emperor took part with Holland, Montecuccoli was given the command of the Imperial army in 1672. He took Bonn and, notwithstanding the endeavors of Turenne to prevent it, effected a junction with the Prince of Orange. In 1675 he was opposed to Turenne on the Rhine, and they spent months in manoeuvres in which neither could gain any advantage and which ended in the death of Turenne. Montecuccoli then pursued the French across the Rhine. The Emperor Leopold made him a prince of the Empire, and the King of Naples bestowed on him the Duchy of Melfi. His memoirs were published in French (Amsterdam, 1770) and in the original Italian by Ugo Foscolo (Milan, 1807) and by Giassi (Turin, 1821). Consult also Campori, *Raimondo Montecuccoli, la sua famiglia e i suoi tempi* (Florence, 1877), and Grossmann, *Raimund Montecuccoli* (Vienna, 1878).

MONTEFIASCONE, môn'tá-fyás-kô'nâ (It., bottle mountain) (Map Italy, C 3). An episcopal town in the Province of Rome, Italy, 9 miles northwest of Viterbo. It is situated 3

miles from the railway station at an altitude of 2076 feet, commanding a magnificent view of Lake Bolsena. The ancient walls are still standing. Its chief buildings are the uncompleted cathedral of Santa Margherita, the early eleventh-century Romanesque-Gothic church of San Flaviano, and a sixteenth-century castle. Montefiascone is celebrated for its high quality of muscat wine. The town dates from the sacred Etruscan Fanum Voltumna. Pop. (commune), 1901, 9371; 1911, 9563.

MONTEFIORE, mōn'tē-fī-ō'rē, CLAUDE JOSEPH GOLDSMID (1858-) An English educator and author. He was born in London of Jewish parents and was educated at Balliol College, Oxford. He devoted himself to communal work in behalf of London Jews, held various high offices in Jewish institutions in London, and with Israel Abrahams edited the *Jewish Quarterly Review*. He became president of the Anglo-Jewish Association. Montefiore delivered the Hibbert lectures for 1892 on the *Origin and Development of the Religion of the Ancient Hebrews*. With Israel Abrahams he wrote *Aspects of Judaism* (2d ed., 1895), and he is sole author of *Liberal Judaism* (1903), *The Synoptic Gospels* (1909), *Some Elements of the Religious Teachings of Jesus* (1910), the Jowett lectures.

MONTEFIORE, SIR MOSES HAYIM (1784-1885) A Jewish philanthropist. The scion of a wealthy Anglo-Italian banking family, he was born at Leghorn, Italy, Oct. 24, 1784. He was educated in London, became a member of the Stock Exchange, and in 1824, having realized a large fortune, retired from commercial pursuits and commenced a crusade for the amelioration of his race. In 1812 he married Judith Cohen, whose sister had married the head of the great Rothschild banking house. He was strenuous in his efforts to remove the civil disabilities of Jews in England, and finally, overcoming great opposition, received the honors of election as High Sheriff of Kent, and Sheriff of London in 1837, when he was knighted. In 1846 Queen Victoria made him Baronet. From 1827 to 1875 he made seven journeys to the Orient, conferring great benefits on his kindred, and being everywhere received by the rulers with the greatest marks of respect. He spent the last years of his life at Ramsgate, where, in 1865, he had endowed a Jewish college to the memory of his wife, who died in 1862. He died there July 28, 1885, in his one hundred and first year. Consult Loewe (ed.), *Diaries of Sir Moses and Lady Montefiore* (London, 1890).

MONTEGO BAY. A seaport on the north coast of Jamaica, 18 miles west of Falmouth (Map, West Indies, C' 3). It has a good harbor defended by a battery, and a general trade of some importance. A United States consular agent resides in the town. Pop., 1891, 4803, 1911, 6616.

MONTÉGUT, mōn'tā'gū', JEAN BAPTISTE JOSEPH EMILE (1825-95). A French writer and editor, born at Limoges. He practiced law until 1847, when he entered the field of letters by an article in the *Revue des Deux Mondes* on the philosophy of Emerson. Later he translated the works of Emerson, Macaulay, and Shakespeare into French, and it is chiefly because of his introducing these writers to French readers that he is remembered. In 1857 he became an editor of the *Revue des Deux Mondes*, but resigned in 1862 to join the *Monteur Universel*.

Among his writings are *Les Pays-Bas: Impressions de voyage et d'art* (1869), *L'Angleterre et ses colonies australes* (1879), *Poètes et artistes de l'Italie* (1881), *Esquisses littéraires* (1893).

MONTEIRO, mōn-tā'io, CÂNDIDO BORGES (1812-72). A Brazilian physician. He was born in Rio de Janeiro and, after taking his degree (1834) at the Medical School there, served the institution as professor of operative surgery and topographical surgery from 1837 to 1862. He was physician to the Emperor, and took an active part in politics, as president of the municipal chamber of the capital, as Secretary of Agriculture, Commerce, and Public Works, and as Senator.

MONTELEONE DI CALABRIA, mōn'tā-lā-ō'nā dē ka-lā-brē-a. An episcopal town in the Province of Catanzaro, Italy, on a hill 1575 feet above the sea, about 2 miles from the Gulf of Santa Eufemia and 70 miles north by east of Reggio di Calabria (Map, Italy, F' 5). Its ruined castle was built by Frederick II and its church is adorned with sculptures by Gagini of Palermo. The town has been several times devastated by earthquakes, the last in 1905. It has a trade in silk and oil. Monteleone is on the site of the Greek Hipponium, mentioned as early as 389 B.C., and the Roman Vibo Valentia. Pop. (commune), 1901, 12,997, 1911, 13,066.

MONTÉLIMAR, mōn'tā-lé'mar'. A town in the Department of Drôme, France, near the confluence of the Roubron and Jabron, 27 miles by rail south of Valence (Map, France, S, J 4). It is irregularly built on a castle-crowned hill, commanding fine prospects of the Vivarais Mountains. The former castle is now a prison. Among its chief institutions are a chamber of agriculture, a communal college, and a public library. It manufactures lumber, cabinetwork, silk, cotton, corsets, hats, chocolate, vermicelli, agricultural machinery, flour, and spirituous liquors and is famed for Montélimar nougat, an almond candy. In the vicinity coal and lignite are mined. Montélimar is on the site of the Aesum of the Romans, the thermal spring at Bondonneau, 2½ miles to the southeast, anciently used by them, was rediscovered in 1854. The town was destroyed by the Saracens and rebuilt by Montheil d'Adhémar in the tenth century. Here Calvinism was first embraced in France. Cohny besieged the town unsuccessfully in 1569, but it was taken by the Huguenots in 1587. Pop., 1901, 13,351, 1911, 13,281.

MONTELIUS, mōn-tā-lé-us, GUSTAF OSCAR AUGUSTIN (1843-). A Swedish antiquarian and ethnologist, born in Stockholm. He took his degree of Ph.D. at Upsala in 1869. From 1868 to 1888 he was connected with the Academy of Antiquities, in 1888 he was appointed professor in the State Historical Museum, and from 1907 to 1913 he was state antiquarian. He traveled widely and lectured in America as well as in Europe. He declined the directorship of antiquities in the Museum für Volkerkunde in Berlin and a professorship in the university there. His costly library was given (1913) to the Academy of Antiquities in Stockholm. He contributed largely to scientific periodicals and was editor of several. Among his works are *Från järnåldern* (1869); *Sveriges forntid* (1872-75); *Lifret i Sverige under hednatiden* (1873; 3d ed., 1903, Eng., Fr., Ger. trans.); *Sveriges historia från äldsta tid till våra dagar* (1875-77; Ger. trans., 1906);

La civilisation primitive en Italie depuis l'introduction des métaux, a great work, of which three volumes of plates (1895, 1905, 1911) and two volumes of text had appeared up to 1915

MONTELUPO, mōn'tā-lōō'pō, RAFFAELLO DA (c.1505-c.1567). An Italian sculptor and architect, the son of Baccio da Montelupo. He was a pupil of Michelangelo and frequently assisted him, but his work is usually clumsy and mannered. One of his best productions is the Rossi Monument in Santa Felicità, Florence. He made three statues for the tomb of Pope Julius II and partly built the monument to Leo X in the church of Santa Maria sopra Minerva in Rome, besides executing a figure of St. Damian in the Medici Chapel in Florence, several bas-reliefs in the Casa Santa at Loreto, and the tomb of Baldassare Turini in the duomo of Pescia. He left part of an autobiography, which is translated in Perkins, *Tuscan Sculptors* (London, 1864).

MONTEMAYOR, mōn'tā-ma-yōr', or **MONTEMÔR**, JORGE DE (?1520-61). A Spanish poet and novelist, born at Montemôr-o-Velho, near Coimbra, Portugal. Little is known as to the details of his life. He seems to have studied music and to have traveled back and forth between Spain and Portugal, in the suite of various members of the two royal families, during the period 1543 to 1555, when he is thought to have gone to England and to the Netherlands in the train of Philip II of Spain. He perished in a duel (or was murdered) in 1561. With the exception of a couple of songs and a few lines of prose in Portuguese, contained in his famous pastoral romance, he composed wholly in Castilian. His literary renown is based on his unfinished *Diana enamorada*, a work modeled on the Italian pastoral novel and published about 1559. It mingles verse with the prose and beneath the fiction of the pastoral situation veils the love experiences of the author himself. An English version, made by Bartholomew Young in 1583 (printed in 1598), is of importance because of the influence which it had upon Sidney's *Arcadia* and upon Shakespeare's *Two Gentlemen of Verona*. As Montemayor's romance remained incomplete, several Spanish continuations of it were made. The best is that of Gaspar Gil Polo (1564). Lyrics of Montemayor are to be found not only in the *Diana*, but also in his *Cancionero* (Antwerp, 2 vols., 1544-58). An edition of Montemayor came out in 1886 at Barcelona. Consult G. Schönherr, *Jorge de Montemayor, sein Leben und sein Schaffen* (Halle, 1886); Domingo García Pérez, *Catálogo de los autores portugueses que escribieron en castellano* (Madrid, 1890); J. Fitzmaurice-Kelly, in the *Revue Hispanique*, vol. II (Paris, 1895); Marcelino Menéndez y Pelayo, "Orígenes de la novela," in the *Nueva biblioteca de autores españoles*, vol. I (Madrid, 1905); J. Marsan, *La pastorale dramatique en France* (Paris, 1905); D. Guimarães, *Bernardim Ribeiro* (Lisbon, 1908); H. A. Rennert, *The Spanish Pastoral Romances* (2d ed., Philadelphia, 1912).

MONTEM CUSTOM, THE. A famous traditional custom at Eton College. Its origin is lost in obscurity; it is described in Malin's *Consuetudinarius* of 1560. Until 1758 its observance took place in January, when it was changed to Whitsun Tuesday, it was held every second or third year, and triennially from 1775, until it was abolished in 1847, owing to the

disorder which attended it. It was a procession of the Eton boys, attired in fancy dresses, to a certain mound (*ad montem*, hence the name) known as Salt Hill. They were licensed to levy contributions, known as salt, from every visitor, and the receipts were given to the captain of the day, who kept what was left after the expenses of the festivity were paid to help him in his university career. For a full account, consult Sterry, *Annals of Eton College* (London, 1898), and Sir H. Maxwell Lyte, *History of Eton College* (ib., 1904). See also **ETON COLLEGE**.

MONTEMOLIN, mōn'tā-mō-lēn', COUNT OF. See CARLOS, DON.

MONTEMÔR, J. DE. See MONTEMAYOR, J. DE.
MONTEMORELOS, mōn'tā-mō-rā'lōs. A town of the State of Nuevo León, Mexico, 42 miles south of Monterrey, on the National Railways of Mexico (Map. Mexico, J 5). It lies in the midst of a fertile irrigated region, celebrated for its production of fruits, especially oranges. Its municipal population, in 1895, was about 3500.

MONTEN, mōn'ten, DIETRICH (1799-1843). A German battle painter, born at Düsseldorf, where he began to study at the Academy in 1821. Later he became a pupil of Peter Hess in Munich, where, after a visit to Italy and study trips in other parts, he made his permanent home. The success of some battle pieces he exhibited led to his being commissioned to paint in the arcades of the Royal Garden three historical episodes, but his reputation dates more especially from his "Finis Poloniae" (1832, National Gallery, Berlin), depicting the departure of the Poles from their country in 1831, a painting which became widely known through lithographic reproductions. Other specimens from his brush include "Death of Gustavus Adolphus at Lützen" (1835, Hanover Museum) and "Napoleon on a Reconnaissance" (New Pinakothek, Munich).

MONTENEGRO, mōn'tā-nā'grō. A kingdom of Europe, situated in the western part of the Balkan Peninsula (q v), between lat. 41° 55' and 43° 30' N and long 18° 30' and 20° 45' E (Map. Balkan Peninsula, B 3). The name Montenegro, given to the country by the Venetians, is a translation of the Slavic Crnogora (pronounced cher-nā-gō'rā), which signifies Black Mountain. The mountains, however, are not black, but are white or grayish. The name was not known before the reign of Crnojevic, the Black Prince, in the fifteenth century, and he is supposed to have given his name to the mountains. The country is bounded by Servia on the east, by Albania on the south, by the Austrian Province of Dalmatia on the west, and by Herzegovina on the west and north. It has a short sea frontage on the Adriatic, but no good port. The area is estimated at 5603 square miles. Montenegro is a part of the great Karst limestone plateau which, beginning in south Austria, extends along the east side of the Adriatic through Turkey and Greece. It is crowded with mountains from 2500 to over 8000 feet in height, the highest elevations being in the northeast. Nearly the whole country is covered by the Karst formation, possessing a cold climate and a few patches of cultivable land scattered among poor pastures, and has the peculiarities of similar limestone formations. Looked at from above, the land would seem to be honeycombed with cells due to the agency of

water. Rivers fully formed suddenly rise out of the rocks and disappear as suddenly. Here they have scooped out wide valleys and there they have merely produced sink holes into which they vanish. Thus, large parts of the country have little surface water, and the inhabitants use rain water or snow. The two important rivers are the Zeta and the Morača. The Zeta disappears in a chasm on the plain of Nikšić and reappears miles away at the head of the Zeta valley, the largest valley and the most fertile part of Montenegro. The Morača flows between stony banks, along which no track leads, and joins the Zeta, and their waters empty into the Lake of Scutari, on the borders of Albania.

Around the shores of the Lake of Scutari is a narrow plain, where agriculture is intensive, but there is no agriculture among the stony wastes of the Karst, and no crops are raised excepting in the alluvial valley of the Zeta and some smaller streams and along the coast. Agriculture is of the most primitive kind. Grain, tobacco, potatoes, and other vegetables are grown. The vine and fig thrive also, and the olive is produced along the narrow coastal plain. The mean annual temperature is from 61° F. in these regions to 35° F. on the higher parts of the plateau. On the whole the climate is raw except in the low-lying river valleys and along the coast. The pasture lands, poor as they are, afford grazing for cattle, goats, and sheep, which are the chief riches of the country. There are about 500,000 sheep and goats, 60,000 cattle, 8000 swine, and 3000 horses.

The flora, though sparse on the whole, includes a considerable variety, on account of the diversity of climate. Practically all the useful plants the people require are grown. Scattering beeches and oak trees are about all that relieve the monotony of the mountains except in the still almost inaccessible north, where fine oak, beech, and pine forests are found, but are valueless because of lack of roads. The fauna includes the bear, wolf, and fox, and a considerable number of aquatic and other birds. The most important fish is the bleak, a considerable quantity of which is exported.

The estimated population in 1905 was 250,000, of whom, roughly, 223,500 were Orthodox Greek, 12,500 Roman Catholic, and 14,000 Mohammedan. An estimate of 1912 placed the total at 285,000. They are thinly scattered over the lower grounds, and on the slopes of the hills their rude stone huts with one door, one window, and roof of straw stand at intervals of about a quarter of a mile, around them are little patches of wheat, barley, and potatoes. The settlements are connected with one another by bridle tracks about 3 feet broad winding over limestone boulders and covered with a loose sliding surface of limestone blocks of all sizes. Such is the characteristic aspect of the settled parts of Montenegro outside of the towns. There are few roads except those recently built which connect Cetinje, Podgoritsa (Podgorica), and Nikšich (Nikšić) with one another and the coasts. The Montenegrins have not desired roads and for ages took care not to construct them, because they feared they would open their country. The Montenegrins are an offshoot of the Servian branch of the Slavic race. Physically they are among the largest and finest people in Europe, and the conditions of their mountain life in a poor country have developed

peculiarities that make them easily distinguishable from the Servians. They are a race of warriors, always ready to take arms against external encroachments and equally ready to defend at home what they regard as their personal rights. They have thus the reputation of being excitable, quarrelsome, and violent, but every man, even the poorest, has a dignified bearing. The figures for population given above relate to the country as it was before the Balkan wars of 1912-13, the area being 3506 square miles. As a result of those wars Montenegro received a considerable accession of territory, viz., 2129 square miles (estimated)—168 square miles from the former Turkish Vilayet of Scutari and 1961 square miles from Kossovo, the inhabitants of the acquired area were estimated to number 230,000, making the total population in 1915 about 520,000. Cetinje, the capital, which is but a few miles distant from the Dalmatian seaport Cattaro, has about 5300 inhabitants (exclusive of the garrison); other towns of importance are Podgoritsa (10,000), Duleigno (5100), Nikšich (5000), and Antivari (2400). In the new territory is Jakova (14,000).

Elementary education is free and nominally compulsory, but illiteracy, especially among females, is common. There are about 120 primary schools, an agricultural school, a few secondary schools, and a theological seminary. The government until December, 1905, was a mild paternal despotism depending on the will of the Prince, who filled all executive offices; under the absolutist régime only the best men filled every grade of offices throughout the country. In 1905, however, the Prince promulgated a constitution and summoned a National Assembly (Skupština) of members popularly elected. A parliamentary régime was therefore introduced. On the occasion of the fiftieth anniversary of his accession Prince Nicholas, in virtue of an enactment of the Skupština, assumed the title of King, Aug. 28, 1910. The country also has a complete system of local government. There are several hundred village councils, elected every three years, levying taxes, distributing charities, and appointing supervisors of education.

The state revenue amounts to between \$700,000 and \$800,000 a year and is derived chiefly from customs, monopolies, and land tax. Austrian, Russian, and Turkish money, weights, and measures are in use.

The external trade is small. In 1905 the imports amounted to about \$944,000, and the exports to \$346,000, in 1911 to \$1,631,000 and \$478,000. The leading exports include hides, wool, horses, cattle, olive oil, and sheep. Cattle are shipped to Malta, Austria, Italy, and France. The chief imports are salt from Turkey, petroleum from Russia (both government monopolies), maize, cottons, hardware, sugar, coffee, and rice. In 1911 over half of the imports came from Austria-Hungary. The construction of a narrow-gauge railway from Antivari to Nikšich (about 100 miles) has been begun. This line will facilitate the development of iron mines. There are reported 538 miles of telegraph line.

Army. The armed forces of Montenegro constitute a true militia. Service is universal and compulsory between the ages of 18 and 62 as follows: 2 years in the training class, 33 years in the active army, 10 years in the reserve.

The active army comprises two classes those physically fit for all field work, those suitable only for service in the transportation, supply, and sanitary units. Each year during the two years' training service the men receive three months' instruction if assigned to the artillery, two months' if to the infantry. There is no cavalry. The active army, so-called—33-year period—may be called to the colors annually for a period of 10 or 15 days. The reserves—10-year period—are assembled once a year for muster and may also be mobilized for manœuvres. Men unable to perform military duty are taxed for the support of the army in proportion to their income.

There are three infantry divisions of three brigades each, one division of two brigades. Total battalions 56, of which three are Moslems. War strength between 30,000 and 40,000 men. Annual budget about \$1,250,000, of which Russia contributes \$350,000.

History. Montenegro belonged in the Middle Ages to the great Servian Kingdom, but after the power of the Servians was broken by the Turks in 1389 at the battle of Kossovo (qv) the Montenegrins under their Prince, who was of the royal blood of Serbia, maintained their independence, though compelled to relinquish the plains about Scutari, with their chief fortress of Zabljak, and to confine themselves to the mountains (1485). In their warfare against the Turks the Montenegrins leaned upon Venice, mistress of the eastern coast of the Adriatic. In 1516 their last secular Prince resigned his office and transferred the government to the Vladika, or Bishop, and the secular and ecclesiastical authority was thereafter united in the Prince-Bishop. The dignity of Prince-Bishop was elective, by the side of the chief magistrate was a civil governor. The Ottoman rulers continued to assert their claims to Montenegro and included it in the Pashalic of Scutari, but the Montenegrins, in their rocky fastnesses, succeeded generally in asserting their independence, and more than once the Moslem invaders met with disaster. In 1696 the office of Vladika ceased to be elective. In that year the present reigning dynasty of Petrović-Njegoš was inaugurated in the person of Danilo Petrović. For a century and a half the succession was from uncle to nephew, the Vladika not being permitted to marry. In 1710 the Montenegrins sought and obtained the protection of Russia, the Czar agreeing to grant them an annual subsidy, while they, on their part, agreed that the Vladika was to be consecrated by the Czar. In 1796 the Prince-Bishop Peter I defeated the Pasha of Scutari, who had invaded Montenegro, and for the next quarter of a century there were no more Turkish invasions. The Montenegrins rendered important aid to Russia at the beginning of the nineteenth century against the French in Dalmatia and took a prominent part in the attack on Ragusa and the capture of Curzola, but they were not allowed to realize their dream of becoming masters of the seaport of Cattaro. Peter II, who ruled from 1830 to 1851, made great efforts to civilize his people and improve their condition. He established the Senate, introduced schools, and endeavored, though unsuccessfully, to put an end to internal feuds and predatory expeditions into the neighboring provinces. In 1851 the last Prince-Bishop died, and his successor, Danilo I, in 1852 separated the religious

from the secular supremacy, retaining the latter under the title of Gospodar, or Prince. In 1852 war broke out with the Turks, who, under Omer Pasha, invaded the country, but through the intervention of the Powers peace was arranged Feb. 15, 1853. In 1855 Danilo decreed civil and religious liberty for his subjects, and in the following year he went to the Paris Conference to obtain recognition of the independence of Montenegro, but his efforts were unavailing. On Aug. 11, 1860, he was assassinated by a Montenegrin whom he had exiled. In the first year of the reign of his nephew and successor, Prince Nicholas, the Montenegrins stirred up an insurrection against the Turkish rule in Herzegovina, which was soon suppressed, and in return they were so hard pressed by the Turks that they were glad to agree to a treaty (1862), by which the sovereignty of Turkey over Montenegro was recognized. The more serious insurrection that broke out in Bosnia and Herzegovina in 1875 caused Prince Nicholas, in conjunction with Prince Milan of Serbia, to declare war against Turkey (July, 1876). As the Servians suffered reverses, an armistice was arranged in November, but with the entrance of Russia into the struggle in the following spring the Montenegrins renewed their war. By the Treaty of Berlin (1878) the European Powers recognized the independence of Montenegro with an enlarged territory, including Nikshich, Podgoritsa, and the port of Antivari, together with the seaboard district thereto appertaining. This was guarded by a restriction prohibiting Montenegro from having a navy and providing that its waters should be closed to ships of war of all nations. In 1880 the Great Powers, against the protests and armed resistance of the Turks, made over Duleigno to Montenegro. In 1896 the bicentenary of the Petrović dynasty was commemorated, and in the same year Princess Helena, a daughter of Prince Nicholas, married the Italian prince who subsequently (1900) became King Victor Emmanuel III. In October, 1905, the Prince proclaimed the abolition of the autocratic system and summoned a popular National Assembly which met on December 19. The Prince thereupon promulgated a Liberal constitution to which he took an oath, and a regular parliamentary government with a responsible ministry was instituted. On Aug. 28, 1910, Prince Nicholas celebrated the golden jubilee of what had been on the whole a most successful and auspicious reign by assuming the title of King. The Montenegrins sympathized more or less openly with the Albanian insurrections of 1910-11 against Turkey and afforded a refuge for hard-pressed tribesmen, especially for the Christian Malissori. Repeated conflicts between Turks and Montenegrins on the border aroused a strong national desire for war, and it was not surprising that Montenegro joined with Greece, Bulgaria, and Serbia in forming (March, 1912) the Balkan Alliance against Turkey. Montenegro preceded her allies in the formal declaration of hostilities by nine days (October, 1912). In the ensuing Balkan War (qv) the chief Montenegrin offensive was directed against Scutari, which capitulated on April 23, 1913, while a smaller Montenegrin force, in conjunction with a Servian army, occupied the seaports of Alessio and San Giovanni di Medua. Much ill feeling was engendered in Montenegro, as well as in Serbia, by the high-handed diplomacy

and military threats which Austria-Hungary employed in order to establish an independent Albania and thereby to deprive Servia of part of her conquests and of any outlet on the Adriatic. A show of force was required from the Great Powers to compel Montenegro to surrender Scutari to the new Principality of Albania (May, 1913). In the second phase of the Balkan War, Montenegro joined with Servia, Greece, and Rumania against Bulgaria and, in accordance with the Treaty of Bucharest (Aug 6, 1913), received from Servia, as compensation for assistance in the Balkan War, approximately a half of the Sanjak of Novi Bazar, including Plevlje, Byelopolye, Ipek, and Djakova. The Balkan War nearly doubled the territory and population of the mountain kingdom. This successful issue of the joint action of Montenegro and Servia against their hereditary Turkish enemy served immediately to turn the patriotic instincts of their common Serb nationality against their feared and hated Austro-Hungarian enemy. The Montenegrins had shared with the Servians the bitterest feeling for their northern neighbor ever since Austria-Hungary in 1908 had annexed the Serb provinces of Bosnia and Herzegovina—a feeling which the attitude of the Dual Monarchy during the Balkan War had not tended to alleviate. Montenegrins as well as Servians no doubt countenanced numerous plots in Bosnia against Hapsburg rule, and, following the assassination of the Austrian Archduke Franz Ferdinand at the Bosnian capital on June 28, 1914, and the outbreak of war between Austria-Hungary and Servia, Montenegro threw in her lot with Servia (Aug 8, 1914) and thereby became a party to the great War in Europe (qv).

MONTENOTTE, mōn'tā-nōt'tā. A village in the Province of Genoa, Italy, 26 miles west of Genoa. Here, on April 12, 1796, Napoleon won his first victory over the Austrians under Argenteau.

MONTÉPIN, mōn'tā-pān', XAVIER AYMON, COUNT DE (1824–1902). A French writer, born at Apremont (Haut-Saône). He studied at the Ecole des Chartes, entered journalism in 1848, founded *Le Canard*, was a contributor to the antirevolutionary *Pamphlet* and *Lampion*, and with De Calonne published two satirical pamphlets, *Les trois journées de Février* and *Le gouvernement provisoire*. He wrote almost 100 works of fiction, originally published as feuilletons in the *Petit Journal*, and more than a score of plays. His plays were frequently the result of collaboration, and in several instances were based upon his own stories. Titles of the

former include *Les chevaliers du lansquenet* (1847), *L'Officier de fortune* (1857); *Le ventriloque* (1876); *Le secret de Titan* (1883), *La police* (1897), of the latter, *Le connétable de Bourbon* and *Tabarin* (1873), with Grangé.

MONTE PINCIO, mōn'tā-pēn'chō. See PINCIAN HILL.

MONTEPULCIANO, mōn'tā-pul-chā'nō. An episcopal town in the Province of Siena, Italy, 28 miles southeast of Siena (Map: Italy, C 3). It is situated 6 miles from its railway station, at an altitude of 1970 feet. It is surrounded by mediæval ramparts, has interesting houses, palaces, churches, and a cathedral of the sixteenth century built by Bartolommeo Ammanati. It contains a monument by Michelozzo. Its institutions include a technical school, Gynnasium, and library. The chief trade is in silks and wines. Pop (commune), 1901, 15,399, 1911, 15,994.

MONTEREAU, mōn't'rō'. A town in the Department of Seine-et-Marne, France, at the confluence of the Seine and Yonne, 49 miles southeast of Paris by rail (Map: France, N, II 4). Its chief buildings are the thirteenth-century parish church and the Château of Surville. The manufactures include porcelain, pottery, brick, tile, shoes, vaimish, dyes, and agricultural machinery, and there is general commerce in agricultural produce and cattle. On the bridge across the river John the Fearless, Duke of Burgundy, was assassinated in 1419, at the instigation and in the presence of the Dauphin, afterward Charles VII, and in the immediate vicinity, on Feb 18, 1814, Napoleon gained his last victory over the Allies, an event commemorated by a bronze equestrian statue of the conqueror, on the bridge, by Pajol. Pop, 1901, 7929; 1911, 8617.

MONTEREAU, PIERRE DE. See MONTREUIL, PIERRE DE.

MONTEREY, mōn'te-rā'. A city in Monterey Co., Cal., 127 miles by rail south by east of San Francisco, on Monterey Bay, on the Southern Pacific Railroad, and on the Pacific Coast and North Pacific steamship lines (Map: California, D 6). The leading industries are farming, cattle raising, fishing, and canning. Monterey is important as a resort. It has an admirable site with beautiful surroundings, an excellent harbor, a climate remarkably mild and equable, and fine facilities for bathing. There are interesting specimens of the picturesque architecture left from the Spanish occupation. Among the many points of interest are the San Carlos and Carmel missions, the old customhouse, the famous 17-mile drive, Colton Hall, in which the convention in 1849 met to frame the state constitution, and the public library. Monterey has adopted the commission form of government. Pop, 1900, 1748, 1910, 4923.

In 1770 the Spanish established here the mission and presidio of San Carlos Borromeo de Monterey. In 1818 the place was captured by insurgents. From 1840 to 1845 it was the capital of the province. It was captured and held for a day in 1842 by Commodore Jones (U. S. N.), acting under the impression that war had broken out between Mexico and the United States. In 1846 (July 7) the American flag was raised here by Commodore Sloat, and in 1847 Monterey became the seat of the military government of California. Three years later it was incorporated as a city.

MONTEREY, BATTLE OF. After the battles of Palo Alto and Resaca de la Palma (qq.v.), during the war between the United States and Mexico, General Taylor remained for some time at Matamoros and in September, 1846, with a force of about 6700 men proceeded against Monterey, then strongly fortified and defended by some 9000 Mexicans, of whom 3000 were regulars, under General Ampudia. On September 19 he arrived before the city and on the 21st simultaneous attacks were made by Generals Worth and Garland on the fortified heights west of the city and the redoubts on the east respectively. The former succeeded, but the latter was repulsed with considerable loss. The fighting continued on the 22d and 23d, General Worth entering from the west and driving the Mexicans before him until they reached the strongly fortified position in the middle of the city. General Ampudia then made overtures of surrender and on the 24th the terms were finally fixed—the Mexicans to march out of Monterey (Mex., Monterrey) with their small arms and accoutrements, one field battery, and 21 rounds of ammunition, seven days being allowed them to evacuate, a mutual armistice of eight weeks was agreed upon; and the munitions of war and supplies, together with the city and its fortifications, were to be left in the hands of the Americans. To many the terms granted by General Taylor have appeared too generous and even by the administration at Washington much dissatisfaction was felt. His judgment was sustained, however, by competent military men and was generally approved throughout the United States both by civilians and experts. During the three days the Americans lost more than 500 in killed and wounded, the Mexicans a very much larger number, though the exact figures have never been determined. Consult: H. O. Ladd, *The War with Mexico* (New York, 1883); O. O. Howard, *General Taylor* (ib., 1892); R. M. McElroy, *The Winning of the Far West* (ib., 1914).

MONTERO RÍOS, mōn'tā-rō rē'ōs, EUGENIO (1832–1914). A Spanish statesman and jurist-consult, born at Santiago (Coruña) Nov. 13, 1832. He studied philosophy, law, and theology at Santiago and jurisprudence at Madrid. After holding the chair of ecclesiastical discipline at the universities of Oviedo and Santiago, and that of canon law at Madrid, he was elected (1869) Progressive deputy in the Constituent Cortes. In a brilliant polemic in *La Iberia*, against the Archbishop of Santiago, he discussed the fifth basis of the constitution of the state and proved himself one of the most learned canonists and theologians in Europe. One of the studies that most attracted public attention was a discourse read before the faculty of the University of Santiago, *El Ultramontanismo y el Cosmopolitanismo*. In the Constituent Cortes, when the religious question was discussed, he made a sound and able defense of liberty of conscience. In 1870–72, while Minister of Justice in the cabinet of General Prim, he established civil marriage and the court of appeals in criminal cases, reformed the mortgage law, and brought about the adoption of a new penal code and the establishment of juries. Between 1885 and 1899 he held various cabinet, legislative, and high judicial offices, and in 1898 was appointed president of the Spanish Commission of Peace to treat with the United States Commission at Paris. On the death of Sagasta he

became leader of the Liberals; served as president of the Council of Ministers (1905); and was again president of the Senate (1910). Chambers of commerce in Spain owe their establishment to him. Montero Ríos died at Madrid, May 12, 1914.

MONTE ROSA, mōn'tā rō'zā. Next to Mont Blanc the highest peak in the Alps. It is situated on the boundary between Italy (Piedmont) and the Swiss Canton of Valais, where the Pennine and the Lepontine Alps meet (Map Italy, A 1). It has eight principal peaks, all exceeding 13,000 feet in height, and the highest, the Dufour Spitze, attaining an altitude of 15,217 feet, 564 feet less than that of Mont Blanc. It is covered with glaciers on all sides and has an abrupt, almost precipitous slope on the east, while on the west the great Gorner Glacier slopes more gradually towards the base of the Matterhorn. The main structure of the mountain is gneiss, while the upper parts consist of mica slate. Iron, copper, and gold are found and several mines are worked, one at an altitude of 11,000 feet. The passes over the chain near Monte Rosa are among the loftiest and most difficult in the Alps, and the peak itself is very difficult of ascent. The climbing of this mountain was first accomplished by the Smith brothers in 1855.

MONTERREY, mōn'tā-rā' The capital of the State of Nuevo León, Mexico, situated 1600 feet above sea level, 160 miles west of Matamoros (Map Mexico, J 5). It is a handsome city with well-paved and clean streets and is surrounded by beautiful gardens and orchards. The town has a fine cathedral and government buildings, and among its educational institutions are schools of law and medicine and a theological seminary. It is an important railroad centre and is second only to Mexico City in commercial activity, carrying on an extensive trade with the United States. Its industries include large smelters, an electric-light and power plant, a foundry, breweries, ice factories, and flour mills. Silver mining and agriculture are carried on in the surrounding region. Much American capital is invested in Monterrey, which is the seat of a United States consul. Pop., 1895, 45,695. 1910, 78,528. Monterrey was founded under the name of León in 1581 and received its present name in 1599. See MONTEREY, BATTLE OF.

MONTES, mōn'tās, ISMAEL (c.1856–). A Bolivian statesman and President. He was educated for the law in the University of La Paz, but in 1879 entered the army, serving with distinction in the war against Chile. Afterward he practiced law, reached the rank of colonel in the army, and in 1903 became acting Minister of War. During the insurrection of the Brazilians in the Acre region, in this latter year, Montes again distinguished himself as a military leader. In 1904 he was elected to the presidency, and because of the death of his successor, Dr. Guachalla, in 1908, before his inauguration, Montes continued in office a year beyond the regular term, pending a new election. Under his able administration the country made rapid progress along economic lines, especially in the extension of the railway system. In 1910 Montes was appointed Minister to England, and while in Europe he negotiated new loans under favorable conditions for Bolivia. He was re-elected President in 1913 and continued his energetic efforts to better the financial and

economic conditions of the country. The principal achievement of his second term was the passage of a law providing for much needed reforms in the banking system (1914).

MONTESA, mōn-tā'sā, ORDER OF OUR LADY OF. An order founded in 1317 by James II of Aragon to take the place of the Templars after their dissolution. The city and castle of Montesa in Valencia were given to it and it was endowed with the property formerly belonging to the Templars. It acknowledged the Order of Calatrava as its superior. In 1587 it was united with the Spanish crown and is now a court order with two classes.

MONTESAN GIULIANO, mōn'tā sán jū-lyā'nō. An episcopal town in the Province of Trapani, Sicily, situated on a mountain 2450 feet above the sea, 4 miles northeast of the town of Trapani. On the mountain (anciently Eryx, q.v.) are the remains of a famous temple of Venus, also a spring dedicated to the goddess. The town has a fourteenth-century church and remains of numerous ancient buildings. There are oil works and marble pits. Pop. (commune), 1901, 28,939, 1911, 28,663.

MONTESANO, mōn'tā-sū'nō. A city and the county seat of Gray's Harbor Co., Wash., 48 miles by rail west by south of Olympia, at the head of tide-water navigation on the Chehalis River, and on the Chicago, Milwaukee, and St. Paul and the Northern Pacific railroads (Map: Washington, B 4). It is in a lumbering, dairying, and farming district and has salmon fisheries, a creamery, and manufactories of incubators and brooders, shingles, sash and doors, etc. There is a salmon hatchery on the Chehalis River, 3 miles above the town. Montesano contains splendid courthouse and city hall buildings. Pop., 1900, 1194; 1910, 2488.

MONTESANT' ANGELO, mōn'tā sánt ān'-jā-lō. A town in the Province of Foggia, Italy, situated near the Gulf of Manfredonia, 27 miles northeast of Foggia, on one of the Gargano mountains, 2765 feet above sea level (Map: Italy, E 4). The grotto church of St. Michael is visited yearly by many pilgrims, particularly during the festival season in May. It contains fine tombs and sculptures. Pop. (commune), 1901, 21,870, 1911, 23,012.

MONTESSES, mōn-tēs'sā. A general term often applied to the pagan tribes of the southern Philippines. In a more limited way it is used to designate the dwellers in the interior of Panay and Negros islands. These people represent the conservative element of the Visaya, who refused Spanish rule and Christianity and retired to the mountains. See PHILIPPINE ISLANDS.

MONTESINOS, mōn'tā-sē'nōs, FERNANDO (c.1593-c.1655). A Spanish historian. In his youth he went to Peru and eventually became a member of the Supreme Administrative Council at Lima. While employed in this capacity he visited different parts of Peru, studying Peruvian history. The fruits of his archaeological research appeared in two historical works, the *Anales Nuevas del Perú* and the *Memorias antiguas historiales del Perú*, which was translated into French and published in Paris, 1840, as volume xvii of Henri Ternaux-Compans's *Voyages, relations, et mémoires originaux*, under the title *Mémoires historiques sur l'ancien Pérou*. This latter work is now most easily consulted in the edition published in the *Colección de libros españoles raros o curiosos*, vol.

xvi, under the title *Memorias antiguas historiales y políticas del Perú*, edited by Marcos Jiménez de la Espada (Madrid, 1882).

MONTESPAN, mōn't-spān', FRANÇOISE ATHÉNAIS DE ROCHECHOUART DE MORMEMART, MARQUISE DE (1641-1707). Mistress of Louis XIV. She was born at the Château of Tonnay-Charante, the second daughter of the Duke of Mormemart. She was the wittyest and most beautiful member of a family renowned for its wit and beauty, and soon became the most popular of the Queen's ladies in waiting at Versailles. She married the Marquis de Montespan in 1663. In 1668 she became the King's mistress, sharing her power for some years with La Vallière (q.v.), whom she finally supplanted. Till 1679 she ruled the King and the court, dictated matters of policy, and was uncrowned Queen of France. From that time on she was gradually supplanted in the King's affections by Madame de Maintenon, whom she had hired as governess for the children she had borne the King. She left court about 1687, wandered disconsolately over France, and finally found peace in a convent. Of her children by the King the best known were the Duke de Maine, the Count de Toulouse, Mademoiselle de Nantes, and Mademoiselle de Blois, who married the subsequent Regent Orléans.

MONTESQUIEU, mōn't-skyē, CHARLES DE SECONDAT, BARON DE LA BRÈDE ET DE (1689-1755). One of the most celebrated politico-philosophical writers of France. He was born Jan. 18, 1689, at his father's Château of Brède near Bordeaux, of a distinguished family of lawyers. He was a brilliant, versatile scholar, illuminating solid legal attainments by an ardent love of classics and science. In 1714 he was appointed a counselor of the Parlement of Bordeaux, and two years later, president of the Parlement. He cared nothing, however, for the routine of legal practice or for the requirements of official duty, and as his fortune was ample he was enabled to gratify his taste for study, travel, and observation without hindrance. His first published work was the famous *Lettres persanes* (1721), in which he ridicules, with exquisite humor and perspicuous criticism, the religious, political, social, and literary life of his countrymen, a proceeding involving some risk of persecution but for his device of placing his comments in the mouths of two Persians of distinction supposed to be traveling in Europe. Although he did not spare the Academy in these letters, he was made a member of it in 1728. In 1726 Montesquieu resigned his office in the Parlement of Bordeaux and spent some years in foreign countries. A two years' sojourn in England, in the course of which he moved in influential circles and had an opportunity to observe English political conditions, made him an admirer of the English political system, which inspired his greatest work, *L'Esprit des lois*. After his return to France he published his *Considérations sur les causes de la grandeur et de la décadence des Romains* (1734), a masterly review of Roman history. It was followed after a long interval by his *Dialogues de Sylla et d'Eucrate, et de Lysimaque* (1748), published under an assumed name, in which the motives and feelings of a despot are skillfully analyzed. In the same year appeared his great work, on which he had been engaged for 20 years, the *Esprit des lois*, in which he attempted to discover the relation between the laws of different

countries and their local and social circumstances. The book proved immensely popular.

The *Esprit des lois* is one of the classics of political science, one of the path-breaking works in establishing the science of politics upon an historical rather than an a priori basis. It has assured Montesquieu a place among the foremost political philosophers of all times. Without adopting Voltaire's hypercynologic criticism, that "when the human race had lost their charters, Montesquieu rediscovered and restored them," it may be said that it was the first work in modern times in which the questions of civil liberty were ever treated in an enlightened and systematic manner. The *Esprit des lois*, next to Locke's *Essay on Government*, was probably the political work best known to the statesmen of the American Revolution and early constitutional period, and its influence was marked in the discussions attending the adoption of the Constitution. It was bitterly attacked in Montesquieu's own day for its radical attitude in regard to the Church and religion and for its alleged Anglomania, but it was admired by the reform party in France and by the Moderates of the French Revolution, though not popular in France in later days. It is divided into 31 parts. The first eight deal with laws in general, their nature and principles, the next five with laws relating to offense and defense, political liberty, and taxation, the next twelve with laws in relation to climate, soil, manners and customs, commerce, population, and religion; the twenty-sixth deals with laws in their relation to the affairs which they determine, the remaining five books, relating to Roman, French, and feudal law, are a kind of historical supplement. The collective editions of his works are numerous. The best is that of Laboulaye in seven volumes (Paris, 1875-79). All of his important works have been translated in numerous editions. The best short work on Montesquieu is Sorel, *Montesquieu*, translated by Masson (London, 1887), the standard authority is Vian, *Histoire de la vie et des œuvres de Montesquieu* (Paris, 1879). There are good essays by Doumic, Brunetière, and Zévort. Consult also E. J. Lowell, *Eve of the French Revolution* (Boston, 1893), C. P. Ilbert, *Montesquieu* (Oxford, 1904), E. P. Dargan, *Esthetic Doctrine of Montesquieu* (Baltimore, 1907). A complete bibliography of the literature dealing with Montesquieu has been published by L. Dangeau (Paris, 1874).

MONTESQUIEU, ROBERT, COUNT DE (1855-) A French poet and essayist, born in Paris. His first verse, in the volume *Iles chauves-souris* (1892, new ed., 1907), attracted much attention because of its unusual form, imaginative quality, and a certain fastidiousness of language, characteristic of all his writings. His poetical works include *Le chef des odeurs suaves* (1894, new ed., 1907), *Le parcours du rêve au souvenir* (1895, new ed., 1908), *Les hortensias bleus* (1896), *Les perles rouges* (1899), *Les poons* (1901, new ed., 1908); *Prières pour tous* (1901). He also became well known as a "conférencier du salon," and in this capacity he visited the United States in 1903. His other writings include *Roseaux pensants* (1897), *Autels privilégiés* (1899), *Professionnelles beautés* (1905); *Altesses scénissimes* (1907); *Passiflora* (1907); *Assemblée de notables* (1909); *La petite mademoiselle* (1911); *L'Inextricable graveur Rodolphe Bresdin* (1913).

MONTESSORI, mōn'tēs-sō'rā, MARIA (1870-) An Italian educator. She studied medicine at the University of Rome and was the first woman in Italy to secure the degree of Doctor of Medicine (1894). Her interest in education came through her experience as assistant doctor at the psychiatry clinic of the university. Here she became interested in the training of feeble-minded children, a subject on which she read a paper at the Pedagogic Congress at Turin in 1898. At the request of Signor Barcelli, then Minister of Education, she delivered a series of lectures to teachers in Rome, which led to the establishment of the Orthophrenic School for feeble-minded children. As principal of this school (1898-1900) she put into practice the ideas of Itard and Séguin (q.v.). The success of her work with idiots led her to turn her attention to the education of normal children. As a preparation for this work she returned to the University of Rome to study experimental psychology and at the same time to investigate the prevailing practices of the ordinary schools. The opportunity of putting her theories into practice offered itself in 1907 when the proposal was made to establish a school in connection with the tenements erected by the Roman Association for Good Building for working-class tenants. The first House of Childhood (*Casa dei Bambini*) was opened in January, 1907, and was soon followed by others. Dr. Montessori maintained her connection with these schools until 1911, when she turned her attention to experiments for extending her methods and applying them to older children. Her work attracted wide attention among laymen as well as among professional educators. She has set forth her principles in two works, *Antropologia pedagogica* (Eng. trans. by F. T. Cooper, *Pedagogic Anthropology*, New York, 1913) and *Il metodo della pedagogia scientifica applicato all'educazione infantile nelle case dei Bambini* (Eng. trans. by Anne E. George, *The Montessori Method*, New York, 1912). For bibliography see under MONTESSORI SYSTEM.

MONTESSORI SYSTEM. An educational experiment conducted in Rome by Dr. Maria Montessori (q.v.), which attracted considerable attention throughout the world between 1910 and 1912. It is difficult to estimate its value at this stage. To some educationalists it is the greatest educational advance since Froebel; by others it is regarded merely as a restatement of the educational theory of the Rousseau-Pestalozzi-Froebel group, with a few additions which in themselves are not of great value. For several reasons the work aroused the greatest interest in Europe and America, it came at a moment when the educational world had reached a transition period and was ready to take a step forward, the experiment in itself met with great success in the particular situation with which Dr. Montessori had to cope, finally, it has received not a little purely commercial advertising. In a very short period the movement has inspired a considerable body of literature, both popular and professional.

Dr. Montessori approached the task of educating normal children after a successful application of the principles of Itard and Séguin to the education of defective and feeble-minded. Success in this field led her to inquire into the reasons for the comparative retardation of normal pupils in the ordinary schools taught by the usual methods of instruction. After de-

voting herself to the study of experimental psychology and the observation of children she concluded that the traditional school methods were calculated to repress the pupils mentally, to insist on their passive obedience, to restrict their spontaneous activities, and to superimpose the will of the teacher on their individuality. In this way she arrived at the central principle of her system, which has perhaps attracted more attention than any other and as a restatement of an old doctrine is of more permanent value. This principle is the doctrine that the pupils should be allowed freedom to unfold themselves, that the liberty of the pupils in their spontaneous manifestations "should be encouraged, and that such liberty and spontaneity could only be attained by auto-education." The teacher in such a system ceases to be a dictator and becomes a supervisor and guide; the pupils have no other incentive to work than the joy of work without the stimulus of rewards and punishments, the impelling force comes from within and is no longer imposed from without, and concentration on attractive occupations leads to self-control without the intervention of restrictive discipline. Students of the development of the theory of education in the last century will recognize that this principle is by no means revolutionary. Dr. Montessori's contribution consists largely in carrying this principle into practice. The Houses of Childhood (*Casa dei Bambini*) are revolutionary in having none of the earmarks of the traditional school; there are no time-tables, no prescribed lessons, and no classes. Each child is an individual and as such follows his own inclination, the function of the teacher being to put occupations in his way. The traditional restrictions in the form of fixed school furniture are removed and are replaced by light furniture that the children can easily move about. Practically the only formal lessons employed consist of a little physical exercise and marching. Dr. Montessori insists that the failure of the traditional school has been due to preconceived theory and philosophy, she claims to have no philosophy and to base her work entirely on scientific experimentation and methods. And, yet, although anthropological measurements and teachers' observations of the pupils are recorded, no known application of these appears to be made.

The second fundamental principle, which after all must be regarded as the outcome of a philosophy of education, is the emphasis on the training of the senses and muscles in the early stages of development. The aim is not, as it has been with other educational theorists, the imparting of knowledge on information through the senses, but "the refinement of differential perceptions of stimuli by means of repeated exercises." Here are introduced the occupations which furnish opportunities for auto-education. For this purpose there has been invented the "didactic apparatus," which consists of 26 items for the training of all the senses except taste and smell. The child using these items educates itself because "the didactic material contains within itself the control of error," since only one thing and that alone can be done with each piece. Among these general senses to be trained are the tactile, thermic, baric, stereognostic, visual, and chromatic. The apparatus for the training of these is supplemented by games, e.g., blindfold games for developing the sense of touch, and games in the dark for the sense of

hearing and discrimination of sounds. The exercises were found to be valuable in the training of defectives, but it is questionable whether they are of equal service in the education of the normal child. So much that is claimed for this work is based on the discarded theory of formal discipline that there is here evidence that the inventor's study of psychology did not carry her very far. Another criticism is that the apparatus is in fact restrictive and does not afford adequate expression for many of the child activities. Indeed, while desiring to avoid "preconceptions," Dr. Montessori, although claiming here to be scientific, is in reality imposing an invention of her own. It must be noted that the apparatus differs from the Froebian gifts, it is not intended to afford opportunities for play activities but for intellectual growth alone. For Dr. Montessori does not favor play and has been quoted as saying, "If I were persuaded that children needed to play, I would provide the proper apparatus, but I am not so persuaded."

But while the didactic materials appear to be somewhat remote from practical life and processes they are supplemented by activities of practical life. Since the children in the Houses of Childhood remain at school all day opportunity is offered in training them to dress, to be of service to others, to serve meals, to wash dishes, and to be neat and clean. They are taught to dress themselves by learning how to button, lace, hook, and clasp articles of dress by the use of special apparatus consisting of light wooden frames to which are attached materials with which to perform the appropriate processes.

The features in the Montessori system that have attracted the greatest popular attention are perhaps those to which Dr. Montessori attaches least value. These are the methods of instruction in the formal studies, especially writing and reading. The sense and muscular training developed by the apparatus is made the basis of the writing lessons. The pupils learn to recognize the symbols by the use of sandpaper letters mounted on cardboard, by means of which they "establish the visual-muscular image of the alphabetical signs", after learning the shape and contour of the letters they are trained to pick out the letters and to pronounce the sounds. Lastly comes the composition of words. The muscular control is further trained by exercises for outlining and filling in geometrical figures with chalk. All the acts necessary for writing are thus mastered before actual writing is begun, after this preparation the pupil "explodes into writing," and in a period varying according to age from one to three months rapidly attains an ability that is not secured by the ordinary school methods in as many years. While this must be recognized as a great contribution, further experimentation is necessary before its value for teaching a language not so phonetic as the Italian has been proved. The methods of teaching reading and arithmetic do not contain anything of special value, or that has not been practiced before in some form or other.

Probably some more years of experimentation and observation of the results of the system must elapse before a true estimate of the Montessori doctrines can be formed. Attempts are already being made to adapt the principles, applied up to the present mainly to children between three and seven years of age, to higher

classes. Montessori schools have been established all over the world, mainly through private effort, but in Switzerland they have been established publicly by a law of 1911. Of undoubted value is the renewed emphasis on the doctrine of liberty of the pupil, which Dr Montessori carries out more logically than did Froebel in his kindergarten. In line with contemporary theory, too, is the insistence on scientific experiment in education rather than empiricism or preconceptions or obscurantism. But Dr Montessori here does not seem well informed on what has already been done in scientific education or in the practice of kindergartens and infant schools. Valuable also is her contribution on the method of teaching writing. The chief criticism that may be brought against the system is its neglect of practical life activities, it is true that to a slight extent they find a place in her work, but only to a slight extent. Those activities usually associated with child life—plays and songs and stories, the constructive and inventive activities, the development of the imagination—find no place in the scheme. As compared with the attempts of John Dewey to carry into practice the doctrine of freedom and self-activity, the Montessori system fails just because Dr. Montessori's conception of education is much narrower than life and because in place of life activities she provides only a set of mechanically simple devices. But the contribution of the system will have been effective if it does nothing more than stimulate thought and criticism of the traditional practices.

MONTEVERDE, mōn'tā-vār'dā, or **MONTE-VERDI**, -vār'dē, CLAUDIO (1567-1643). An Italian composer, born at Cremona. He rebelled against the limited and arbitrary musical rules of his day and made valuable innovations, especially in harmony, so that his music approaches closely to our modern system of major and minor modes. He was a pioneer in the movement that led to modern opera, and the most important representative of the Florentine *stilo rappresentativo*. He improved and enlarged the orchestra, and in his operas treated the instruments with considerable freedom, thus anticipating a real instrumental style as distinct from the purely vocal style then exclusively in vogue. There are even attempts at dramatic characterization by means of instruments. From 1601 to 1612 he was maestro di cappella to the Duke of Mantua. In 1613 he was called in a similar capacity to San Marco in Venice, where he remained till his death. His works consisted in part of *Orfeo* (1603); *Arianna* (1608); *Il combattimento di Tancredi e Clorinda* (1624); *Proserpina rapita* (1630); *Adone* (1639). *Le nozze di Enea con Lavinia* (1641). *Il ritorno d'Ulisse in patria* (1642), songs, motets, church music, and vespers. Consult Emil Vogel, "Monteverde," in *Vierteljahrsschrift für Musik-*

wissenschaft (Leipzig, 1889), and Rafael Mitjana, *Claudio Monteverde y los orígenes de la ópera italiana* (Malaga, 1911). See OPERA.

MONTEVERDE, GIULIO (1837-). An Italian sculptor, born at Bistagno, Liguria. He studied at the Genoa Academy under Varni and afterward removed to Rome, where he became professor at the Academy and a leader of the naturalist movement in sculpture. His works are brilliant, but often lacking in spiritual and intellectual elevation. They include the groups "The Genius of Franklin" and "Jenner Inoculating his Child"; the equestrian statue of Victor Emmanuel at Bologna, the monument to Bellini at Catania, and a "Madonna and Child" in the Campo Santo, Genoa.

MONTEVIDEO, mōn'tā-vid'ē-ō, *Sp. pron.* mōn'tā-vē-dā'ō. The capital of Uruguay, situated on the north shore of the estuary of the Río de la Plata, 68 miles east of Buenos Aires (Map: Uruguay, H 4). It is built on a peninsula running westward from the mainland and inclosing the bay forming the harbor. On the west side of the entrance to the bay, opposite the city, rises the Cerro, a picturesque mountain, in connection with which the name Montevideo is derived. The ground of the peninsula rises gradually from the water on either side to the central ridge, giving the city, besides an imposing appearance, an excellent natural drainage, which, together with its pleasant climate, good water supply, sewerage system, and general sanitary conditions, makes it a very healthful place of residence. The streets are wide, straight, and well paved, and are regularly laid out both in the new and the old quarters. The latter occupies the west end of the peninsula and is the main commercial quarter. The central portion, occupying the east end of the peninsula, contains the cathedral and the chief public buildings. From the base of the peninsula the new parts of the city spread out like a fan over the heights of the mainland, with large avenues in all directions, along nearly all of which street railway lines run to the suburbs.

The principal street is that of the Décemotavos de Julio, which runs along the central ridge of the peninsula and terminates in the Plaza de la Independencia, the principal square of the city, surrounded by prominent buildings and colonnades. Among the other squares are the Plaza Constitución, Plaza Zabala, and Plaza Libertad, all beautified by gardens. Many of the streets are lined with shade trees, and the Prado, outside of the city, is a handsome park and promenade. The most notable edifices include the Government Building, University, Ministry of Fomento, Exchange Building, Post Office, School of Arts and Trades, Administration of the Lottery, Municipal Building, National Penitentiary, Insane Asylum, and numerous hospitals, churches, and theatres. The chief educational institution is the university, with faculties of law, medicine, mathematics, and pharmacy. There are also a seminary, a normal school, several Catholic and foreign academies, a national museum, a public library, and a large number of public schools. Its chief industry is meat packing, the products forming a large percentage of its exports. It is the port of call for all steamship lines from Europe to the Pacific, and its location is more favorable than that of Buenos Aires for becoming the principal outlet for the products of south-central South America.

In order to improve its harbor facilities a contract was let in 1899 to a French company for dredging and the construction of breakwaters and docks, involving an expenditure of \$15,000,000. When this work was completed in 1909 it did not meet the requirements of the rapidly developing trade and vessels drawing more than 20 feet were still obliged to anchor in mid-stream. A new project was approved in 1913 providing for further improvements and the deepening of the entrance and a part of the harbor so as to admit the largest vessels, at an estimated expense of about \$25,000,000. These improvements are paid for by a tax of 3 per cent on imports and 1 per cent on exports. In 1909, 94 per cent of the imports and 71 per cent of the exports of Uruguay passed through the port of Montevideo, the total value of the imports and exports of the city being respectively \$34,251,069 and \$32,685,267. The principal exports are wool, hides, meat and meat extracts, animal fat, and live stock, and the imports, cotton goods, iron and steel, sugar, coal, woodwork, woolen goods, wines, machinery, and chemicals. The recent rapid development of the city has been marked by an increase in the population during the past 15 years amounting to about 40 per cent, a considerable portion of which is due to immigration. In 1803 it had a population of 13,937, in 1832, 33,994, in 1860, 57,916, in 1900, 268,334; and in 1914 (est.), 377,994. Foreigners form about one-third of the population, the chief nationalities represented being the Italian, Spanish, and Brazilian.

Montevideo owes its origin to a fort built in 1717 by the Viceroy of Buenos Aires to check the encroachments of the Portuguese. The first settlements of civilians around the fort began in 1726. Its commercial importance was not recognized until 50 years afterward. In the war of independence the Spaniards maintained possession of it until 1814. In 1828 it was made the capital of the new Republic of Uruguay. Between 1842 and 1851 it was besieged at intervals by Oribe (qv), who was supported by the Argentine dictator, Rosas, and has since been disturbed by internal dissensions. Peaceful conditions during a number of years and its great natural advantages have contributed to its present state of prosperity. Consult Bordon, *Montevideo e la repubblica dell' Uruguay* (Milan, 1885), C. M. Maeso, *Tierra de promisión* (Montevideo, 1906), N. Estrada, *Uruguay contemporáneo* (Valencia, 1907), W. H. Koebel, *Uruguay* (New York, 1913).

MONTEVIDEO. A city and the county seat of Chippewa Co., Minn., 134 miles by rail west of Minneapolis, at the confluence of the Minnesota and Chippewa rivers and on the Chicago, Milwaukee, and St. Paul Railroad (Map Minnesota, B 6). It has a Carnegie library, a State high school, public hospital, and Windom College (Congregational), and attractive courthouse and city hall buildings. The industrial establishments include several grain elevators, flouring mills, canning, gate, and broom factories, and a creamery. There is in the vicinity a fine monument which marks the surrender of the Sioux chief Little Crow in the Indian outbreak of 1862. Pop., 1900, 2146, 1910, 3056.

MONTE VISTA, mōn'té vistá. A city in Rio Grande Co., Colo., 150 miles west of Pueblo, on the Denver and Rio Grande and the San Luis Central railroads (Map Colorado, C 4). It contains the State Soldiers and Sailors Home.

Monte Vista has extensive stock-raising interests and a large sugar refinery. The surrounding country is well irrigated and adapted to the growing of alfalfa, grains, potatoes, and sugar beets. Pop., 1900, 536, 1910, 2544.

MONTEZ, mōn'tēs, LOLA (?1818-1861). The assumed name of Maria Dolores Eliza Rosanna Gilbert, an adventuress, born in Ireland, in 1818 according to some, in 1824 according to her own statement. When very young she married a Captain James, followed him to India, grew weary of him and came back to Europe. She appeared as a danseuse in nearly all the continental capitals, and attracted a fair amount of notoriety by her beauty and escapades. In 1847 she became the mistress of King Louis I of Bavaria, who made her Countess of Landsfeld and allowed her to have considerable influence in the government. An insurrection in 1848 drove the King from his throne and Lola from Munich. She went to London, married George Heald, a guardsman, was divorced from him quickly, and came to America in 1851. She traveled over the country, acting in a play entitled *Lola Montes in Bavaria*, married a number of times, lectured, published books, and finally settled in New York, devoting herself to rescue work. Her writings comprise *The Arts of Beauty and Lectures* (1858), the latter containing an autobiography.

MONTEZUMA. A town and the county seat of Poweshiek Co., Ia., 72 miles east of Des Moines, on the Minneapolis and St. Louis and the Chicago, Rock Island, and Pacific railroads (Map Iowa, E 3). There are considerable manufacturing interests, and it has a foundry and machine shop, a creamery, and manufactures of cement block, etc. There are deposits of coal in the adjacent region, which is engaged chiefly in agriculture, stock raising, and dairying. The water works are owned by the town. Pop., 1900, 1210, 1910, 1172.

MONTEZUMA, mōn'tē-zōō'mā, or **MOTE-CUHZOMA (I), ILHUICAMINA** (?1390-1469). An Aztec warrior and Emperor of Mexico, the son of Huitzilhuhtl. He acquired great fame as a leader of expeditions against the neighboring nations during the reigns of his father, uncle, and brother, and assisted in the formation of the confederacy of Tezcuco, Mexico, and Tlacopan in 1423. His efficient services in the war against the Tepanecs during the reign of Izcoatl gained for him the election to the throne in 1440, and his coronation took place amidst splendid festivities accompanied by human sacrifices of captives taken in war. After his succession he began war upon the Chalcas, reducing them to subjection, but was compelled repeatedly to crush out revolts of this nation. He also undertook other conquests which extended the Mexican power to the Gulf of Mexico and the Pacific Ocean. He built temples, enlarged and beautified the city of Mexico, and began a vast system of dams for the protection of the city against inundations. During his reign the country suffered a six years' famine, nevertheless he left it in a most flourishing condition. Consult E. K. Kingsborough, *Antiquities of Mexico*, vol. ix (London, 1848), and H. H. Bancroft, *Native Races* (San Francisco, 1874-82).

MONTEZUMA (II), XOCOTZIN (1466-1520). The last Aztec ruler and Emperor of Mexico. The fact that he was an able general and a priest of the temple of the war god Huitzilopochtli brought about his election to the throne in 1503 and he was crowned amidst

festivities and human sacrifices. He was of a haughty character and readily espoused the cause of the ancient nobility against the more recently created nobles. Furthermore, his despotic rule and oppressive taxation served to alienate the merchants and poorer classes. During his reign he was occupied with expeditions of conquest, suppression of revolts, erection of temples, and extensive immolations of human victims. He undertook many campaigns against Tlascala, but never succeeded in subjecting this nation to Mexico. Better success attended his efforts towards the south, where he extended the rule of Mexico to Honduras and Nicaragua. His reign was full of signs and omens which were interpreted as indicating the end of the Aztec power, and the arrival of Cortés and the Spaniards was considered as the fulfillment of the national tradition that Quetzalcoatl, a tribal divinity or hero, would return from the rising sun, white in color and bearded. This caused Montezuma to pursue a weak and vacillating course, although he endeavored by diplomacy and rich presents to prevent the Spaniards from coming to Mexico City. He met the invaders outside the city with more gifts and made no resistance to their entry (Nov 8, 1519). He was soon made a prisoner by Cortés, and the loss of leadership paralyzed the natives and allowed the Spaniards to make their position secure. The Mexicans, refusing longer to endure the actions of the Spaniards, revolted under the leadership of Cuhtlahuatzin, Montezuma's brother. In the hope of quelling the uprising Cortés induced Montezuma to address the natives from the roof of the house occupied by the invaders, but the only result was that the subjects showered their sovereign with stones and arrows. Montezuma died a few days later, either from his wounds or at the hands of the Spaniards who now knew him to be of no further use to their cause. (See CORTÉS, HERNANDO.) Consult Kingsborough, *Antiquities of Mexico*, vol. ix (London, 1848), and H. H. Bancroft, *Native Races* (San Francisco, 1874-82).

MONTFAUCON, mōn'fō'kōn', BERNARD DE (1655-1741). A French scholar and antiquary. He was born at the castle of Soulage in Languedoc, entered the army about 1672 and served in Germany under Turenne, but after a serious illness and in pursuance of a vow he entered the Benedictine Order (1676) at the abbey of La Daurade in Toulouse. He went to Paris in 1687 to share in the translation into Latin of the Greek church fathers and in the great Benedictine patrology, and spent three years (1698-1701) in research in Italy. The years from 1701 until his death he spent in the abbey of Saint-Germain-des-Prés. Among his works are: *Diarum Italicum* (1702); *Palæographia Græca* (1708); *L'Antiquité expliquée et représentée en figures* (1719-24), and editions of Athanasius (1698), of Origen's *Hexapla* (1713), and of John Chrysostom (1718-34). See also CANON ALEXANDRINUS. Consult De Broglie, "La Société de Saint-Germain-des-Prés au XVIIIe siècle," in *Bernard de Montfaucon et les Bernardins* (Paris, 1891).

MONTFERRAT, mōn'fe-rà' (It. *Monferrato*). Formerly an independent duchy of Italy, bounded by the territory of Genoa, the Po, and the Maritime Alps. It was divided into upper and lower Montferrat, the former including the cities of Mondovì, Aequi, and Alba, the latter, Alessandria, Asti, and Casale. The capital was

Casale. Montferrat, after the disruption of the Frankish Empire, was ruled by its own marquises or marquises till the beginning of the fourteenth century. This house for a long time disputed the sovereignty of Piedmont with the rulers of Savoy. Some of its members, notably Boniface II (qv), became celebrated in connection with the Crusades. On the death of Marquis John I, in 1305, the second son of his sister, Isolande or Irene, who was Empress of Constantinople, succeeded to Montferrat, becoming the founder of the family of Montferrat-Paleologus, which became extinct in 1533. Montferrat passed in 1536 to the Gonzagas of Mantua, for whom it was erected into a duchy. In 1631 the dukes of Savoy obtained possession of a portion of Montferrat, and in 1703, with the consent of the German Emperor, Leopold I, the remaining portion passed under their sway, and was incorporated with their dominions.

MONTFERRAT, BONIFACE, COUNT OF (?-1207). An Italian soldier and Crusader. He participated in the war against Saladin and was taken prisoner at Hittin (1187). In 1201 he joined the Fourth Crusade and after the death of Theobald of Champagne was chosen its leader. He became ruler of Macedonia and Greece, under the title of King of Thessalonica, in 1204. He was killed near Mosynopolis in a battle with the Bulgarian invaders.

MONTFERRAT, MARGRAVE OF. See BONIFACE III.

MONTFORT, mōn'fōr' (MONTFORT L'AMAURI). The name of a noble French house, descended from the early counts of Hainault. It took its name from a castle on a "strong mount" between Paris and Chartres. The first member of importance was Simon III, Count of Montfort l'Amauri and Evreux, who married Amicia, daughter of Robert of Beaumont, third Earl of Leicester. His second son was the famous Simon de Montfort, Count of Toulouse. This nobleman, so conspicuous in the crusade against the Albigenses (qv), was born about the year 1160. In 1198 he went to Palestine at the head of a troop of French knights, but failed to accomplish anything against the Saracens and was obliged to return. In 1202 he joined the Fourth Crusade, which, however, was soon diverted from its purpose (see CRUSADE), in consequence of which Montfort abandoned it and went to the Holy Land, where he did some fighting against the infidels. In 1209 he engaged in the war against the Albigenses and signalized himself by his relentless ferocity and his brilliant successes. He was invested with the territories of the leader of the Albigenses, Count Raymond VI of Toulouse. He was killed by a stone at the siege of Toulouse, June 25, 1218. His son Amauri continued the struggle, lost nearly his whole patrimony, but was recompensed by Louis VIII, who made him Constable of France. He died about 1241. The brother of Amauri was the Simon de Montfort (qv) famous in English history. Consult Celestin Donais, *La soumission de la vicomté de Carcassonne par Simon de Montfort* (Paris, 1884).

MONTFORT, SIMON DE, EARL OF LEICESTER (c 1208-65). A famous English statesman. He was the third son of Simon de Montfort (see MONTFORT), the leader in the crusade against the Albigenses, and was born in France. He inherited the title of Earl of Leicester from his grandmother, Amicia de Beaumont, sister and heiress of Robert, Earl of Leicester. In 1231

Simon received the lands which his father had held, his elder brother Amauri having resigned his claim to them. In 1238 he married Eleanor, sister of King Henry III and the youthful widow of the Earl of Pembroke. In 1248 he was sent by the King to undertake the command in Gascony. He held this office until 1252, amid constant revolts; was charged with having governed badly, and quarreled frequently with the King, but he was supported by the nobles in England. After his resignation Henry III was soon compelled to ask his aid. It is probable that he was a stern, ruthless, but not an unjust governor. In 1258 the King's debts were so great and the rapacity of his foreign relatives so unbearable that the people were in a state of insurrection. The barons assembled and under the direction of Montfort held the celebrated Parliament at Oxford. They passed statutes to enforce the provisions of Magna Charta, and from this resulted the Provisions of Oxford (q.v.) and a little later followed the Provisions of Westminster (q.v.). The King swore to observe them, but sent forthwith to the Pope praying to be absolved from his oath. The bull of absolution arrived. Henry set his barons at defiance, and finally both sides agreed to submit the matter in dispute to Louis IX of France, and he rendered a decision, on Jan. 23, 1264, which upheld Henry III in all points (See MISE OF AMIENS). The nobles, however, would not accept the decision and took up arms. They were aided by the whole middle class, who looked up to Montfort as their champion and leader, and the war began with the battle of Northampton. At Lewes (1264) the royal forces were signally discomfited and the King taken captive. The conditions imposed upon the King were summed up in the Mise of Lewes (q.v.), and Montfort was the real ruler of the Kingdom. In summoning a Parliament for 1265 to deliberate upon the measures to be adopted at this great crisis, writs were issued to the sheriffs in 1264 by Montfort directing them to return two knights for each shire and two citizens for every borough, besides the clergy and lay barons, which is of importance in the development of the representation of the commons as an estate of the realm in Parliament. A second war broke out after the young Duke of Gloucester deserted the baronial party and joined the King. Prince Edward (afterward Edward I) encountered the barons at Evesham with a greatly superior army. When defeat was inevitable, the great leader refused to flee and fell fighting bravely (Aug. 4, 1265). The death of Montfort filled the whole land with mourning, the people bewailed their dead champion, and the Franciscans pointed to his glorified spirit in heaven, regardless of the fact that on purely political grounds he had been excommunicated from the Church in 1264. The influence of Montfort was felt after his death, and his policy, in general, was followed out by Edward I (q.v.).

MONTGAILLARD, mōn'gā'yār', MAURICE JACQUES ROQUES, COMTE DE (1761-1841). A French political adventurer, born at Montgaillard, Haute-Garonne. He served as a lieutenant of French infantry in the West Indies in 1777-83 and in 1789 was established at Paris as the secret agent of the Bourbons. He emigrated to England in 1792 and continued in the service of the Royalists. In 1796 he entered into friendly relations with Napoleon Bonaparte and subsequently was instrumental in disclosing the treason of Pichegru. For this service he received a pension of 14,000 francs (later reduced to 6000), from 1804 to 1814 he was a member of the Emperor's secret cabinet. He was one of the first to accept Louis XVIII after the Restoration. His writings include *Etat de la France au mois de mai 1794* (1794), *Ma conduite pendant le cours de la révolution française* (1795), *De la France et de l'Europe sous le gouvernement de Bonaparte* (1804), *Mémoires politiques* (3 vols., 1805-19, new ed., 1896), *Clémence et justice* (1815), *Histoire de France depuis 1825 jusqu'à 1828* (2 vols., 1829).

MONTGOLFIER, mōn'gōl'yā', JOSEPH MICHEL (1740-1810) and JACQUES ETIENNE (1745-99). Two French inventors, born at Vidallon-lez-Annonay in Ardèche. They were the sons of a paper manufacturer, and though Etienne studied architecture, he gave up his profession to take charge of his father's factory, as Joseph had gone into business for himself. The two brothers became interested in aeronautics (q.v.), and their fame rests upon their achievement in making the first successful balloons. For this work Louis XVI decorated Etienne with the Order of Saint-Michel, gave Joseph a pension of 1000 livres, raised their father to the nobility, and later granted the brothers 40,000 francs that they might devote their whole attention to aerial navigation. Their work was interrupted by the Revolution, and during the Reign of Terror Etienne, who had been administrator of his department, was denounced and escaped only through the devotion of his workmen. Napoleon decorated Joseph and appointed him to various offices, and the Institute in 1807 elected him a member of its section of general physics. He made several other inventions of considerable value, among them the parachute, and published *Discours sur l'aérostat* (1783), *Les voyageurs aériens* (1784), *Mémoire sur la machine aérostatique* (1784), in collaboration with his brother. Consult Turpin, *Les ballons* (Paris, 1851).

MONTGOMERIE, mōnt-gūm'ē-ri, ALEXANDER (c.1556-c.1610). A Scottish poet. He evidently received a scholarly training and for a time held an official position at the court of James VI. Some years were spent in foreign travel. *The Cherrie and the Slae* (1597), still popular among the Scotch, gives him a conspicuous place in a period of the literature of his country which was without poetic genius. The poem lacks design, but contains many passages of homely beauty. He is also author of some sonnets and a scurrilous poem, entitled *The Flyting between Montgomery and Polwart* (1621). A collection of his works was published by Laing in 1821, and another, edited by Cranston for the Scottish Text Society, appeared in 1887.

MONTGOMERIE, ARCHIBALD. See EGLINTON AND WINTON.

MONTGOMERY. The capital of Alabama and the county seat of Montgomery County, 180 miles by rail northeast of Mobile, on the Alabama River, at the head of navigation, and therefore one of the principal gateways to those Gulf ports nearest the Panama Canal (Map. Alabama, C 3). It is an important commercial and railroad centre, being served by the Atlantic Coast Line, the Central of Georgia, the Louisville and Nashville, the Mobile and Ohio, the Seaboard Air Line, and the Western of Alabama systems.

A large inland cotton market, its annual trade being about 500,000 bales, Montgomery is the distributing point for manufactured products throughout Alabama, northern Florida, eastern Mississippi, and southwest Georgia. There are 52 wholesale houses and 110 manufacturing concerns, including sirup factories, boiler and coope-
rage plants, fertilizer, show-case, confectionery, barrel, and cracker factories, marble works, railroad repair shops, carriage and wagon works, and foundries and machine shops, besides a number of mills devoted to the cotton industry. (Owing to the city's accessibility to timber, and deposits of coal and iron, its industries have achieved considerable importance)

The city is built on the high river bank and has many spacious old-fashioned residences and large gardens. Its principal buildings are the State capitol, Federal building, city hall, courthouse, Pythian and Masonic temples, and the Carnegie library. Montgomery has done much to further the cultural life of its people. In the past 10 years group societies have grown rapidly; patriotic organizations and women's clubs abound; and there are a number of educational institutions, including the Woman's College of Alabama, occupying a campus of 50 acres, excellent grade schools, a fine new high school, a State normal school for colored pupils, musical studios, and several libraries. There are also more than 50 acres of public parks. Among the charitable institutions are the city infirmary, St. Margaret's Hospital, an orphanage, and a home for widows.

Montgomery has adopted the commission form of government, the municipal powers being vested in a commission of three members, who are elected by popular vote and who choose their own president. All departments, with the exception of that of education, are under the control of these men. The water works are owned and operated by the city, having been acquired in 1898. In the year 1914-15 Montgomery's receipts amounted to \$1,230,000, while its payments were \$1,305,000, the chief items of expenditure being \$102,000 for education, \$56,000 for police, \$57,000 for fire, \$57,000 for public health and sanitation, and \$58,000 for the water works. The city's assessed valuation (1915) is about \$25,000,000.

When De Soto explored the Alabama River, as early as 1540, he discovered an Indian village 3 miles below the site of the present city of Montgomery; but it was not until 1817 that white settlers began to build their cabins on the bluffs of the river, and Montgomery was founded as New Philadelphia. In 1819, with a population of 600, it was consolidated with East Alabama Town as Montgomery. Incorporated in 1837, it supplanted Tuscaloosa as the State capital in 1847. The famous Alabama Platform was adopted here Feb. 14, 1848, and Montgomery was the seat of the Confederate government from

February to May, 1861. It was occupied by the Union army, April 12, 1865. Pop., 1900, 30,346; 1910, 38,136, 1914 (U. S. est.), 41,777. Consult L. P. Powell (ed.) in *Historic Towns of the Southern States* (New York, 1900).

MONTGOMERY, FLORENCE (1843-). An English novelist of Irish parentage. Her most popular books are for children or child lovers. They include: *A Very Simple Story* (1866); *Peggy and Other Tales* (1868), *Misunderstood* (1869), *Thrown Together* (1872), *Thwarted* (1873), *Wild Mike and his Victim* (1874), *Scaforth* (1878), *The Blue Veil* (1883), *Transformed* (1886); *The Fisherman's Daughter* (1888); *Colonel Norton* (1895), *Tony* (1897), *Prejudged* (1900), *An Unshared Secret and Other Stories* (1903), *Cats and Kitts* (1910); *Behind the Scenes in a Schoolroom* (1914).

MONTGOMERY, FORT. See FORT MONTGOMERY.

MONTGOMERY, GABRIEL, COUNT DE (c. 1530-74). A French knight of Scottish extraction. He was an officer in the Scottish Life Guard of the King of France, and in a tournament held June 29, 1559, accidentally inflicted a mortal wound on Henry II. Montgomery, although blameless, fled to Normandy, where he embraced Protestantism. On the commencement of the religious wars in 1562 he supported the Protestant cause and defended Rouen with great bravery. In the third civil war he was one of the leaders of the Protestants and gained many advantages over the Royalists in Languedoc and Béarn. During the Massacre of St. Bartholomew he happened to be at Paris, but fled to England, owing his escape to the fleetness of his horse. In April, 1573, he vainly attempted to relieve Rochelle with a small fleet. Next year, at the head of a band of Huguenots, he landed in Normandy and commenced war there; but being compelled at last to surrender the castle of Domfront, he was carried to Paris and was beheaded.

MONTGOMERY, JAMES (1771-1854). An English poet, the son of a Moravian preacher. He was born at Irvine, Ayrshire, Scotland, Nov. 4, 1771. At the age of seven he was sent to the Moravian settlement at Fulneck, near Leeds, to prepare for the Moravian ministry. To the annoyance of the Moravians, his leisure at school was employed in the composition of epics on King Alfred and the fall of man. In 1787 he ran away, and after four years of various employment became engaged as clerk to the editor of the *Sheffield Register*. In 1794 he started the *Sheffield Iris*, which he edited till 1825. He was twice fined and imprisoned in York Castle for libel. He afterward became a moderate Conservative, and in 1835 was granted a government pension of £150. He died at Sheffield, April 30, 1854. His principal volumes of verse are: *The Wanderer of Switzerland* (1806); *The West Indies* (1809); *The World before the Flood* (1812); *Greenland* (1819); *The Pelican Island, and Other Poems* (1826). Montgomery is now chiefly remembered for his hymns (collected in 1853), of which nearly 100 are still in use. Montgomery had little depth and drew his observations from books rather than from nature. His fame is kept up, not by lovers of literature, but by lovers of religious feeling. Consult: Holland and Everett, *Memoirs* (London, 1854-56), formidably prolix; *Life* by King (ib., 1858); *Poetical Works*, edited by their author (ib., 1841; reprint, 1881) and by Carruthers (Boston, 1860).

MONTGOMERY, JOHN BERRIEN (1794-

1873). An American naval officer, born in Allentown, N. J. He entered the navy as a midshipman in 1812, served in the attack on Kingston, Canada, in November of the same year and in the capture of York in April of the following year, and for gallantry on board the *Niagara* in Perry's victory on Lake Erie, Sept. 10, 1813, received a vote of thanks and a sword from Congress. In 1815 he served in Decatur's squadron in the war with Algiers, was made a lieutenant in 1818 and commander in 1839. During the Mexican War, in command of the sloop *Portsmouth*, he took possession of various places on the coast of California, blockaded Mazatlan for some months, and, with the assistance of Captain Lavalette in the *Congress*, captured Guaymas. He was made a captain in 1853 and commanded the Pacific squadron in 1860-61, retiring in December, 1861. In 1862 he was advanced to the rank of commodore on the retired list and in 1866 to that of rear admiral.

MONTGOMERY, RICHARD (1736-75). An American soldier. He was born near Feltrim, Ireland, Dec. 2, 1736, and was educated at St. Andrew's College and Trinity College, Dublin. In 1756 he obtained a commission as ensign in the British army, came to America with his regiment in 1757, during the French and Indian War, and displayed personal courage and military sagacity at the siege of Louisburg and in various actions. In 1760 he was made adjutant of his regiment and in 1762 was promoted to be captain. After the conquest of Canada he took part in the expedition against Havana and Martinique, and in 1765, after being stationed in New York for two years, returned to England, where he remained until 1772, when, selling his commission, he emigrated to New York. In 1775 he represented Dutchess County in the first Provincial Convention, and in June was appointed by Congress brigadier general in the Continental army. He was second in command of the expedition sent under Gen. Philip Schuyler against Canada, but, owing to the illness of Schuyler, became the actual leader in October. He at once pressed forward and before the end of November captured successively Chambly, St. Johns, and Montreal. In the next month he joined Benedict Arnold before Quebec. On December 9 Montgomery was promoted to be major general. On December 31, shortly after midnight, the assault upon the town was attempted. Montgomery scaled the Cape Diamond bastion and, pressing forward at the head of his troops, was instantly killed by the first and only volley. The undisciplined colonial troops were then overwhelmed and a precipitate retreat ensued. Montgomery's conduct and character were eulogized in Parliament by Burke, Chatlam, and even Lord North. Congress recognized his services by resolutions of respect, and by its order a monument was erected in his honor in front of St. Paul's Church, New York City, where in 1818 his remains were interred with impressive ceremonies. Consult Armstrong, *Life of Richard Montgomery*, in Jared Sparks's "American Biography" (Boston, 1834).

MONTGOMERY, ROBERT (1807-55). An English preacher and writer of verse. He was born in Bath, graduated at Oxford in 1833, was ordained in 1835, served as pastor at Whittington, Shropshire, and of the Church of St. Jude in Glasgow, and in 1843 became minister at Percy Chapel, St. Pancras, London, where he remained for the rest of his life. He was most

widely known through his numerous poetical compositions, which were extravagantly praised by readers who, enjoying their religious tone and facile versification, overlooked their defects. Condemned by literary critics, including Macaulay, they soon lost their popularity. Editions of Montgomery's verse appeared in 1839, 1840, 1841, and 1853.

MONTGOMERY, SIR ROBERT (1809-87). A British administrator in India. He was born in County Donegal, Ireland, and received his education at Foyle College, Londonderry, and at Wroxall Hall School, North Wiltshire, England. He entered the Bengal civil service in 1827, was actively engaged in organizing the Punjab after the annexation of that province, and at the outbreak of the Sepoy Mutiny was the highest civil officer in its capital city, Lahore. He promptly disarmed the Sepoy garrison, and thus not only saved the Punjab from the horrors which befell the neighboring provinces, but made it a rallying point from which the British began the task of reconquest. In 1858 he became chief commissioner of Oudh and the next year Lieutenant Governor of the Punjab. In 1865 he resigned and returned to England, where he was appointed one of the council of the Secretary of State for India. Consult Dodwell and Miles, *Bengal Civil Servants* (London, 1839).

MONTGOMERY, THOMAS HARRISON, JR. (1873-1912). An American zoologist. He was born in New York City and studied at the universities of Pennsylvania (1889-91) and Berlin (Ph.D., 1894). From 1898 to 1903 he was assistant professor of zoology at the University of Pennsylvania and professor of biology at the Wagner Free Institute of Science, Philadelphia, where he was also director of the museum (1899-1903). He held the professorship of zoology at the University of Texas from 1903 to 1908, when he took up the same duties at the University of Pennsylvania. He is author of some 80 monographs, a memoir of his father, Thomas Harrison Montgomery (1905), and *Analysis of Racial Descent in Animals* (1906).

MONTGOMERYSHIRE. An inland county of North Wales, between Shropshire on the east and the Welsh counties Merioneth and Cardigan on the west (Map England, C 4). Area, 797 square miles; largely mountainous. In the valleys on the Shropshire side good crops of wheat, oats, and barley are raised. Copper, lead, and zinc are obtained. slate and limestone are quarried. The uplands provide pasturage and cattle; sheep and the pure breed of Welsh ponies called merlins are reared. The county is watered by the Severn and the Wye and a number of other small streams. The Welsh flannel manufacture is extensively carried on. Capital, Montgomery, but the county business is carried on at Welshpool and Newton alternately. Pop., 1901, 54,900. 1911, 53,146.

MONTH (AS. *mōnaþ*, Goth. *mēnāþs*, OHG. *mānōd*, Ger. *Monat*; connected with OIr. *mí*, Lett. *mēnes*, Lat. *mensis*, Glk. *μήν*, *mēn*, month, Skt. *mās*, moon, month, probably from Skt. *mā*, to measure, and ultimately connected with Eng. *moon*). Originally the period of the moon's revolution round the earth. If this is reckoned from the position of the moon among the stars to her return to the same position, the period is called a *sidereal* month and averages 27 days, 7 hours, 43 minutes, 11.5 seconds in length; but if from new moon to new moon, it is longer, being on the average 29 days, 12 hours, 44 min-

utes, 28 seconds; this is called a *synodic* month (See *SYNODIC*.) The latter period forms one of the three natural measures of the lapse of time and ranks next to the day in importance. There are several other periods used by astronomers to which the name month is applied, as the *nodical* or *draconic* month (27 days, 5 hours, 5 minutes, 35.8 seconds), from ascending node to ascending node (see *NODE*), the *anomalistic* month (27 days, 13 hours, 18 minutes, 37.4 seconds), from perigee to perigee, the *tropical* month (27 days, 7 hours, 43 minutes, 47 seconds), from equinox to equinox, and the *solar* month, which is the twelfth part of a solar year, consisting of 30 days, 10 hours, 29 minutes, 4 seconds. Distinct from all these is the *civil* or *calendar* month, fixed by law for ordinary purposes, and consisting of a fixed number of days—from 28 to 31—according to the particular month. The calendar months, with the number of days belonging to each, are as follows

	Days
1 January	31
2 February	28
(Leap years)	29
3 March	31
4 April	30
5 May	31
6 June	30
7 July	31
8 August	31
9 September	30
10 October	31
11 November	30
12 December	31

The names by which the months are designated throughout Christendom were given them by the Romans. In the earliest time the number of Roman months seems to have been ten, viz. (1) Martius, (2) Aprilis, (3) Maius, (4) Junius, the remaining six were numbered as the fifth month, sixth month, etc.—(5) Quinctilis, (6) Sextilis, (7) Septembris, (8) Octobris, (9) Novembris, (10) Decembris. The months are thought to have been lunar, but how the year was filled out is unknown. To the time of the kings is ascribed a reform according to which were added two new months, Januarius and Februarius. February had 28 days; March, May, Quinctilis, and October, 31, the rest 29. The sum is 355, being one in excess, seeing 354 days go to the lunar year. The reason for the addition, and for making months of 31 days instead of 30, as usual, is said to have been that luck lies in odd numbers, but this explanation is only the conjecture of an ancient writer. Adjustment with the sidereal year was effected by intercalating two months, respectively of 22 and 23 days, inserted after February 23, the feast of the Terminalia (and ritual conclusion of the year), added in the course of a four-year period. The odd day still was in excess, moreover, the pontifices, who were charged with the duty of making the intercalation, were, by reasons superstitious or political, often induced to neglect their task, accordingly, the Roman months were constantly varying from their proper seasonal position and required arbitrary adjustment. In the reform of Julius Cæsar (see *CALENDAR*) the 10 days additional required to make a true solar year were distributed among the deficient months of 29 days, two each were given to Sextilis, December, and January; one each to April, June, September, and November. Hence our present numeration. The year was made to begin with January, shortly after the winter solstice. The month Quinctilis received the name of Julius,

and later Sextilis was given that of Augustus. The Roman names were adopted throughout Europe. In the French revolutionary calendar (see *CALENDAR*) the months received new names, which had reference to the weather, vegetation, and harvest, but these were discarded when the revolutionary calendar went out of use. As to symbolic art, the months have borrowed from the zodiacal signs. (See *ZODIAC*.) In poetry they have received symbolic representation chiefly on the basis of their seasonal characteristics in central and western Europe. Consult William Hone, *Everyday Book* (London, 1838), and Chambers, *Book of Days* (new ed., ib., 1906). See *CALENDAR*, *MOON*.

MONTH. In law, both solar (or calendar) and lunar months are recognized. At the early common law, where the term was not otherwise defined, it was held to mean the lunar month of 28 days, except in case of commercial paper and other mercantile obligations, when, by the custom of merchants, it was deemed to mean the calendar month of 30 or 31 days. By statute in England the term month, where it occurs in statutes, must be interpreted to mean calendar month, but this does not alter the common-law rule as to contracts and other transactions. In the United States generally the term, unless otherwise defined, is usually construed to mean a calendar month, especially in contracts and other mercantile transactions. It is so defined by statute in New York, Massachusetts, Pennsylvania, and other States. However, in the interpretation of the word where found in statutes, it seems the common-law rule still prevails in some jurisdictions. See *TIME*.

MONTHOLON, mōn'tōlōn', CHARLES TRISTAN, MARQUIS DE (1783-1853). A French soldier, born in Paris. He displayed great zeal on behalf of the First Consul on the 18th Brumaire in the capacity of *chef d'escadron*, served in a number of campaigns, and was severely wounded at Wagram. Napoleon made him his chamberlain in 1809. He became brigadier general in 1814 and was appointed to the chief command in the Department of Loire. On Napoleon's abdication Montholon remained in France, held aloof from the Bourbons and joined the Emperor on his return from Elba. He was present at Waterloo and accompanied Napoleon to St. Helena, continuing his devoted attentions to him till he breathed his last, and, having been named in his will as one of his trustees, spared no exertion to carry its provisions into effect. For participating in Louis Napoleon's unsuccessful coup at Boulogne in 1840 Montholon was sentenced to 20 years' imprisonment, but was pardoned in 1848. In 1849 he was a member of the Legislative Assembly. With General Gourgaud he published *Mémoires pour servir à l'histoire de France sous Napoléon, écrits à Sainte-Hélène sous sa dictée* (1823). He was also the author of *Récits de la captivité de Sainte-Hélène* (1847).

MONTH'S MIND. In the Roman Catholic church, the requiem mass celebrated for a deceased person a month after death, as "year's mind" was used for an anniversary mass in a similar case. In the ancient English church it meant constant prayer for a person during the month after his death.

MONTHYON, mōn'tē'ōn'. An incorrect spelling of Montyon (q.v.).

MONTI, mōn'tē, ACHILLE (1863-). An Italian physician. Born in Arcisate (Como), he studied medicine at Pavia (M.D., 1887) and

under Koch at the Institute for Infectious Diseases at Berlin (1891-92). He then traveled in Europe and the United States, was lecturer at Pavia, and became professor of pathology at Palermo (1895) and in 1899 at Pavia. Among his works are: *Il paese di malaria et la preservazione dell' uomo* (1891); *La patologia cellulare e la patologia parasitaria* (1891); *Le febbri malariche, etc.* (1892); *Su gli scheletri di alcune scimmie rachitiche* (1900); *Su l'istopatologia dei canalicoli contorti del rene* (1903). He translated, with C. Golgi, *Elementi d'istologia normale dell' uomo*, from the German of S. L. Schenk (1889).

MONTI, LUIGI (1830-1914) An Italian author and teacher, born at Palermo, Sicily. He participated in revolutionary outbreaks in 1848-49, and, having been exiled, went to Boston, Mass., in 1850. There he taught the Italian language, becoming a prominent figure in the life of Boston and Cambridge. He served as an instructor at Harvard in 1854-59, receiving an honorary A.M. in 1857, was United States Consul at Palermo in 1861-73, and returned to Boston to devote himself to teaching and literary work. He lectured at Lowell Institute, Boston, at Wellesley and Vassar colleges, and at Peabody Institute, Baltimore. Monti was the original of "the young Sicilian," in Longfellow's *Tales of a Wayside Inn*, and he married a daughter of Thomas William Parsons (qv), "the Poet" of the *Tales*. He translated Guerrazzi's *Beatrice Cenci* (1857), *Manfred* (1875), and *Isabella Orsini* (1881), and published *A Grammar of the Italian Language* (1855), *Adventures of a Consul Abroad* (1878), *Leone*, a novel in the "Round Robin Series" (1882). Consult H. W. Longfellow, *Tales of a Wayside Inn* (Boston, 1863), and Samuel Longfellow, *Life of Henry Wadsworth Longfellow* (Boston, 1886).

MONTI, VINCENZO (1754-1828) An Italian poet, born near Fusignano in the Province of Ferrara, Feb. 19, 1754. He studied jurisprudence very much against his will, being inclined to classical studies. In 1778 he went to Rome and stayed there some time as secretary to Prince Braschi. In 1791 Monti's evident leaning towards the ideas represented by the French Revolution brought him into bad odor, and the feeling against him was hardly allayed by the composition of the *Bassavilliana* (1793), which seemed to show his horror of the excesses due to revolutions. Finally in 1797 Monti fled from Rome and accompanied the French agent, Marmont, to Florence and Bologna. Afterward at Milan he obtained a position in the government of that region, and when the Cisalpine Republic fell he betook himself to Paris. After Napoleon's victory at Marengo he took the chair of oratory and poetry at the University of Pavia in 1802. By Napoleon's favor he held a position at the Collège de France, where he ended his tragedy, *Caio Gracco*, and began in Dantesque style a poem on the mathematician Mascheroni. When Napoleon became King of Italy Monti was made historiographer of the realm, an office which he lost in 1814, although he was permitted to retain his professorship. The rest of his life was passed in study, but was saddened by adversity. He died at Milan, Oct. 13, 1828.

The various political changes through which Monti passed reveal themselves in his literary works. The first edition of the lyrics of Monti was the *Saggio di poesie* (Leghorn, 1779); the next the *Versi* (1788). In 1783 or thereabout

he began the *Feromade*, a mythological poem in blank verse on the draining of the Pontine marshes. The work was never finished, although the poet spent the last years of his life in elaborating it. One of his most notable poems, because of its perfection of form, was the *Mascheroniana* (1801), in which the spirit of Mascheroni discourses on the misfortunes of Italy. To about 1825 belongs the *Sermone sopra la mitologia*, a manifesto in verse in favor of classicism and attacking romanticism. Although his temperament was not eminently dramatic, Monti essayed the drama with some success. The *Aristodemo* was printed at Parma in 1786 and performed at Valle di Roma in 1787. His *Calcoetto Manfredi* is really a romantic drama, it was published at Rome in 1788. Monti's most successful dramatic composition is the *Caio Gracco* (Milan, 1802). His translations include versions of the *Natures* of Persius, of a fragment of the *Philoctetes* of Sophocles, and, most notable of all, of the *Iliad*. This last, published at Milan, 1810 and 1812, is pretty true to the tone of the Homeric epic. Monti's prose works are less numerous than his works in verse. Among them are the *Lezioni di eloquenza*, delivered from his chair at Pavia, the *Lettere filologiche*, the *Lettera*, addressed to Bettinelli, and the *Dialoghi*, on the Italian language. With the aid of his son-in-law, Perticari, he prepared a lexicographical work, the *Proposta di alcune correzioni ed aggiunte da farsi al vocabolario della Crusca* (Milan, 1817-26). Consult A. Monti, *Vincenzo Monti, ricerche storiche e letterarie* (Rome, 1873); Cantù, *Monti e l'età che fu sua* (Milan, 1879); Vicchi, *Vincenzo Monti, le lettere e la politica in Italia dal 1750 al 1830*, especially vols. vi-viii (Faenza, 1870, Rome, 1885-87).

MONTIANO Y LUYANDO, mōn'tē-ā'nō é lō-yān'dō, AGUSTÍN DE (1697-1764). A Spanish poet, born at Valladolid. His first poem, *El robo de Dina*, was written while he was a young man at Majorca. Afterward he went to Madrid, where he was connected with the Department of State for many years. He was a man of acknowledged authority in literary matters, was elected a member of the Royal Spanish Academy of the Language, and became permanent director of the Royal Academy of History, founded at Madrid in 1738. With the accession of the Bourbon King Philip V everything French was the fashion, and all Montiano's writings were designed to reorganize Spanish drama on the classic lines of Racine. His two tragedies, *Virginia* and *Ataulfo*, were too dull ever to be acted, but when published they were accompanied by two *Discursos sobre las tragedias españolas* (2 vols., Madrid, 1750), which set forth Montiano's dramatic principles and were distinctly influential.

MONTICELLI, mōn'tē-chèl'lè, ADOLPHE (1824-86). A French genre and portrait painter. He was born at Marseilles, studied at the Academy of Fine Arts in his native city, and when a young man went to Paris, where he lived almost continuously until 1870. He then returned to Marseilles and there passed the remainder of his life. During his last years he was demented, his imagination ran riot, and his paintings tended to become chaotic masses of color. His first manner was influenced by his study of the great Venetians, the great Dutch masters, of Delacroix and Diaz. Some splendor from each one of these sources enriched his own palette and brought to his second period remarkable color conceptions and combinations of tints.

Like Watteau, he painted "fêtes galantes," which are his favorite subjects. In them figures of gorgeously clothed men and women are grouped beneath splendid trees, or on marble steps, while dogs, horses, and other animals are introduced as accessories. Such are his "Court of Henry III" (1874), a characteristic work, and "Court Ladies" and "The Court of the Princess," both in the Metropolitan Museum of Art, New York. He is quite as effective with an Eastern subject, a scene from Boccaccio, with the landscapes of his own province, and with marines, "The Miraculous Draft of Fishes," a remarkable treatment of light effects on water, with still-life subjects and portraits. He is well represented in American collections, those of Mrs Ichabod T. Williams, New York, Sir William Van Hoiné, Montreal, and especially in the Lambert collection, Paterson, N. J. Consult: Guigon, *Vingt planches d'après les tableaux originaux de Monticelli* (Paris, 1890); Gourand, *Monticelli* (ib., 1900); Fézensac, "Monticelli," in the *Gazette des Beaux-Arts*, vol. xxv (3d series, ib., 1901), Faure, *Monticelli* (ib., 1908).

MONTICELLO, mōn'ti-sel'ō or -chēl'ō (It, little mountain). The name given by Thomas Jefferson to his residence and estate in Albemarle Co., Va., about 3 miles east of Charlottesville. The mansion, designed by Jefferson himself and first occupied, though then in an unfinished condition, in 1770, stands on the summit of a hill overlooking a large extent of the neighboring country, and was long one of the finest and most picturesque residences in the South. It was Jefferson's home for 56 years, but passed out of the hands of his heirs a short time after his death. On the estate Jefferson, his wife, and two daughters were buried. Uriah P. Levy, U.S.N., who purchased Monticello 10 years after Jefferson's death, willed it to the people of the United States. The will having been successfully contested by heirs, Jefferson M. Levy, Congressman from New York, bought out the other owners. Subsequently he spent a large sum on the improvement of the estate and restored it from the 218 acres to which it had become reduced to the original 750. Beginning about 1912, Mrs. Martin W. Littleton, wife of a New York Congressman, carried on a campaign to have the government acquire the property by purchase or condemnation, the Virginia Legislature memorialized Congress on the subject, and in 1915 Secretary of State Bryan urged Mr. Levy, who had long been unwilling, to part with the property. Mr. Levy finally agreed to sell for \$500,000 (less than half the supposed valuation), provided Monticello should not be turned into a museum, merely, but be used as a Virginia home for Presidents of the United States.

MONTICELLO, mōn'ti-sel'ō. A town and the county seat of Drew Co., Ark., 40 miles west of Arkansas City, on the Arkansas, Louisiana, and Gulf and the St. Louis, Lion Mountain, and Southern railroads (Map: Arkansas, D 4). There are cotton and other manufactures and a considerable trade in fruit, cotton, and lumber. The Arkansas Baptist Orphans Home is here, also Hinemon University School and the State agricultural school. The town owns its water works, sewage system, and electric-light plant. Pop., 1900, 1579; 1910, 2274.

MONTICELLO. A city and the county seat of Jefferson Co., Fla., 31 miles east by north of Tallahassee, on the Seaboard Air Line and the Atlantic Coast Line railroads (Map: Florida,

C 1). It is interested principally in fruit growing and cotton raising. Monticello is one of the oldest towns in Florida. Pop., 1900, 1076; 1910, 1829.

MONTICELLO. A city and the county seat of Piatt Co., Ill., 28 miles northeast of Decatur, on the Sangamon River and on the Wabash and the Illinois Central railroads (Map: Illinois, H 5). It has a fine courthouse, the Allerton Library, and an excellent high-school building. It is surrounded by a productive farming and stock-raising country and has a large sirup factory. The water works are owned by the city. Pop., 1900, 1982; 1910, 1981.

MONTICELLO. A city and the county seat of White Co., Ind., 21 miles west of Logansport, on the Tippecanoe River and on the Pittsburgh, Cincinnati, Chicago, and St. Louis and the Chicago, Indianapolis, and Louisville railroads (Map: Indiana, D 3). Good water power is derived from the river; and there are various manufacturing establishments, the principal of which are flouring mills, cement, tile, and agricultural-implement factories, thread mill, and a poultry-packing plant. Monticello contains a Carnegie library. The water works are owned and operated by the municipality. Pop., 1900, 2107; 1910, 2168.

MONTICELLO. A village and the county seat of Sullivan Co., N. Y., 113 miles by rail northwest of New York, on the New York, Ontario, and Western Railroad (Map: New York, A 1). There are manufactures of leather goods, gloves, and perfume, but the village is known principally as a summer resort, attracting thousands of persons annually. Besides its many hotels and boarding houses there are a high school, convent, and fine courthouse. The Montgaup Falls here afford excellent water power. Monticello was ravaged by fire in 1909, the property loss being estimated at \$1,000,000. The water works are owned by the village. Pop., 1900, 1160; 1910, 1941; 1915, 2166.

MONTIGNIES-SUR-SAMBRE, mōn'tē'nyē'-sur-sin'br. A town of Belgium, in the Province of Hainaut, situated 30 miles south of Brussels. It is the centre of a coal-mining region and has machine shops, blast furnaces, rolling mills, nail factories, and manufactures of chicory. Pop., 1900, 18,440; 1910, 21,748.

MONTIJO, mōn-tē'hō, EUGÉNIE-MARIE DE Empress of the French. See EUGÉNIE-MARIE DE MONTIJO.

MONTILLA, mōn-tē'lyā. A town of south Spain, in the Province of Cordova, 23 miles south of Cordova, on the railroad between that city and Malaga (Map: Spain, C 4). It stands on a hillside rising from the south bank of a tributary of the Jemil. Manufactures of coarse linen and earthenware are carried on and oil mills are in operation. A famous white wine, called Amontillado and possessed of a peculiar flavor, is produced in the vicinity. The palace of the dukes of Medinaceli, located here, is the birthplace of Gonsalvo de Córdoba, the Great Captain. Pop., 1900, 12,943; 1910, 13,565.

MONTJOIE, mōn'zhwā', or **MONTJOYE**. The name given in the Middle Ages to any hillock situated on the boundary between two territorial divisions and serving as a meeting place for hostile armies. From this the word became a common war cry. Special designations were added for each political division: e.g., Montjoie Saint-Denis for the kings of France, Montjoie Saint-George for the kings of England, etc.

Montjoie is also the surname of the king-at-arms of France.

MONTLOSIER, mōn'lō'zyā', FRANÇOIS DOMINIQUE DE REYNAUD, COUNT DE (1755-1838). A French politician and publicist, born at Clermont-Ferrand, Puy-de-Dôme. In 1789 he was elected a deputy to the States-General, where he upheld the royal cause, and when the Constituent Assembly gave way to the Legislative Assembly in 1791, he emigrated and joined the royalist army at Coblenz. From 1794 to 1801 he published the *Courrier de Londres* in London, and then for a short time the *Courrier de Londres et Paris* in Paris. In 1802 he edited the *Bulletin de Paris*, conducting an anti-English agitation. At the wish of Napoleon he prepared *De la monarchie française* (3 vols., 1814), a work intended as a justification of the Empire. The clerical policies of Charles X after the Restoration aroused his anger and led him in 1826 to publish *Mémoires à consulter sur un système religieux, politique, et tendant à renverser la religion, la société, et la trône*, which, like his other writings of the same stamp, had much influence. After the revolution of 1830 he supported the government of Louis Philippe and in 1832 he entered the House of Peers. He wrote also *Mémoires sur la révolution française, le consulat, l'empire, la restauration, et les principaux événements qui l'ont suivie* (2 vols., 1829) and *Mystères de la vie humaine* (2 vols., 1829).

MONTLUC, mōn'luk', BLAISE DE. See MONLUC

MONTLUÇON, mōn'lu'sōn'. A town in the Department of Allier, France, on the Cher, 45 miles northwest of Clermont-Ferrand (Map France, N, H 6). It is the industrial capital of Allier. The town consists of two parts—the mediæval portion on the steep right bank of the river with its hôtel de ville, formerly a convent, another abandoned convent used as a college, and its timbered houses dating from the fifteenth and sixteenth centuries, dominated by a castle-crowned hill (the ancient fortification now converted into barracks), and the newer portion extending along the left bank of the Cher, where are located the extensive manufactories of glass, steel, iron, sewing machines, chemicals, and liquors. The town owes its rapid development to the opening up of the Commentry coal field. It has a considerable trade in grain and fruit. Pop., 1901, 35,062, 1911, 33,799.

MONTMAGNY, mōn'mā'nyé. A town and the capital of Montmagny Co., Quebec, Canada, on the St Lawrence River and the Intercolonial Railway, 35 miles east-northeast (direct) of Quebec (Map Quebec, H 4). The public buildings and institutions include the courthouse, theatre, Roman Catholic college and convent, high school, customhouse, and an asylum for the aged. Among the manufacturing establishments are grist, saw, pulp, and lumber mills, carding and planing mills, and manufactories of wagons, foundry and machine-shop products, sashes and doors. Butter is also produced. The town has an electric-lighting system. Pop., 1901, 1919, 1911, 2617.

MONTMAGNY, CHARLES JACQUES HUAULT DE (?-c.1651). A governor of New France. His education was under Jesuit auspices and he became a Knight of Malta. Though probably appointed Governor soon after the death of Champlain in 1635, he did not arrive at Quebec until June, 1636. During his stay the strength of the colony increased, a seminary for Huron boys was

founded, and the Iroquois were defeated in several skirmishes. His administration was a continued struggle to maintain the feeble French settlements against the power of the Iroquois, during which the Huron and Algonquin allies of France were almost annihilated. Mary H. Catherwood's (q.v.) *Romance of Dollard* (1889) was based on public and private papers describing the fight at Richelieu River. As a result of the fight at the mouth of the Richelieu River a peace was made at Three Rivers in 1645, but this was broken the next year. Montmagny was intensely religious, but viewed with disfavor the colony at Montreal, thinking it a mistake to divide the strength of the missionary forces. He was recalled in September, 1647.

MONTMARTRE, mōn'mär'tr'. A northern district of Paris.

MONTMEDY, mōn'mā-dé'. A fortified town of the second class in the Department of Meuse, France, near the German frontier, on the Chiers, 31 miles east-southeast of Sedan. It consists of two parts, the upper containing the citadel on a commanding rock 960 feet above the sea, and the lower portion, or Bas-Médy, surrounded by a strongly fortified wall. It was in the line of the German invasion of France in 1870 and resisted bombardment in September, but succumbed to a second attack December 14. It was captured by the Germans in the European War which began in 1914. (See WAR IN EUROPE.) Pop., 1901, 2600, 1911, 2774.

MONTMORENCY, mōnt'mō-rēn'sī. A village in Quebec Co., Canada, on the Quebec and Light and Power Company railways, 6 miles northeast of the city of Quebec (Map Quebec, G 4). The celebrated Montmorency Falls (q.v.) are situated here. There is a children's hospital. A large cotton mill gives employment to over 1000 persons and there are three saw mills. The village owns its water, lighting, and sewerage systems. Pop., 1911, 1717.

MONTMORENCY, mōn'mō-rēn'sé'. An old and illustrious French family named from a village near Paris, whose members in 1327 received the title of first baron of France. The mythical founder of the house is LESBRIUS (or *Isbrius*), who is said to have died with the martyr Dionysius; the first authentic lord of Montmorency is BOUCHARD I, who lived in the tenth century. MATTHIEU II (1189-1230) is the most famous member of the family before the sixteenth century. He was called the Great Constable. In the reign of Philip Augustus he captured Château Gaillard, in Normandy, and in 1214 helped to win the battle of Bouvines. In 1226 he defeated the Albigenses, and during the regency of Queen Blanche, the mother of Louis IX, was a powerful upholder of royal power as opposed to that of the great vassals. After Matthieu's death the family divided into two houses—the baronial branch of Montmorency and the younger line of Montmorency-Laval. The former attained the title of duke with ANNE DE MONTMORENCY (1493-1567). He was born at Chantilly and was educated with the princes of the royal blood. Becoming a soldier at an early age, he distinguished himself by his gallantry and military skill in the wars of Francis I, particularly at Melegnano (1515), at the defense of Mézières (1521), and in the battle of La Bioccca (1522). In 1522 he was made marshal of France and in 1525 was taken prisoner with his sovereign in the battle of Pavia. He then helped to negotiate the Treaty of Madrid, and in 1526 became

grand master of the royal household and Governor of Languedoc. In 1536 he repelled Charles V's attack on Marseilles, and in 1538 was made Constable of France. In this capacity he directed the foreign and domestic affairs of France for some years with energy and ability. His brusqueness of manner, however, made him an object of dislike to many; and the suspicions of the King having been aroused against him, he was suddenly banished from court in 1541. The next six years were passed in retirement on his estates, but with the accession of Henry II (qv) in 1547 he came again to the head of affairs, though he shared this power with Henry's mistress, Diana of Poitiers, and the family of Guise. In 1557 he commanded the French army which was defeated at Saint-Quentin (qv). Here he was taken prisoner, but was liberated by the treaty made at Cateau-Cambrésis between France and Spain in 1559. During the minority of Charles IX Montmorency with the Duke of Guise and the Marshal Saint-André composed the famous triumvirate which resisted the influence of Catharine de' Medici in state affairs. He commanded the royal army against the Huguenots, though Coligny was his nephew. He was captured at Dreux (1562), but later gained several victories over them. In 1563 he forced the English to evacuate Havre. At the battle of Saint-Denis against the Huguenots under Condé he received a fatal wound and died in Paris on the following day, Nov. 11, 1567.—HENRY II, fourth Duke of Montmorency (1595-1632), was the grandson of the Constable Anne de Montmorency and was born at Chantilly. When he was 17 years of age Louis XIII made him Admiral of France and Viceroy of Canada, and in 1613 he became Governor of Languedoc. When the Huguenot war broke out afresh he fought successfully for the King and in 1625 took the islands of Ré and Oléron during the siege of La Rochelle. He afterward gained other victories, and in 1630 received the chief command of the French troops in Piedmont during the War of the Mantuan Succession. He defeated the Spaniards and received the marshal's baton. Having espoused, in 1632, the cause of Gaston, Duke of Orléans, brother of King Louis XIII, and opponent of Richelieu, he was declared guilty of high treason, and Marshal Schomberg defeated him at Castelnaudry (1632) and took him prisoner. He was carried to Toulouse and there sentenced to death through the influence of Richelieu. This sentence was summarily executed, in spite of powerful intercession on his behalf by various rulers, he was beheaded Oct. 30, 1632.—LAVAL MATTHIEU JEAN FÉLICITÉ, Duke of Montmorency-Laval (1766-1826), was born in Paris. He served in the American Revolution with his father; and after the outbreak of the French Revolution as a representative of the nobility in the Constituent Assembly he urged the abolition of the privileges of his order, but he became conservative after the attack on the Tuileries. After the overthrow of the constitutional monarchy of 1791 he joined Madame de Stael, with whom he was long intimate, at Coppet in Switzerland, and returned to France in 1795, then to become quite as closely attached to Madame Récamier, whose memoirs give a vivid picture of him. In 1821 Montmorency was appointed Minister of Foreign Affairs, and as representative of France at the Congress of Verona (1822) urged armed intervention in Spain in behalf of Ferdinand VII. In 1825 he was made a member of the French

Academy. Consult Vetillard, *Notice sur la vie de M. le duc de Montmorency* (Le Mans, 1826).

MONTMORENCY-BOUTEVILLE. See LUXEMBOURG, DUKE OF

MONTMORENCY, FALLS OF. A picturesque cascade, 150 feet wide and 265 feet high, at the mouth of the Montmorency River, an affluent of the St. Lawrence, 6 miles northeast of Quebec, Canada (Map Quebec, G 4). They supply the power for Quebec's electric plants and are much visited by tourists.

MONTMORENCY, FRANÇOIS XAVIER DE LAVAL. See LAVAL-MONTMORENCY, F. X.

MONTMORENCY ET D'ANGOULÊME, DUCHESSE DE. See DIANE DE FRANCE

MONTORO, mōn-tōr'ō. A town of south Spain, in the Province of Cordova. It is situated on a rocky peninsula formed by the south bank of the Guadalquivir, 27 miles by rail east-northeast of Cordova (Map Spain, C 3). The river is here spanned by one of its best bridges, built in the sixteenth century by popular subscription. In spite of the uneven ground, the streets are well paved and they are lighted by electricity. One of the largest and best hospitals of south Spain is located here. There are many interesting Roman, Gothic, and Moorish remains. The chief industry is the manufacture and exportation of olive oil. Pop. 1910, 15,144.

MONTORSOLI, mōn-tōr'sō-lē. FRA GIOVANNI ANGELICO (or ANGIOLODA) (1507-63). A Florentine sculptor and architect. He was born at Montorsoli, worked in Florence, Rome, Genoa, Bologna, and Messina, visited Paris; and died in 1563 in Florence, where he was interred in a tomb erected by himself (1561) in the chapter house of the Annunziata Church. He was for a short time connected with the Order of the Servites, whence the Fra commonly prefixed to his name. His earliest important work was at Genoa (1522-25), where he built or enlarged the Serra and Doria palaces and remodeled the interior of the church of San Mateo, to which he added a chapel with a monument to Andrea Doria. Between 1530 and 1534 he assisted Michelangelo on the Medicean Chapel, Florence, for which he carved the statue of St. Cosmas. In 1547 he went to Messina, where he executed the fountain in front of the cathedral and another near the customhouse, besides designing several chapels in the cathedral, the church of San Lorenzo, and the lighthouse.

MONTOUR, mōn-tōor', ESTHER. An Indian chieftainess, usually known by the name of Queen Esther. She is reputed to have been the granddaughter of Count de Frontenac, and became the wife of Eghobund, a chief of the Senecas. Owing to her strength of mind she gained great influence among her people. She several times visited Philadelphia with the delegates of the Six Nations, and is said to have comported herself on such occasions with dignity and good manners. Despite some good qualities, however, she was at heart a savage, and in the Wyoming massacre of July, 1778, tomahawked more than a dozen helpless prisoners in revenge for the death of her son, who was killed the day before. Consult Frederick Cook, *Journals of the Military Expedition of Major-General John Sullivan against the Six Nations of Indians in 1779, with Records of Centennial Celebrations* (Auburn, N. Y., 1887).

MONT PELÉE. See PELÉE, MONT

MONTPELIER, mōnt-pē'lyēr. A city in

Blackford Co., Ind., on the Salomon River, 39 miles by rail south by west of Fort Wayne, on the Fort Wayne, Cincinnati, and Louisville Railroad (Map Indiana, G 3). It is surrounded by oil wells, and has machine shops, brass and iron foundries, stone crushers, and manufactories of steel castings and shovels. Montpelier contains a Carnegie library. Pop., 1900, 3405, 1910, 2786.

MONTPELIER. A village in Williams Co., Ohio, 59 miles west of Toledo, on the St. Joseph River and on the Wabash Railroad (Map Ohio, A 2). It contains railroad repair shops and has a large manufactory of hardware-store fixtures. The village owns its water works and electric-light plant. Pop., 1900, 1869, 1910, 2759.

MONTPELIER. A city, the capital of Vermont, and county seat of Washington County, 40 miles by rail southeast of Burlington, on the Winooski River and on the Central Vermont and the Montpelier and Wells River railroads (Map Vermont, D 4). The handsome capitol is built of granite, its dome rising to a height of 124 feet, and surmounted by a statue representing Agriculture. Among other features of the city are the State Library, the Wood Art Gallery, the Kellogg-Hubbard Library, Washington County grammar and Montpelier high schools, the historical society, courthouse and city hall buildings, State arsenal, Federal Building, National Life Building, Montpelier Seminary, Green Mount Chapel, Heaton Hospital, and the Montpelier Country Club. The principal industries are granite working and the manufacture of saddlery, hardware, clothespins, patent medicines, crackers, and saw-mill and other machinery. The city controls an important trade with the surrounding region, which is largely agricultural, and is the centre of large insurance interests. The city owns and operates the water works. Pop., 1900, 6266, 1910, 7856. A charter to the land about Montpelier was secured in 1781, but no settlement was made until 1787. In 1791 Montpelier was organized as a town and in 1805 became the capital of the State; it was incorporated as a village in 1855, and in 1894 it was chartered as a city. Montpelier is the birthplace of Admiral George Dewey (qv). Consult D. P. Thompson, *History of Montpelier, 1781-1860* (Montpelier, 1860), and Hemenway, *History of the Town of Montpelier* (ib., 1882).

MONTPELLIER, mōn'pēl'yā'. The capital of the Department of Hérault, France, at the junction of the Lez and Mordansun, 76 miles west by north of Marseilles and 7 miles from the Mediterranean, with which it is connected by canal (Map France, S., H 5). Seen from a distance Montpellier has an imposing appearance. Its suburbs are clean and well built, although the older portion of the town has narrow, crooked streets. Boulevards have replaced the ancient walls and medieval fortifications, of which the only remains are the citadel and the twelfth-century Tour de la Babotte. The principal attraction is the Peyrou, or public square, on high ground commanding splendid views of the Alps, the Cévennes, the Pyrenees, and the Mediterranean. It is ornamented with a triumphal arch and equestrian statue, both commemorating Louis XIV. The water works, water tower, and aqueduct, having a double-arched structure 2893 feet long, are monumental features. The most noteworthy buildings are the theatre, the exchange, the halls of justice, the prefecture, and the observatory. Montpellier University, founded in 1289, with faculties of

law, medicine, science, letters, and pharmacy, had (1913) 1958 students and a library of 125,000 volumes, including many old and rare works. There are also schools of agriculture. Montpellier has a botanical garden, founded in 1593, and one of the oldest in Europe, a public library of 130,000 volumes, and a museum, founded by the painter F. X. Fabre, containing one of the finest provincial collections of paintings and curios in France. The climate is mild, and the city is a favorite winter resort for invalids. Among the industries the making of wine is the most important. Machinery, chemicals, scales, billiard tables, candles, chocolate, paper, soap, baskets, corks, sugar, leather, cotton, and woolen goods are manufactured, and the city is noted for its fine confectionery. There is an important trade in manufactured articles, wine, olive oil, and fruits. Founded in the eighth century about a Benedictine abbey, Montpellier began to prosper in the twelfth century, when its school of medicine acquired fame. It had a stirring history in the Middle Ages, during which it was for a time under the rule of Aragon, Majorca, and Navarre, before its final union with France towards the close of the fourteenth century. Comte, the philosopher, was born at Montpellier. It was a stronghold of the Protestants during the wars of the Reformation. Pop., 1901, 75,950, 1911, 80,230. Consult Aigréfeuille, *Histoire de Montpellier* (Montpellier, 1877-88), Guiraud, *Recherches topographiques sur Montpellier* (ib., 1895), Febre, *Histoire de Montpellier* (ib., 1897).

MONTPELLIER, UNIVERSITY OF. A French university. As early as the first half of the twelfth century the university of medicine at Montpellier was famous beyond any other in Europe save Salerno. To this, about 1160, was added a university of law by Placentinus, a distinguished doctor of law exiled from Bologna and Mantua. A university of theology grew up around a Carthusian college founded in 1263, and a university of arts came into existence somewhat earlier. Besides the colleges of the four mendicant orders, seven others were founded from time to time, and from the twelfth to the fourteenth century Montpellier was one of the great universities of Europe. Save in medicine, the fame of the university declined greatly after the latter period. It remained the chief medical school of France till modern times. Here Rabelais taught in 1537, and in the next century, during a period of Protestant supremacy, Casaubon. Under Napoleon the university was reorganized and thrown into the general scheme of national education. It comprises four faculties—law, medicine, mathematics-science, and philosophy—besides a school of pharmacy. In 1913 it had 1958 students. Its library contains nearly 125,000 volumes.

MONTPELIER, mōn'pān'syā', ANNE MARIE LOUISE D'ORLÉANS, DUCHESS OF (1627-93). The daughter of Gaston d'Orléans, brother of Louis XIII of France, known as La Grande Mademoiselle. She grew up beautiful, eccentric, and ambitious. While still a child there was idle talk of a marriage with Louis XIV of France, and subsequently her matrimonial aspirations centred about the persons of the future Philip IV of Spain, the Emperor Ferdinand III, and his brother, the Archduke Leopold. All these plans miscarried, probably through the secret hostility of Cardinal Mazarin. Upon the outbreak of the troubles of the Fronde, Mademoiselle, with

her worthless father, whom she appears to have loved, remained faithful to the court, but in 1651 she embraced the cause of the great Condé, whom she originally hated most bitterly, but later seemingly sought in marriage. Her vanity and courage found delight in the rôle of party leader, which she now was enabled to play. In March, 1652, she held the city of Orléans against the royal army and then went to Paris, where her masculine decision made her for a time the leader practically of the resistance to the King. On July 2, 1652, when Condé, after stubborn fighting in the Faubourg Saint-Antoine, had been decisively beaten by Turenne, Mademoiselle saved the Prince's army from annihilation by training the guns of the Bastille on the royal forces and opening the gates of the city to receive the defeated troops. In October she was banished from the court and lived for some time in retirement. She was recalled to court in 1657 and after some years fell violently in love with the Duke of Lauzun (qv), a handsome and accomplished Gascon cavalier and a favorite of Louis XIV. In December, 1670, the King consented to the marriage, but within three days withdrew his sanction, owing probably to the enmity of Madame de Montespan for Mademoiselle. In the following year Lauzun was thrown into the Bastille, where he remained for 10 years in spite of the exertions of Mademoiselle, who finally obtained his freedom by ceding the County of Eu and the Principality of Dombes to the Duke of Maine, son of Madame de Montespan. There is some reason to believe that a secret marriage took place between Lauzun and Mademoiselle. It is certain that Lauzun repaid her devotion by brutal neglect and that they became totally estranged. She left *Mémoires*, first published at Amsterdam in 1729 and subsequently edited by Chéruel (Paris, 1858). A religious essay, *The Eight Beatitudes*, has been edited in 1908 by E. Rodocanachi under the title *Un ouvrage de piété inconnu*. Consult Margerie, *La Grande Mademoiselle* (Nancy, 1869); Arvède Barine, *La Grande Mademoiselle, 1627-1652* (New York, 1902), id., *Louis XIV and la Grande Mademoiselle, 1652-1693* (ib., 1905); E. C. Price, *Princess of the Old World* (ib., 1907).

MONTPENSIER, ANTOINE MARIE PHILIPPE LOUIS D'ORLÉANS, DUKE OF (1824-90), fifth son of Louis Philippe. He was educated at the Collège Henri IV and went to Africa in 1844 as lieutenant in the artillery. After a tour in the East he married, in 1846, the Infanta Luisa de Bourbon, sister of Queen Isabella II of Spain. The marriage created great excitement, Louis Philippe being generally credited with the intention to seat his son upon the throne of Spain. During the revolution of 1848 the Duke resided in England, but soon returned to Spain, taking up his residence at Seville. In 1859 he was appointed captain general of the Spanish army. During the political agitation preceding the flight of Isabella the Duke quitted Spain. Returning in 1868, under the provisional government, he offered himself as a candidate for the throne, but destroyed whatever chances for election he may have had by killing his cousin, the Infante Don Enrique de Bourbon, in a duel, March 12, 1870. His eldest daughter, Marie, was married to the Count of Paris in 1848, and his third daughter, Maria de las Mercedes, married her cousin, Alfonso XII, in 1878.

MONTREAL, mōn'trè-äl' (Fr. Mount Royal).

The largest city in the Dominion of Canada, situated in Hochelaga County in the Province of Quebec, 180 miles by rail southwest of the city of Quebec and 420 miles by rail north of New York, on the southeast side of Montreal Island (30 miles long by 7 to 10 miles wide), at the confluence of the St. Lawrence and Ottawa rivers, 620 miles from the sea by the course of the St. Lawrence (Map Quebec, E 5). It occupies a low tract of land between the St. Lawrence River and Mount Royal, a mountain rising to an elevation of 769 feet above the sea, which gives a picturesque background to every view of the city, the summit being laid out as a public park of 460 acres. Fine residential streets lie in terraces upon the slope. The chief business streets are St. James, St. Paul, St. Lawrence, McGill, Bleury, Craig, Notre Dame, St. Catherine, Ontario, and Wellington. The French section is on the east, the dividing line being St. Lawrence Street. Montreal is about 7 miles long and contains many public squares and parks, such as Dominion (with a statue of Sir John A. Macdonald and a monument to Canadian soldiers who fell in the Boer War), Victoria (with a fountain and a statue of Queen Victoria), St. Louis, and the Viger Gardens, Lafontaine, and Mount Royal parks. The buildings are largely of gray limestone, quarried in the vicinity, and include the church of Notre Dame, built in 1824, opposite the site of an earlier church (1672); it is one of the largest cathedrals in America, being 255 feet long by 145 feet wide, and can accommodate over 10,000 people. Its towers are 220 feet high and have a noted chime of bells. Near it is the seminary of St. Sulpice, the oldest building in Montreal (1684). Other important edifices and places of interest are the courthouse, city hall, Bank of Montreal; customhouse, the old Château de Ramezay (1705), for a time the official residence of the British governors and the headquarters of the American general and commissioners in 1775-76; the Champ de Mars, the old parade ground of the French and British troops; Jacques Cartier Square, with a statue of Nelson (1808); Bonsecours Market, 500 feet long; the church of Notre Dame de Bon Secours, St. Patrick's Church; the cathedral of St. James, on Dominion Square, a reproduction on half the scale of St. Peter's in Rome, Christ Church Cathedral (Episcopal), a fine example of Gothic architecture; St. James's Methodist Church; church of Notre Dame de Lourdes (1874), the Jesuit Church, noted for its frescoes; St. Andrew's; St. Paul's, St. George's; Erskine Presbyterian; and Mountain Street Methodist. The Windsor, Place Viger, Ritz-Carlton, and Queen's hotels are fine structures. Among other points of interest are the Fraser Institute, a public library; the art gallery; the Protestant and Roman Catholic deaf and dumb asylums; an asylum for the blind, and the convents of the Holy Names of Jesus and Mary, and Villa Maria. The most important educational institutions are McGill College (qv.), founded in 1824 by a bequest of James McGill, also containing the Macdonald scientific laboratories, the Redpath Library, an observatory, and a natural history museum; the Montreal branch of the Roman Catholic Laval University; and the Collège de Montreal, or Petit Séminaire. There are Presbyterian, Wesleyan, and other colleges, academies, schools, and libraries; Grey Nunnery, a hospital and orphan asylum; Naza-

reth Asylum for blind children, the Hôtel Dieu, founded in 1644 by Mademoiselle Mance, an original settler of Montreal, the Royal Victoria, the Montreal General, the Notre Dame, the Children's Memorial, and the Western hospitals; and the Victoria Rifles and Royal Scots armories and the Drill Sheds. There are many publications printed in French and English. The leading dailies are the *Gazette*, founded in 1778 and continuous since 1795, the *Herald*, the *Star*, and the *Witness*.

Montreal's wealth and importance first accrued from the fur, lumber, and grain trade of the Northwest. It is now the metropolis of Canada and the chief commercial city and port of entry. Its fine harbor, with quays, wharves, and docks of solid masonry extending for miles, lies at the head of ship navigation and accommodates vessels up to 30-feet draft at low water. The construction of canals has enabled Montreal to command the navigation of the Great Lakes. The Lachine Canal was opened in 1825, the Grand Trunk Railway in 1852; the Victoria tubular bridge, built over the St. Lawrence in 1854-59, was reconstructed and enlarged as a truss bridge in 1898-99, the Champlain and St. Lawrence Railway, from Laprairie to St. John's, was opened in 1836, and the Canadian Pacific in 1886. Other railways entering Montreal are the Intercolonial, Canadian Northern, Grand Trunk Pacific, New York Central, the Central Vermont, the Rutland, the Quebec, Montreal, and Southern, and the Delaware and Hudson. Various steamship lines run to transatlantic ports, and lines also run to the chief eastern Canadian ports. The exports in 1913 amounted to \$99,398,102, and the imports to \$154,485,087; in 1890 they were respectively \$31,660,216 and \$45,934,406. In 1913 the total number of ocean-going ships entering port was 820, of a total tonnage of 2,690,535. Inland clearances numbered 13,426, of a measurement of 5,703,467 tons. The exports and manufactures include lumber, grain, flour, apples, butter, phosphates, cheese, boots, shoes, cottons, woolens, clothing, rubber goods, hardware, glass, carriages, sleighs, drugs, paints, steam engines, locomotives, railway cars, electric goods, confectionery, cement, tobacco, machinery, boilers, sewing machines, musical instruments, paper, etc. There are also saw, flour, and rolling mills, brass and iron foundries, lead works, etc., gas and electric-light plants, electric street railroads, and a costly system of water works. The value of the manufactured output in 1910 was \$166,296,972, as compared with \$71,099,750 in 1900, an increase of over 133 per cent. Electric power for manufacturing is supplied from Shawinigan Falls, Lachine Rapids, and Chambly Rapids. There are many banks, the chief of which is the Bank of Montreal, one of the world's greatest banks. The bank clearings in 1913 were \$2,879,118,000. The climate presents great extremes of heat and cold, the temperature reaching 90° in summer and sometimes sinking to 20° below zero in winter. The winter carnivals which formerly attracted thousands of visitors to engage in gay skating tournaments, in snowshoe parades, masquerades, tobogganing, and the storming of the ice castle (generally erected in Dominion Square) by torchlight are no longer prominent as a feature of the winter diversions.

Montreal's first record dates from 1535, when Jacques Cartier ascended the St. Lawrence and found an Indian village named Hochelaga at the

foot of the mountain—a name still preserved in a portion of the modern city. It was inhabited by the Hochelaga or Beaver Indians, active traders, who traversed the St. Lawrence from their district to Ottawa. When Champlain visited the spot in 1603 the Indian town had vanished, as the result of a war between the Hurons and the Iroquois, and here he established, eight years later, a trading post. In 1642 Paul de Chomedey, Sieur de Maisonneuve, for La Compagnie de Montréal founded the Ville Marie-de-Montréal on romantic ideas of religion and patriotism. The town was engaged in struggles with the Iroquois for many years and its inhabitants suffered many hardships, but in 1665 the Marquis de Tracy arrived from France with the famous Carignan-Salières Regiment, which broke the power of the red men. In 1672 the town became the centre of the fur trade and the starting point for military and exploring expeditions, from which it became known as the Mother of Cities. With Indian massacres and warfare, and strife between the religious and civil authorities, Montreal soon acquired a romantic history. In 1760 the British took the town, and their entry marked a new era. In 1775-76 it was occupied by the Continental forces, but the citizens resented Franklin's incitement to revolt against British rule. In 1844 it was made the seat of the Canadian government, but it lost the honor after the riot of 1849, when the Parliament buildings were destroyed by the mob. The British garrison was removed in 1870. In 1901 a great fire devastated four acres of the commercial portion of the city, the Board of Trade building constituting the chief loss. The damage was estimated at \$4,000,000.

With its suburbs Montreal's population numbered, in 1901, 266,826, half being French, the rest of Irish, English, and Scottish descent, in 1911, 470,480; in 1915 (local est.), 570,000; including suburbs, 656,500. Three-fourths of the inhabitants are Roman Catholics, and the city is the seat of both Roman Catholic and Anglican bishops.

Consult: A. Sandham, *Ville Marie: or, Sketches of Montreal Past and Present* (Montreal, 1870); W. Maclellan, *Montreal and Some of the Makers Thereof* (ib., 1893); N. M. Hinchelwood, *Montreal and Vicinity* (ib., 1904); and the authorities referred to under CANADA. See Plate of LACHINE RAPIDS.

MONTREAL. An island in the Province of Quebec, Canada, formed at the junction of the Ottawa with the St. Lawrence River (Map. Quebec, E 5). It is 30 miles long, 10 miles wide at its greatest breadth, and contains 197 square miles. It is of great fertility and productiveness and is celebrated for its apple orchards. Undulations, called coteaux, culminate in Mount Royal, 769 feet high. The city of Montreal is located on it.

MONTREAL D'ALBANO, mōn'trâ-il' dâl-bâ'nô, or FRA MORTALE, frâ mō'râ-â'la, or MON-REALE (?-1354). A famous Italian condottiere. He was a native of Provence (France) and as a young man entered the Order of the Knights of St. John, but was expelled. He subsequently distinguished himself as a soldier under Louis I of Hungary in the wars with Naples. About 1353 he started his Great Company, a band of mercenaries, which soon became the terror of Italy. In 1354 he aided Rienzi in getting possession of Rome, but was later accused of

intriguing with Rienzi's enemies, the Colonna. He was seized and, after a short trial, beheaded on Aug. 29, 1354. Consult Ferdinand Gregorovius, *History of the City of Rome in the Middle Ages*, vol. vi (trans. from the 4th Ger. ed., London, 1898).

MONTREUIL, mōn'trē'y'. A town of France in the Department of Seine, situated 5 miles east of Paris, near Vincennes. It is surrounded by large peach orchards, has gypsum quarries, and manufactures porcelain, paints, toys, pianos, gelatin, glue, soaps, glass, and chemicals. Pop. (commune), 1901, 31,673, 1911, 43,217.

MONTREUIL, GERBERT DE (fl. c.1250). A French poet of the thirteenth century about whom hardly anything is known. His great work is the *Roman de la molette* (q.v.). Gerbert also wrote a long sequel to the *Perceval* of Chrestien de Troyes. This sequel is still unprinted.

MONTREUIL (MONTEREAU), PIERRE DE (c.1266). A French architect of the Gothic period. He was principal architect to Louis IX, for whom, in 1245-48, he built the Sainte Chapelle (q.v.), one of the finest creations of the matured Gothic style. Among other important works built by him were the refectory and the lady chapel of the monastery of Saint-Germain des Prés, destroyed during the Revolution, the original Sainte Chapelle at Vincennes (demolished 1400), and possibly the refectory of Saint-Martin des Champs at Paris. His relative, Eudes de Montreuil (died 1289), architect, engineer, and sculptor, accompanied St. Louis to the Holy Land, where he fortified Jaffa. Returning to Paris in 1254, he built there the Hospice des Quinze Vingts, the chief asylum of the blind, and a number of churches. All of these buildings were demolished during the Revolution. In 1285 he became architect to the King. For his own tomb in the church of the Cordeliers he carved a relief of himself between his two wives.

MONTREUX, mōn'trē'. A parish in the Canton of Vaud, Switzerland, at the east extremity of Lake Geneva, including the villages of Vernex, Clarens, Territet, Glion, Veytaux, Colonges, Charnex, and others (Map: Switzerland, A 2). The district is noted for its romantic Alpine scenery and mild, healthful climate and is a favorite resort of tourists and invalids during fall and winter months. From Glion a rack and pinion railway leads up to the Rochers de Naye, at 5800 feet elevation, commanding a magnificent view. Near Veytaux is the celebrated castle of Chillon. Pop., 1900, 15,854; 1910, 18,800. Consult F. H. Gribble, *Montreux* (New York, 1908).

MONTBROND, mōn'trōn', CASIMIR, COUNT OF (1768-1843). A French political agent. He served in the army up to the Revolution and then rashly stayed in Paris instead of accompanying his family in exile. In 1794 he was arrested and imprisoned, but escaped with Mademoiselle de Coigny, Duchess of Fleury, the heroine of Chénier's *Jeune captive*, whom he married, but soon divorced. It was at this time that he came under the influence of Talleyrand and became his most trusted agent. Having been persecuted by Napoleon, whose régime he severely criticized, he was exiled in 1809, finally escaping to England in 1812. Montrond was prominent in bringing about the Second Restoration. After the revolution of 1830 he lived in England, where he boasted that Louis Philippe

paid him 20,000 francs a year to speak well of him in the English clubs. He returned to France and died soon afterward.

MONTROSE, mont-rōz'. A royal, municipal, and police burgh and seaport in Fife-shire, Scotland, at the mouth of the South Esk, 90 miles northeast of Edinburgh (Map: Scotland, F 3). The town stands on a level peninsula between the mouth of the river and the basin of the Esk (an expanse 7 miles in circumference and dry at low water). It has a town hall, academy, museum, house of refuge, and royal asylum. A fine suspension bridge connects the town with Rossie Island. The magnificent tower, named the Seurdyness Lighthouse, is at the mouth of the Esk. The town has one of the best golf courses in Scotland. Flax spinning is the chief industry; linen, canvas, rope, starch, soap, chemicals, machinery, leather, cabinetwork, and beer are the chief products. Fish curing and shipbuilding are also carried on. The corporation owns the water supply. The harbor, one of the best on the east coast, has quays and dry and wet docks, and affords accommodation to vessels drawing 19 feet. The principal exports are manufactured goods, agricultural produce, and fish, imports, timber and coal. The city was chartered in the twelfth century by David I and was made a royal burgh in 1352. Pop., 1901, 12,427, 1911, 12,666. Consult Mitchell, *History of Montrose* (Montrose, 1866).

MONTROSE, mōn-trōz'. A city and the county seat of Montrose Co., Colo., 353 miles by rail southwest of Denver, on the Denver and Rio Grande Railroad and on the Uncompahgre and Gunnison rivers (Map: Colorado, B 3). It is in the Uncompahgre valley, a district made highly productive by irrigation, the government having completed the Gunnison Tunnel here, which is 6 miles long, and is engaged in farming, fruit growing, and stock raising. There are flour mills, a brick and tile plant, and municipally owned water works. Montrose has adopted the commission-manager form of government. Pop., 1900, 1217, 1910, 3254.

MONTROSE, mōnt-rōz'. A borough and the county seat of Susquehanna Co., Pa., 46 miles north by west of Scranton, on the Lackawanna and the Lehigh Valley railroads (Map: Pennsylvania, K 2). It is known as a summer resort, having an attractive and elevated location, some 2000 feet above the sea, and contains a public library and an historical society building. There are creameries and manufactories of cut glass, boxes, sawing machinery, lumber, etc. Pop., 1900, 1827; 1910, 1914.

MONTROSE, mont-rōz', JAMES GRAHAM, first MARQUIS OF (1612-50). He was the son of John, the fourth Earl of Montrose, and his family can be traced back to 1128. He studied at Glasgow and at St. Salvator's College, St. Andrews, and in 1626 succeeded to his father's earldom. After studying and traveling for some years he became involved in 1637 in the national movement, for Charles I had treated him coldly and the King's representative in Scotland, Hamilton, was vain and incapable. In 1638 was signed the National Covenant, which was to prevent the introduction of the Prayer Book and the ascendancy of the bishops in Scotland. In support of the Covenant, Montrose took up arms several times, until the Treaty of Berwick (June 18, 1639) put an end to the fighting. About this time Montrose met Charles I, and

MONT ST. MICHEL

partly through his personal influence, and also because the Scottish Parliament had fallen under the control of the radical Presbyterians, Montrose became a supporter of the King, but changed sides again as a result of Charles's blundering policy. In May, 1641, however, he threw himself completely on the Royalist side. Argyll, the Governor of Scotland, was preparing to aid the English Parliament, yet Charles would not permit Montrose to begin an insurrection in Scotland until the Scots had actually begun the invasion of England in support of Parliament. Then, when it was too late, Montrose was appointed (1644) Lieutenant General of Scotland, and after he had made an unsuccessful inroad into Scotland from across the border he was created, on May 6, 1644, Marquis of Montrose. On August 18 he again entered Scotland, this time in disguise, and won six pitched battles over the Covenanters. Montrose's tactics and ability to meet changing conditions were a revelation to his enemies, but he was nevertheless unable to range the Lowlands on the royal side, and on Sept. 13, 1645, he was defeated at Philiphaugh by David Leslie, his army, composed of heterogeneous elements, melted away, and in 1646 Montrose escaped from the country to Bergen. He went to Paris, but could gain no support there. In 1649 Montrose again invaded Scotland, but was defeated at Invercarron on April 27, 1650, and ultimately fell into the hands of his enemies. He was executed on May 21, 1650. Montrose was an able man, of noble character, but as his armies were without discipline, he was unable to restrain their ravages, and his name and reputation have had to suffer in consequence. Consult: S. R. Gardiner, *The Great Civil War* (London, 1891). Mowbray Morris, *Montrose* (New York, 1892), in the "English Men of Action Series"; John Buchan, *The Marquis of Montrose* (ib, 1913).

MONTs, mŏn, PIERRE DU GUAST, SIEUR DE (1560-1611). A French explorer and colonizer of Canada. He was born in Santonge, France, of an Italian Roman Catholic family, but was converted to Protestantism and attached himself to Henry IV, who appointed him to an important office in the royal household. In 1603 the King made him governor of the French Company of Canada, which was given exclusive right to trade in furs between lat. 40° and 50° N. and the right to make land grants and govern the country, under the name of Acadia, with the title for himself of Vice Admiral and Lieutenant General. Taking with him Samuel Champlain, Poutrincourt, Biencourt, and Pontgrave as chief officers, he sailed from Havre, March 7, 1604. After exploring the Bay of Fundy they passed the winter on an island at the mouth of the St. Croix River, and in the summer of 1605 founded Port Royal on the present site of Annapolis. De Monts made Poutrincourt Governor of Port Royal, explored the Bay of Fundy, made Tadoussac on the St. Lawrence his fur-trade depot, and returned to France. There he found that his monopoly had excited such lively opposition that his privileges had been withdrawn. He succeeded, however, in recovering a part on more specific conditions and continued to send out expeditions to Canada, and in the course of one of these Champlain founded the city of Quebec in 1608. After Henry IV's death, in 1610, De Monts's privileges were taken away, to his financial ruin. He died

soon after in Paris. Consult: Francis Parkman, "Pioneers of France in the New World," in *France and England in North America*, part 1 (Boston, 1898), and *Tercentenary of De Monts' Settlement at St. Croix Island*, published by the Maine Historical Society (Portland, 1905).

MONT SAINT-MICHEL, mŏn sän-mé'shél'. A remarkable granite cone in the Bay of Cancale or Saint-Michel, off the coast of, and belonging to, the Department of Manche, France, near the mouth of the river Couesnon, here separating Brittany and Normandy, 6 miles southwest of Avranches. It was formerly isolated, but since 1879 a causeway three-quarters of a mile long connects the Mont with the mainland. Capped by an imposing mass of monastic buildings with a statue-tipped apex towering 233 feet above the level of the extensive bay, it forms the most striking feature in the landscape. The bay, left bare at low water, extends 8 miles from north to south, with a maximum width at its mouth of 15 miles, and is noted for its quicksands and the treacherous rapidity of its rising tides. The base of the Mont, 2 miles in circumference, is surrounded by sixteenth-century ramparts, towers, and bastions. A single gate gives admittance to a small village on the south slope, with mediæval houses, hostels for pilgrims and travelers, an interesting museum, the famous Porte du Roi, Du Guesclin's observatory, and an ancient parish church. The village is built along a narrow, winding street which ends in a flight of steps leading to the summit crowned by the abbatial castle surmounted by a basilica or church with a lofty Gothic spire. The principal features of the abbey are the Crypte de l'Aquilon, almonry, cellar, and dungeons, dating from the twelfth century; the Crypte des Gros Piliers, the Salle des Chevaliers, the refectory, the graceful cloister, dormitory, and La Merveille, or north wall of the abbey, 246 feet long and 108 feet high, dating from the thirteenth century, and the châtelet, or donjon, and the Flamboyant Gothic church, dating from the fifteenth century. The Mont was the ancient Mons Tumba, an elevation, crowned by a temple of the Druids, in the Forest of Scissy, which was submerged by an inundation in the seventh century. The abbey was founded in 709 by St. Aubert, Bishop of Avranches. It became a noted pilgrimage resort and in the twelfth century was famous for its library and the learning of its monks, whose chronicles describe it as the "mons in periculo maris." The buildings date chiefly from after 1203, when the abbey was burned down by the soldiers of Philip Augustus. It successfully resisted the assaults of the English and Huguenots, was dismantled at the Revolution and converted into a political prison, and is now included among the historical monuments of France. Since 1863 it has been undergoing a process of restoration, not yet completed, which gives it a surprisingly fresh aspect. The building is the property of the Commission of Historical Monuments. Pop. (of village), 1901, 235, 1911, 232. See CARNAC.

MONTs-DE-PIÉTÉ, mŏn-de-pv'á'tá' (Fr., funds of pity). A name applied throughout Europe to public or semipublic institutions organized to loan money to the poor at low rates of interest on goods deposited. The establishment of the monts-de-piété dates from the middle of the fifteenth century, when a certain Barnabé Terni proposed a charitable bank which should lend money without interest. To

this was given the name Monte di Pietà. The principle was adopted by Orvieto (1460), Bologna (1475), and Milan (1496). At first no interest was charged, but as it was impossible to secure sufficient funds gratuitously, a moderate rate of interest was demanded. This policy was attacked on the ground that it violated the canon law forbidding usury. In 1515 the fifth Lateran Council declared that it was permissible to take a low interest to meet the necessary expenses. Cities in other countries soon adopted the plan. In 1534 a pawn bank was started at Ypres and one at Bruges in 1572, and by 1633 they existed in some 16 cities. Their success has not been uniform, but they now do a large business, controlling practically all pawnbroking in Belgium. The rate of interest varies from 4 to 16 per cent per annum. In Holland the first mont-de-piété, the Groote Bank van Leening, was established at Amsterdam in 1614. Financially the Dutch banks have not been profitable, as the constant endeavor has been to keep the rate of interest low. In Germany, Augsburg in 1591 appropriated funds to form a loan bank (Leihhaus), and in 1618 Nuremberg followed this example. To-day public pawnshops are found in many cities. The laws fix the interest at 2 per cent per month on all sums of less than 30 marks and 1 per cent per month on larger sums.

Monts-de-piété were introduced into France at Avignon (1577), Carpentras (1612), and Aix (1635). The famous Mont-de-Piété at Paris was established in 1777 by the General Hospital, which was to have the profits. It has had a varied history, but is in successful operation to-day. It has now a central station and over 20 auxiliary stations. Since the Revolution the pawnbroking business of France has been under the direct charge of the communal and city authorities. At the head of the Paris bank is the Prefect of the Seine with a special council of lawyers who form a comité consultatif and have charge of the legal work of the institution. The interest rate is now 6 per cent per annum. In Germany and Austria-Hungary municipal pawnshops do an extensive business, and in Spain the business is conducted with savings banks. In England a Charitable Corporation began business in 1708, but this was so mismanaged that it became a subject of parliamentary investigation and was closed. The principles of the monts-de-piété were introduced into the United States by the Collateral Loan Company of Boston in 1859; they have also been adopted by the Workmen's Loan Association of Boston (1888), the St. Bartholomew's Loan Association of New York (1894), and many others. Among the Jews there exists the Hebrew Free Loan Association of New York, which loans money without interest.

The monts-de-piété have been of great service and have always tended to keep the rates of interest low. In all countries it is the custom to restrict the articles on which loans may be made and to take the necessary precautions against fraud and loss. If the pledges are not redeemed within a given time, the goods are sold. Sometimes the owner has the right to ask for the sale of the goods. It is usual to return to the owner any sum realized above the indebtedness.

Consult: Blaize, *Des monts-de-piété et des banques de prêts* (2d ed., Paris, 1856); Vanlaer, *Les monts-de-piété en France* (ib., 1895);

Patterson, "Pawnbroking in Europe and the United States," in *Department of Labor, Bulletin No. 21* (Washington, 1899). See PAWNBROKER.

MONTSERRAT. A mountain in Spain. See MONSERRAT.

MONTSERRAT, mönt'sé-rät'. One of the Leeward Islands, British West Indies, situated 34 miles northwest of Guadeloupe and 26 miles southwest of Antigua (Map: West Indies, G 3). It is triangular in shape, 11 miles long by 7 miles broad, and has an area of 32 square miles. It is of volcanic origin, and its surface is mountainous, reaching a height of 3000 feet in the volcano of Souffrière. The chief products are sugar, coffee, cacao, arrowroot, and lime juice. Its industries received a heavy blow from a destructive hurricane which swept over the island in 1899. Montserrat is subject to the general government of the Leeward Islands and is locally governed by a nominated Legislative Council. Pop. 1901, 12,215; 1911, 12,196. The capital is Plymouth, on the southwest coast, with a population (1911) of 1534. The island was discovered in 1493 by Columbus and colonized by the British in 1632.

MONTT, mönt, JORGE (1846-). A president of Chile. He was a captain in the navy when, in January, 1891, the relations between President Balmaceda and the Chilean Congress reached the point of active hostilities, and the fleet under his leadership declared for Congress. On January 7 the fleet, with a number of Congressmen on board, sailed for Iquique, where a provisional government was formed under the direction of a junta composed of Montt, Waldo Silva, and Ramón Barros Luco. The army remained faithful to Balmaceda, but the majority of the people were hostile. The insurgents raised an army of 10,000 men and inflicted defeats upon the Balmacedists at Concepción (August 21), and Placilla (August 28), both near Valparaíso. These victories brought Balmaceda's power to an end, and the provisional government, with Montt at its head, established itself in Santiago and called for the election of a new President and Congress. This election resulted in the almost unanimous choice of Montt for President, and under his administration the parliamentary régime was firmly established. The confidence thus shown in him was amply justified by his administration. He exerted himself to mend the breach made by the civil war and granted amnesty to all who had supported Balmaceda. During his term the army and navy were reorganized, the currency of the country was placed on a gold basis, and a large measure of local autonomy was granted to the municipalities. In foreign affairs he endeavored to settle the boundary dispute between Chile and Argentina by providing for the submission of the question to Great Britain, but in this he was not entirely successful. On Sept. 18, 1896, having completed the five years of his term of office, he quietly resigned the government to Federico Errázuriz, who had been elected his successor.

MONTT, MANUEL (1809-80). A Chilean statesman and president. He was educated for the legal profession in the National Institute at Santiago, of which he served as rector from 1835 to 1840. He began his political career as an official in the Ministry of the Interior in 1837. In 1840 he was elected member of the Chamber of Deputies, of which he was chosen President. The same year he was made Minister

of the Interior, in which position he managed the presidential election of General Bulnes. During the first term of Bulnes, Montt held various portfolios, rendering especially valuable service in that of Public Instruction by the establishment of the university and the normal school. As a member of the Chamber of Deputies and as counselor of government, he continued to exercise a dominant influence in politics in the second administration of Bulnes. In 1851 Montt was successful as the administration candidate for the presidency. The defeated Liberal candidate, General Cruz, at once headed an insurrection, but this was effectively crushed in the bloody battle of Loncomilla (Dec. 8, 1851). In 1856 Montt was elected for a second term of five years. During his two administrations he devoted his energies to the economic and social betterment of the country. He established railways and telegraphs, fostered steam navigation, encouraged immigration, aided in the revision of the civil code, and extended popular education. So effectively did he impress his character upon this period that it is known in Chilean history as the Decade of Montt. Opposition to the Montt-Varista party and agitation for an amnesty led to a serious revolt in 1859, the main purpose of which was to prevent the succession of Varas to the presidency. This, however, was suppressed after considerable fighting. During his later years Montt served as president of the Supreme Court and as professor in the faculty of law and political science at the University of Santiago.

MONTT, PEDRO (1846-1910). A Chilean statesman and president, born in Santiago, the son of Manuel Montt. He studied law in the National Institute at Santiago and in 1872 was elected a member of the Chamber of Deputies, in which he held a seat for nearly 30 years. In 1885 he was chosen Speaker of the Chamber, in 1886 Minister of Justice and Public Instruction, and later Minister of Industry and Public Works. He was one of the leaders of the congressional opposition to President Balmaceda (q.v.), in 1890, and upon the overthrow of the latter was sent to Washington as Minister. Returning to Chile, he was named Minister of the Interior (1894), and by his activity and policy of conciliation during the years 1899-1902 he did much to avoid an armed conflict with Argentina. In 1901 he was the unsuccessful candidate of the coalition party for the presidency, but after the election he continued his efficient services to the government. Montt was elected President by an overwhelming majority, in 1906, on the National Union ticket, receiving the support of the Liberals, Radicals, Conservatives, and Democrats. He had always been the champion of sound finances, public economy, and a conciliatory foreign policy. It was expected, moreover, that his election would bring about administrative regeneration, putting an end to the excessive parliamentary control and restoring the executive to its proper position. He helped the country to recover from the earthquake, which occurred just after his inauguration, and to weather the ensuing financial crisis. During his administration the railways were extended, the number of public schools was increased, works of sanitation were begun in various cities, and irrigation projects were undertaken. He labored energetically against the debasement of the currency and, in 1909, vetoed a measure postponing from 1910 to 1915

the putting into operation of the conversion law. This, however, was passed over his veto by Congress, which still retained much of its power over the executive. One of his last acts was the approval of the submission to arbitration on the Alsop dispute with the United States. In 1910 he obtained a leave of absence in order to take medical treatment in Germany, visited the United States, and died upon the day of his arrival in Bremen.

MONTUCLA, mōn'ty'klā', JEAN ETIENNE (1725-99). A French mathematician, born at Lyons, and by profession a lawyer. He was employed by Jombert in 1765 to edit various scientific works, including *Récollections mathématiques d'Ozanam* (1778), and is chiefly remembered as author of the first great history of mathematics, the *Histoire des mathématiques* (2 vols., 1758, 2d ed., 1798, completed by Lalande and republished, 4 vols., 1799-1802). He published also *Histoire des recherches sur la quadrature du cercle* (1754, new ed., 1831).

MONTÚFAR, mon-tōō'far, LORENZO (1823-98). A Guatemalan jurist, politician, and author. He studied law and was admitted to the bar in 1845. He served as rector of the University of Costa Rica, was judge of the Supreme Court and Minister of Foreign Relations of Guatemala, practiced law for a while in Lima, and served as Minister to the United States, Peru, Spain, and elsewhere. He also did journalistic work, wrote books, was a judge, taught political economy, and participated in many revolutions. Among his published works are *Crítica del gobierno civil de Guatemala* (1854), *Memorias históricas de Centro América* (1881), and *Apuntamientos sobre economía política* (1887).

MONTVILLE. A town in New London Co., Conn., 6 miles north of New London, on the Central Vermont Railroad (Map Connecticut, G 4). It contains the Palmer Memorial Library. There are paper mills, cotton factories, and manufactories of bed quilts and building board. A considerable amount of water power is derived from the Oxoboxo River. Pop., 1900, 2395. 1910, 2804.

MONTYON, mōn'tē-ōn' (sometimes incorrectly MONTHYON), ANTOINE JEAN BAPTISTE ROBERT AUGER, BARON DE (1733-1820). A celebrated French philanthropist. He became an advocate and was successively a counselor to the Grand Council, master of requests to the Council of State, and intendant of Auvergne, Provence, and La Rochelle. In 1775 he became a Counselor of State, and in 1780 he was appointed chancellor to Monsieur, the brother of the King. On the outbreak of the Revolution, Montyon emigrated, and resided first in Geneva and later in England, and did not return to France until the Bourbon Restoration. He did much, during this period, to help his brother emigrés. Throughout his whole life he was generous with his wealth, relieving the poor and founding prizes for the encouragement of invention and improvement in French arts and manufactures. Many of the prizes given by the Institute of France were founded or endowed by him, and he made large and munificent gifts to the hospitals and other charitable institutions of Paris. He was a prolific writer on historical, political, and economic subjects, but his works have become antiquated, and he is chiefly remembered for his philanthropy. Consult: Franklin, *Éloge historique de Montyon* (Paris,

1834). Dumoulin, *Montyon* (ib., 1884). L. Guimbaud, *Auget de Montyon* (ib., 1909) For the different prizes endowed by Montyon, see INSTITUTE OF FRANCE

MONUMENT (OF., Fr. *monument*, from Lat. *monumentum*, *monumentum*, memorial, from *monere*, to warn, admonish). 1. Anything made or erected to perpetuate the memory of persons or events. The earliest forms of monument are the cairn or pile of stones, the tumulus or mound, and the single stone or pillar. From these primitive types an immense variety of forms of commemorative structures has been developed, from the megalithic menhirs, dolmens, and cromlechs to the pyramids and obelisks of Egypt and such splendid modern works as the Victor Emmanuel Monument at Rome. The Monument, in London, is the common name of the column near London Bridge which commemorates the Great Fire of 1666. Bunker Hill Monument, in Charlestown, Mass., erected in 1846, is an obelisk-like shaft in memory of the Revolutionary battle of Bunker (Breed's) Hill. The Washington Monument is a similar but loftier shaft at Washington to the memory of the first President of the United States; it is 555 feet high. The chief kinds of monuments are described under their special names. See especially ARCH, TRIUMPHAL, BRASSES, SEPULCHRAL, MAUSOLEUM, MEGALITHIC MONUMENTS, MEMORIAL ARCHITECTURE, OBELISK, PYRAMID, SEPULCHRAL MOUND, TOMB, ETC. 2. The term is also used, by extension, of any important work of architecture or sculpture, such as a church, castle, palace, monastery, etc. 3. By further extension any important remains of a past time may be referred to as a monument, including literary remains, inscriptions, etc.; thus, the King James Version of the Scriptures is a literary monument of the Jacobean period.

MO'NUMEN'TA GERMA'NIÆ HISTORICA (Lat., historical monuments of Germany). A great work on the antiquities of Germany, the chief source for the history of the Middle Ages. It was begun by the Gesellschaft für altere deutsche Geschichtskunde, founded in 1819, and after that body was dissolved the Prussian Academy of Sciences assumed charge of the enterprise, to which the German and Austrian governments gave financial support. The work proceeds under various divisions—historians, laws, archives, documents, letters, chronicles, and antiquities—of which 47 volumes were issued up to 1874. Since 1876, 20 volumes of a *New Archives* have been in publication. The first volume was published in 1826 by the Hahnische Hofbuchhandlung in Hanover under the direction of Peitz, who was succeeded in 1874 by Wartz, and after his death in 1886 by Dümmler.

MONUMENTAL CROSS. See CROSS

MONUMENT PARK. A small park in El Paso Co., Colo., north of Colorado Springs, that is remarkable for its natural stone columns, which rise from its floor in great numbers. The columns are composed of sandstone in horizontal layers and bear on top, 15 to 25 feet to the base, a cap of hard ferruginous sandstone which sometimes joins two or more of the shafts into a group. They have been sculptured by the erosive processes into various shapes, some showing resemblance, more or less fanciful, to human forms, as in the Dutch Wedding. (See illustration accompanying EROSION.) It is the presence of the harder sandstone above the

softer layers that has protected the latter and led to the formation of the columns.

MO'NUMEN'TUM AN'CYRA'NUM. The name given to the great inscription found at Ancyra (modern Angora, q.v.) describing the career of Augustus.

MONVEL, mōn'vèl'. The assumed name of JACQUES MARIE BOUTET (1745–1812). A French actor and dramatist, father of the famous Mesdemoiselles Mars (q.v.). He made his appearance on the stage of the Comédie Française in 1770. He was the author of some successful plays, among them *Les victimes cloîtrées*, in which he gave expression to his sympathy with the principles of the Revolution.

MONVEL, LOUIS MAURICE BOUTET DE (1850–1913). A French genre and portrait painter and illustrator, born in Orléans. He studied under Cabanel and other Classicists at the Ecole des Beaux-Arts and, after the War of 1870–71, with Carolus Duran. He began to exhibit portraits in 1873 and afterward won several medals, notably a gold one at the Paris Exposition (1900), but meanwhile he took up illustrating. Soon his individual, unmistakable style showed itself in the drawings he made for the French edition of *St Nicholas* (1878), for *Chansons et rondes* (1883), *Chansons de France* (1884), *Vos enfants* (1886), *La culture puérile*, the fables of La Fontaine (1888), and the exquisite black and white work in Fabre's *Variété* (1890). His work is usually done in flat tones and is exceedingly decorative in quality. His technical training made him a faultless draftsman. The decision and beauty of his line, his strong, clear color, the charm and naïveté of his delineation of child life, have made him a conspicuous figure in this field of illustration. His "Jeanne d'Arc" (1897) is a masterpiece of composition. He also did six canvases, representing the history of the Maid, for the memorial church at Domrémy; these were widely exhibited in the United States. Another series of great beauty, on the same theme, is owned by Senator W. A. Clark. His portraits, particularly those of children and notably the daughter of Madame Réjane, are well known in America and rank among the highest. His large pictures, which include "The Apotheosis" (1884), an episode of the Commune, are less interesting. At the time of his death he was occupied with illustrations of the "Life of St Francis of Assisi." Consult *Modern French Masters*, edited by Van Dyke (New York, 1896), W. H. Downes, *Twelve Great Artists* (Boston, 1900), Vandovez, in the *Gazette des Beaux-Arts*, vol. IV (Paris, 1913).

MONYPENNY, mōn'ī-pen'ī, WILLIAM FLAVELLE (1866–1912). A British journalist and author, born in County Armagh, Ireland. In 1888 he graduated from Trinity College, Dublin. He was a contributor to the *Spectator* in 1891–93 and assistant editor of the *Times* in 1894–99. In the latter year he was appointed editor of the *Johannesburg Star*, which was suspended during the South African War and resumed under Monymenny's direction in 1902, but he resigned the editorship in 1903. During the war he held a commission with the Imperial Light Horse and in 1900–01 was director of civil supplies to the military governor of Johannesburg. In 1908 he became director of the London Times Publishing Company. He published *The Two Irish Nations. An Essay on Home Rule* (1913) and *The Life of Benjamin Disraeli, Earl of Beaconsfield* (3 vols., 1910–14),

the third volume of which (for the period 1846-55 of Disraeli's life) was prepared by George Earle Buckle after Monypenny's death.

MONZA, mōn'tsā. A town in the Province of Milan, Italy, on the Lambro, 10 miles north-northeast of Milan (Map: Italy, B 2). The cathedral of St. John the Baptist, founded in the sixth century by Queen Theodolinda and rebuilt in the fourteenth century, contains interesting memorials of the Queen and the famous Iron Crown of Lombardy (q.v.). Other notable buildings are the church of Santa Maria in Istrada, the Gothic town hall, and the palace, the summer and autumn residence of the royal family, situated in beautiful grounds traversed by the Lambro. Its institutions include a Gymnasium, a lyceum, a technical school, and a school of industry. The town has manufactures of silk, cotton, and woolen goods, hats, leather, machines, dyestuffs, books, and church organs. It is surrounded by a fertile district, which yields abundance of grain, fruits, and wine. Monza, the ancient Modicia, has been the residence and coronation town of the kings of Lombardy since the eleventh century. It was once conspicuous for its wealth and the extent of its cloth trade. Here on July 29, 1900, King Humbert of Italy was assassinated. Pop. (commune), 1901, 42,599. 1911, 53,214.

MONZIE-LASSERRE, PAUL JOSEPH HENRI DE. See LASSERRE, P. J. H. DE MONZIE.

MOOD (AS. *mōd*, OHG. *muot*, spirit, courage, Ger. *Mut*, courage, Goth. *mōds*, wiath, possibly connected with Gk. *μαρθαί*, *μαρῆσθαι*, to desire, OChurch Slav. *sūmēti*, to dare). A weak emotion, usually of long duration. The mood, like the emotion, is made up of ideas and affection, but it does not centre about a "situation" as the emotion does. The emotion of fear, e.g., always has its object. One fears an enemy, an approaching storm, a ruined reputation. But in a mood all sorts of mental processes may demand the attention in turn and in turn pass out of consciousness, while the mood remains as a vague background to them all. In other respects, however, the mood has the characters of an emotion; the mood of cheerfulness is similar to the emotion of joy, depression to sorrow, irritability to anger, apprehension to fear; and mood, like emotion, is largely an organic consciousness. The older psychology classified acquiescence, mild surprise, expectancy, etc., as moods; but recent work upon the psychology of thought has assigned them to a separate category of "conscious attitudes." See THOUGHT. Consult: James Sully, *The Human Mind* (New York, 1892); Oswald Kulpe, *Outlines of Psychology* (ib., 1909); E. B. Titchener, *Textbook of Psychology* (ib., 1910); Wilhelm Wundt, *Physiologische Psychologie* (Leipzig, 1911).

MOOD. See GRAMMAR; LOGIC

MOODIE, SUSANNA (1803-85). A Canadian author. She was born at Bungay, Suffolk, England, her father being Thomas Strickland, Beydon Hall. Her sisters, Agnes Strickland (q.v.), Mrs. Katherine Parr Traill, Elizabeth and Jane Strickland, were authors. She married J. W. D. Moodie, a British officer, in 1821 and in 1832 emigrated with her husband to Upper Canada (Ontario), settling first near Port Hope and shortly afterward in the backwoods north of Peterborough, where she remained eight years. In 1839 she removed to Belleville, and later to Toronto, where she died. She began to write at a very early age, contributing to periodicals

short poems and tales for children; and later she wrote poems, novels, and works describing conditions of Canadian life. Her publications include: *Enthusiasm* (1830), a book of poems, *Roughing It in the Bush* (1852), her best-known work, describing her pioneer life; *Life in the Clearings* (1853), *Mark Hurdlestone, the Gold Worshiper* (2 vols., 1853); *Matrimonial Speculations* (1854), *Flora Lindsay* (1854); *Geoffrey Moncton, or the Faithful Guardian* (1856); *Dorothy Chance* (1867).

MOODS, IN LOGIC. See SYLLOGISM.

MOODY, AGNES MARY (CLAYPOLE) (1870-). An American biologist, born at Clifton, Bristol, England. She graduated from Buchtel College, Ohio, in 1892, from Cornell (M.S.) in 1894, and from the University of Chicago (Ph.D.) in 1896. In the latter year she became instructor in zoology at Wellesley and in 1898 assistant in histology and embryology at Cornell. From 1901 to 1903 she was instructor in zoology and geology at Throop College. She was married to Robert Orton Moody. Her special contributions to journals of applied microscopy and morphology were on the histology of the Cayuga Lake lamprey and on the embryology of *Anurida maritima*.

MOODY, DWIGHT LYMAN (1837-99). An American evangelist. He was born at Northfield, Mass., Feb. 5, 1837. At the age of 17 he became clerk in a shoe store in Boston. In 1856 he removed to Chicago, became active in mission work, and established a Sunday school which numbered over 1000 children. During the Civil War he was employed by the Christian Commission and subsequently as city missionary in Chicago by the Young Men's Christian Association. A church was built for him and, though unordained, he became its pastor. The building was destroyed by the fire of 1871, but a new one was erected to hold 2500 persons. In 1873 he visited Great Britain and Ireland with Ira D. Sankey, the singer, and in 1875 held a long series of meetings in Brooklyn and Philadelphia, and in 1876 in New York. Similar services followed in many large cities throughout the country. In 1882 a second visit to England was made. Most of his work was done in the provinces, but he held large meetings also at the universities of Oxford and Cambridge. He also held meetings at Paris. His later years were applied to the building up of a seminary for young women at Northfield, Mass., a training school of Christian workers in Chicago, and the Mount Hermon School for Boys at Gill, near Northfield. He died at Northfield, Dec. 22, 1899. Many of his sermons were published. Consult his biography by his son (New York, 1900).

MOODY, GRANVILLE (1812-87). An American Methodist Episcopal clergyman, born at Portland, Me., and self-educated. He entered the ministry in 1833, joining the Ohio conference. When the Civil War broke out he resigned his pastorate and entered the army as colonel of the Seventy-fourth Ohio Volunteer Infantry, which he had organized. In 1865 he was brevetted brigadier general of volunteers. His brother was a colonel in the Confederate army. Moody was an ardent temperance advocate. He was a member of the General Conferences of 1852, 1860, 1864, and 1876. His writings include *Popery and its Aims* (1875) and *A Life's Retrospect—Autobiography*, edited by Sylvester Weeks (Cincinnati, 1890).

MOODY, JAMES (1744-1809). An American

Loyalist, born in New Jersey. In 1777 he joined the British, and for several years he was very active as a partisan leader and as a remarkably fearless and resourceful spy, performing many daring exploits in Pennsylvania and New Jersey, capturing Revolutionary officers and soldiers and intercepting dispatches. At the close of the war he went to England, and later settled in Nova Scotia. In reward for his services the English government gave him the half pay of a lieutenant and an estate. An account of his adventures, entitled *Lieutenant James Moody's Narrative of his Exertions and Sufferings in the Cause of Government since 1776*, was published in London in 1783 and in New York in 1865.

MOODY, JOHN (1868-). An American financial writer. He was born in Jersey City and was early engaged in newspaper work. From 1890 to 1900 he served in various capacities with the banking house of Spencer Trask & Co. He founded in 1900 and was editor until 1907 of *Moody's Manual of Railroads and Corporation Securities*; founded in 1905 and thereafter was editor of *Moody's Magazine*, an investor's monthly; and established in 1909 the reference publication, *Moody's Analyses of Railroad Investments*, and in 1914 *Moody's Analyses of Investments*, dealing with public utilities and industrials. He became known as a lecturer on investment values. His writings include *The Truth about the Trusts* (1904); *The Art of Wall Street Investing* (1906); *The Investor's Primer* (1907; 3d ed., revised, 1912); *Masters of Capital in America* (1911); *How to Analyze Railroad Reports* (1912).

MOODY, WILLIAM HENRY (1853-) An American public official and jurist. He was born in Newbury, Essex Co., Mass., graduated at Phillips Academy (Andover, Mass.) in 1872 and at Harvard in 1876, and studied law in the office of Richard H. Dana. From 1890 to 1895, while district attorney for the Massachusetts Eastern District, he carried through successfully the prosecution of boodling aldermen in the city of Lawrence. In 1895 he was elected by the Republican party to fill the vacancy in the House of Representatives caused by the death of General Cogswell, and he was thrice reelected. As Congressman he made a reputation by his knowledge of parliamentary procedure and by his perseverance in debate. As a member of the Committee on Appropriations he had special charge of the Sundry Civil Appropriation Bill. He was regarded as a very able man. In 1902, on the resignation of J. D. Long, President Roosevelt appointed him Secretary of the Navy. His service continued until 1904, when he was made Attorney-General. In 1906 he was appointed Associate Justice of the Supreme Court, but because of prolonged ill health he was retired by special Act of Congress in 1910.

MOODY, WILLIAM VAUGHAN (1869-1910). An American poet and playwright, born at Spencer, Ind. Graduating from Harvard University in 1893, for two years he taught English at Harvard and Radcliffe, leaving Cambridge to be instructor (1895-1901), and then (1901-07) assistant professor, of English and rhetoric at the University of Chicago. He received the degree of Litt.D. from Yale in 1908, and was a member of the American Academy of Arts and Letters. As a poet he was perhaps the most promising man of his day in America. This aspect of his work is represented by the lyrical drama *The Masque of Judgment* (1900), *Poems*

(1901), and *The Fire-Bringer* (1904). In the drama he is at his best in *The Great Divide* (1907), which was a great success on its first appearance and remains one of the best American plays. His *The Faith-Healer* (1909) is also noteworthy in the drama of its day, though below the standard of its predecessor. As a part of his literary accomplishment are to be reckoned his *History of English Literature* (1907), in collaboration with R. R. Lovett, and several editions of the English classics, notably *Milton's Poems* (1899) in the "Cambridge Poets." His early death was lamented as a misfortune to American letters.

MOODY BIBLE INSTITUTE OF CHICAGO. An institution for Bible training founded in 1886 by Dwight L. Moody. The general purpose of the institute is the training of Bible teachers and missionaries. It is not endowed, but is maintained by the gifts of Christians all over the world. While in training a large percentage of the students are compelled to work a few hours each day in order to meet their expenses. In 1914 there were enrolled in the day classes 837 students representing 30 denominations, 38 States, and 30 foreign countries. In the evening classes 429 students were enrolled and in the correspondence departments 1567. The extension department enrolls hundreds of thousands throughout the United States and Canada by means of various conventions, evangelistic meetings, and correspondence courses. In 1915 the faculty contained 29 members. Since foundation the institute has enrolled 13,000 students in its three departments of instruction. Over 700 have entered the foreign-mission fields under the several denominational boards, while thousands are engaged in various Christian activities in the United States.

MOOGHA, mōō'ga. See SILKWORM.

MOOLTAN, mōōl-tan'. A city of British India. See MULTAN.

MOON (AS. *mōna*, Goth. *mēma*, OIIG. *māno*, Ger. (with excrecent *d*) *Mond*, moon, connected with Lith. *menu*, moon, Gk. *μήν*, *mēn*, month, Skt. *mās*, moon, month, probably from Skt. *mā*, to measure, and ultimately connected with Eng. *month*). The satellite of our earth, revolving round the earth from west to east in a period of one month (q.v.) and accompanying the earth in its motion round the sun.

Phases of the Moon. The first peculiarity about the moon is the constant and regular change of her illuminated surface from a thin crescent to a circle, and vice versa, and a corresponding change in the time of her appearance above the horizon. These changes depend upon the position of the moon relative to the earth and the sun, for it is only the half of the moon facing the sun that is illuminated by his rays, and the whole of this illuminated portion can be seen from the earth only when the sun, earth, and moon are nearly in a straight line (the line of *syzygies*) and the earth is between the sun and moon. When the moon is in the line of *syzygies*, but between the earth and the sun, no part of her illuminated disk can be seen from the earth. In the former case the moon is said to be *full*, and in the latter, *new*. A few days after new moon the moon appears to be a little to the east of the sun as a thin crescent, with the horns pointing to the east, and as she increases her angular distance from the sun at the rate of about 12° daily, the crescent of light

MOON

THE MOON, FIRST QUARTER
From a Photograph by Loewy and Pulseux

becomes broader till, after the lapse of a little more than seven days, at which time she is 90° in advance of the sun, she presents the appearance of a semicircle of light. The moon is then said to have completed her first quarter. Continuing her course, she becomes gibbous; and at the fifteenth or sixteenth day from the new moon attains a position 180° in advance of the sun, and now presents the appearance known as full moon. From this point she begins to approach the sun, again appearing gibbous, and after a third period of more than seven days reaches a point 90° west of the sun and enters her last quarter. Here, again, she appears as a semicircle of light, the illuminated portion being that which was not illuminated at the end of the first quarter. The moon, now rapidly approaching the sun, resumes the crescent form, but this time with the horns pointing westward, the crescent becoming thinner and thinner, till the moon reaches the position of new moon and disappears. The earth as seen from the moon presents similar phases, and has consequently, at the time of new moon, the appearance of a round illuminated disk, and at full moon is invisible. This explains the peculiar phenomenon occasionally observed when the moon is near the sun (either before or after the new moon), of the part of the moon's face which is unilluminated by the sun appearing faintly visible, owing to the reflection upon it of strong earth light. This phenomenon is often called the new moon in the old moon's arms. At new moon the moon comes above the horizon about the same time as the sun, and sets with him, but rises each day about 50 minutes later than on the day previous, and at the end of the first quarter rises at midday and sets at midnight, continuing to lag behind the sun. When full she rises about sunset and sets about sunrise, and at the commencement of her last quarter she rises at midnight and sets at midday. The daily retardation of the moon's rising, just stated to be about 50 minutes, is subject to considerable variations. In the latitude of New York it may range from 23 minutes to 1 hour, 17 minutes. See HARVEST MOON.

Distance and Magnitude. From repeated observations of the moon's horizontal parallax (q.v.) and of the occultations by her of the fixed stars, her mean distance from the earth has been estimated at 238,840 miles and her mean angular diameter at $31' 7''$ and her actual diameter as 2163 miles, or about $\frac{1}{4}$ of the earth's diameter. Her actual distance from the earth may vary from 252,972 miles at apogee to 221,614 at perigee. Her volume is about $\frac{1}{5}$ that of the earth, her density 0.62 (that of the earth being taken as unity), and her mass $\frac{1}{81.5}$ of the earth's mass.

Orbit. The moon revolves round the earth in an elliptic orbit with the earth in one focus, the eccentricity of the ellipse being 0.05491, or more than $3\frac{1}{4}$ times that of the earth's orbit. The plane of her orbit does not coincide with the ecliptic, but is inclined to it at an angle of $5^\circ 8' 40''$, and intersects it in two opposite points, which are called the nodes. (See NODE.) Were the moon's orbit a true ellipse, which, owing to various irregularities known as perturbations (q.v.), it is not, the lunar theory (q.v.) would be exceedingly simple; but these perturbations cause in the case of the moon a distinct and well-marked deviation from her previous course in a single month. The regression of her nodes

along the ecliptic causes a continual change in the plane of her orbit, so that if, during one revolution round the earth, she occults certain stars, at the next revolution she may pass to one side of them, and will remove farther and farther from them in each successive revolution. Owing to this continual change of her orbit, the moon in course of time passes over or occults every star situated within $5^\circ 24'$ of the ecliptic. The motion of the nodes is so rapid that they perform a complete circuit of the orbit in 18.6 years. Another important change in the moon's orbit is the revolution of the line of apsides (q.v.), by which the perigee and apogee are continually changing their position relative to the earth and sun. This revolution is more than twice as rapid as that of the nodes, being performed in 8.85 solar years. This motion is analogous to the perturbations of planetary orbits, and its nature and origin are treated in the article PERTURBATIONS. Its effect upon the moon is to produce a variation in her distance from the earth, independent of that produced by her elliptic motion. Among the further disturbances or perturbations of the lunar orbit we may mention the evection (q.v.), which may displace the moon's position in the sky $1^\circ 16' 27''$, the variation, which may amount to $39' 31''$, and the annual equation, whose maximum is $11' 9''$. See LUNAR THEORY.

Eclipses. As the moon in her course passes the sun once every month, and also places the earth between herself and the sun once a month, it is evident that if she moved in the plane of the ecliptic there would be either a total or an annular eclipse of the sun and a total eclipse of the moon every month. The inclination of her orbit, allowing her to pass the sun $5^\circ 9'$ to the north or south of his track, prevents such a frequent occurrence of eclipses. See ECLIPSE.

Rotation. The moon rotates on her axis with a velocity such that one complete revolution occupies precisely the time needed for one revolution of the moon around the earth. As a consequence of this, the moon always turns the same side towards us, and we see only one-half her surface plus a small additional amount brought into view by libration (q.v.).

Physical Features. The surface of the moon, as seen from the earth, presents a most irregular grouping of light and shade. The dark portions were named by the earlier astronomers as seas, lakes, etc., and still retain these names, although there is strong evidence against the supposition that the moon, or at least that portion of it presented to us, contains any water. The brighter parts of the moon are mountainous, as is proved by the fact of their casting shadows when the sun's rays fall upon them obliquely, and also by the ragged appearance presented by the interior illuminated border of the moon, an appearance which can only be satisfactorily accounted for on the supposition that the surface of the moon is not level, in which case the higher portions will be illuminated some time before the light reaches the level parts, and it is observed that as the illumination proceeds bright spots start up in advance of it, and when the moon is on the wane these same spots continue to shine for some time after the surrounding surface is immersed in gloom. The mountains occur either singly, when they are generally of a circular form and are called craters, or in groups, which are mostly annular and form a sort of wall inclosing a deep de-

pression or plain in which are situated one or more conical mountains. The craters are not infrequently 8 or 10 miles in diameter, and some measure more than 100 miles across. The principal mountains attain an altitude of about 20,000 feet, according to a micrometric measurement of the length of their shadows. The moon everywhere presents traces of volcanic agency, but no active volcanoes have yet been discovered, nor is there any sign of recent volcanic action. Through the telescope she presents a desolate appearance, without indications of animal or vegetable existence. She appears to be devoid of an atmosphere, or, if one exists, it must be of exceeding rarity, or else concentrated into cavities within the moon's rocky surfaces. Probabilities are in favor of a low surface temperature, not higher, perhaps, than that of ordinary ice. (For the influence of the moon upon terrestrial tides, see **TIDES**.) Recent theorists hold that very large lunar tides, caused by the earth, existed many thousands of years ago, when the moon was still in a semiplastic condition. This tidal theory can be made to account for the remarkable coincidence of the lunar axial rotation period with that of her revolution round the earth. The best lunar map based upon visual observations is that of Beer and Maedler, which was published in 1837. In 1904 Pickering published his *Photographic Atlas of the Moon* and the elaborate *Atlas photographique de la lune* of Loewy and Puiseux, begun in 1896, was completed in 1908.

Superstitions Regarding the Moon. The moon was anciently an object of worship and has remained to the present day the centre of many superstitions. The times for killing animals for food, gathering herbs, cutting down wood for fuel, sowing seeds of various kinds, were all regulated by the age of the moon. There were similarly defined periods for taking particular medicines and attempting the cure of particular diseases. In northern European countries the waning moon has been considered to have an evil influence, and full or new moon to be the most auspicious season for commencing any enterprise. Farmers and sailors still believe in the influence of changes in the lunar phases on the weather. See **ASTRONOMY**, **SUPERSTITION**.

Bibliography. Elger, *The Moon* (London, 1895); Franz, *Die Figur des Mondes* (Königsberg, 1899); W. H. Pickering, *The Moon* (New York, 1903); Nasmyth and Carpenter, *The Moon as a Planet, a World, and a Satellite* (London, 1903); Phillip Fauth, *The Moon in Modern Astronomy* (New York, 1907); G. P. Serviss, *The Moon* (ib., 1907).

MOON, MOCK. See **MOCK MOON**, **HALO**.

MOON, WILLIAM (1818-94). An English philanthropist, born in Horsemonden, Kent. He was educated in London and in 1840 gave up his studies for the Church because of total blindness. Moon started a school for blind children and, finding that previous systems were too complicated, devised an embossed type for the use of the blind with only nine letters, which, by variation of position, made up a complete alphabet. Following the same method, he published pictures and maps for the blind. Moon traveled in Europe and in the United States (1882) and established loan libraries of his books and schools for home instruction. All his philanthropic efforts were largely tinged with evangelistic methods. He published *Sight for*

the Blind (1873), which gives the history of his system. Consult Rutherford, *William Moon and his Work for the Blind* (London, 1898). See **BLIND**, **EDUCATION OF THE**.

MOONBILL. A local name in the United States for the ring-necked scaup duck. See **SCAUP**.

MOONEYE, JAMES (1861-). An American ethnologist, born at Richmond, Ind. In 1885 he became connected with the Bureau of American Ethnology at Washington. His first labor in Indian ethnography, which had occupied him since boyhood, was a tribal list containing 3000 titles. He discovered the Cherokee ritual, studied the ghost dance in 1890, and later the Kiowas. His writings include: *Myths of the Cherokees* (1888); *Sacred Formulas of the Cherokees* (1891); *Siouan Tribes of the East* (1894); *The Messiah Religion and the Ghost Dance, Calendar History of the Kiowa Indians* (1898). He was a contributor to the **NEW INTERNATIONAL ENCYCLOPEDIA**.

MOONEYE, LAKE HERRING, OR WHITING. Names applied to the cisco (q.v.) or whitefish.

MOONFISH (so called from its shape). 1. A fish of the family Carangidae, allied to the pompanos and having compressed, oval, silvery bodies. The species (*Selene vomer*), called jorobado, look down, horsehead, and horsefish, is numerous on both coasts of the warmer parts of America and grows to a foot or more. It passes through a remarkable series of transformations in growth, being so thin when young as to be useless for food, though well liked as a pan fish when adult. (See Plate with article **HORSE MACKEREL**.) 2. A closely related fish (*Vomer setipennis*), known about New York as blunt-nosed shiner, and highly esteemed as food. Some other species are known, but their habits and manner of breeding remain obscure. 3. The opah (q.v.).

MOONFLOWER. See **IPOMOEA**.

MOON'GA, OR MOOGHA. See **SILKWORM**.

MOONJA, MOON'JA, MUNJAH, MOON-YAH, SARA, OR SIUR (Anglo-Ind., from Skt *muñja*, reed), *Saccharum sara* An East Indian grass of the same genus as the sugar cane, growing on the banks of the Ganges and the Indus. The leaves yield a tough fibre, not thoroughly tested, but used for making rope.

MOONLIGHT SONATA, THE. A sonata by Beethoven (1802). It is the second of two sonatas forming Opus 27. C sharp minor, *Sonata quasi una fantasia*, dedicated to Countess Guicciardi. The imaginary title is probably due to Rellstab's likening the first movement to boating on Lake Lucerne by moonlight.

MOONSEED, YELLOW PARILLA (so called from the crescent-shaped seeds), *Menispermum canadense*. A North American climbing plant of the family Menispermaceae, with peltate, roundish-cordate, and angular leaves, small clusters of white flowers, and black, kidney-shaped fruits. The cylindrical root, which attains a length of several feet and a diameter of a quarter of an inch, was formerly known in commerce as Texas sarsaparilla. It contains berberin, resin, tannin, etc., and has tonic, alterative, and diuretic properties.

MOONSHINERS. This term is a colloquialism applied in the United States to persons who manufacture illicit whisky. The scope of its application has come to be restricted usually, however, to those who reside in or near the Appalachian Mountain Range, though it is still

employed generally concerning those who make such liquor. Moonshiners of modern times come most frequently from the mountainous parts of Kentucky, Tennessee, West Virginia, Virginia, North Carolina, Georgia, and Alabama; and they are most active in Kentucky, Tennessee, and North Carolina. The whisky they produce is usually made from corn, although rye and barley, as well as peaches for brandy, are sometimes used. It is sweetened commonly, if at all, with molasses, and is called "mountain dew," possibly because of the colorless, crystalline appearance of corn whisky.

The unproductivity of the rocky soil and the absence of variety in the possible occupations have tended to make the manufacture of whisky the most profitable means of disposing of the scanty harvests, particularly if that disposition can be effected without paying the Federal tax. To the mountaineer the revenue laws are an invasion of his natural right to utilize and sell his property—a feeling which to him removes moral stigma from his chosen business. This philosophy and practice, however, have involved him in perennial struggle with the revenue officers. This conflict may be said with historical accuracy to have begun in the United States with the passage of the Alexander Hamilton Excise Law of 1791. The differences between the Pennsylvania farmers and the Washington administration about this law led finally to the so-called Whisky Insurrection of 1794, in which the government encountered an armed organization. The result then demonstrated that organized and public opposition to the law was futile; so distillers thenceforward resorted to secrecy and evasion. Although the excise law, which was opposed by public opinion, was repealed during the Jefferson administration, moonshining appeared again when the law was reenacted. The generally accepted idea of the mountaineer moonshiner is that he is secretive and suspicious of outsiders until his confidence is won, on which he becomes a generous and faithful friend, hospitable to the limit of his resources. In his seclusion and ignorance he has evolved peculiar social customs and sanctions, together with a dialect, of his own, and he is of a blood singularly unmixed with foreign elements. One seemingly ineradicable characteristic of the life is the feud, which is often conducted with savagery and implacable hatred, becoming an hereditary legacy of families and clans. The origins of such blood wars are probably too numerous for comprehension, but one fruitful cause lies in the practice of individuals of giving information respecting the illegal distilleries of their enemies to the revenue officials, which provokes reprisals. The family of the man injured, however much it may disapprove of his conduct, considers it necessary to assume his quarrel. Such has been said to have been one of the causes of the famous Breathitt County War in Kentucky.

The Commissioner of Internal Revenue reported in 1913 that "illicit distilling continues with slight abatement" and that in that fiscal year 2375 stills were seized. Of these, 2120 were located in the States mentioned above. The forces of civilization, i.e., of law and education, together with the approach and multiplication of modern industries, have slowly invaded the moonshiner's domain; and he, learning new and more profitable occupations, has been thought to be abandoning his unlawful business.

But it is impossible to predict with certainty when these forces will eventually triumph.

MOON SNAKE. A Brazilian colubrine venomous snake of the genus *Scytale*. They are of small size and dull colors. Some of them are arboreal, others fully terrestrial. They hunt almost exclusively at night and feed mainly on lizards. Although their fangs (see *OPISTHOGLYPHA*) are large, these reptiles seem never to attack human beings.

MOONWORT. A fern. See *BOTRYCHIUM*.

MOONYAH. See *MOONJA*.

MOOR, MOORING. (probably from Dutch *marren*, to tie, moor, hinder, retard, AS *mirran*, *myran*, *merran*, OHG. *marrian*, *marren*, dialectic Ger. *marren*, to entangle, Eng. *mar*). To moor a vessel is to secure it with ropes or chains to anchors or to a wharf or to the buoys of permanent moorings. The common method of mooring with two anchors is to drop one anchor, veer chain to 60, 75, or 90 fathoms and let go the other, and then heave in on the long chain and veer on the shorter until lying with both chains equal, or with one about 15 fathoms shorter than the other. This method is generally resorted to when the anchorage ground is contracted and there is insufficient room for a ship to swing about a single anchor with a full scope of chain. In many harbors, where the anchorage space is limited, permanent moorings are laid down. These usually have buoys to which the anchor chains are attached, the ship being secured to the buoy by a hawser or short length of chain. In many European roadsteads the buoys are of no greater size than is necessary to support light chains which are attached to the real mooring cable. The light chain is used to haul the upper end of the main cable on board the ship, where it can be secured. The lower end of the cable is shackled to the ends of others leading along the bottom to the anchors, two to four in number, placed at the corners of a square or triangle or up and down stream. See *ANCHOR*; *HAWSE*; *MOORING SWIVEL*.

MOOR. Wet land, with peaty soil, possessing a vegetation in which mosses are usually conspicuous. Two types of moor are distinguished, the one characterized by the presence of the peat mosses or sphagnum, and on account of the tendency of this plant to grow in thick soft masses above the surrounding areas often called high moor; the other without sphagnum, known as low moor. In America high moors are usually called bogs (see *BOG*). Low moor is also known as meadow moor, sedge moor, swamp meadow, or fen. Here sphagnum is nearly or quite absent; although other mosses are found which contribute to the scanty peat. The bulk of the vegetation is usually made up of a variety of grasses and sedges with the addition of various herbs and such shrubs as low willows, alders, and dwarf birches, the last being more abundant at high altitudes and in northern areas. Low moors are easily transformed into tillable land that is often of excellent quality on account of the sufficient but moderate amount of peat and humus. Often upon the removal of the surplus water by drainage rich farm lands are at once available for tillage. See *BOG*; *PEAT*; *SPHAGNUM*; *SWAMP*.

MOOR, EDWARD (1771-1848). An English writer on India. He entered the service of the East India Company in 1782, but in 1790 joined the army. He retired in 1806 on a special pension and a large grant as a reward for his

bravery and for a *Digest of the Military Orders and Regulations of the Bombay Army* (1800). Moor's most valuable book was the *Hindu Pantheon* (1810; new ed. by Simpson, Madras, 1864), which is still an authority because of its unique illustrations. His *Oriental Fragments* (London, 1834) is also worthy of note.

MOOR BLACKBIRD. See RING OUZEL.

MOOR/CROFT, WILLIAM (c.1765-1825). An English veterinary surgeon and traveler, born in Lancashire. He studied medicine in Liverpool, but subsequently devoted himself to veterinary surgery. In 1808 he became veterinary surgeon to the Bengal army and superintendent of the East India Company's stud at Púrá, near Cawnpore. While occupying these positions he undertook a series of remarkable journeys in northern India, was the first Englishman to cross the Himalayas, vainly endeavored to penetrate Chinese Turkestan, and died while returning from Bokhara. His papers were edited by Prof. H. H. Wilson and published in 1841 under the title *Travels in the Himalayan Provinces of Hindustan and the Punjab from . . . 1819 to 1825*. Among his other writings is a translation of Valli's *Experiments in Animal Electricity* (1793).

MOORE, ADDISON WEBSTER (1866-). An American philosophical scholar, born at Plainfield, Ind. He graduated from DePauw University (A.B., 1890; A.M., 1893); studied at Cornell (1893-94); and took his Ph.D. in 1898 at the University of Chicago, with the faculty of which he had been connected for three years, and where he remained, becoming professor of philosophy in 1909. Moore was president of the Western Philosophical Association in 1911. For some years he was associated with John Dewey, to whose philosophical ideas he gave his support. See PRAGMATISM; EMPIRICISM. His writings include: *Functional versus Representational Theories of Knowledge in Locke's Essay* (1902); *Existence, Meaning, and Reality in Locke's Essay and in Present Epistemology* (1903); *Pragmatism and Its Critics* (1910).

MOORE, mōor or mōr, ALBERT JOSEPH (1841-93). An English decorative and figure painter, born in York, of a family of painters. (Henry Moore, 1831-95, was his brother.) He studied for a short time at the Royal Academy Schools and began his career with a number of purely decorative works done principally for theatres and churches. He was at first inclined to follow the Pre-Raphaelites, but soon developed an original style, classic in character, though his subjects, which are usually figures of women, are not drawn from antiquity. His sentiment is purely æsthetic, never emotional or dramatic, his sense of beauty is unerring, his color harmonious and delicately brilliant, and his composition simple and decorative, with a quality that is Japanese. His best-known paintings include "Midsummer" (1887), "Blossoms" (Tate Gallery, 1881); "A Summer Night" (Liverpool Gallery); "The Open Book" and "Somnus," both in the Victoria and Albert Museum; "Dreamers" (Birmingham Gallery). For his biography, consult Baldry (London, 1894) and the *Masters in Art*, vol. ix (Boston, 1908).

MOORE, ALFRED (1755-1810). An American jurist, born in Brunswick Co., N. C., a son of Maurice Moore (q.v.). He was educated in Boston. In August, 1775, he was made captain in the First Regiment, North Carolina Line, of

which his uncle, James Moore, was colonel, and took part in the defense of Charleston, S. C., in June, 1776. He resigned in March, 1777, but served in the militia against Cornwallis after the battle of Guilford Court House. In 1792 he was elected Attorney-General by the Assembly, though he knew little or no law. He was elected judge of the Superior Court in 1798, but in December of the next year was appointed by President Adams an associate justice of the Supreme Court of the United States. He resigned in 1805.

MOORE, BENJAMIN (1748-1816). An American Protestant Episcopal bishop. He was born in Newtown, Long Island, N. Y., graduated at King's College in 1768; prepared for the ministry; and went to England, where he was ordained by the Bishop of London in 1774. Returning to America, he was appointed assistant minister in Trinity Church, New York, in the same year. In 1800 he became rector of Trinity Parish. In 1801 he was consecrated Bishop of New York and at the same time was appointed president and professor of logic and rhetoric in Columbia College. He performed the duties of both these positions till 1811, when paralysis disabled him. Bishop Moore's publications include sermons and a pamphlet in vindication of Episcopal services.

MOORE, CHARLES LEONARD (1854-). An American poet and essayist, born in Philadelphia. He became a lawyer and in 1878-79 served as United States Consul at San Antonio, Brazil. Besides contributing critically to the *Chicago Dial*, he published *Atlas* (1881), *Poems Antique and Modern* (1883), *Book of Day Dreams* (1883), *Banquet of Palacios* (1889), a comedy; *Odes* (1896), *The Ghost of Rosalys* (1900), a poetical drama, *The Red Branch Crests—a Trilogy* (1904).

MOORE, CLARA JESSUP (1824-99). An American philanthropist and writer, born in Philadelphia. She organized in Philadelphia a hospital relief committee during the Civil War and assisted in the foundation of the Temperance Home for Children. After the death of her husband in 1878 she spent much of her time in London, where she died. She published *Miscellaneous Poems* (1875), a romance called *On Dangerous Ground* (1876), *Sensible Etiquette* (1878); *Ether the True Protoplasm* (1885), *Social Ethics and Social Duties* (1892), and other books. The book on ether was written because she believed that ether could account for the Keely motor (q.v.), to whose projector she gave liberally in order that he might develop his idea.

MOORE, CLARENCE BLOOMFIELD (1852-). An American archæologist, born in Philadelphia. He traveled in nearly every part of Europe, in Asia Minor, and in Egypt; crossed the Andes and went down the Amazon River in 1876; and made a trip around the world in 1878-79. During a period of 20 years he explored Indian mounds in nearly all the Southern States. His writings, for the most part published by the Academy of Natural Sciences in Philadelphia, include *Some Aboriginal Sites in Louisiana and in Arkansas* (1913).

MOORE, CLEMENT CLARKE (1779-1863). An American poet and educator, a son of Bishop Moore of New York. He was born in New York, graduated from Columbia College (1798), and was made professor of biblical learning in the General Theological Seminary in New York

(1821), a post that he held until 1850. The ground on which the seminary now stands was his gift. He compiled a *Hebrew and English Lexicon* (1809), and published a collection of *Poems* (1844), among which is "Twas the Night before Christmas," or more properly, "A Visit from St. Nicholas," which has long been a favorite with young people. It was written for his children in 1822 and appeared anonymously and without his knowledge in the *Troy Sentinel*, Dec. 23, 1823. Consult Stedman, *An American Anthology* (Boston, 1900).

MOORE, CLIFFORD HERSCHEL (1866-). An American Latin scholar. He was born at Sudbury, Mass., and was educated at Harvard (A.B., 1889) and at Munich (Ph.D., 1897). He taught the classics at the Belmont (Cal.) School in 1889-92 and at Phillips Academy, Andover, Mass., in 1892-94. At the University of Chicago he was instructor (1894-95) and assistant professor (1895-98) of Latin, and at Harvard he served as assistant professor of Greek and Latin (1898-1905) and as professor of Latin after 1905. In 1905-06 he was professor of Latin at the American School of Classical Studies in Rome. He edited Allen's edition of Euripides' *Medea* (1899) and Horace's *Odes and Epodes* (1902), is author of *A First Latin Book* (1903) and *The Elements of Latin* (1906), with J. J. Schlicher; and contributed to the NEW INTERNATIONAL ENCYCLOPEDIA.

MOORE, DAVID HASTINGS (1838-1915). An American Methodist Episcopal bishop, born at Athens, Ohio. He graduated at Ohio University in 1860; was ordained to the ministry the same year, entered the Civil War as a private and rose to be lieutenant colonel of volunteers in the 125th Ohio Infantry. He was president of Cincinnati Wesleyan College (1875-80), president of Colorado Seminary and chancellor of the University of Denver (1880-89), and editor of the *Western Christian Advocate* from 1889 to 1900, when he was elected Bishop and sent to take charge for four years of the Methodist missions in China, Japan, and Korea. From 1904 to 1908 his official residence was Portland, Oreg., from 1908 to 1912 Cincinnati. In 1912 he retired. He was a member of the General Conferences of 1888, 1892, 1896, and 1900, and of the North China Branch of the Royal Asiatic Society.

MOORE, EDWARD (1712-57). An English dramatist, born at Abingdon, Berkshire. He was a linen draper in early life, but failed in business and devoted himself to literature, *Fables for the Female Sex* (1744) being his first publication. He afterward wrote two unsuccessful comedies, *The Foundling* (1748) and *Gul Blas* (1751). These were followed by *The Gamester* (1753), the good fortune of which may have been due to Garrick's acting and his collaboration. In 1753 he became editor of the *World*, a satirical weekly, with a very talented staff, including Lord Lyttelton, Horace Walpole, and Lord Chesterfield. His *Poems, Fables, and Plays* were collected and published in 1756. The *Fables* were often reprinted with those of John Gay, and were translated into German.

MOORE, EDWARD (1838-1916). An English scholar, born at Cardiff. He was educated at Bromsgrove Grammar School and at Pembroke College, Oxford. For a time he was rector of Gatcombe, Isle of Wight. From 1862 to 1864 he was fellow and tutor of Queen's College, Oxford. In 1864 he became principal of St. Ed-

mund Hall, and in 1903 he was made canon of Canterbury Cathedral. He became honorary fellow of Pembroke and Queen's colleges, and received the Dublin D.Litt. His publications comprise *Aristotle's Ethics*, books i-iv (5th ed., 1896); *Aristotle's Poetics, with Notes* (1875); *Time References in the Divina Commedia* (1887), translated and published at Florence in 1900 with the title *Gli accenni al tempo nella Divina Commedia; Textual Criticism of the Divina Commedia* (1889); *Dante and his Early Biographers* (1890); *Tutte le opere di Dante Alighieri, the "Oxford Dante"* (1894); *Studies in Dante* (first series, 1896; second series, 1899; third series, 1903). The "Oxford Dante," by all means the best edition of Dante's works, together with Moore's other studies in the same field, placed him among the first of Dante scholars.

MOORE, EDWARD CALDWELL (1857-). An American theologian, brother of George Foot and Frank Gardner Moore. He was born at West Chester, Pa.; graduated from Marietta College in 1877 and from Union Theological Seminary in 1884, and studied at Berlin, Göttingen, and Giessen in 1884-86, and at Brown (Ph.D., 1891). Ordained to the Presbyterian ministry in 1884, he was pastor at Yonkers, N. Y. (1886-89), and of the Central Congregational Church of Providence, R. I. (1889-1901). In the latter year he became Paikman professor of theology at Harvard, where he was university preacher in 1905-06. He lectured also at Mansfield College, Oxford, in 1894 and 1913, at Andover Theological Seminary in 1900, at Lowell Institute, Boston, in 1903, and at Yale Divinity School in 1906. In 1914 he was elected president of the American Board of Commissioners for Foreign Missions. His publications include *The New Testament in the Christian Church* (1904) and *An Outline of the History of Christian Thought since Kant* (1912).

MOORE, EDWARD MOTT (1814-1902). An American surgeon, born at Rahway, N. J. He received his medical education in New York City and Philadelphia (M.D., University of Pennsylvania, 1838). His family had settled in Rochester, N. Y., and it was there that he made his permanent residence, although at different periods, with the title of professor of surgery, giving series of lectures at medical colleges—at Woodstock, Vt. (1842-54), at Berkshire, Mass. (1855), at Starling Medical College, Columbus, Ohio (1857), and at Buffalo Medical College (1858-83). He was president of the New York State Medical Society (1874), of which society he was one of the founders, of the American Surgical Association (1883), and of the American Medical Association (1890). For many years he was president of the board of trustees of the University of Rochester, and he is remembered as the "father" of the Rochester park system.

MOORE, ELIAKIM HASTINGS (1862-). An American mathematician, born at Marietta, Ohio. He studied at Yale (A.B., 1883, Ph.D., 1885) and at Berlin (1885-86); was instructor in mathematics at Yale (1887-89) and professor at Northwestern University (1889-92) and then at Chicago, where in 1896 he was made head of the department. He became a member of the National Academy of Sciences in 1901. The author of many important papers in advanced mathematics, among them "Introduction to a Form of General Analysis," published in

the *New Haven Mathematical Colloquium* (1910), Moore also edited the *Transactions of the American Mathematical Society* (1899-1907), and he was president of the society in 1901-03.

MOORE, EVA (1870-). An English actress, born in Brighton. She went on the stage in 1887, joined Toole's company in 1888, and married in 1891 Henry V. Esmond (q.v.), with whom she managed his play *Eliza Comes to Stay* in 1913. She had played Lady Ernestine in Esmond's *My Lady Virtue* (1903) and Wilhelmina Marr in his *Billy's Little Love Affair* (1903); and was Mabel Vaughan in *The Wilderness* (1901) and Kathie in *Old Heidelberg* (1902 and 1909) with George Alexander. In 1907 she took the name part in *Sweet Kitty Bellairs* (1907), and she played Mrs. Errol in *Little Lord Fauntleroy* and Mrs. Crowley in *The Explorer* in 1908, and the Hon. Mrs. Bayle in *Best People* and the Hon. Mrs. Rivers in *The House Opposite* in 1909.

MOORE, FRANK (1828-1904). An American journalist and compiler, a brother of George Henry Moore. He was born in Concord, N. H., but removed to New York City and became a journalist and general writer. In 1869-72 he was Assistant Secretary of Legation in Paris. He edited *Songs and Ballads of the American Revolution* (1856); *Cyclopedia of American Eloquence* (1857); *Diary of the American Revolution* (2 vols., 1860); *The Rebellion Record* (12 vols., 1861-68), a collection of original material bearing on the Civil War; *Lyrics of Loyalty* (1864); *Confederate Rhymes and Rhapsodies* (1864); *Personal and Political Ballads* (1864); *Speeches of Andrew Johnson* (1865); *Life and Speeches of John Bright* (1865); *Women of the War 1861-66* (1866); *Songs and Ballads of the Southern People, 1861-65* (1887).

MOORE, FRANK FRANKFORT (1855-). A British novelist and dramatist, born at Limerick, Ireland, and educated at the Royal Academical Institution, Belfast. His plays include *A March Hare* (1877); *The Queen's Room* (1891); *Kitty Clive, Actress* (1895). Some of his numerous novels are: *Coral and Coconut* (1890); *The Two Clippers* (1893); *The Secret of the Court* (1895); *The Millionaires* (1898); *A Damsel or Two* (1902); *He Loved but One* (1905); *An Amateur Adventuress* (1908); *The Keeper of the Robes* (1912); *Discovering "Evelina"* (1913). His novels are generally of a sensational kind, and frequently draw upon the author's travels in two hemispheres for characters and incidents. Moore is also author of *Oliver Goldsmith* (1910) and *The Commonsense Collector. A Book of Hints on the Collecting and Housing of Antique Furniture* (1911). In 1915 he published *The Lady of the Reef*.

MOORE, FRANK GARDNER (1865-). An American Latin scholar, brother of Edward Caldwell and George Foot Moore. He was born at West Chester, Pa., and educated at Yale (A.B., 1886; Ph.D., 1890) and at Berlin (1890-91). He was a Latin tutor at Yale in 1888-93, assistant professor of Latin (1893-1900) and associate professor of Latin and Roman archaeology (1900-08) at Dartmouth College, and professor of Latin at Trinity College, Hartford, Conn. (1908-10). In the latter year he became professor of classical philology at Columbia University. He edited the *Transactions* and the *Proceedings* of the American Philological Association, of which he became secretary in 1904.

He edited also Cicero's *Cato Maior* (1904) and *Tacitus' Histories* (1910).

MOORE, GEORGE (1853-). An Irish novelist, the son of George Henry Moore, M.P., of Moore Hall, Ballyglass, County Mayo, Ireland. He was educated at a Catholic school in Ireland and under a tutor in London, where, at his father's wish, he prepared to enter the army. Later, in London and in Paris, he studied art. After abandoning this prospective profession he continued his Bohemian life in Paris, becoming intimate in good literary and artistic circles. In the late 1870's he returned to London and, temporarily in straitened circumstances, worked hard as a journalist, critic, and novelist, acquiring by degrees idiomatic fluency in the writing of English, which for years had been an unused tongue to him. In 1901 an interest in the movement known as the Irish literary revival (see IRISH LITERATURE, II), in which his friends Edward Martyn (q.v.) and William Butler Yeats (q.v.) bore a prominent part, took him to Dublin, where he remained for a decade, assisting in the establishment of a theatre (a feature of the revival) and identifying himself variously with its literary activities. The interference of Catholic Irish objections with the free play of ideas in art, and also, perhaps, a general failure to fit in with the aims, moods, and methods of the movement, led him to abandon his native land again in 1911, and to present the world with a record of his decade's adventures in a book of most indiscreet confessions, *Hail and Farewell* (3 vols., *Ave, Salve, and Vale*, New York, 1911-13). Primarily a novelist, Moore was also a critic of art and a dramatist. Following two small volumes of verse, *Flowers of Passion* (1877) and *Pagan Poems* (1881), came his first novel, *A Modern Lover* (1883), which showed him a disciple—with a difference, however—of Flaubert and Zola, and a realist in his strict regard for major and minor truth, but a realist whose work is often aglow with imaginative insight and poetic quality. Other novels followed close upon his first, but it was not until *Esther Waters* (1894) appeared that Moore's eminence among the novelists of his generation was recognized. This book, together with *A Mummer's Wife* (1884), *Evelyn Innes* (1898), and its sequel *Sister Theresa* (1901), gives Moore his claim to remembrance as a writer of fiction. *The Untilled Field* (1903), a book of stories of anti-Catholic tendency, and *The Lake* (1905), a novel, are Irish in theme and setting, and grew out of his 10 years of later residence in Ireland. In art criticism Moore's stimulating quality is found in his *Impressions and Opinions* (1890) and in *Modern Painting* (1893). In the drama his work is competent and effective, if not masterly and impressive. His plays include *The Strike at Arlingford* (1893), *The Bending of the Bough* (1900), *Diarmid and Grania*, with W. B. Yeats (unpublished, but played 1901). Other works are: *A Drama in Muslin* (1886), *Parnell and his Ireland* (1887); *Confessions of a Young Man* (1888); *Mike Fletcher* (1889); *The Celibates* (1895); *Memoirs of my Dead Self* (1906); *Hail and Farewell* (see above). Besides the last-named book, the *Confessions* and *Memoirs* also are largely autobiographical. Consult also: William Archer, *Real Conversations* (London, 1904); G. K. Chesterton, *Heretics* (New York, 1905); J. G. Huneker, *The Pathos of Distance* (ib., 1913).

MOORE, GEORGE FOOT (1851-). An American Orientalist, brother of Edward Caldwell and Frank Gardner Moore. He was born at West Chester, Pa. He graduated at Yale in 1872 and at Union Theological Seminary in 1877, entered the Presbyterian ministry, and was pastor of the Putnam Presbyterian Church at Zanesville, Ohio, for five years. From 1883 to 1902 he was Hitchcock professor of Hebrew and the history of religions at Andover Theological Seminary, and at Harvard University he was professor of theology (1902-04), and thereafter Frothingham professor of the history of religion. He was for several years editor of the *Journal of the American Oriental Society*, whose president he was in 1911-12. His publications include *A Critical and Exegetical Commentary on the Book of Judges* (1895); *The Book of Judges: A New English Translation* (1898); *The Book of Judges: Critical Edition of the Hebrew Text* (Leipzig, 1900); *The Literature of the Old Testament* (1913); *History of Religions* (vol. i, 1913); *Metempsychosis*, the Ingersoll lecture at Harvard (1914).

MOORE, GEORGE HENRY (1823-92). An American historical writer and librarian, born in Concord, N. H. He removed in 1839 to New York City and in 1843 graduated at New York University. Before leaving college he had become connected with the New York Historical Society, as an assistant to his father, Jacob Bailey Moore, the librarian, and in 1849 succeeded him as its librarian. In this position he remained until 1872, when, on the opening of the Lenox Library (now a part of the New York Public Library), he became its first superintendent. Here he remained until his death. He was a frequent contributor to historical magazines and to the proceedings of historical societies. Among his best-known works are: *The Treason of Charles Lee* (1858); *The Employment of Negroes in the Revolutionary Army* (1862); *Notes on the History of Slavery in Massachusetts* (1866); *A History of the Jurisprudence of New York* (1872).

MOORE, GEORGE THOMAS (1871-). An American botanist, born at Indianapolis, Ind., and educated at Wabash College (B.S., 1894) and at Harvard (A.B., 1895; Ph.D., 1900). He was plant physiologist and algologist of the Bureau of Plant Industry at Washington (1901-03), had charge of the Laboratory of Plant Physiology of the Department of Agriculture (1903-05), and was in charge of botany at the Marine Biological Laboratory at Woods Hole, Mass. He served as professor of applied botany and plant physiology at the Shaw School of Botany, Washington University, in 1909-12, and during the same period was physiologist to the Missouri Botanical Garden, of which he became director in 1912. He discovered a method of preventing the pollution of water supplies by algae and made experiments in introducing atmospheric nitrogen by means of bacteria into the soil for crop purposes. He is author of various contributions to scientific journals and of governmental bulletins.

MOORE, HARRY HUMPHREY (1844-). An American genre and portrait painter, born in New York City. He studied under Waugh in Philadelphia and at the Ecole des Beaux-Arts, Paris, under Gérôme. Afterward he became the pupil and friend of Fortuny in Madrid, and still later traveled and painted in Germany, Italy,

and Japan. Although both deaf and dumb, he achieved success in his profession at Paris, his permanent residence. His best works include refined, sparkling Japanese studies and Spanish and Moorish scenes, such as "Gypsy Encampment, Granada," and "A Moorish Bazar." He received the Order of Charles III of Spain.

MOORE, SIR HENRY (1713-69). An English Colonial Governor, born in Vere, Jamaica. He became Lieutenant Governor of his native island in 1755 and, except for a few weeks in 1759, directed the administration of Jamaica until 1762. In reward for his services in suppressing the slave insurrection of 1760 he was made Baronet. In July, 1765, he was appointed Governor of New York, where he arrived at the beginning of the trouble over the Stamp Act. Influenced by public opinion, he suspended the execution of the act. His administration was generally popular with the people on account of the moderation with which he carried out the orders of the home government during the years following the Stamp Act. He continued to hold the office of Governor until his death.

MOORE, HENRY (1751-1844). A Wesleyan minister and biographer of John Wesley. He was born in a suburb of Dublin and was apprenticed to a wood carver. Impressed by the preaching of John Wesley, he frequented the Methodist meetings and joined a class in Dublin in 1777. He served from 1784 until 1786 as assistant traveling companion and amanuensis to John Wesley, and again from 1788 to 1790. Wesley made him one of his three literary executors and appointed him to be, after his death, one of the 12 ministers to regulate the services of City Road Chapel. He was president of the Wesleyan Conference in 1804 and 1823. Moore refused ordination in the Church of England, although he accepted it from Wesley assisted by two Episcopal clergymen, opposed Coke's Lichfield scheme of 1794 for the creation of a Methodist hierarchy and also the proposal brought forward in 1834 for the establishment of a theological school; and on the formation of a centenary fund in 1839 objected to the acquisition of land by the Methodist body. In conjunction with the Rev. Thomas Coke, and under the authority of the conference, he published a *Life of the Rev. John Wesley* in 1792, which, however, owing to a difference with the third literary executor, they had been obliged to prepare without access to Wesley's papers. Most of the papers were afterward obtained, and a new *Life* was published in 1824-25. Moore's other works are: *A Reply to Considerations on the Separation of the Methodists from the Established Church* (1794); *Poems, Lyrical and Miscellaneous* (1806); *Life and Death of Mrs. Ann Moore* (1813); *Thoughts on the Eternal Sonship* (1816); *The Life of Mrs. Mary Fletcher of Madeley* (2 vols., 1817; 9th ed., 1838); *A Short Account of Miss Mary Titherington of Liverpool* (1819); *Sermons* (1830), with autobiography to 1791. His life was published by Mrs. Richard Smith, with the autobiography in 1844.

MOORE, HENRY (1831-95). An English marine and landscape painter, a brother of Albert Joseph Moore, born in York. He was the pupil of his father, William Moore, and studied also at the York School of Design and the Royal Academy Schools. At first an excellent animal and landscape painter, he gave himself after

1857 almost entirely to marine subjects. In rendering of wave movement, in veracity of color and texture, and in subtle atmospheric effects he has few rivals. His works include: "The Newhaven Packet" (Birmingham Gallery), "Cat's-paws off the Land" (Tate Gallery, London), "Mount's Bay" (1886, Manchester Gallery), and "Clear Shining after Rain," which won the Grand Prix at Paris in 1889. Moore was elected an academician in 1893.

MOORE, JACOB BAILEY (1797-1853). An American journalist and historical writer, born at Andover, N. H. He learned the printer's trade at Concord, engaged in editorial work and edited the *New Hampshire Journal* from 1826 to 1829, when he was elected sheriff of Merrimack County, N. H. He was a member of the Legislature in 1828. In 1839 he removed to New York and edited the *Daily Whig*. He was in the government employ in Washington, 1841-45, but returned to New York and served as librarian of the Historical Society from 1845 to 1849. From 1849 to 1853 he was postmaster of San Francisco. He published, with John Farmer, *Collections Historical and Miscellaneous* (3 vols., 1822-24), relating principally to the early history of New Hampshire; *Gazetteer of the State of New Hampshire* (1823); *Annals of the Town of Concord* (1824), *Lives of the Governors of New Plymouth and Massachusetts Bay* (1846).

MOORE, JAMES (c.1640-1729). An American Colonial soldier and official. He was said to be a son of Roger Moore, the Irish rebel, and came to South Carolina about 1665. He settled on Goose Creek (Otranto), near the Cooper River, about 15 miles north of Charleston, and soon became prominent in resisting the demands of the Lords Proprietors. He was a member of the Governor's Council in 1682 and of the Assembly in 1692 and in the latter year was excluded from pardon by name by the Proprietors. In 1695 he was a member of Governor Archdale's Council and traded extensively with the Indians. He was elected Governor by the Council in 1700 and served until the arrival of Sir Nathaniel Johnson in 1703.

MOORE, JAMES (1667-1740). An American soldier and Colonial official, born in Charleston, S. C. He saw service in various Indian expeditions, under his father, James Moore, Governor of South Carolina in 1700-03. In 1702 he fought against the Spaniards in Florida, but the expedition he commanded was not successful and left the State in debt. He conducted a victorious campaign against the Appalachian Indians in 1703, and in 1713 commanded the forces sent by Governor Craven to aid the Colony of North Carolina in its desperate struggle with the Tuscarora Indians. When the Convention threw off the proprietary government and deposed Gov. Robert Johnson in 1719, Moore was made Governor, but was succeeded by Arthur Middleton the same year. He afterward became Attorney-General of the State and an admiralty judge. He was Speaker of the Assembly in 1721-25. Ten years later he went with a pioneer colony to North Carolina and settled near Cape Fear, where he died.

MOORE, JAMES HOBART (1852-). An American lawyer and industrial promoter, born at Berkshire, N. Y. He was a bank clerk at Binghamton, N. Y., from 1871 to 1873, when he moved to Chicago. There he was admitted to the bar in 1881. He was associated with his

brother, William Henry Moore (q.v.), in the promotion of various great industrial corporations, and was also a director of the Rock Island lines and of the American Can Company.

MOORE, JOHN (1729-1802). A Scottish physician and author, born at Stirling. He studied at the University of Glasgow, was apprenticed to a surgeon, became in 1747 surgeon's mate in the army, and served in military hospitals in the Netherlands during the War of the Austrian Succession. After further study and two years of practice at Glasgow he traveled extensively on the Continent. In 1792 he was in France during the disturbances of August and September, and in 1793-94 published his two-volume *Journal* of his residence, frequently quoted in Carlyle's *French Revolution*. His works of travel, *A View of Society and Manners in France, Switzerland, and Germany* (1779) and *A View of Society and Manners in Italy* (1781), are merely interesting in style. He wrote also a volume of *Medical Sketches* (1786), containing some results of first-hand investigation, and three dull works of fiction, *Zeluco* (1786), *Edward* (1796), and *Mordaunt* (1800), to the first of which Byron referred in the addition to the preface of *Childe Harold*. He edited (1797) the works of his friend and patient, Smollett, and wrote the memoir that introduced the edition. Prevost and Blagdon edited *Mooriana, or Selections from the Moral, Philosophical, and Miscellaneous Works of Dr. John Moore* (London, 1803). Consult the *Life* by Anderson (Edinburgh, 1820).

MOORE, SIR JOHN (1761-1809). A British general. The eldest son of Dr. John Moore (q.v.), he was born at Glasgow, Nov. 13, 1761. He entered the army when only 15 and served with distinction in Nova Scotia, Corsica, the West Indies, Ireland, and Holland. He was in Egypt with the army under Abercromby, and obtained the Order of the Bath for his services during the operations around Abukir Bay. In 1802 Moore served in Sicily and Sweden. In 1808 he was sent with a corps of 10,000 men to strengthen the English army in the Peninsula. In October he moved his army from Lisbon, with the intention of advancing by Valladolid to unite with the Spanish general Romana and threaten the communications between Madrid and France. But the apathy of the Spaniards and the successes of the French in various parts of the Peninsula soon placed him in a critical position. He had determined to make a bold advance from Salamanca to attack Soult, when the news reached him that Madrid had fallen and that Napoleon was marching to crush him at the head of 70,000 men. Moore's forces amounted to only 25,000 men and he was consequently forced to retreat. In December he began the march from Astorga to Coruña, a route of nearly 250 miles, through a desolate and mountainous country, made almost impassable by snow and rain, and harassed by the enemy. The soldiers suffered intolerable hardships, and arrived at Coruña in a very distressed state, but it was impossible to embark without fighting. On Jan. 16, 1809, the French under Soult attacked and a desperate battle ensued. Moore was struck by a cannon ball on the left shoulder and died in the moment of victory. The French were repulsed with the loss of 2000 men. Consult: J. C. Moore, *Life of Sir John Moore* (London, 1834); W. F. P. Napier, *History of the Peninsular War* (5 vols., New York, 1856);

C. B. Mayne, "Moore," in Spenser Wilkinson, *From Cromwell to Wellington* (London, 1899); *Diary*, edited by Sir J. F. Maurice (2 vols., London, 1904).

MOORE, JOHN (1826-1907). An American physician, a surgeon-general of the United States army. He was born in Indiana, entered the United States army as assistant surgeon in 1853, and served in Florida and on the Utah expedition (1857). When the Civil War broke out he was attached to the Cincinnati Marine Hospital, was promoted surgeon in 1862, and was assigned to the Army of the Potomac. In 1863 he became medical director of the Army of the Tennessee and accompanied General Sherman on his march to the sea and through the Carolinas. In 1865 he received the brevet of colonel, in 1883 he was made assistant medical purveyor with the rank of colonel, and in 1886 he was appointed surgeon-general of the army with the rank of brigadier general. He was retired for age in 1900.

MOORE, JOHN BASSETT (1860-). An American publicist, an authority on international law. He was born Dec. 3, 1860, at Smyrna, Del., graduated at the University of Virginia in 1880, studied law at Wilmington, and at 23 was admitted to the Delaware bar. Entering the Department of State as a law clerk in 1885, the next year he was appointed Third Assistant Secretary of State. During his service in this position he acted as secretary to the Conference on Samoan Affairs (1887) and to the Fisheries Conference (1887-88). After 1891 he held the chair of international law and diplomacy at Columbia, but was frequently granted leave of absence to accept appointments in the public interest. For part of 1898 he served as Assistant Secretary and Acting Secretary of State, and after the close of the war with Spain was secretary and counsel to the American Peace Commission at Paris. Subsequently Moore represented the government as agent before the United States and Dominican Arbitration Tribunal (1904), as delegate to the Fourth International American Conference at Buenos Aires and special plenipotentiary to the Chilean centenary (both 1910), and as delegate to the International Commission of Jurists at Rio de Janeiro (1912). In 1913 he accepted the post of counselor to the State Department (with power to act as Secretary of State), but the next year he resigned and resumed his duties at Columbia. A member of the Permanent Court at The Hague (from 1913), member of the Institut de Droit International and of the Institut Colonial International, president of the American Political Science Association (1914), and chairman of the Lake Mohonk Peace Conference (1914 and 1915), Moore was further honored by the degree of LL.D. from Columbian (now George Washington) University, Delaware College, Yale, the University of Chile, and Brown. His works, of the highest importance in their field, include: *Reports on Extraterritorial Crime* (1887); *Extradition and Interstate Rendition* (2 vols., 1891); *American Notes on the Conflict of Laws* (1896); *History and Digest of International Arbitrations* (6 vols., 1898); *American Diplomacy: Its Spirit and Achievements* (1905); *Digest of International Law* (8 vols., 1906); *Four Phases of American Development: Federalism, Democracy, Imperialism, Expansion* (1912). He also edited *The Works of James Buchanan* (12 vols., 1908)

and became an editor of the *Political Science Quarterly* and of the *Journal du Droit International Privé*.

MOORE, JOHN PERCY (1869-). An American zoölogist, born at Williamsport, Pa. He was educated at the Central High School of Philadelphia (A.B., 1886) and at the University of Pennsylvania (B.S., 1892, Ph.D., 1896), where he was instructor in zoölogy from 1892 to 1907, assistant professor in 1907-09, and thereafter professor. In 1902 he became assistant curator of the Academy of Natural Sciences at Philadelphia. After 1890 he was repeatedly employed by the United States Fish Commission, served as instructor in biology at the Hahnemann Medical College in 1896-98, and was instructor in zoölogy at the Marine Biological Laboratory at Woods Hole, Mass., after 1901.

MOORE, JOHN WHITE (1832-1913). An American naval officer, born at Plattsburg, N. Y. He was appointed third assistant engineer in the United States navy in 1853 and was promoted to chief engineer in 1861. During the Civil War he took part in the engagements with the ram *Manassas* and in the capture of the defenses of Pensacola in 1861; in the passage and capture of Forts Jackson and St. Philip, the capture of New Orleans, the passage of the Vicksburg batteries, and the fight with the ram *Arkansas* in 1862, and in the capture of Port Hudson in 1863. He originated the use of chain cables to protect the sides of wooden ships, of a paint designed to render fighting ships less easily visible, and of the fighting tops until lately found on the masts of all large war vessels. He retired in 1894 with the rank of commodore, but during the Spanish-American War he served as an inspector in the New York Navy Yard. For his services in the Civil War he was raised to the rank of rear admiral in 1906.

MOORE, MAURICE (1735-77). An American Colonial legislator and jurist, born in Brunswick Co., N. C. He became a member of the State Assembly in 1757. From 1767 to 1773 he was one of the three judges of the Superior Court. He served as colonel of brigade in the expedition of Governor William Tryon (q.v.) against the Regulators (q.v.) in 1771. In this year he published the venomous attack on Governor Tryon signed "Atticus." He was a member of the Provincial Congresses of 1775 and 1776 and of the Constitutional Convention of 1776.

MOORE, NICHOLAS (?-1689). A chief justice of Pennsylvania, born in England. He was chairman of the first Provincial Assembly in 1682, Speaker of the Assembly in 1684, and in the same year was appointed Chief Justice. In 1685 he was impeached by the Assembly for exceeding his powers, but he was never tried by the Council. His case is peculiarly interesting as being probably the first instance of impeachment that occurred in America. Consult: W. R. Shepherd, *History of Proprietary Government in Pennsylvania* (New York, 1896, and as vol. vi of *Columbia University Studies in History, Economics, and Public Law*).

MOORE, ROBERT (1838-). An American civil engineer, born at New Castle, Pa. He graduated from Miami University in 1858 and after 1863 was engaged in civil engineering, chiefly in the location and construction of railroads. In 1877-81 he was sewer commissioner and a member of the board of public works of St. Louis, Mo., where from 1897 to 1913 he was a member of the board of education. He

was president of this board in 1905-06 and 1909-10. He became a consulting engineer and a member of the Brazos River and the Southwest Pass boards of engineers. He served as president of the American Society of Civil Engineers in 1902.

MOORE, THOMAS (1779-1852). An Irish poet, born in Dublin, May 28, 1779. In 1794 he went to Trinity College, Dublin, which had been opened to Roman Catholics in 1793. He had already shown a remarkably quick mind, a gift for music, and had written in 1793 "Lines to Zelia" and "A Pastoral Ballad." These verses appeared in the *Anthologia Hibernica*, a periodical which lived only two years. Noteworthy in his university experience was his friendship with Robert Emmet, which nearly involved him in the United Irish conspiracy. He went to London in 1799 and soon arranged for the publication by subscription of his *Anacreon* (1800). He had the good luck to find a patron in the Prince of Wales, who accepted the dedication of the poem. The *Anacreon* was followed by *Poems by the Late Thomas Little* (1801), a volume of sweet but oversensuous verse, much blamed, much applauded, and widely read. Moore's musical talents soon made him a welcome guest among the aristocracy. In 1803 he was appointed admiralty registrar at Bermuda, but, disliking the post, he intrusted it to a deputy (1804) and traveled through the United States and Canada, visiting, among other cities, New York, Washington, Baltimore, Philadelphia, and Boston. He returned to England in November, 1804. In 1806 appeared *Odes and Epistles*, which Jeffrey made the occasion for a savage attack on Moore's earlier erotics (*Edinburgh Review*, July, 1806). The incident led to a duel interrupted by the police (Aug. 11, 1806). After this fiasco the combatants became cordial friends. In 1807 Moore published his *Irish Melodies*, 124 in number, in 10 parts. His three satires, *Corruption* and *Intolerance* (1808) and the *Skeptic* (1809), fell flat, as they deserved to do. On the other hand, lampoons on the Regent and his favorites went from mouth to mouth and were still liked when they were gathered in *The Two-penny Post Bag* in 1813. In 1811 Moore married a young actress, Miss Bessie Dyke, with whom he seems to have lived happily. In 1815, with the aid of a library of books on Oriental themes, Moore set to work on *Lalla Rookh*, a sugared Oriental romance in verse, with which he made an immediate and striking success on its publication in 1817. About this time he became embarrassed by the defalcation of the deputy left at Bermuda and was compelled to retire for a time to the Continent. At Venice he visited Lord Byron, from whom he received the famous *Memoirs*, afterward reluctantly burned. Moore returned to England in 1822. In 1835 he was granted a literary pension of £300, which was supplemented in 1850 by a civil pension of £100.

Moore's popularity as a poet in his day well-nigh rivaled that of Byron or Scott. His fame now rests mostly upon a few of the best poems of the *Irish Melodies* (10 parts, 1807-34) and *National Airs* (1815). Since the Elizabethan age the lyric had been dissociating itself from music. Moore again united them, and so completely that it is unfair to estimate his lyrics independently. They are light, airy, and graceful, though without the passion of Byron or Shelley. Among Moore's other works are: *The Fudgel Family in Paris* (1818), humorous verses;

The Loves of the Angels (1823); *The Memoirs of Captain Rock* (1824), an attack on the Irish church; a prose romance entitled *The Epicurean* (1827), lives of Sheridan (1825), Byron (1830), Edward Fitzgerald (1831); and a *History of Ireland* (completed in 1846). The *Life of Byron*, the main source for all later biographies, is still a classic. Consult: Lord John Russell (ed.), *Memoirs, Journals, and Correspondence of Moore* (8 vols., London, 1853-56); Kent, *Poetical Works*, with memoir (ib., 1883); Gunning, *Thomas Moore, Poet and Patriot* (ib., 1900); S. L. Gwynn, *Thomas Moore* (New York, 1905); J. C. L. Clark, *Tom Moore in Bermuda* (2d ed., Boston, 1909).

MOORE, WILLIAM HENRY (1848-). An American lawyer and capitalist. He was born at Utica, N. Y., studied at Amherst College, and was admitted to the Wisconsin bar in 1872. Settling in Chicago, he made a specialty of promoting corporations and with his brother James H. Moore (q.v.) he formed in 1898-99 four great corporations, the American Can Company, the American Tin Plate Company, the American Steel Hoop Company, and the American Sheet Steel Company, known together as the "Moore group." They had a combined capital of \$187,000,000; eventually they were absorbed by the United States Steel Corporation. Judge Moore promoted also the Diamond Match Company and the National Biscuit Company in 1898. He became a director of the United States Steel Corporation, the Rock Island lines, and other important corporations. "Judge" Moore, as he was called, was a familiar figure at American and English horse shows, where his coaching turnouts carried off various prizes.

MOORE, WILLIS LUTHER (1856-). An American meteorologist, born at Scranton, Pa. He was at first a reporter for the Binghamton (N. Y.) *Republican* and then was on the staff of the Burlington (Iowa) *Hawkeye*. Entering the United States Signal Corps, he rose rapidly, becoming professor of meteorology in 1894. From 1895 to 1913 he was chief of the United States Weather Bureau. He served as president of the National Geographic Society from 1905 to 1910 and materially aided in its development. His writings include a *Meteorological Almanac and Weather Guide* (1901) and *Descriptive Meteorology* (1910).

MOOREA, mō'ō-rā'a, or **EIMEO**, i'mē-ō. One of the Society Islands (q.v.), situated 25 miles west-northwest of Tahiti, in lat 17° 30' S and long 149° 50' W. It covers an area of about 50 square miles, has several good harbors, and is very rugged but fertile. The chief products are coconuts, bananas, sugar cane, oranges, and vanilla beans; also copra and pearls. It contains a missionary station, and most of the inhabitants are Protestants.

MOOREHEAD, WARREN KING (1866-). An American archaeologist and anthropologist, born in Siena, Italy. He studied at Denison University and the University of Pennsylvania and at the Smithsonian Institution, explored the mounds of the Ohio Valley, and had charge of researches in Colorado, New Mexico, and Utah. He became an assistant in the archaeological department of the Columbian Exposition, soon after was appointed curator of the museum of the Ohio State University, and then became curator of the department of archaeology at Phillips Academy, Andover, Mass. He wrote: *Fort Ancient* (1890); *Primitive Man in Ohio* (1892),

Prehistoric Implements (1900); *Prehistoric Relics* (1905); *Tonda: A Story of the Snow* (1904); *Explorations in New Mexico, Arizona, Indiana* (1906), *The Stone Age in North America* (1910).

MOORE PROCESS. See section on *Metalurgy* under **GOLD**

MOORE'S CREEK. A small stream in North Carolina, on the banks of which, about 20 miles from Wilmington, a battle of the American Revolution was fought on Feb. 27, 1776, between 1600 Loyalists, mostly Highland Scotch, under Brig. Gen. Donald MacDonald, and about 1000 militia and minutemen, under Gen. James Moore and Cols. Richard Caswell and Alexander Lillington. The Loyalists charged across the girders of a bridge from which the planks had been removed, but within three minutes from the beginning of the engagement the Loyalists were routed. Several of them were killed, MacDonald and about 20 others taken prisoners, while of the patriots only two were wounded. The effect of this battle, says Fiske, "was as contagious as that of Lexington had been in New England."

MOORESVILLE, mōrz'vil. A city in Iredell Co., N. C., 28 miles north of Charlotte, on the Southern Railroad (Map. North Carolina, B 2) It has cotton-goods factories, flour mills, lumber yards, creameries, saw mills, and manufactories of furniture, mattresses, shingles, etc. The surrounding region is well adapted to dairying and farming. Mooresville owns its water works, sewage system, and electric-light plant Pop., 1900, 1533, 1910, 3400

MOORFIELDS. A tract of marshy ground outside the old wall of London, north of the Tower. It was later called Fensbury or Finsbury, the present name of the district

MOOR FOWL. See **GROUSE**

MOORGATE, mōr'gāt or mōr'gāt. The later name of a gate in the wall of Roman London leading to Moorfields. It was removed about the middle of the eighteenth century. Its name is preserved in the present Moorgate Street.

MOORHEAD. A city and the county seat of Clay Co., Minn., on the Red River of the North, opposite Fargo, N. D., and at the junction of the Northern Pacific and the Great Northern railroads (Map: Minnesota, A 4). It is the seat of a State normal school and of Concordia College, and contains a public library. Moorhead is an important distributing centre for the tributary agricultural country and has a large trade in wheat and potatoes. It has grain elevators, canning factories, tent and awning plant, concrete block and silo factories, brickyards, railroad yards, a foundry, and machine shops. The water works and electric-light plant are owned and operated by the municipality. Pop., 1900, 3730, 1910, 4840.

MOOR HEN. The British gallinule. See **GALLINULE**.

MOOR ILL. See **RED WATER**

MOORING SWIVEL. A device employed to join the two chain cables by which a ship is moored so that the swinging of the vessel by the tide or wind will not cause the cables to be crossed or fouled (i.e., twisted about each other). It consists of a large and very heavy link, one end of which has been much thickened. Through this end, in the longitudinal axis of the link, a hole is bored. Through this hole passes the large swivel pin, having a heavy head on the inside to prevent its pulling out and a pair of eyes or holes in the other end, which is flattened

for the purpose. Links are fitted in each of these holes, and two others are in the heavy link of the swivel. By means of shackles the four links are connected to the parts of the ship's chains,

MOORING SWIVEL.

the two on the pin to the parts leading from the anchors, the other two to the parts leading into the ship. It is difficult to take off a mooring swivel in bad weather, therefore, if a storm is expected, it is usually removed so that the vessel will be free to work her cables or heave up the anchors. See **ANCHOR**, **HAWSE**; **MOOR**, **MOORING**.

MOORISH ART. A term applied to the art of the Mohammedans in north Africa, outside of Egypt, and in Spain, though the latter phase of its development is more often called Hispano-Moresque. See **MOHAMMEDAN ART**.

MOORS (ML *Morus*, Lat. *Maurus*, Gk. *Μαῦρος*, perhaps from *μαῖρος*, *mauros*, *μαυρός*, *amauros*, dark, or perhaps from their original native name) The name given to a mixed people constituting a very important element in the population of northern Africa, especially Morocco. Their appearance indicates their origin, which is a mixture of the Mauri, Numidians, Phœnicians, Romans, and Arabs, who have successively held possession of the country. They are a well-formed race, with fine Oriental features and a mild and melancholy expression of countenance. The Moors employ the Arabic language, but with many corruptions and deviations from the original. They were conquered and converted by the Arabs at the beginning of the eighth century after a severe struggle. Having once embraced Mohammedanism, they joined the Arabs in the invasion of Spain, passing over in such numbers that in the early period of Spanish history the terms Moors, Saracens, and Arabs are used synonymously to designate the Mussulmans of the peninsula. In the tenth century Moorish domination supplanted that of the Arabs in north-western Africa. At the close of the eleventh century the Moorish sect of the Almoravides (q.v.), who had established their sway in Morocco, invaded Spain and swept away the Arab kingdoms which had arisen on the ruins of the Caliphate of Cordova. After half a century their realm fell to pieces, and the Moorish sect of the Almohades (q.v.) became dominant in Morocco and Spain. In the meanwhile the Christian power in Spain had been steadily growing, and in 1212 the power of the Almohades was shattered in the battle of Navas de Tolosa (q.v.) What was left of Moorish dominion in the peninsula was soon consolidated in the Kingdom of Granada, which rose to a height of splendor almost rivaling that of the former Caliphate of Cordova. The kings of Granada carried on a vigorous warfare with the kings of Castile; but at length, weakened by internal discord, they succumbed in 1492 to the arms of Isabella of Castile and Ferdi-

nand of Aragon. The Moors, or at least that portion of them who refused to accept Christianity, were then expelled from Spain and began their piratical career in the Barbary states. Those who accepted the religion of their conquerors came to be known as Moriscos. They were subjected to the most rigorous supervision, and any lapses from their adopted religion were ruthlessly punished by the Inquisition. For more than three-quarters of a century they lived as peaceful subjects of Spain and constituted by far the most industrious and intelligent element in the population. The persecutions of Philip II drove them to revolt (1568-70), but the insurrection was suppressed with great cruelty by Don John of Austria, and a large number were driven from the country. The policy of oppression was continued with increased severity under Philip III, and in 1609 the Moriscos were finally expelled from the country, the loss of more than half a million of her most active citizens proving in the end a disastrous blow to Spain. The Moriscos crossed over to Africa, but were received with hostility by their kin, from whom long absence had estranged them. According to the 1910 census, there were 60,000 Moriscos in Spain.

Consult: Abu ibn Mohammed al Makarri, *The History of the Mohammedan Dynasties in Spain*, translated and annotated by P. de Gayangos (2 vols., London, 1840-43); Dozy (ed.), *Histoire de l'Afrique et de l'Espagne* (Leyden, 1848-51), translated from the Arabic of Ibn Adhari; id., *Recherches sur l'histoire politique et littéraire de l'Espagne pendant le moyen âge* (2 vols., 2d ed., Leyden, 1860); Coppée, *History of the Conquest of Spain by the Arab Moors* (2 vols., Boston, 1881); Lane-Poole, *The Moors in Spain* (London, 1886); Lea, *The Moriscos of Spain* (Philadelphia, 1901); Scott, *History of the Moorish Empire in Europe* (3 vols., ib., 1904); Fitzgerald, *In the Track of the Moors* (New York, 1905); A. MOORSHEDABAD, mōūr'shē-dā-bād'. A town of British India. See MURSHIDABAD.

MOORUP (native name). A cassowary (q.v.); often wrongly written mooruk.

MOORWORT. See ANDROMEDA; and Plate of ANEMONE, ETC.

MOOS, mōs, SALOMON (1831-95). A German aurist, born at Randegg, Grand Duchy of Baden. He studied at Heidelberg, Prague, and Vienna, in 1859 became lecturer in aural surgery at the first-named university, and in 1866 was appointed professor there. His researches in the pathology of the labyrinth of the ear were important. He first showed that the derangement of hearing and equilibrium observed in certain infectious diseases is due to the presence of microorganisms in the labyrinth. Among his publications are *Ueber Pilzinvasion des Labyrinths im Gefolge von einfacher Diphtherie* (1887) and *Untersuchungen über Mittelohrerkrankungen bei den verschiedenen Formen der Diphtherie* (1890). From 1868 he edited at Wiesbaden, in collaboration with Knapp, the *Zeitschrift für Ohrenheilkunde*, of which an edition in English was also published.

MOOSE (Algonquian *musu*, Knisteneaux *mouswah*, wood eater). The popular name for the deer of the genus *Alces*, the largest quadruped of North America. The male, called bull

moose, is much larger than the female (cow) and stands 6 feet high or more at the shoulders, while the weight may exceed half a ton. The head is very large and bears antlers of remarkable size and shape. They consist of an imperfectly separated anterior and posterior part, and in the female and in the yearling male are only knobs an inch high. The ungainly aspect of the head is greatly increased by the large nostrils and by the large, hairy muzzle, which is almost long and muscular enough to be a proboscis, and it practically serves that purpose in gathering leaves, lichens, and twigs. The neck is short and stout, but the legs are very long, so that the animal cannot accommodate itself to feeding from the ground and consequently seeks its food on shrubs and trees. The front legs are considerably longer than the rear ones, and this makes its gait, whether slow or fast, extremely awkward. The color of the moose is generally some shade of brown, the legs yellowish, but the pelage varies with age and season and may be strongly grayish. During the summer moose are solitary in their habits, except that the young are usually found with the mother. The breeding season begins in September, and mating goes on through the fall. At this season the bulls lose their natural timidity, become savage, and will readily attack any animal or even man, if their rage is aroused.

During the winter the moose often gather in small herds and form moose yards by trampling down the snow over a limited area, so that the shrubs and young trees become available for food. The young are born in the spring or early summer, one or two at a birth, and remain with the mother until the third year. Moose are among the very finest of game animals and have been so eagerly sought, not only for sport, but for meat, which is highly prized, that their numbers have been greatly reduced in all the settled parts of America. They are hunted in the late summer and early fall, oftentimes by means of jack lights, as are other deer; but later in the season they are generally captured after being called within gunshot, the call being a rude trumpet made of a roll of birch bark, through which the voice of the animal is imitated. In winter moose are often followed on snowshoes. When taken young, moose are easily tamed, and there are many instances recorded of their use as draft animals.

The elk (*Alces malchus*, or *alces*) of the Old World is quite distinct from the moose (*Alces americana*). In the Old World the elk is found throughout the forested portions of northern and central Europe, it is at present confined, in the region west of Russia, to the milder parts of the Scandinavian peninsula and eastern Germany. Recently the moose of the Yukon valley, called the Alaskan moose (*Alces gigas*), has been separated as a distinct species. The differences between these species are, however, very slight, consisting of slight variations in the palmation of the horns, the color of the pelage, and the size. The Alaskan moose is undoubtedly the largest form known. It is found in northwestern British Columbia, Yukon, and Alaska as far north as the Arctic Ocean and westward to the Yukon delta and along the south coast as far as Katmai. The common moose of America is found throughout Canada and southward into Maine, Minnesota, and the northern Rocky Mountains. In 1915 moose were protected throughout the United States ex-

cept in Minnesota, where there was an open season—for bull moose only—from November 10 to 30. In the United States the moose is at present found in five States: Maine, Minnesota, Montana, Wyoming, and Idaho. There are 550 in the Yellowstone Park. In northern Minnesota a national moose preserve of over 900,000 acres has been formed, with an estimated population of 10,000 head. This and the great New Brunswick preserve will save the American moose, and the restricted Kenai peninsula in Alaska will preserve from extinction the giant moose of that region. Consult authorities mentioned under DEER, see HUNTING BIG GAME; Plate of DEER OF NORTH AMERICA

MOOSE, LOYAL ORDER OF. A secret, beneficiary society, paying sick and funeral benefits: founded to furnish an organization affording the advantages of brotherhood without the necessity of purchasing life insurance or enlisting in any other common cause. It was founded in 1888 by Dr. J. H. Wilson at Louisville, Ky. The first lodge was established at Cincinnati, Ohio. At Mooseheart, near Aurora, Ill., the society owns 1000 acres, on which are extensive buildings comprising a plant variously referred to as a farm, home, and vocational school, with arrangements to care for orphans of members and dependent members of the order. The society is governed by a Supreme Lodge. It has 1610 subordinate lodges and about 615,864 members

MOOSE BIRD (so called from its frequent companionship with the moose). A local name in eastern Canada for the Canada jay. See JAY

MOOSE FLY. A biting fly (*Hematobia alcis*) closely allied to the horn fly (q.v.). It is a very annoying parasite of the moose in the great cranberry swamps of northern Minnesota and elsewhere. Unlike other external parasites of animals, it does not leave the body of the host as long as it remains unskinned

MOOSEHEAD LAKE. An irregular body of water on the border of Somerset and Piscataquis counties, Me. (Map: Maine, C 3). It is the largest lake in New England, being about 35 miles in extreme length and 12 miles in maximum width and having an area of about 115 square miles. It receives the Roach and Moose rivers, and its outlet is the Kennebec River. It lies at an elevation of 1026 feet above sea level, in the midst of a wild and sparsely inhabited forest region where moose and deer are still found. A railroad now runs along the south shore through Greenville, and steamboats have for many years plied on the lake.

MOOSEJAW. The chief city of the electoral division of Moosejaw, Saskatchewan, Canada, situated on Moosejaw River and on the Canadian Pacific, Grand Trunk Pacific, and Canadian Northern railways (Map: Saskatchewan, E 7), about 400 miles west of Winnipeg. Its buildings and institutions include the city hall, courthouse, land-titles office, public library, two business colleges, and collegiate institute. Among its industrial establishments are lumber yards, bridge and iron works, flour mills, and manufactories of sashes and doors, automobiles and tractors, faced and pressed bricks, tiles and pottery, mattresses, tents, brushes and brooms. The city possesses three parks, an electric street railway, and electric power available for manufacturing. It owns its electric-lighting and water systems, with incinerator plant. It is

situated in a fertile wheat-growing district. Pop., 1901, 1558; 1911, 13,823.

MOOSEWOOD. See LEATHERWOOD.

MOOSIC, mōō'sik. A borough in Lackawanna Co., Pa., 6 miles south of Scranton, on the Lackawanna River and on the Delaware and Hudson, the Central of New Jersey, the Lackawanna and Wyoming Valley, and the Wilkes-Barre and Eastern railroads (Map: Pennsylvania, K 4). It is in a coal-mining region, and there are manufactories of canvas gloves and silk products. Pop., 1900, 1227; 1910, 3964.

MOO'SOMIN. A town, port of entry, and the judicial centre of the electoral division of Qu'appelle, Saskatchewan, Canada, on the Canadian Pacific Railway (Map: Saskatchewan, J 7). It has a normal school, collegiate institute, a school of music, and general hospital. There is a government creamery. The town, which was incorporated in 1889, is the centre of a rich mixed farming district. It is district headquarters for the Royal Northwest Mounted Police. Pop., 1911, 1143.

MOOT (AS. *mōt*, meeting, assembly; connected with *mētan*, to meet). The name given in Anglo-Saxon England to the meetings of the tribe or district and the like. In these moots was transacted a great part of the public business, whether executive, legislative, or judicial. The best known of these assemblies is the one which was attended by the great men of the whole nation or tribe and was known as the moot of the wise men or Witenagemot (q.v.). But smaller districts, like the shire, the hundred, and the township, also held moots, which were usually attended by all the freemen of the district. The place of meeting of such an assembly was also frequently termed moot. Consult William Stubbs, *Constitutional History of England*, vol. 1 (6th ed., Oxford, 1897).

MOPSUESTIA, THEODORE OF. See THEODORE OF MOPSUESTIA.

MOP/SUS (Lat., from Gk. *Móψος*). 1. In Greek mythology, a seer, one of the Thessalian Lapithæ, the son of Apollo by Himantia, or of Ampyx by Chloris. He took part in the combat between the Centaurs and Lapithæ, in the Calydonian Hunt, and in the Argonautic Expedition, during which he was killed by a snake in Libya, which sprang from the blood of the Gorgon Medusa. (See GORGO.) After his death he was honored as an oracular hero. 2. A renowned seer, the son of Apollo and Manto, daughter of Tiresias. At Colophon he surpassed Calchas in prophecy. With Amphilocheus he was credited with having built the Cilician city Mallos, where both the founders perished in a dispute over its possession.

MOQUEGUA, mō-kā'gwā. A coast department of Peru, bounded by the Department of Arequipa on the north, Puno on the east, Tacna (disputed with Chile) on the south, and the Pacific Ocean on the west (Map: Peru, C 7). Its area is 5549 square miles. It is traversed by the main range of the Andes, whose slopes are the most fertile and populous portions of the department. The coast region is a rainless desert. Vineyards cover large parts of the cultivated areas, and wine and brandy are the chief products. The mining of copper, marble, silver, sulphur, borax, and coal is carried on to some extent. Pop (est.), 31,920. The capital, Moquegua, is situated in the centre of the province, about 68 miles by rail from the port of Ilo. Founded in 1626, it suffered frequently from de-

structive earthquakes and was entirely destroyed by the last upheaval, which occurred in August, 1868. Its population is estimated at 5000.

MOQUELUMNAN, mō'ke-lūm'nan. See MIWOK STOCK.

MOQUI, or **MOKI**, mō'ké. A tribe of North American Indians. See HOPÍ.

MOR, mōr, or **MORO VAN DASHORST**, mō'rō vān dās'hōrst, ANTONIS (1512-c 178). An eminent Dutch portrait painter. He was born at Utrecht and studied under Jan Scorel and in Italy. His rise to eminence was rapid. He secured the patronage of Emperor Charles V and was appointed court painter by Philip II. He visited Italy, Spain, and England and was frequently employed by the Duke of Alva at Brussels. About 1568 he settled in Antwerp, where he died between 1576 and 1578. Mor was the finest portrait painter of his day north of the Alps and, though strongly influenced by Titian, developed a masterly individual style, distinguished by warmth of color and powerful characterization. Among his most celebrated portraits are: "Queen Mary of England" (Prado, Madrid); "Portrait of a Goldsmith" (The Hague Gallery); "Alexander Farnese" (Parma Gallery); "Hubert Goltzius" (Brussels Gallery); "Duke of Alva" (Hispanic Society, New York). He is also well represented in the galleries of Berlin, Vienna, Cassel, Florence, and St. Petersburg, in the Louvre, and in many private collections in England. Consult the monograph by Hymans (Brussels, 1910).

MORA, mō'rā (Guiana name). Certain species of trees of the genus *Mora* of the family Leguminosæ, especially *Mora excelsa*. The timber, which is exported as mora wood, is darker than mahogany. It is valued for shipbuilding and is said to be equal to oak of the finest quality, being one of the eight woods rated as first class. *Mora excelsa* is said to be one of the largest trees in British Guiana, often attaining a height of 150 to 200 feet. In addition to its use in shipbuilding the wood is said to be well adapted for use as railroad ties and paving blocks. It resists dry rot well, but is subject to the attack of marine worms if used under water.

MORA, mō'rā, JOSÉ (1638-1725). A Spanish sculptor, pupil of the versatile Alonso Cano. Some of his best work is found in the Capilla del Cardenal in the mosque at Cordova and in the Cartuja near Granada. Consult B. Hændeke, *Studien zur Geschichte der spanischen Plastik* (Strassburg, 1900).

MORA, (FRANCIS) LUIS (1874-). An American figure and portrait painter. He was born in Montevideo, Uruguay, and studied at the Boston Museum Art School under Benson and Tarbell and at the Art Students' League, New York, under Mowbray. After some time spent in illustrating magazines he received in 1900 his first important commission, a large decorative panel in the public library, Lynn, Mass. Success came early. Among his numerous prizes are gold medals from the Philadelphia Art Club (1901) and Pennsylvania Fine Arts Society, Philadelphia (1902), first Hallgarten prize, National Academy of Design (1905), Evans prize, Salmagundi Club (1908), and the Shaw prize, National Academy (1910). He was elected a member of the Academy in 1906 and also became a member of the American Water Color Society and the Architectural

League. Mora made himself one of the most prominent of the younger American painters of his day. His art, though essentially modern in feeling and treatment, is reminiscent of the old Spanish masters and shows the influence of his independent studies in Spain. A facile brushman and a good draftsman, he excels especially in his treatment of color, which, while rich and glowing, shows refinement and at times much delicacy in tone values. Good examples of his work are "The Letter", "The Mendicants" (1906), "Spanish Café" (1906); "Vacation Time" (water color, 1907), "The American Gladiators" (1908), "After the Bull Fight, Granada" (1910), "The Studio Tea" (1911); "Summer Morning" (1912), "The Cruise of the Ellira"; "Evening News" (1914). His figure compositions are perhaps his happiest efforts. He exercised a wide influence as a teacher in the Art Students' League and in the New York School of Art.

MORA/CEÆ (Neo-Lat. nom. pl, from Lat. *morus*, mulberry), or **MULBERRY FAMILY**. A family of dicotyledonous shrubs and trees comprising about 1000 species, natives of temperate and tropical regions. The largest genus is *Ficus* (fig), which includes nearly 700 species. The representatives of the family in North America are the genera *Morus* (mulberry) and *Maclura* (osage orange). The native mulberry is *Morus rubra* (red mulberry), which occurs in rich soil throughout the eastern United States. *Morus alba* (white mulberry) was introduced from the Old World for feeding silkworms and has escaped from cultivation. The genus *Maclura* contains a single species and is a native of the south-central United States, being much planted for hedges. Some of the Moraceæ are valuable for their fruit, some for their caoutchouc, obtained from their milky juice, and others for their fibre and timber. Among the well-known genera not mentioned above are *Artocarpus* (breadfruit), *Castilloa* (rubber tree), and *Antiaris* (upás tree).

MORADABAD, mō-rād'ā-bād'. A city of British India. See MURADABAD.

MORAES, mō-rish', FRANCISCO DE (c.1500-72). A Portuguese author. Of his life we know only that he was treasurer of the household of John III, member of the suite of the Portuguese Ambassador to Paris, Francisco de Noronha (thus residing in France at least from 1540 to 1544), and Knight Commander of the Portuguese Order of Christ. In 1572 he was murdered at Evora. His great work was the famous romance of chivalry *Palmeirim de Inglaterra* (next to *Amadis de Gaula* the greatest chivalresque novel in the world), which he perhaps wrote as early as 1544 and while in France. The first Portuguese edition did not appear until 1567, however, and as in the meanwhile a Spanish version had appeared in 1548, Moraes was long deprived of the credit of authorship, and his original was called a translation (See HURTADO DE TOLEDO, LUÍS.) In 1904 the true state of the case was shown by W. E. Purser, of Dublin, in his masterly study *Palmeirim of England*. For bibliography, see W. E. Purser, as above, and Inocencio F. da Silva's Portuguese Bibliography.

MORAES BARROS, mō-rish' bār'rōs, PRUDENTE (1841-1902). A Brazilian politician, born at Itú, São Paulo. Having studied law, he entered the National Legislature of the Empire in 1885 and became a leader of the Re-

publican party. Upon the establishment of the Republic he was appointed Governor of the State of São Paulo (1889) and later was President of the first National Congress. In the election of the first President, held by this body, he was defeated by Fonseca (1891), but in 1894 he became the administration candidate and was elected, being the first civilian President. He upheld civil rights, suppressed the praetorian system of government, and checked the power of the military party. He crushed out the revolt in Rio Grande do Sul (1894-95), but in November, 1896, obtained a leave of absence on account of his health. A threatened military revolt caused him to reassume the presidency four months later, thus preventing a coup d'état. In 1897 he brought to a successful conclusion the campaign against the revolt headed by Antonio Conselheiro. An unsuccessful attempt was made on his life in this same year. In the presidential elections of 1898 he supported the candidacy of Manoel Campos Salles, who became his successor.

MORaine, mô-rân' (Fr., from *It mora*, heap of stones, from Bavarian Ger. *mur*, débris). An accumulation of earth and stone carried forward by a glacier. When such materials are heaped up along the margins of a glacier, the lines of débris are called *lateral moraines*. The confluence of glaciers causes a coalescing of the inner lateral moraines, which are then carried forward as *medial moraines*. Débris frozen in the lower part of the glacier and pushed along its bed is called the *ground moraine*. Finally, the materials transported in the various ways accumulate at the lower end of the glacier in irregular mounds constituting *terminal moraines*. The moraine deposits that resulted from the ice invasion of Pleistocene time are conspicuous features of the landscape in the northern sections of North America and Europe. They are especially marked along the southern border of the area covered by the ice and in places where the latter remained stationary for a long time in the stages of general advance and retreat. The great terminal moraine can be traced nearly across the continent by the lines of kames, drumlins, and other deposits of glacial materials which still retain their original forms and structures. In the east the moraine begins in Nantucket and thence extends across Long Island and Staten Island into New Jersey, crossing the latter State it enters Pennsylvania and follows a northwesterly direction to the New York border and then turns southwest through western Pennsylvania to pass into Ohio, where it reaches nearly as far south as Cincinnati. It then follows a sinuous line across Indiana, Illinois, and Iowa, thence bearing off to the northwest to cross the Dakotas and Montana and to pass into Canada. See **GLACIER**; **PLEISTOCENE**.

MORALES, mô-rá'lás, LUÍS DE, called EL DIVINO (c.1510-86). A Spanish painter, born at Badajoz. He is said to have studied in Valladolid or Toledo, but was probably self-taught. His work shows the influence of the early Flemish and of the Milanese school, but is essentially Spanish in its stern and melancholy religious sentiment. He possessed a strong feeling for color and painted with minute finish, but later developed exaggerated mannerisms. His subjects are always religious—hence his sobriquet. Among his finest works are an im-

pressive "Pieta," in the Madrid Academy; a charming "Madonna and Child," in the Bosch collection, Madrid; "Presentation in the Temple" and a "Mater Dolorosa," in the Prado; a fine altarpiece, in the church of Arroyo del Puerco (Estremadura); a "Madonna," in the New York Hispanic Society; an "Ecce Homo," in the gallery of the New York Historical Society.

MORALITY (OF. *moralite*, Fr. *moralité*, from Lat. *moralitas*, morality, character, from *moralis*, relating to manners, from *mos*, custom). The third stage in the development of the modern drama, following upon the mystery and the miracle play (qq.v.). Essentially the morality was ethical teaching cast in dramatic form. According to the usual plot, various personages, each representing a virtue or a vice, contend for dominion over an abstraction called Mankind. The virtues usually win. The serious character of the play was relieved by comic scenes and buffoonery. The leading Vice, a sort of clown, in time became the centre of attraction and is thought to have been the origin of the Fool of Shakespeare's plays. Besides the virtues and vices, however, allegorical personages were introduced, such as Riches, Good Deeds, Death; in fact, any human condition or quality. The French moralities adhered less strictly to these purely abstract qualities, and even the later English authors are more apt to use historical characters celebrated for the vice or virtue in question, as Aristides instead of abstract Justice. Later still, as the passions of the Reformation were stirred up, actual men and women were shown under very thin disguises. In other ways the morality was a distinct advance towards the regular drama. There being no prescribed plot as in the mysteries and miracle plays, it was necessary to create one, with a clear end towards which the action of the characters was to lead up. So close, in fact, did the morality come to the regular drama that it did not cease to be acted in England until almost the end of the reign of Elizabeth. In 1902 and 1903 *Everyman*, perhaps the best morality in English, was performed successfully in England and in the United States by a company of English players under Ben Greet. Though this play lacks swiftness of action, its sincerity is unbroken, its moralizing does not fall into platitudes, and various scenes, e.g., the appeal to Riches, are poignantly dramatic. For bibliography, see **MYSTERY**.

MORAL PHILOSOPHY. See **ETHICS**.

MORAN. A family of American painters. **EDWARD** (1829-1901), a marine painter, was born in Bolton, Lancashire, England, but removed with his parents in 1844 to Philadelphia, where he became a pupil of James Hamilton and of Paul Weber. After 1862 he studied in England, where he was strongly influenced by Turner, and later on the Continent, returning to reside first in Philadelphia and then in New York from 1869. Among his best works are: "Outward Bound"; "Launch of the Life-Boat" (1865), "Coming Storm in New York Bay"; "Foggy Morning"; "Melodies of the Sea" (1890); "The South Coast of England" (1900). He completed in 1899 a series of 13 historical paintings representing epochs in United States marine history from the landing of Leif Ericson (c.1000) to Admiral Dewey's return (1899). Exhibited at the Metropolitan Museum, New

York, in 1904, they attracted wide attention. (Consult the monograph by their owner, Theodore Sutro, New York, 1905.) Moran was an associate of the National Academy and a member of the Society of American Artists and of the Pennsylvania Academy of Fine Arts.—Edward's son, PERCY MORAN (1862–), became known especially as a painter of Colonial subjects and for his portraits of women. He took the Hallgarten prize in 1886 and the gold medal of the American Art Association in 1888. His "Castle Garden, New York" is in the Wilstach collection, Philadelphia.—Another son, LEON (1864–), likewise a painter, treats chiefly historical genre subjects.

PETER MORAN (1842–1914), a painter, etcher, and illustrator, studied painting and etching in Philadelphia under his brothers, Thomas and Edward, continuing his studies in England. His taste led him to pastoral and quiet scenes in country life and especially to animal painting. Among his paintings are: "Return of the Herd," which received a medal at the Centennial Exhibition; "Santa Barbara Mission"; "Pueblo of Zia, New Mexico." He was one of the earliest American etchers and received a medal at the Centennial of 1876 for etchings of animals.

THOMAS MORAN (1837–), an etcher, illustrator, and landscape painter, was a younger brother and a pupil of Edward in Philadelphia. During an apprenticeship to a wood engraver he devoted himself to water colors with success, then studied oil painting under James Hamilton and later in Paris and Italy. After his return to the United States in 1871 he made sketches in the Yellowstone, from which he produced the painting "Grand Cañon of the Yellowstone," now filling a panel in the capitol at Washington. In 1873 he joined the United States exploring expedition, conducted by Maj. J. W. Powell, which surveyed the cañons of the Colorado River, and on his return completed a picture of "The Chasm of the Colorado," which was purchased by Congress as a companion of the Yellowstone picture. He established himself in New York and was elected a member of the National Academy in 1884. Among his smaller pieces are "The First Ship," "Ruins on the Nile," and others, in the Wilstach collection, Philadelphia, and "Bringing Home the Cattle," in the Buffalo Museum. Moran designed the illustrations on wood for the reports of both Hayden's and Powell's explorations. His style is a strong souvenir of the works of the English painter Turner, in the iridescent play of color of which he is very fond. He paints the momentary and evanescent phases of nature with much facility of hand and sound scientific knowledge. Both he and his wife and pupil, MARY NIMMO MORAN (1842–), became prominent etchers and members of the British Society of Painter-Etchers.

MORAN, PATRICK FRANCIS, CARDINAL (1830–1911). An Irish Roman Catholic prelate, born at Leighlinbridge, County Carlow. He studied at the Irish College of St. Agatha at Rome and was ordained by special dispensation as to age in 1853. He then served as vice president of the Irish College and as professor of Hebrew in the College of the Propaganda in Rome; in 1866–72 was private secretary to his uncle, Cardinal Cullen, in Ireland; served as Bishop of Ossory in 1872–84; and in 1874–84 held the chair of Hebrew and Scripture at Clonliffe College, Dublin. He went to Australia

in 1884 as Archbishop of Sydney, and in the following year he was appointed the first Australian Cardinal. His publications include: *Essays on the Origin of the Irish Church* (1863); *History of the Catholic Archbishops of London* (1864); *Historical Sketch of the Persecutions Suffered by the Catholics of Ireland under Cromwell and the Puritans* (1865); *Irish Saints in Great Britain* (1879); *Letters on the Anglican Reformation* (1890); *History of the Catholic Church in Australia* (1894); *Reunion of Christendom and its Critics* (1896).

MORANDO, mò-ràn'dò, PAOLO. See CAVAZZOLA, PAOLO.

MORAN-OLDEN, mò-ràn-òl'den, FANNY (1855–1905). A German soprano singer, born at Oldenburg. She appeared first in Dresden as a concert singer in 1877. The following year she made her début in opera in Frankfort with such success that she afterward sang only in leading rôles. In 1879 she married Karl Moran, leading tenor of the Frankfort Opera. From 1884 to 1891 she was a member of the Leipzig Opera. In 1889–90 she sang the great Wagner rôles at the Metropolitan Opera House. The remarkable range of her voice enabled her to sing rôles so diverse as Elisabeth in *Tannhäuser* and Ortrud in *Lohengrin*.

MORANT, mò-rant', SIR ROBERT LAURIE (1863–). An English educator, born in London and educated at Winchester and at New College, Oxford, where he graduated in 1885. After several years in educational work in England he became tutor to the royal family of Siam and organizer of education in that country. In 1895, after a period of social and educational work in the East End of London, he became Assistant Director of Special Inquiries and Reports in the English Education Department and contributed several reports to this series on education in France, Switzerland, and England. Appointed in 1903 permanent Secretary of the reconstructed English Board of Education, he gave to the administrative control of that board a direction which has been regarded by some as the entering wedge of bureaucracy in England and by others as a necessary step in the development of a strong national system of education. It was his large administrative ability that led in 1911 to his appointment as chairman of the new board of commissioners to administer the National Insurance Act.

MORA STONES. A group of stones near Upsala, Sweden, interesting on account of their historical associations. The kings of Sweden on their election anciently swore fidelity to the laws of the land near these stones, after which the judges, on behalf of the people, took the oath of allegiance to the monarch, whose name was then inscribed on one of the stones. In 1770 the remaining 10 stones were protected by an inclosing building.

MORAT, mò-rá'. A town in the Canton of Fribourg, Switzerland, on the Lake of Morat, 8½ miles north by west of Fribourg (Map: Switzerland, B 2). It is famous for the victory of the Swiss and their allies, 25,000 in number, over Charles the Bold (q.v.), Duke of Burgundy, with an army of 35,000 men, June 22, 1476.

MORATÍN, mò-rá-tén', LEANDRO FERNÁNDEZ DE (1760–1828). A Spanish dramatist, born in Madrid, the son of Nicolás Fernández de Moratín. A year spent at Paris (as secretary to the Count of Cabarrús, who had been sent on a

difficult mission) had much influence upon the artistic development of the young poet, who was later to make the Molièresque drama successful in Spain. Returning to Madrid in 1788, he gained the favor of the powerful Godoy and was allowed to have his play in verse, *El viejo y la niña*, produced upon the stage at Madrid in 1790. This drama was followed by a more important piece (in prose), the *Café*, also called the *Comedia nueva* (1792), a sharp satire upon the wretched playwrights of the day. At the expense of the government Moratín went abroad to study the foreign stage. From Paris he passed on to London, and after a year in that metropolis, where he began his translation of *Hamlet* (published in 1798), he journeyed through Holland, Flanders, Germany, Switzerland, and Italy. After his return he was for a while a member of the bureau established to reform the theatre. His third comedy, *El barón*, originally written as a zarzuela or vaudeville, was performed in 1803, and the next year witnessed the appearance of a third comedy in verse, the *Mojigata* (The Female Hypocrite). With the *Si de las niñas*, the second of his prose comedies, he reached the height of his power and fame. Molière was the guiding star of Moratín the Younger in all his dramatic compositions. Yet Moratín displays originality, for he excellently describes the manners of his time and handles dialogue with skill. Though he adhered to the French system of unities, he also adopted certain peculiarities of the native Spanish stage, dividing his plays into three acts, using the favorite short romance verse, and introducing some truly Spanish intrigue into his plots. Taking him for all in all, he was the best dramatist that Spain had had since the *Siglo de oro*. In 1812 Moratín brought out *La escuela de los maridos*, a successful translation of Molière's *Ecole des maris*. At Barcelona, in 1814, there was a representation of his *Médico á palos*, a version of Molière's *Médecin malgré lui*. He was at Bayonne and Bordeaux after 1821, and at Bordeaux he finished his historical account of the Spanish stage, *Orígenes del teatro español*. He died in Paris in 1828. His works may be read in *Biblioteca de autores españoles* (3d ed., vol. ii, Madrid, 1850), his *Obras póstumas* (3 vols, ib., 1867-68), and Ford's edition of the *Si de las niñas* (Boston, 1899).

MORATÍN, NICOLÁS FERNÁNDEZ DE (1737-80). A Spanish playwright, called the Elder, born in Madrid. He was a teacher as well as a man of letters and had a chair of poetry in the Imperial College. The chief significance of the work of the elder Moratín lies in the fact that he contributed to the success of the principles of literary art imported from France. Spanish literature had greatly degenerated when this reform movement to which Moratín belonged undertook to improve matters by following the rigid rules of French classicism. Moratín illustrated these rules in a comedy, *La peticetra* (printed in 1762), and a tragedy, *Lucrecia*, neither of which appeared upon the stage. His drama *Hormesinda* and his tragedy *Guzmán el bueno* were performed with some success. Of his other productions there may be mentioned the *Diana*, a short poem on the chase, the narrative, or epic poem as he called it, *Las naves de Cortés destuidas*, celebrating the burning of his ships by the Conquistador; and the *quintillas* on a bullfight, which are probably his

best and his best-known work. Consult his works in volume ii of the *Biblioteca de autores españoles* (Madrid, 1850) and the poem on the bullfight in J. D. M. Ford, *A Spanish Anthology* (New York, 1901).

MORATORIUM, mōr'a-tō'ri-ūm (Neo-Lat., neut. sing. of Lat. *moratorius*, relating to delay, from *mora*, delay). An extension of time for the payment of commercial or financial obligations. A moratorium usually takes the form of a legal decree, either by the executive or by the lawmaking body, and may vary as to its scope according to the terms of the decree. In the early history of banking, especially in undeveloped countries, a moratorium frequently applied to the redemption of bank notes in coin and amounted to the suspension of specie payments. With the wider employment of commercial instruments of exchange, however, the chief importance of a moratorium has come to relate to its effect upon bills of exchange, drafts, and bank deposits. While it may extend to all classes of obligations, recent instances of the moratorium have generally excluded from its operations the payment of rent and other household and personal obligations not of a banking character. The language of the Law of Jan 27, 1910, passed by the French Chambers on the occasion of the floods in Paris was as follows:

"In case of the mobilization of the army, flood, or public calamity, or of the interruption of the public services managed by the government or by the departments or communes, or subject to their control, the Council of Ministers may by decree extend, for the whole or a part of the territory involved, the time within which protests and other acts required to preserve recourse for all negotiable instruments shall be made.

"During the sessions of the Chambers the extensions provided for by this article shall not exceed 30 days; between sessions the extension may be renewed one or several times."

Prior to the European War of 1914, moratoria had been limited chiefly to occasions of public calamities, like the earthquake at Messina in 1908 or the floods in Paris in 1910. It will be observed that the French law quoted extends the recognized occasions for such action to the interruption of railway and tramway communication by strikes, where the lines are operated by the governments. Such delays were authorized also in the Balkan states during the wars in 1912-13. At the outbreak of the War in Europe, however, moratoria were declared more generally than on any previous occasion in modern history. Owing to the cessation of remittances from abroad to meet bills of exchange due in London, a moratorium was declared by the British government on August 4 for 30 days, applying only to bills of exchange running for long terms. This moratorium was twice extended, but finally expired without causing disturbance on November 4. In the meantime, however, the government had authorized the Bank of England to rediscount drafts and bills of exchange drawn prior to August 4 and had given a guarantee to the bank against loss. In France a moratorium was declared, which was continued for several months. In Germany the declaration of a moratorium was avoided in form, but it was provided that balances claimed by foreigners residing abroad, including bills of exchange, could not be sued for in the courts for three months,

but exceptions might be granted for entire nations as well as for individuals. A moratorium was declared for various periods by Italy, Russia, Belgium, Austria-Hungary, Switzerland, Sweden, Norway, Denmark, Portugal, Bulgaria, and other European countries. The cutting off of the credit accommodations usually extended by European bankers compelled such a declaration in Brazil, which continued for several months, and in several other countries of South and Central America.

A moratorium has an important bearing upon the liability on bills of exchange and promissory notes, because its usual effect is that the liability of indorsers on such instruments shall continue in spite of the failure of the holder to present them for payment or to make the usual legal protest in case of nonpayment at maturity. Prior to the international conferences at The Hague on the uniform law of bills of exchange, in 1910 and 1912, no legal recognition was given in several important European countries, including Germany and Switzerland, to obstacles which might prevent presentment and protest of a bill of exchange within the time required by law. By the protocol of the uniform law on bills of exchange, which was signed by the continental Powers on July 23, 1912, the principle was recognized that insurmountable obstacles might arise to the presentment of a bill, and rules were established governing the obligations of the parties in such cases. These regulations involved a possible delay of 30 days, in case the obstacle to presentment was not sooner removed, during which the holder was not permitted to exercise recourse against the indorsers or against the drawer, but an amicable adjustment of the obligation might be made.

It was recognized that it was not within the authority of an international treaty to provide fully for the cases in which the public authority might extend by moratorium the time for presentment and protest of paper, and it was declared that such public acts were binding upon foreign countries only so far as the courts of such countries chose to take them into consideration in passing upon facts. The Protocol of 1912 was ratified by Germany and a few other countries, but was not in actual operation in the majority of continental countries at the outbreak of the war in 1914. Great Britain and the United States were not signers, because of the differences between continental and Anglo-Saxon systems of jurisprudence, but were sympathetic with the adoption of the uniform law among the continental countries and willing to give such weight to its operation in the case of international instruments of exchange as was permissible under their own legal systems.

Consult Reports of the American Delegation to the Conferences on Bills of Exchange and Cheques, Senate Document No. 768, 61st Cong., 3d Sess., and Senate Document No. 162, 63rd Cong., 1st Sess. (Washington, 1913-14), also W. G. S. Schwabe, *Effect of War on Stock Exchange Transactions* (London, 1915).

MORAVA, mŏ'rá-vá. The largest river of Servia. It is formed by the union at Stolač, Servia, of the southern and the western Morava (Ibar), the former rising on the slopes of Kara Dag in the newly acquired Servian possessions and the latter near the boundary of Servia with Montenegro (Map: Balkan Peninsula, C 3). The united stream enters the Danube 30 miles east of Belgrade. The Morava is about 240

miles long and is navigable for small boats 50 miles from its mouth.

MORAVIA (Ger. *Mähren*). A margraviate and crownland of Austria, bounded by Prussian Silesia, Austrian Silesia, Hungary, Lower Austria, and Bohemia (Map: Austria, E 2). Area, 8580 square miles. It is traversed along the northern boundary by the Sudetic Mountains, along the eastern boundary by the Carpathians and the White Mountains, and along the western boundary by the Bohemian-Moravian highlands, which descend in terraces towards the valley of the March. Moravia belongs to the basin of the Danube, and is watered by its tributary, the March, which flows through the centre of the country from north to south. The climate is generally mild. The mean annual temperature is 48° at Brunn. The principal minerals are coal, lignite, graphite, and iron. The output of coal in 1911 was 2,040,574 metric tons and, in 1912, 2,208,853 tons. The mineral output in 1911 was valued at 23,925,206 kronen and, in 1912, at 25,770,847 kronen, over 7 per cent of the value of the mineral production of Austria.

Agriculture is the principal industry, Moravia being one of the foremost cereal-producing parts of Austria. The principal products are rye, oats, barley, wheat, corn, and flax, sugar beets, clover, hay, and grapes. Stock raising is carried on extensively. Among manufactures the woolen industry is especially developed. Other manufactures are those of linen, yarn, cotton goods, leather, sugar, spirits, machinery, railway supplies, tobacco products, etc. The railways had a total mileage of 1311 miles in 1911.

The Landtag is composed of the Prince-Archbishop of Olmütz, the Bishop of Brunn, 30 representatives of the landed aristocracy, 31 representatives of the towns, 6 representatives of the chambers of commerce and industries of Brunn and Olmütz, and 31 representatives of the rural districts. The representatives of the rural districts are indirectly elected. In the Lower House of the Austrian Reichsrat Moravia is represented by 49 members.

At the head of the administration is the Governor, representing the crown. The crownland has a system of district courts, and at Brunn a court of second instance, from which appeals can be made to the Supreme Court at Vienna. Moravia is well provided with educational institutions, and over 98 per cent of its school population attend school. Capital, Brunn (q.v.). In 1890 the population was 2,276,870 (102 per square kilometer); in 1900, 2,437,706 (110), in 1910 (census of December 31), 2,622,271 (118). In 1912 the estimated population was 2,651,300. Of Austrian subjects (2,604,857) in 1910, those whose vernacular was returned as Moravian, Bohemian, or Slovak numbered 1,868,971 (71.75 per cent); German, 719,435 (27.62); Polish, 14,924 (0.57). Roman Catholics in 1910 numbered 2,502,808 (95.45 per cent); Evangelicals (Augsburg and Helvetican), 74,391 (2.83); Jews, 41,148 (1.57). Population of the larger towns in 1910: Brunn, 125,737; Mährisch Ostrau, 36,754; Prossnitz, 31,462; Iglau, 25,914; Witkowitz, 23,151; Olmütz, 22,245; Prerau, 20,669; Znaim, 18,825; Kremsier, 16,528; Oderfurt, 16,462.

History. Moravia was anciently occupied by the Boii and later by the Quadi, who left the country at the time of the great migration of nations. They were succeeded by other Ger-

manic peoples, whose sojourn was temporary, and in the sixth century the region was occupied by Slavs. These peoples took the name of Moravians, from the river Morava. Charles the Great, the ruler of the Franks, held them under nominal subjection, and their King, Samoslav, received baptism; but Christianity was first formally established in the second half of the ninth century by Cyril and Methodius. The ninth century witnessed repeated wars between the Germans and the Moravians. Svato-pluk, who ruled over the Moravians from about 870 to 894, built up an extensive but short-lived realm, which soon after his death was crippled by the onslaught of the Magyars. From 1029 Moravia was generally united with Bohemia, either as an integral part of that realm or as a fief ruled by margraves. On the death of Louis II, at the battle of Mohács, in 1526, Moravia, with all the other Bohemian lands, passed under the rule of the house of Austria. In 1849 it was formally separated from Bohemia and declared a distinct province and crownland.

S. Monroe, *Bohemia and the Czechs, together with Accounts of Moravia and Silesia* (Boston, 1910).

MORAVIANS, called also **THE UNITED BRETHREN** (**UNITAS FRATRUM**) and **THE MORAVIAN CHURCH**. An evangelical church which arose in Bohemia and Moravia among followers of John Huss (q.v.), originally known as Bohemian Brethren (q.v.). They secured the episcopacy from the Austrian Waldenses in 1467. Fraternizing with the Reformers of both Germany and Switzerland, they increased rapidly, and after the Schmalkaldic War established a third province in Poland. By 1617 they numbered at least 200,000. With the granting of the Bohemian charter, in 1609, they obtained a legal status, but were systematically suppressed and exiled during and after the Thirty Years' War. Their Polish province, with its centre at Lissa, now acquired importance, and a number of parishes were founded in Hungary. But the Peace of Westphalia excluded Austrian lands from the benefits of religious liberty, and in 1656 Lissa was destroyed in the war between Poland and Sweden. The Polish parishes were gradually absorbed by other Protestant bodies. Meanwhile a "hidden seed" of the *Unitas Fratrum* remained in Bohemia and Moravia, and their bishop, Johann Amos Comenius (q.v.), republished their history, confession, and discipline, and took steps to perpetuate the episcopate. Hence for about 50 years clergymen who at the same time served parishes of the Reformed church were consecrated bishops of the *Unitas Fratrum*.

A revival of religious life among the "hidden seed" in Moravia led the awakened to abandon their homes and secretly flee to Saxony to secure religious liberty. Here, in 1722, they began to build the town of Herrnhut on the estate of Count Zinzendorf (q.v.), who had granted them an asylum. Herrnhut became

the rallying place for descendants of the Brethren, several hundred of whom migrated from Austrian lands. They introduced the discipline handed down by Comenius, and in 1735 the episcopate was transmitted from its surviving representatives, Jablonski and Sitkovius. The development of the *Unitas Fratrum* now took a new form. Zinzendorf became the leading bishop and strove to subordinate denominationalism to the promotion of Christian life. He did not permit the church to expand, as other churches expand, nor distinctly to sever connection in every respect with the state church, but established on the Continent, in Britain, and in America an "exclusive system" by which it was attempted to secure a membership solely of converted men and women. Their culture in spiritual life was promoted by exceedingly close supervision, by an abundant supply of the means of grace—daily services and services for the several divisions of the congregation distributively—and by an effort to separate them from the rest of the world. The members of the establishments were indefatigable in missions among the heathen, maintained schools for young people not of their communion, and conducted the so-called Diaspora, or inner mission, among members of the state churches of Germany, the Baltic Provinces, Scandinavian lands, Holland, and Switzerland, seeking the conversion of individuals without drawing them from their former communion.

Though the "exclusive system" was wholly abandoned in America in 1856, and practically so in Britain, while in Germany it has been much modified, the three chief forms of activity continue. Missions among the heathen are maintained in Labrador and Alaska, among the Indians of North America, among the negroes of the West Indies, in Nicaragua, British and Dutch Guiana, Cape Colony, German East Africa, Australia, and among Tibetan people of the Western Himalayas. A home for lepers is maintained near Jerusalem. Thirty-three schools are carried on, in addition to colleges and theological seminaries. The mission in Greenland, maintained since 1733, was transferred to the Danish Lutheran church in 1900.

The Moravian church now consists of four provinces—the German, the British, and the American, North and South—which are united as one body in regard to doctrine, ritual, discipline, and mission work. Internally each province is independent, its affairs being administered by a synod, which elects a provincial executive board consisting of bishops and other ministers. This board appoints the ministers to the various congregations. The executive boards of the four provinces constitute the Directing Board of the Unity. Every 10 years a general synod convenes, each province and the missions having representatives. This synod takes cognizance of the life, doctrine, and activity of the entire church, elects the mission board, and to it the mission board is responsible.

The Moravian church has a complete ritual, including services for the Lord's Day and other forms, but allows free prayer in public worship; its music, vocal and instrumental, is highly developed. It perpetuates the three orders of the ministry, but its bishops, who alone ordain, do not exercise administrative functions *ipso facto*. It observes the Christian year; admits new converts by confirmation; receives members of other churches by certificate;

encourages lay work; and exercises strict discipline. The cardinal points of Moravian teaching are those held in common by all evangelical churches. Eight cardinal points in regard to which the teaching of Holy Scripture is plain have been repeatedly reaffirmed by the General Synod in the language of Scripture. As formulated by the General Synod of 1899 these doctrines teach: (a) total depravity of human nature; (b) the love of God the Father, who has "chosen us in Christ"; (c) the real Godhead and real humanity of Jesus Christ, (d) reconciliation and justification through the sacrifice of Jesus Christ, (e) the Holy Ghost and the operation of His grace; (f) good works as the fruit of the Spirit, (g) the fellowship of believers; (h) the second coming of Christ and the resurrection. These truths are held not as a rigidly formulated confession, but as the Moravian conception of the main contents of Christian doctrine. The resuscitated Moravian church has never issued a confession of faith, as such.

The Moravian Church in America. Moravian emigrants went to Georgia in 1735, but five years afterward they removed to Pennsylvania, where they built the towns of Bethlehem and Nazareth. A form of communism was temporarily adopted as a quick mode of subduing the wilderness and at the same time promoting missions. The lands were the property of the church, and the farms and industries were carried on for its benefit; but he who had means of his own retained them; there was no common treasury. This system, "the Economy," continued for 20 years. Each member was pledged to devote his time and powers as they might be best applied for the spread of the gospel, and missionaries went to the Indians of New York, Connecticut, and Pennsylvania, and later Ohio. Though "the Economy" was of short duration, the American division of the church was administered from Germany, and the exclusive policy prevailed until 1856. According to statistics compiled in 1914, the American provinces reported 20,133 communicants and a total membership of 29,375. There were 124 congregations and 110 ministers actively engaged. In the home provinces, including the Bohemian-Moravian mission, there were 45,551 members, in the foreign missions 14 provinces, 156 stations, 187 outstations, and 1503 preaching places, with 367 missionaries, exclusive of secretaries, etc., 111 native missionaries and 2059 other native agents. The communicant membership of the missions was 35,238, with a total membership of 100,606 and a grand total in care of the missionaries of 107,379.

The American Moravians have a theological seminary, founded in 1807, at first as a department added to the academy at Nazareth, begun in 1759, and known as Nazareth Hall. It has been situated at Bethlehem since 1858. A collegiate department preparatory to the theological proper was inaugurated at an early period. Buildings have been erected valued at \$120,000, exclusive of the ground. The endowment fund is now \$125,000. A six years' course of study is pursued, three and one-half years classical and two and one-half theological. Five professors constitute the permanent faculty. The number of students varies from 50 to 70.

Hamilton, *History of the Missions of the Moravian Church during the Eighteenth and Nineteenth Centuries* (Bethlehem, 1901).

MORAWETZ, mōr'a-wēts, VICTOR (1859-). An American lawyer and economist, born in Baltimore. He studied at foreign universities and graduated from Harvard Law School in 1879. Admitted to the bar in 1880, he became attorney for railroad and other corporate interests. He was general counsel and director of the Atchison, Topeka, and Santa Fe and became director of the Norfolk and Western Railway, the New York National Bank of Commerce, etc. The honorary degree of LL.D. was conferred on him by Williams College in 1914. He is author of *Law of Private Corporations* (1882, 2d ed., 1886), *The Banking and Currency Problem in the United States* (1909, 2d ed., 1909), an address on *Evolution of the Interpretation of the Sherman Law* (1914).

MORAY, mō'rā. Any of a large group (suborder Calocephali, of order Apodes) of eel-like fishes, especially one of the family Muræidae and genus *Muræna*. They are degenerate, aberrant eels, distinguished by their small round gill openings and the absence of pectoral fins. They inhabit warm and especially tropical seas, particularly about coral reefs. They are brightly colored, often of large size, and always voracious and pugnacious. Ten or twelve genera are known, embracing about 120 species, among which the true morays (genus *Muræna*) are characterized by the presence of two pairs of nasal barbules. The muræna of the Romans, or murry (*Muræna helena*), abounds in the Mediterranean, and is sometimes of large size, 4 feet or more in length, golden yellow in front and purple towards the tail, beautifully banded and mottled. Its flesh is white and highly esteemed. It prefers salt water, but can accommodate itself to a fresh-water pond. The ancient Romans kept and fed it in vivaria. The story of Vedius Pollio feeding his murænas with offending slaves is well known. Two species of this genus are found in American waters. The common spotted moray, or hamlet, the most numerous eel in the West Indies, is *Lycodontis moringa*, and is yellowish in color, thickly spotted and marbled with dark markings. A larger one (5 to 6 feet) is the greenish-black moray, or morena verde (*Lycodontis funebris*), the biggest and most ferocious of the eels of the American tropics (both coasts), and one well known

MORAY

about the Florida reefs. The so-called conger eel of California (*Lygodonts mordax*) is a food fish of some local importance. See **PLATE OF EELS, CONGERS, AND MORAYS**.

MORAY, mūr'ā, JAMES STUART, EARL OF. See **MURRAY**.

MORAY FIRTH. An arm of the North Sea, extending southwestward into the northeast part of Scotland (Map: Scotland, E 2). It is 16 miles wide at the entrance and about 40 miles long. It forms a good harbor and is navigable for large steamers as far as Inverness. The inner channel, southwest of Fort George, is called Inverness Firth. The name Moray Firth is sometimes extended to the whole of the large, triangular indentation of the shore between Kinaird and Duncansby heads, having a width of 75 miles.

MORAYSHIRE, mūr'ā-shēr. A maritime county of Scotland. See **ELGINSHIRE**.

MORAZÁN, mō'rā-thān', FRANCISCO (1799-1842). A soldier and statesman, born in Tegucigalpa, Honduras. He was a member of a French West Indian family and entered politics when his country became independent of Spain, in 1821. He became Secretary General (1824) and took part in the organization of the new government. He also played an important part at the head of the troops in putting down the demonstrations of the various revolutionary factions, and was in 1830 elected President of the Central American Confederation. In this office he became the foremost representative of liberal principles, as opposed to the reactionary policy of the old Spanish party, whose stronghold was Guatemala. He expelled the archbishop and the friars who were inciting the pro-Spanish faction to revolt, and abolished the most important Church privileges. In 1832 he suppressed an insurrection against the federal government in Salvador. In 1838 a formidable revolution again broke out, headed by Carrera, leader of the conservatives in Guatemala. Morazán, after defending the federal government with courage and ability, felt that the tide was too strong to struggle against, he therefore resigned his office, April 5, 1840, and went to Peru. There he organized a force and in 1842 invaded Costa Rica, hoping to reorganize the Confederation. He overthrew the government without difficulty and was enthusiastically elected Governor. His popularity, however, was short-lived. His advocacy of the Central American Confederation led to another insurrection. He was taken prisoner, court-martialed, and shot, Sept. 15, 1842. Consult H. H. Bancroft, *History of Central America*, vol. II (San Francisco, 1887).

MORBIHAN, mōr'bé'an'. A department of west France, situated along the south coast of the peninsula of Brittany (Map France, N., C 5). It is hilly in the north, very sparsely wooded, while the central portion is distinguished by a marshy tract known as the Landes de la Lanvaux. The belt near the sea is fertile. Only one-third of its area, which covers 2739 square miles, is cultivated, producing cereals, flax, hemp, and apples. Cattle and bees are raised. Iron ore is found, but there are no industries or commerce of any importance save at the naval base, Lorient. There is much fishing along the entire coast. Pop., 1901, 563,468, 1911, 578,400. Capital, Vannes.

MORBILLI, mōr-bil'li. See **MEASLES**.

MORBUS SA'CER. Fr. **EPILEPSY**.

MOR'DANTS (OF., *See mordant*, from Lat.

MORDEN

mordens, pres. p. of *mordere*, to bite). Substances used in dyeing for the purpose of fixing colors on textile fabrics. The manner in which mordants act has been described under **DYEING**. It remains to enumerate here the most important mordants employed by the dyer. Among *basic mordants* may be mentioned alum, aluminium sulphate, ferrous acetate, ferrous sulphate, ferric sulphate, ferric acetate, ferric nitrate, stannous chloride (tin crystals), stannic chloride (the solution is known commercially as cotton spirits), stannic oxide (produced by soaking cotton in a solution of sodium stannate and then passing it through dilute sulphuric acid), potassium (or sodium) bichromate, chromium acetate, and chrome alum. Among the acid mordants may be mentioned tannic acid and the so-called fatty acids. The latter are applied first in the form of their sodium or potassium salts (soaps) dissolved in water, then the fabric is passed through a solution of aluminium sulphate, which combines with the fatty acids to form insoluble aluminium salts on the fibre; finally when a basic dyestuff is applied the aluminium salts react with it, their acids combining to yield permanent colors. See **DYEING**; **LAKES**.

MORDAUNT, mōr'dūnt, CHARLES, EARL OF PETERBOROUGH. See **PETERBOROUGH**.

MORDAUNT, FRANK (1841-1906). An American actor, born at Burlington, Vt. After playing as an amateur in New York, he joined the theatrical profession in 1859. He supported Mary Anderson in 1878, then Edwin Booth, taking the parts of the King in *Hamlet* and Kent in *King Lear*. Among his later rôles were Tommaso in *Mr. Barnes of New York* (1888), Nicholas Vanalstyne in *The Henrietta* (1889), and General Kendrick in *The Heart of Maryland* (1895).

MORDECAI, mōr'de-ki, ALFRED (1804-87). An American soldier and military writer, born at Warrenton, N. C. He graduated at West Point in 1823 and remained there the two following years as assistant professor of philosophy and engineering. He was an assistant engineer in fort construction in Virginia (1825-28) and assistant to the chief engineer at Washington. In 1830-60 he was a member of the Board of Ordnance at Washington. For his services in the Mexican War he was made brevet major (1848) and later was promoted major of ordnance (1854). At the outbreak of the Civil War he resigned from the United States army. From 1863 to 1866 he was assistant engineer of the Mexico and Pacific Railroad. In 1867 he became secretary and treasurer of the canal and coal companies controlled by the Pennsylvania Railroad. Mordecai was sent abroad in 1840 and 1855 to investigate European arsenals, ordnance and military organization. In 1860 he assisted in revising the curriculum at West Point. His publications are *A Digest of Military Laws* (1833), *Report of Experiments on Gunpowder* (1845, 1849), *Artillery for the United States Land Service* (1849), *Ordnance Manual for the Use of the Officers of the United States Army* (1841, 2d ed, 1850), *Report on Military Commission to Europe* (1861).

MOR'DEN. A town and a judicial centre of the electoral district of Lisgar, Manitoba, Canada, situated on Cheval Creek and on the Canadian Pacific and the Great Northern railways, 64 miles southwest (direct) of Winnipeg (Map: Manitoba, E 4). It has a courthouse

and jail, general hospital, isolation hospital, and nurses' home. There are several grain elevators, flour mills, cement-block and pump plants, and a creamery. The surrounding district has cement deposits. The town owns its electric-lighting plant. Pop., 1911, 1130.

MOR'DENT. A musical embellishment consisting of a rapid alternation of the principal note and its second below, indicated by the sign \wedge ; or the second above (major or minor, according to the key), indicated by the sign \vee .

MORDVINS, or MORDVA. A mixed Finno-Turkish people numbering about 1,000,000, living in the heart of Russia between the Volga and Oka. In height they average 1.639 meters and are brachycephalic (cephalic index, 83.8). They are divided into two main branches, the Ersä or northern and Moksha or southern. They are finely built and have dark hair—darker in the south than in the north—and blue eyes. Agriculture is their principal occupation, but they are excellent carpenters and woodworkers, selling great quantities of wooden vessels and other objects, and they are noted for beekeeping. Nominally the Mordvins have accepted Christianity, but many interesting pagan customs are preserved among them. The women especially preserve their old national costume, wearing embroidered jackets and skirts, an elaborate coiffure, large earrings, and necklaces. Consult: Mainov, "Rezultaty antropologicheskikh issledovaniy sredi Mordvy-Erzy," in *Memoirs of the Imperial Geographic Society*, ethnographic division, vol. xi (St. Petersburg, 1883); Heikel, *Trachten und Muster der Mordvinen* (Leipzig, 1897); Smirnov, *Les populations finnoises de la Volga* (French trans., Paris, 1898); the grammatical studies of Ahlquist (1861), Wiedemann (1865), Budenz (1876), and Paasonen (1903); and papers in the *Journal de la Société Finno-ougrienne* and *Finnish-ugrische Forschungen*.

MORE, mör, HANNAH (1745-1833). An English author, born at Stapleton, near Bristol, Feb. 2, 1745. She was well educated, scribbled essays and verse as a girl, and wrote a pastoral drama (1762). She became acquainted with Garrick, Burke, Reynolds, and Dr Johnson, and was encouraged by Garrick to write two tragedies, *Percy* (1777) and *The Fatal Falsehood* (1779), both of which met with some success. About 1780 she withdrew from society, built a cottage at Cowslip Green, 10 miles from Bristol, and began writing moral and religious works. *Sacred Dramas* (1782) were succeeded by the extensively read *Thoughts on the Importance of the Manners of the Great to General Society* (1788). With the aid of her sisters she established Sunday schools in the neighboring districts. A successful tract called *Village Politics* (1793) led to the famous *Cheap Repository Tracts* (1795-98), of which 2,000,000 were circulated the first year. Her religious novel *Cælebs in Search of a Wife* (1809) ran through eight editions the first year, and was still more popular in the United States. She died at Clifton, Sept. 7, 1833. Consult: H. Thompson, *Life of Hannah More* (London, 1838); E. P. Terhune (Marion Harland, pseud.), *Hannah More* (New York, 1900); C. M. Yonge, *Hannah More*, in

"Eminent Women Series" (new ed., Boston, 1912).

MORE, HENRY (1614-87). An English theologian. He was born at Grantham, Lincolnshire, of Calvinist parents, but became a warm adherent of the Church of England. After some years at Eton he went to Christ's College, Cambridge, where he pursued the study of philosophy, especially the Platonic writers. About 1639 he took holy orders and lived henceforth a quiet life within the courts of his college, refusing all preferments. His numerous works represent the mysticism of the Cambridge Platonists (q.v.), to which group he belonged. His poems, including the "Song of the Soul," were collected and published as *Philosophical Poems* (1647). The characteristic principles of his philosophy are to be found in the *Divine Dialogues* (1668). Complete editions of his *Opera Theologica* appeared in 1675, and of his *Opera Philosophica* in 1678. Consult his *Life* by Ward (London, 1710) and an analysis of his life and works in Principal Tulloch's *Rational Theology*, vol. ii (Edinburgh, 1872). See the literature noted under CAMBRIDGE PLATONISTS.

MORE, LOUIS TRENCHARD (1870-). An American physicist, brother of Paul Elmer More. He was born in St. Louis, graduated there from Washington University in 1892, and studied at Johns Hopkins, where he took his Ph.D. in 1895. He served as instructor in physics at Worcester Polytechnic Institute in 1896 and as instructor and adjunct professor of physics at the University of Nebraska from 1896 to 1900. In the latter year he became professor of physics at the University of Cincinnati, where he was also dean in 1910-13. Besides papers dealing with electricity, magnetism, light, and sound, he published *The Limitations of Science* (1915).

MORE, PAUL, ELMER (1864-). An American essayist, whose scholarly equipment, philosophical grasp, and effectiveness of method have placed him in the front rank of American literary critics. A brother of Louis Trenchard More, he was born in St. Louis, graduated from Washington University, took his A.M. degree at Harvard in 1893, and taught Sanskrit at Harvard for a year and Sanskrit and classical literature at Bryn Mawr from 1895 to 1897. From 1901 to 1903 he was literary editor of the *Independent* and from 1903 to 1914 he held the same position on the *New York Evening Post*. In 1909, in addition, he became editor of the *Nation*, whose high standard he maintained and to which he contributed many valuable reviews and essays in literary criticism. In 1914 he resigned his editorship, though retaining an advisory connection. The body of his critical work is contained in his *Shelburne Essays* (1904 et seq., vol. viii, 1913), which cover much of English literature and include excursions into other literatures. These volumes take their title from the town of Shelburne, N. H., where the author with a dog and his books for companions spent two years of study. In addition to the eight volumes of essays named above, his work includes: *Helena and Occasional Poems* (1890); *The Great Refusal: Letters of a Dreamer in Gotham* (1894); *A Century of Indian Epigrams* (1898); a translation of the *Prometheus Bound* of Æschylus (1899); *Benjamin Franklin* (1900); *The Jessica Letters* (1904), with Corra Harris (q.v.); *Nietzsche* (1912).

MORE, SIR THOMAS (1478-1535). An English author and statesman. He was born in

London and was educated first at St. Anthony's School, near his home, but at 13 was placed in the household of Cardinal Morton. Morton quickly recognized his gifts and predicted that he would "prove a marvelous man." His interest a year or two later sent the boy to Oxford, where he entered at Canterbury Hall, afterward merged in Christ Church. Here he laid the foundations of the scholarship which made him such an admirable type of the Renaissance learning, under Linaere and Grocyn. Though he left Oxford after two years and studied law at New Inn and Lincoln's Inn, he kept up his literary studies and his friendship with these men and with Erasmus, Colet, and Lilly; with Erasmus, in particular, whom he met in 1497 on his first visit to England, he had a close friendship which was only terminated by death. More at one time thought of becoming a priest and in these days lived a very austere and ascetic life. He lectured on St. Augustine's *De Civitate Dei*, and it is possible that his meditations on the City of God may have suggested his own famous conception of an ideal community in the *Utopia*. Though he abandoned his idea of taking orders about 1503, he remained a fine specimen of the devout layman all his life, though a sharp critic of any shortcomings in the clergy.

In 1504 he entered Parliament and soon gained fame by opposing a large grant of money to the King, Henry VII, whose hostility compelled him to retire to private life. His law practice, however, brought him a large income. When Henry VIII came to the throne he was made undersheriff of London and engaged in a number of important commercial missions, during his absence in Flanders on one of which he began his *Utopia*, published 1516. He was made justice of the peace in 1515, and two years later master of requests, an office which brought him into frequent contact with the King, to whose council he was admitted in the same year. He was knighted in 1521 and continued a prominent figure at court. Attracting the notice of Wolsey, he was recommended by the Cardinal as Speaker of the House of Commons and was elected in 1523.

Though, like Erasmus and Colet, he had much at heart a reform of the Church in practical matters, he had no sympathy with the violent measures of Luther and his followers, and in 1523 appeared as a champion of his sovereign against the German reformer. Henceforward until his death he was constantly in the lists against the supporters of the new doctrines. On Wolsey's fall in 1529 More was appointed to succeed him as Chancellor, the holding of the office by any but a great ecclesiastic being an unheard-of innovation. He held the office only two years and a half, and then resigned it, foreseeing that his conscience would bring him to an open struggle with the King, whom he had already opposed at several stages of the gradual breach with Rome.

The inevitable conflict came in the spring of 1534, when subscription was required to the act of succession, including a renunciation of the jurisdiction of "any foreign potentate." More flatly refused to take the oath, and was committed to the Tower, where he remained a prisoner until his death. He was brought to trial on a charge of treason, was convicted by the most flagrant perjury and injustice, and was sentenced to be hanged at Tyburn. The King commuted the sentence to beheading. On July

6 he was executed in the Tower, retaining the calmness and wit which had marked his life to the last. His execution shocked the whole of Europe, and Charles V declared that he would rather have lost his best friend than such a counselor. More was beatified by Leo XIII in 1886, together with other English martyrs.

More is to-day best known as the author of the *Utopia* (q.v.). It was written in Latin, so as to reach the learned world, and is full of dramatic skill and fertile invention. The earliest English version, of which five scholarly reprints were published between 1869 and 1893, appeared in 1551, but earlier than this it had been translated into German, Dutch, and Italian. More's English works, principally of a controversial or devotional character, are marked by forcible, nervous, simple style and by an abundance of witty illustration. His *History of Richard III* (first correctly printed in 1557), though incomplete, is notable among the beginnings of modern history in English, and his early biography of Pico della Mirandola (1510) is characteristic of his devotion to the Renaissance ideal.

Bibliography. The basis for all biographies of More is the *Life* by his son-in-law, William Roper, first printed at Paris in 1626, with numerous subsequent editions, a recent one in the "King's Classics" (London, 1903); Cresacre More, his great-grandson, published a fuller biography about 1631 (last ed., London, 1828). Consult also Anne Manning, *The Household of Sir Thomas More* (London, 1851; new ed., New York, 1908); Désiré Nisard, *Renaissance et réforme* (Paris, 1877); T. E. Bridgett, *Life of Sir Thomas More* (London, 1891); W. H. Hutten, *Life and Writings of Sir Thomas More* (ib., 1895); Sir Sidney Lee, in *Great Englishmen of the Sixteenth Century* (New York, 1904); Henri Brémont, *Sir Thomas More*, translated by Harold Child (London, 1904), containing a bibliography; Frederick Seebohm, in *Oxford Reformers* (New York, 1911); *The Book of Sir Thomas More*, in the Malone Society Reprints (London, 1911); Randall Davies, *The Greatest House at Chelsey* (New York, 1914). See COMMUNISM.

MOREA. The peninsular portion of Greece, connected with the northern half of the country by the narrow Isthmus of Corinth. It was known in ancient times as the Peloponnesus (q.v.), but has been known by its present name since the Middle Ages, if not from as early a period as the fourth century (Map: Greece, D 6). This name is usually said to be derived from *morus*, a mulberry—the outline of the peninsula bearing a resemblance to the leaf of that tree. Others, however, such as Fallmerayer, trace it back to the Slavic word *more*, the sea, which nearly encircles the Morea. See GREECE.

MOREA. One of the Society Islands. See MOOREA.

MORÉAS, mô'râ'a', JEAN (1856-1910). A French poet and novelist, born in Athens, his real name being Papadiamantopoulos. In 1877 he settled in Paris and about 1882 began to publish his verse in some of the newer reviews. His first volume, *Les syrtés* (1884), cleverly parodied by Beauclair under the title *Les déliquescentes*, "par Adoré Floupette, poète décadent," brought on his school the title of "decadent." In 1886 Moréas published *Les cantilènes*. Moréas repudiated his earlier manner in 1892 for that of the school of Romance, which urged a return to the verbal richness of

old French poetry. For such a task the "grammarians poet" with his thorough knowledge of early French diction and metre was peculiarly fitted. Moreau wrote also: *Le pèlerin passionné* (1891); *Eriphule* (1894); *Les stances* (1898-1902; 2d ed., 1906); *Premières poésies* (1907), combining *Les syrtes* and *Les cantilènes*; *Esquisses et souvenirs* (1908). With Paul Adam he wrote *Le thé chez Miranda* (1886) and *Les demoiselles Goubert* (1887), practically all he did as a novelist. His tragedy *Iphigénie* was first played in 1903. In 1889 he had written the symbolistic manifesto in *Les premières armes du symbolisme*. See SYMBOLISTS.

MOREAU, mō'rō, GUSTAVE (1826-98). A French painter, born in Paris, where he studied under Picot and Chassériau. In Italy he was influenced by Leonardo da Vinci, Mantegna, and other early Renaissance masters. He exhibited little, and did not become known until towards the end of his life. The only modern painter with whom he can be compared is Burne-Jones. He left his 800 or more works in water color and oil to his native city to form the Musée Moreau in the Rue de la Rochefoucauld. There his "Prometheus" (1869), "Hesiod and the Muses," "The Apparition," "Leda," "Micornes," and many like subjects furnish fine examples of the weird, morbid imagination, suppressed passion, and brilliant, glittering color that distinguish his peculiar style. In the Luxembourg Museum are "Orpheus," "Jason," the "Rape of Europa," and "Calvary," one of a cycle of religious paintings. From 1892 to 1898 he was a professor in the Ecole des Beaux-Arts. He received the cross of the Legion of Honor in 1875. Consult Flat, *Le Musée Gustave Moreau* (Paris, 1905). Muther, *A History of Modern Painting* (New York, 1907). Loisel, *L'Inspiration chrétienne du peintre Gustave Moreau* (Paris, 1912).

MOREAU, HÉGESIPPE (1810-38). A French poet. He was born in Paris, worked as a typesetter and teacher, and then turned his attention to literature. He suffered the greatest privations and died in a hospital just as his talent began to be appreciated. His works comprise: *La Voulue*, elegies, and *Contes à ma sœur*, prose romances reminiscent of Nodier, of which the most notable is "Le gui de chêne." His works appeared under the title of *Myosotis* (1838), and his correspondence in the first volume of his *Œuvres complètes* (1890-91).

MOREAU, JEAN VICTOR (1763-1813). A celebrated French general of the revolutionary and Napoleonic period. He was born Aug. 11, 1763, at Morlaix in Brittany, and studied law at Rennes. In 1789 he embraced the cause of the Revolution, and was later chosen to command the battalion of volunteers from his native town. He served under Dumouriez in 1793 and displayed such military talent that in 1794 he was made a general of division. His father was put to death by the guillotine, but Moreau decided that he could not withdraw from the service of his country. When Pichegru (q.v.) fell under suspicion in 1796 the Directory appointed Moreau to the chief command on the Rhine and Moselle. He crossed the Rhine at Kehl, defeated Latour at Rastatt and the Archduke Charles at Neresheim, and drove the Austrians back to the Danube; but, owing to the defeat of Jourdan at Würzburg, he found himself in danger of being cut off from the Rhine, and was obliged to make a desperate effort to regain that river, which he

accomplished in the face of great difficulty fighting two unsuccessful battles at Emmendingen and Hünningen in October. A suspicious participation in the plots of Pichegru led to his being deprived of his command in 1797, but in 1799 he succeeded Scherer in the command of the army in Italy. By a retreat conducted with consummate skill he saved the French army from destruction, though defeated April 6, 1799, by Suvaroff at Cassano. The Directory deprived him of the chief command and gave it to Joubert, but Moreau remained with the army and after the death of Joubert at Nov. 6, 1799, again assumed the command and conducted the troops back to France. The disinterestedness of Moreau's character, his military talent, and his political moderation brought him great popularity. He assisted Bonaparte on the 18th Brumaire and, receiving the command of the Army of the Rhine, gained victory after victory over the Austrians in the campaign of 1800 and on December 3 won the great and decisive battle of Hohenlinden (q.v.). A strong feeling of mutual distrust now arose between Moreau and Bonaparte, and the former retired to his country seat, which became a gathering place of the discontented. He was accused of participation in the plot of Pichegru and Cadoudal (q.v.) against the life of the First Consul, and was arrested, brought to trial, and found guilty on June 10, 1804, although the evidence against him was worthless. Bonaparte could not venture to condemn him to death, and a sentence of two years' imprisonment was therefore pronounced, which was commuted into banishment. Moreau went to America, where he settled first in New Jersey and later at Morrisville, Pa. Regarding with great dissatisfaction the whole of Bonaparte's career in 1813 he joined the Emperor of Russia and the King of Prussia in the march against Napoleon, where, as he stood with the Emperor Alexander on a height at Räcknitz on August 1, a French cannon ball broke both his legs. Amputation was performed, but he died in Laun in Bohemia, Sept. 2, 1813, and was buried in St. Petersburg. Consult: Beauchamp, *La politique, militaire et privée du général Moreau* (Paris, 1814; Eng. trans., London, 1814); Clotaire, *Histoire du général Moreau* (Paris, 1814); C. Jahmus, *General Moreau* (Berlin, 1814); Paul Swinn, *Some Details Concerning General Moreau and his Last Moments* (London, 1814).

MOREAU, MARIE JULES EMILE (1852-). A French dramatist, born at Briçon (Yonne). Among his writings are: *Parthénice* (1877); *Camille Desmoulins* (1879); *Bonne nuit* (1882); *Un divorce* (1884); *Gerfaut* (1886); *Pallas Athénée* (1887), which received the Frer Academy's grand prize for poetry; *La peur l'être* (1889); *Le drapeau* (1890); *Madame Sans-Gêne* (1893); *Le capitaine Flor* (1895); *Madame de Lavalette* (1899); *Elle*, and *Le vert-galant* (1907); *La reine Elisabeth* (1912). In his *Le procès de Jeanne d'Arc* (1909) the rôle of Jeanne was created by Sax Bernhard.

MOREAU DE SAINT-MÉRY, de sän-mä' MÉDÉRIO LOUIS ELIE (1750-1819). A French statesman, born in Martinique. He was a member of the Constituent Assembly in 1790. From 1793 to 1799 he was in the United States, where his moderate views brought him into conflict with the Jacobins. He set up as a bo-

seller in Philadelphia. He was a Councilor of State in 1800, and administrator of Parma, Piacenza, and Guastalla in 1802-06. Falling out of favor with Napoleon, he lived in poverty till 1817, when Louis XVIII pensioned him. He published *Lois et constitutions des colonies françaises de l'Amérique de 1550 à 1785* and *Description de Saint-Dominique* (Philadelphia, 1796-98). Consult Moreau de Saint-Méry's *Diary of a Voyage to the United States* (New Haven, Conn., 1913), edited, with biographical sketch, by S. L. Mims.

MOREAU-VAUTHIER, mô'rô'-vô'tyâ', GABRIEL JEAN PAUL (1871-). A French sculptor, born in Paris. He received several medals and prizes at various expositions, beginning to exhibit as early as 1891. Among his works are: "Dante" (1895), "Flora" (1896); "Sphinx" (1897), "Bietonne" (1898), "The City of Paris," a monumental door (Exposition, 1900); "The Seasons," "Embraces" (1903); "Nymphs and Satyrs," decorative panels (1905); "War," "Faun and Nymph" (1906), the Châlons Monument (1907). He made a number of marble and bronze pieces, "Bacchante," "Nereid," "Molière," "Fortune," "Plenty," for the Élysée Palace, the hôtel de ville, and Père Lachaise Cemetery.

MORECAMBE, môr'kam. A popular watering place in Lancashire, England, on Morecambe Bay, 3½ miles northwest of Lancaster (Map: England, D 2). It has a pier, promenade, aquarium, people's palace, pavilions, and a golf course. Its climate is mild and healthful. Pop., 1901, 11,798; 1911, 12,131.

MORECAMBE BAY. An inlet of the Irish Sea, on the northwest coast of England (Map: England, C 2). It is about 17 miles long, 10 miles in average breadth, and very shallow.

MOREEN. See MOIRE.

MOREL, môr'el (Fr. *morille*, from OHG. *morhela*, Ger. *Morchel*, mushroom, dim. of OHG *morahâ*, *morhâ*, Ger. *Mohre*, carrot), *Morchella*. The common name of *Morchella esculenta*, which is prized as an edible mushroom, although it is not a mushroom. The genus belongs to the Ascomycetes (q.v.), and the ascocarp is a remarkable fleshy structure, rising above the ground from a usually subterranean mycelium. The surface of this stalked and more or less conical structure is reticulated with irregular pitlike depressions which are lined with the hymenium (q.v.). Morels are reckoned among the best of esculent fungi. The common morel, perhaps the best known, is found in America and in many parts of middle and southern Europe. Its stalk is only about an inch long, the pileus is roundish, oval, oblong, or conical, yellowish or brown. Fresh or dried it is nutritious and not difficult to digest, but is chiefly used in sauces and gravies, on account of its pleasant flavor. See ASCOMYCETES, and Colored Plate of EDIBLE FUNGI with the article FUNGI.

MOREL EAR. See STIGMA.

MOREL-FATIO, ALFRED PAUL VICTOR (1850-). The leading French Hispanist of his time. He was born at Strassburg and completed his studies at the Ecole des Chartes, Paris. From 1875 to 1880 he was attaché of the department of manuscripts of the Bibliothèque Nationale, during which period he prepared his excellent *Catalogue des manuscrits espagnols et portugais de la Bibliothèque Nationale*. For the next five years he was professor at the Ecole Supérieure des Lettres at Algiers. In

1885 he returned to Paris to accept the chair of languages and literatures of southern Europe in the Collège de France. He became also assistant director of Romance philology at the Ecole Pratique des Hautes-Etudes, and secretary of the Ecole des Chartes. In these positions he exercised a great influence over students from many lands, and by his writings he influenced a wide public. In 1894 he was Taylorian lecturer at Oxford University. By Spaniards he came to be regarded as the foreign scholar who best understood that nation. He was elected corresponding member of the Spanish Royal Academy of the Language, and was appointed a Knight Commander of the Order of Charles III, and in his own country became an officer of public instruction, a member of the Institute of France (1910), and a Knight of the Legion of Honor. In addition to the *Catalogue* previously mentioned, the following are the most important of his many publications: translation of the *Grammaire des langues romanes* by Friedrich Diez (1874-76); a critical edition of Calderón's *Mágico prodigioso* (1877); *L'Espagne au XVIIe et au XVIIIe siècle* (1878); *Libro de los fechos et conquistas del principado de la Morea*. . . *Chronique de Morée aux XIIIe et XIVe siècles* (1885); *Vu de Lacañillo de Tormes, Etudes sur l'Espagne* (3 vols., 1888-1904; 2d ed. of vols i and ii, 1895 and 1906); "El Libro de Alijandre," in *Gesellschaft für romanische Literatur*, vol x (1906); *Recueil des instructions données aux ambassadeurs de France en Espagne*; *Historiographie de Charles-Quint* (1913). After 1874 Morel-Fatio was a contributor to the *Romania*, and after 1899 one of the directors of the *Bulletin Hispanique*.

MORELIA, mô-râ'lê-â, or VALLADOLID, va'-lyâ-dô-lêd'. The capital of the State of Michoacan, Mexico, situated in a mountainous region, 6300 feet above sea level and 130 miles west-northwest of Mexico City (Map Mexico, II 8). The town lies in a fertile valley and is regularly built with many squares and two pascos or promenades. It has a fine cathedral, built in Plateresque style and completed in 1745, and a state capitol built of hewn stone in Byzantine style, other notable buildings are the city hall, the courthouse, and the public library. It has also a number of educational institutions, the most important being the theological seminary and the Colegio San Nicolas de Hidalgo. A good water supply is obtained by a handsome aqueduct, 4 miles long, which was completed in 1789. The chief industries of the town are the manufacture of cotton and woolen goods, palm hats, sugar, pulque, and cheese. Pop., 1900, 37,278; 1910, 40,042. Morelia was founded under the name Valladolid in 1541, and the present name was given it in honor of Morelos. See MORELOS Y PAVON.

MOR'ELL, GEORGE WEBB (1815-83). An American soldier, also an engineer and lawyer. He was born at Cooperstown, N. Y., graduated with the highest honors in his class at West Point in 1835, served as assistant engineer from 1835 to 1837, and in June, 1837, left the service to take up railroad building. He became assistant engineer first of the projected Charleston and Cincinnati Railroad and then of the Michigan Central Railroad (1837-40), after which he went to New York City and was admitted to the bar. He was later commissioner of the United States Circuit Court for the southern district of New York (1854-61). After the

outbreak of the Civil War he served for a few months as a colonel of New York militia and chief of staff of Major General Sanford, became a brigadier general of volunteers in August, 1861, served under McClellan throughout the Peninsular campaign, and in July, 1862, was appointed major general of volunteers, though the commission, not being sent to the Senate for confirmation, lapsed in March of the following year. Morell participated in the second battle of Bull Run and in the Maryland campaign of September, 1862, and commanded the forces guarding the upper Potomac from Oct. 30 to Dec. 16, 1862, and the draft rendezvous at Indianapolis, Ind., from December, 1863, to August, 1864. In December, 1864, he was mustered out of service, and afterward until his death lived as a farmer near Larrytown, N. Y.

MORELL, JOHN DANIEL (1816-91). An English philosopher, born at Little Baddow, Essex. He graduated at Glasgow University in 1840, took his M.A. degree a year later, and then went to Bonn, where he studied theology and philosophy. After his return he became Independent minister at Gosport, but three years later (1845) resigned the position. In 1846 he published his *Historical and Critical View of the Speculative Philosophy of Europe in the Nineteenth Century*, which was highly praised and which led Lord Lansdowne to appoint him inspector of schools, an office which he held until 1876. In 1849 appeared his *Philosophy of Religion*, a work that was widely discussed. Among his other publications are: *On the Philosophical Tendencies of the Age* (1848); *A Grammar of the English Language* (1857); *On the Progress of Society in England as Affected by the Advancement of National Education* (1859); *Philosophical Fragments* (1878). In philosophy he was an eclectic, but inclined towards idealism, while in religion he gradually outgrew the narrow limits of his earlier belief until he came into sympathy with all branches of the Christian Church. Consult R. M. Theobald, *Memorials of J. D. Morell* (London, 1891).

MORELLA, mō-rā'lyā. A strongly fortified town of east Spain, in the Province of Castellón, situated among the mountains, 50 miles west of the mouth of the Ebro (Map: Spain. E 2). It is built on a steep hill in the midst of a rough and inaccessible country and is surrounded by walls and towers, the wall being tripled on one side. Pop., 1900, 7078; 1910, 6722.

MORELLA, COUNT OF. See CABRERA, RAMÓN.

MOREL-LADEUIL, mō-rē'l-lā'dē'y, LEONARD (1820-88). A French goldsmith and sculptor. He was born at Clermont-Ferrand, was apprenticed in Paris to Antoine Vellite, from whom he learned the art of repoussé, and also studied sculpture under J. J. Feuchère. In 1850 he accepted an offer to work for the English goldsmith's firm of Elkington in Birmingham. Two tazzas in repoussé silver, the vase "Modern Inventions," and the beautiful repoussé table "Dreams" (1862), presented as a wedding gift to the Princess of Wales, soon placed him at the head of his profession. After three years he removed to London, remaining altogether a quarter of a century in England. Skill in execution, grace and harmony in composition, purity of style, refined feeling for ornament, and a sense of the dramatic made Morel one of the greatest masters in the art of repoussé. Among his celebrated works, besides those already men-

tioned, are the "Shield of Empire" (1852, Royal Artillery Officers' Mess, Woolwich); "Milton Shield," in steel and silver repoussé (South Kensington Museum); a "Pompeian Lady at her Toilet" (plaque executed for the Philadelphia Centennial, 1876); "The Bunyan Shield"; and the Shakespearean plaques, "Merry Wives of Windsor," "Much Ado about Nothing," and "The Merchant of Venice." Consult Morel, *L'Œuvre de Morel-Ladeuil* (Paris, 1904).

MORELLET, mō'r-lā', ANDRÉ, ABBÉ (1727-1819). A French author, born in Lyons. After graduating at the Sorbonne as licentiate in theology he came into possession of a small annuity and thenceforth lived in Paris. He was in sympathy with, and was one of the last of, the Encyclopédistes and was a personal friend of Voltaire. He was made a member of the Académie in 1785, entered the reorganized Institute in 1803, and in 1808 was named deputy from the Seine. He belonged to the school of Turgot in political economy. His numerous works are more remarkable for eloquence, force, and biting wit than for original thought. Among his most powerful pamphlets are: *Théorie du paradoxe* (1775), against Linguet; *Préface de la comédie des philosophes, ou La vision de Charles Palissot* (1760), directed against the Bastille; *Le cri des familles* (1795), a protest against the confiscation of property owned by those condemned by the revolutionary tribunals; *Mélanges de littérature et de philosophie au XVIIIème siècle* (4 vols., 1818), in volume ii of which is "L'Avis de Franklin aux faiseurs de constitution." His other works include *Mémoires sur le XVIIIème siècle et sur la Révolution* (1821). He also translated numerous essays from English, Italian, and Latin. Many of his pamphlets were translated into English.

MORELLI, mō-rē'l-lē, DOMENICO (1826-1901). An Italian historical painter, born in Naples. He studied at the Naples Academy and for a short time in Rome under Overbeck. He was afterward professor at the Naples Academy and, with Philippo Palizzi, became a leader of the Realist movement in Italy, where the younger generation was strongly influenced by his independent and progressive spirit, his love of light and resplendent color, and his bizarre imagination. His most important paintings are "Tasso Reading his Poem to the Three Eleanoras" and the "Iconoclasts," both in the Royal collection, Capodimonte, "Mahomet Praying," in the Trieste Museum, "The Madonna of the Golden Stair"; "Christ in the Wilderness," in the Galleria Moderna, Rome; and "The Temptation of St. Antony." Consult Willard, *Sketch of the Life and Works of Domenico Morelli* (Boston, 1895).

MORELLI, GIOVANNI (1816-91). An Italian art critic, whose researches and attributions were epoch-making for Italian painting. He was born in Verona, passed his youth in Bergamo, studied medicine at Munich, Erlangen, and Berlin, and in 1838 assisted Agassiz in his investigations of glaciers. He took a prominent part as a leader of the volunteers in the Italian revolution of 1848, and was sent as national Envoy to the German Parliament at Frankfurt. He was a member of the Italian Parliament in 1860-70 and was made a Senator of the Kingdom in 1873. It was on his recommendation that the government appointed a commission to prepare a law for the conservation of works of art in Italy and to prevent their alienation by

heads of religious and public institutions. Although he refused the post of Minister of the Fine Arts and the directorship of the Florence galleries, he did much to reform the administration of Italian museums and galleries. He is best known for his critical work on Italian painting, published in a popular dialogue form under the pseudonym Ivan Lermoliev. Published at first in the periodicals of Germany, to the scholars of which country his appeal was chiefly directed, it is embodied in *Die Werke italienischer Meister in den Galerien von München, Dresden, und Berlin* (1880). This was subsequently amplified to *Kunstkritische Studien über italienische Malerei* (1890-93), and translated into English by Ffoulkes under the title *Italian Painters: Critical Studies of their Works* (2 vols., 1892). His principles of art criticism, which have since been generally adopted for the identification of Italian and indeed of all paintings, consider not only the important features of facial form and expression, but even emphasize the less important features, such as the hands, and ears, which the painter would render in a certain habitual fashion, little influenced by the model before him. Morelli left an important collection of paintings, rich in the Lombard schools, to Bergamo, which he considered his home.

MORELLY, mò'r'lè'. A French Socialist of the middle of the eighteenth century. He was born at Vitry-le-Français, taught there, and became an abbé, but of his life nothing more definite is known. His works include *Le prince, les délices du cœur* (1751), in which he describes a ruler who makes his people happy and contented through practical adaption of theoretical philosophy, a poem, *Naufrage des îles flottantes* (1753), which describes an ideal government ruled by the laws of nature, *Le code de la nature* (1755-60), a work long attributed to Diderot, and the forerunner of modern communism. Consult Lichtenberger, *Le socialisme au XVIIIème siècle* (Paris, 1895).

MORELOS, mò-rà'lòs. One of the smallest states of Mexico, situated in the interior and bounded by the State of Mexico with the Federal District on the north and west, Guerrero on the west and south, and Puebla on the east (Map Mexico, J 8). Area, 2734 square miles. It lies on the south slope of the great central plateau, and its northern part is extremely mountainous. The centre and the south comprise fertile valleys, which are devoted to agriculture. The climate in the north is cold and in the centre and south is hot. The principal agricultural products are sugar cane, rice, coffee, cereals, and fruits. The chief industry is the manufacture of sugar. The first sugar plantation and sugar mill in Mexico were established by Cortés in Morelos. It was the scene of much of the activity of Zapata during the revolutions of 1910 and the years following. The state is traversed by two railway lines and has a considerable trade. Pop., 1900, 160,115, 1910, 179,594. Capital, Cuernavaca (q.v.).

MORELOS. A city of Mexico. See CUAUTLA DE MORELOS.

MORELOS Y PAVON, mò-rà'lòs è pà-vôn', JOSÉ MARÍA (1765-1815). A Mexican patriot and general, born at Valladolid (now Morelia), Michoacan. Left an orphan by poor parents, he spent the years of early manhood as a mule driver and was 32 years of age before he began his education in the College of San Nicolás, of

which Hidalgo was then rector. Having progressed rapidly in his studies, he entered holy orders and became the curé of Carácuaro and Nireupétaro, where he was serving when in 1810 his old rector began the revolt against Spain. He decided to follow the fortunes of Hidalgo and at once won a reputation as a brave fighter and a safe leader. Upon the death of Hidalgo Morelos became the leader of the insurrection and during the following winter (1811-12) waged a successful campaign against the Spaniards in the south and west. From Feb. 19 to May 2, 1812, he, with 4000 men, was besieged in Cuautla by a superior force of Loyalists, but succeeded in escaping with most of his army. He captured Orizaba (Oct. 28, 1812), took Oaxaca by storm (November 25), and successfully besieged and entered Acapulco (Aug. 19, 1813). For the purpose of organizing an independent Mexican government he called a congress at Chilpancingo (September 14), which named him generalissimo of the Patriot army and abolished slavery and religious tithes. On Nov. 6, 1813, Morelos issued, in the name of the Congress of Anáhuac, a Declaration of Independence, declaring that the Congress "has recovered its usurped sovereignty" and that "the dependence upon the Spanish throne is broken and dissolved forever." His star now began to wane. He was defeated by Iturbide at Valladolid (Dec. 23, 1813) and again at Puruarán (Jan. 5, 1814). He retired to Acapulco, but was forced to abandon the town upon the approach of the enemy. The Royalists now drove the revolutionists from place to place, and finally in the battle of Tescmalaca Morelos was defeated and taken prisoner. He was taken to Mexico City, where he was condemned by the Inquisition as "an unconfessed heretic and a traitor to God, the King, and the Pope" and was ordered to be degraded from the priesthood. The military court-martial condemned him to death and he was shot, Dec. 22, 1815. His remains at present repose in the cathedral in Mexico City, and his name and that of Hidalgo are revered throughout the country as the earliest martyrs to the cause of Mexican independence.

MORENDO (It., dying away). A musical term, equivalent to decrescendo (q.v.).

MORENO, GABRIEL GARCÍA. See GARCÍA MORENO, GABRIEL.

MOREPORK. 1 In Australia, a caprimulgin bird (*Podargus cuvieri*, or *strigoides*) of Australia and Tasmania. Like many other nightjars, this bird has a peculiar cry, of two syllables, resembling the words *more pork*, whence the name. It is also called frogmouth on account of its immense opening of the bill. It is remarkable for a habit, when alarmed, of stiffening itself in a fixed attitude, sometimes flat on the log, or rock, or fence rail, where it happens to be, and sometimes erect. Then, as it is dull gray, it looks like an excrescence or projection from the surface, and so escapes casual observation. An extended discourse, illustrated by photographic pictures, will be found upon this example of protective mimicry in Saville-Kent's *Naturalist in Australia* (London, 1897). Several species belong to the genus—all large birds and remarkable in structure for the possession of a pair of powder-down patches on the back at the base of the tail. See Plate with NIGHTJAR.

2. In New Zealand, an owl (*Spiloglaux novae-zealandia*).

MORÉRI, mô'rà'rè', LOUIS (1643-80). A French scholar, born at Barge-mont (Provence). He entered the Church and was made chaplain to the Bishop of Apt in 1673. He published the first edition of his *Grand dictionnaire historique ou le mélange curieux de l'histoire sacrée et profane* at Lyons in 1674. This work is still of importance from a biographical point of view, and has often been translated. The twentieth edition, printed in Paris in 1759, and comprising 10 volumes, is considered the best.

MORESNET, môr'nâ'. A town and neutral territory of about 1½ square miles on the borders of Belgium and Prussia and under the double protectorate of those countries, about 5 miles southwest of Aix-la-Chapelle. On either side of its borders are the villages of Prussian Moresnet and Belgian Moinesnet. It is mountainous and has valuable zinc deposits. It received an independent constitution after the Vienna Congress of 1815. It attained self-government in 1841 with a burgomaster alternately appointed by Belgium and Prussia. Its population consists of German, Flemish, Dutch, and French. Each inhabitant may choose whether he will do military service and seek legal redress in Germany or in Belgium. Pop. (est.), 3400.

MORETON (môr'ton) **BAY**. A harbor on the east coast of Queensland, Australia, formed inside the islands of Stradbroke and Moreton (Map: Queensland, H 9). It is about 40 miles long by 17 miles wide and receives the waters of six navigable rivers. Among them is the Brisbane, with the city of Brisbane 25 miles from its mouth.

MORETON BAY CHESTNUT (*Castanospermum australe*). An Australian tree of the family Leguminosæ, which attains a height of about 100 feet, has widespreading branches, pinnate leaves, large racemes of beautiful red and yellow flowers, and pods 6 to 7 inches in length. The seeds are soaked for several days in water, dried and roasted, when they taste like chestnuts, hence the name.

MORETON BAY PINE. See ARAUCARIA.

MORETO Y CABAÑA, mô-râ'tô è ka-ba'nyâ, AGUSTÍN (c 1618-69). A Spanish dramatist, born at Madrid. He studied at Alcalá de Henares and then went to Madrid, where he found a friend and patron in Calderón. A volume of his plays appeared at Madrid in 1654. Although inferior to Lope de Vega and to Calderón, he yet takes rank as one of the best dramatists of the latter part of the *siglo de oro*, or golden age. He achieved his real success in the category of dramas styled *comedias de capa y espada*, i.e., dramas of intrigue. Moreto's masterpiece is the play *El desdén con el desdén* (Scorn for Scorn). Borrowing the idea from Lope's *Milagros del desprecio*, he produced a work better artistically than that of the master and most brilliant. In his *Princesse d'Elide* Molière imitated the *Desdén con el desdén*. Another excellent play is *El lindo Don Diego*. Of his historical dramas one of the most interesting is the *Rico hombre de Alcalá*, dealing with Pedro the Cruel as the justice-loving King. Consult: *Comedias escogidas* of Moreto in *Biblioteca de autores españoles*, vol. xxxix (Madrid, 1873), which also has L. Fernández Guerra y Orbe's essay on him, and *Biblioteca de autores españoles*, vol. lviii (ib., 1884), for his *Gran casa de Austria y divina Margarita* (Iuto Sacra-

mental); E. Gigas, *Studien og Essays* (Copenhagen, 1898). E. Carrara, *Studio sul teatro ispano-veneto di Carlo Gozzi* (Cagliari, 1910), Cristóbal Pérez Pastor, *Bibliografía Madrileña, Parte iii* (Madrid, 1907); Jaime Mariscal de Gante, *Los autos sacramentales desde sus orígenes hasta mediados del siglo XVIII* (Madrid, 1911).

MORETTO DA BRESCIA, mô-rèt'tô da brèsh'a (1498-1554). An Italian painter of the Renaissance, the chief master of the Brescian school. His real name was Alessandro Bonvicino and he was born at Brescia, where he obtained his early art education under Fioravante Ferramola. Later he was influenced by Savoldo, Romanino, Lotto, and Titian. In frescoes executed in the chapel of San Giovanni Evangelista at Brescia, painted as early as 1523, he showed himself strong in conception and handling of form and endowed with a genius for color harmony. His works are pervaded by a characteristic cool silvery tone with a fine play of light and shade, they have great simplicity of expression and poetic sentiment. Although by the introduction of secular portrait groups into some of his religious compositions he foreshadows Paul Veronese, he differs from that painter in the gravity of his conception and his reverent religious feeling. Between 1521 and 1544 Moretto executed many paintings in and about Brescia, where his works may best be studied. Among the finest are "Fair Ladies on a Parapet" and "The Vision of Moses," Martenengo Gallery. "Elijah," San Giovanni Evangelista, "Mary Appearing to a Shepherd Boy," in the church of Partone (Province of Brescia). In 1544 he painted his celebrated "Christ in the House of the Pharisee" for Santa Maria della Pietà, Venice, a work virile in presentation and pleasing in composition. Among other important works are a splendidly heroic "St. Justina," in the Vienna Gallery, an impressive "Entombment" and "Christ in the Desert," in the Metropolitan Museum, New York, a "Madonna with Doves," in the Johnson collection, Philadelphia. His finest portrait is that of an "Ecclesiastic," in the Munich Pinakothek. There are also typical examples in the Berlin Gallery, the National Gallery, London, the Brera, Milan, and the Louvre. Moretto died at Brescia in 1554. Among his pupils the most important was Giambattista Moroni, of Bergamo. Consult Benson, *North Italian Painters of the Renaissance* (New York, 1907), "Moretto da Brescia," in *Masters of Art*, vol. ix (Boston, 1908). *The Masterpieces of Moretto da Brescia*, in "Painters' Series" (New York, 1910).

MORET Y PRENDERGAST, mô-ré' è prên'-dèr-gást', SEGISMUNDO (1838-1913). A Spanish statesman, born at Cadiz. He studied at Madrid University, where he subsequently held the chair of political economy and finance. He was elected to the Chamber of Deputies in 1863, was Minister of the Colonies under General Prim, of Finance under King Amadeus, and of the Interior under Alfonso XII. In 1871 he had been sent as Ambassador to London. In 1885 he was Minister of State, and later again Minister of the Interior. In 1893 he became Minister of Public Works and ad interim Minister of State, taking the place of the Marqués de la Vega de Armijo, who had become President of the Congress. The next year he was made Minister of State. From 1895 to 1898 and again at the time of his death he was

president of the Ateneo Científico, Literario, y Artístico of Madrid. In 1897-98 he was again Minister of the Colonies. Later he served as president of the Congress (1901-02). He became head of a Liberal cabinet in December, 1905. His term of office was signalized by the meeting of the Algeciras Conference (see *Moreocco*) and the marriage of Alfonso XIII. He resigned in August, 1906, but was again president of the Council of Ministers in 1909-10. His ability was recognized by his election to membership in the Royal Academy of Moral and Political Sciences and in the Royal Spanish Academy of the Language. He received also the grand cross of the Order of Charles III of Spain. Consult Luis Antón del Olmet and Arturo García Carraffa, "Moret," in *Los grandes españoles*, vol. v (Madrid, 1913).

MO'REY, SAMUEL (1762-1843) An American inventor, chiefly remembered for his attempts to solve the problems of steam navigation. He was born at Hebron, Conn., and lived in Orford, N. H., and Fairlee, Vt. In 1793, after several years of experimenting, he succeeded in constructing a small steamboat, which was propelled at a speed of about four miles an hour by a paddle wheel, which was first put at the prow and later at the stern. It was exhibited on both the Connecticut River and the Hudson. Chancellor Livingston is said to have encouraged Morey by large, conditional promises and to have offered him \$7000 for a patent covering navigation in the waters about New York. The offer was declined. In 1795 Morey patented a crank-motion steam engine for use in boats. Two years afterward he built at Bordentown, N. J., a boat with a paddle wheel on each side and operated it successfully on the Delaware. He seemed, in fact, to have had the problems of steam navigation practically solved, but misfortunes prevented him from following up his success, and to Robert Fulton went the honor that might otherwise have been Morey's.

MOREY, WILLIAM CAREY (1843-) An American professor and writer on history and political science, born at North Attleboro, Mass. He entered the University of Rochester, but left to volunteer in the Civil War. At its close, having been brevetted major and lieutenant colonel, he returned to college and graduated in 1868. For a year he studied at Rochester Theological Seminary, in 1870-72 he was professor of history and English literature at Kalamazoo College (Michigan), and thereafter he was a member of the faculty of his alma mater, as professor of Latin (1872-77), professor of Latin and history (1877-83), and then professor of history and political science. The degree of D.C.L. was conferred on him by Denison and Rochester. He published, besides numerous papers to be had in reprints *Outlines of Roman Law* (1884), *Papers and Addresses of Martin B. Anderson* (1895), *Outlines of Roman History* (1900), *The Government of New York* (1902), *Outlines of Greek History* (1903), *Outlines of Ancient History* (1906), revised as *Ancient Peoples* (1915).

MOREY FORGERY. In American political history, the forgery, during the presidential campaign of 1880, of the name of James A. Garfield, the Republican candidate for the presidency, to a letter which was widely used for campaign purposes. The letter, which favored Chinese immigration and purported to be addressed to "H. L. Morey, Lynn, Mass.," was

made public in *Truth*, a New York paper, on Oct. 20, 1880, and on the 23d what purported to be a facsimile of the letter was published in the same paper. Garfield immediately denounced the letter as a forgery, but extensive use was made of it by the Democratic campaign managers, and many votes were supposed to have been turned by it from the Republican ticket, especially in the West. Consult Davenport, *History of the Morey Letter* (New York, 1884).

MORFILL, WILLIAM RICHARD (1834-1909). An English Slavic scholar. He was educated at Oriel College, Oxford, where he graduated with a first-class in classics in 1855 and in 1889 became reader of Russian. He became professor of Slavonic languages and was appointed curator of the Taylor Institute. His excellent works on Slavic literature, language, and history include: grammars of Polish (1884), Serbian (1887), Russian (1889), Bulgarian (1897), and Czech (1898); *Russia* (1880), *Slavonic Literature* (1883), *Story of Russia* (1891; 5th ed., rev., 1904), *Story of Poland* (1893), and a *History of Russia from the Birth of Peter the Great to Nicholas II* (1902).

MORGAGNI, môr-gu'nyê, GIOVANNI BATTISTA (1682-1771) A celebrated Italian pathological anatomist, born at Forlì in Romagna. He studied at Bologna, graduating in both medicine and philosophy in 1701. In his twenty-third year he assumed the presidency of an independent medical school. In 1715 he was appointed to fill the chair of anatomy at Padua, where he remained and performed his life work as a pathologist. He is generally regarded as the founder of pathological anatomy, and his book on the *Seats and Causes of Disease* has remained a classic. Morgagni became known wherever the art of medicine was known and practiced. He was made a fellow of the Royal Society of London in 1724, of the French Academy of Science in 1731; of the Imperial Academy of St. Petersburg in 1735, and of the Academy of Berlin in 1754. His more important works are *Adversaria Anatomica*, published in six parts, the first at Bologna and Padua (1706-19, Leyden, 1741), *In Aurelium Celsum et Quantum Serenum* (Padua, 1704, 1721); *Opuscula Miscellanea* (Leyden, 1763), *De Sedibus et Causis Morborum per Anatomiam Indagatus* (Bassano, 1761). His *Opera Omnia* appeared at Bassano in 1765.

MORGAN. See MORGAN THE FAY.

MORGAN, (JAMES) APPLETON (1845-). An American lawyer and author, born in Portland, Me. He graduated at Racine College, Wisconsin (1867), and in law at Columbia (1869), and practiced from 1871 to 1886 in New York. There he founded (1885) the Shakespeare Society, of which he served as president until 1910. He edited, in 20 volumes, the *Bankside Shakespeare* (1888-92), wherein the oldest versions of the text are compared with a view to showing how the plays as they now stand are a growth from the originals, which Shakespeare himself modified, as did others after his death. In defense of his theory Morgan had already published *The Shakespearean Myth* (1880), *A Study in the Warwickshire Dialect* (1884); *Shakespeare in Fact and Criticism* (1884); *Some Shakespearean Commentators* (1885); *Digesta Shakespeareana* (1887). The *Bankside Restoration Shakespeare* appeared in 1905-08 (5 vols.), and in 1911 Morgan published as his autobiography *Forty Years*

of *Shakespeare Study and Controversy* (Somerville, N. J.). He also published *Macaronic Poetry* (1870), an anthology; *The Law of Literature* (1874); *Legal Maxims* (1877); a genealogy of his family (1880 et seq.); *The People and the Railways* (1888); *Society and the Faç* (1890); and edited several legal works, including *Addison on Contracts* (1875); *Best on the Principles of Evidence* (1876); *Forsyth on Trial by Jury* (1876).

MORGAN, CHARLES HILL (1831-1911). An American mechanical engineer and manufacturer. He was born at Rochester, N. Y., and was educated at Lancaster and Clinton (Mass.) academies. He worked as a draftsman in 1855-60, was in business at Philadelphia in 1860-64, and then served as superintendent (1864-87) and director (1876-87) of the Washburn and Moen Company, Worcester, Mass. Thereafter he was consulting engineer of the American Wire Company of Cleveland, Ohio, of which he later became vice president and director. He became president of the Morgan Spring Company in 1881 and of the Morgan Construction Company in 1891. In 1900 he served as president of the American Society of Mechanical Engineers.

MORGAN, CONWY LLOYD (1852-). A British zoologist and psychologist, born in London. He was educated at the Royal Grammar School, Guildford, and at the Royal College of Science. In 1878-83 he was lecturer in English and physical science at the Diocesan College, Rondebosch, Cape Colony. In 1884 he became professor of zoology and geology in University College, Bristol, where he was principal from 1887 to 1909 and professor of psychology after 1901. His publications include: *Animal Biology* (1887); *Animal Life and Intelligence* (1890); *Animal Sketches* (1891); *Psychology for Teachers* (1895; rev. ed., 1909); *Habit and Instinct* (1896); *Animal Behavior* (1900); *Introduction to Comparative Psychology* (1901); *The Interpretation of Nature* (1905); *Instinct and Experience* (1912); *Spencer's Philosophy of Science* (1913).

MORGAN, DANIEL (1736-1802). An American soldier prominent in the Revolutionary War. He was born in Hunterdon Co., N. J., of Welsh ancestry, removed to Virginia in 1753, served as a teamster under Braddock in 1755, and during an Indian campaign three years later was seriously wounded. He moved to Winchester in 1762 and occupied himself with farming and stock raising, but served as a lieutenant in Pontiac's War and as a captain in Lord Dunmore's War. In 1775 he was put in command of a company of Virginia riflemen, with whom he joined Washington at Cambridge in July. Accompanying Arnold's expedition against Quebec, he served with great efficiency and gallantry, both on the march and in the attack of Dec. 31, 1775, when he was captured by the enemy. He was regularly exchanged before the close of 1776; was appointed colonel of a Virginia regiment, and in 1777 played a most important part in the campaign against Burgoyne. At the first battle of Saratoga (September 19) he was, until Arnold's arrival late in the day, the ranking officer in the field; and in the second battle (October 7) he also took a prominent part. In 1778 he served in New Jersey under Washington, and in June, 1779, dissatisfied with the policy of Congress as regards promotions, he resigned; though in September, 1780, he joined

Gates at Hillsboro, N. C., as a brigadier general. He was conspicuous for his ability and energy throughout the Southern campaign, and was in chief command at the battle of Cowpens (q.v.), where he defeated Tarleton. Only 200 of the British escaped, and Morgan by forced marches rejoined Greene, in spite of the vigorous efforts of Cornwallis to head him off. Owing to bodily infirmities he was forced to withdraw from the army in August, 1781. After the war he devoted himself chiefly to farming, though in 1794 for a time, during the Whisky Insurrection, he served as a major general, and in 1796 he was elected to Congress, serving in that body as a Federalist Representative from 1797 to 1799. He died at Winchester, Va., July 6, 1802. Consult Graham, *Life of General Daniel Morgan of the Virginia Line* (New York, 1856), and McConkey, *The Hero of Cowpens* (2d ed., ib., 1885).

MORGAN, EDWIN DENNISON (1811-83). An American politician, Governor of New York from 1859 to 1863. He was born at Washington, Berkshire Co., Mass.; in 1828 he removed to Hartford, Conn., and in 1836 he settled in New York City, where he met with great success as a merchant. From 1849 to 1853 he was a member of the State Senate. He was a delegate to the first national convention of the Republican party at Philadelphia and was one of the vice presidents of that assembly. His high standing as a business man led to his being chosen chairman of the Republican National Committee. He retained the position until 1864 and ably managed the first three national campaigns in which the party participated. In 1858 he was elected Governor of New York, being the first Republican executive of the State, and was reelected in 1860. In the latter term it fell to him to supervise and control the sending of New York's quota of troops to the front in defense of the Union, and when he left office in 1863 more than 223,000 volunteers had been enlisted in the Federal service. In 1861, in order that he might better carry out the administration's desires, New York State was made a military district, and he was placed in command with rank of major general of volunteers. From 1863 to 1869 he was a member of the United States Senate, and in 1872 he was again made chairman of the Republican National Committee. He was one of the ablest and most efficient of the "war governors." He gave liberally to Union Theological Seminary, Williams College, and other institutions.

MORGAN, EDWIN VERNON (1865-). An American diplomat, born at Aurora, N. Y. He graduated in 1890 from Harvard University, where he was an assistant in history in 1892-94; studied at Berlin in 1891-92 and 1894-95; and was instructor in history at Adelbert College (Western Reserve University), in 1895-98. In 1899 he was secretary to the Samoan High Commission, and afterward he held diplomatic and consular positions at Seoul (Korea), St. Petersburg, and Dalny (Manchuria). He served as United States Minister to Korea in 1905, to Cuba in 1905-10, to Uruguay and Paraguay in 1910-11, and to Portugal in 1911-12. In the latter year he was appointed the first Ambassador from the United States to Brazil.

MORGAN, FORT. See FORT MORGAN.

MORGAN, G (BOERGE) CAMPBELL (1863-). A British Congregational preacher born in Tetbury, Gloucester, the son of a clergyman. He

was educated in the Douglas School at Cheltenham, was a master in the Jewish Collegiate School at Birmingham from 1883 to 1886, and after two years as a mission preacher was ordained to the Congregational ministry in 1889. He was pastor of churches at Stone (1889-91) and Rugeley (1891-93) in Staffordshire; the Westminster Road Church in Birmingham (1893-97) and the church in New Court, Tooting Park, London (1897-1901). He was well known in America, especially at the Northfield conferences, and in 1901-04 was extension lecturer for the Northfield Bible Conference. In 1904 he became pastor of the Westminster Congregational Chapel, Buckingham Gate, London, and in 1911 also became president of Cheshunt College, Cambridge. He edited the *Westminster Bible Record* and the *Westminster Pulpit*. Among his books are *The Life of the Christian* (1904), *The Analyzed Bible* (1910), and *God, Humanity, and the War* (1914), sermons.

MORGAN, SIR GEORGE OSBORNE (1826-97). An English lawyer and Liberal politician. He was born at Gothenburg, Sweden, studied at Oxford, where he won the Newdigate prize in 1846, graduated at Worcester in 1848, and was civil-law fellow at University College, Oxford, where he was intimate with Arthur Penrhyn Stanley, Sellar, and Clough. Morgan was called to the bar in 1853. He was elected to the House of Commons in 1868, and zealously befriended ecclesiastical and educational reform and the amendment of English land laws. In 1880 he was appointed Judge-Advocate-General during Gladstone's ministry, and in this post carried an army discipline bill which did away with flogging (1881). He was Undersecretary for the Colonies in 1886, remained in the House of Commons until his death, and held the leadership of the Welsh party. He was made Baronet in 1892.

MORGAN, GEORGE WASHINGTON (1820-93). An American soldier, born in Washington Co., Pa. In 1836 he left college to fight in the Texan War of Independence. In 1841 he entered West Point, but left in 1843, was admitted to the bar and began the practice of law at Mount Vernon, Ohio. Upon the breaking out of the Mexican War he was appointed colonel of the Second Ohio Volunteers, and later became colonel of the Fifteenth United States Infantry. For gallantry at Contreras and Churubusco the Ohio Legislature on his return brevetted him brigadier general and gave him a vote of thanks. He was appointed United States Consul to Marseilles in 1856, and from 1858 to 1861 was United States Minister to Portugal. Returning home upon the breaking out of the Civil War, he was made brigadier general of volunteers, and served for a time under General Buell. He was then put in command of the Seventh Division of the Army of the Ohio, was with Sherman at Vicksburg, and later led the expedition that captured Fort Hindman in Arkansas. Owing to ill health he resigned from the army in 1863. He was the Democratic candidate for Governor of Ohio in 1865, but was defeated. From 1869 to 1873 he served in Congress and was a member of the House committees on foreign affairs, military affairs, and reconstruction. In 1876 he was a delegate at large to the Democratic National Convention at St. Louis.

MORGAN, SIR HENRY (c.1635-88). A Brit-

ish buccaneer, born at Llanrhymny, Glamorganshire, Wales. He is said to have been kidnapped at Bristol when a boy and sold as a servant in Barbados, whence after a time he worked his way to Jamaica. There he joined the buccaneers, participated in several of their expeditions, and by 1663 was in command of a privateer of his own. In 1666 he commanded a ship under Edward Mansfield, who captured Santa Catalina, and after the death of that leader Morgan was chosen admiral of the buccaneers. In 1668 he was sent by Modyford, Lieutenant Governor of Jamaica, to Cuba. He took and sacked Puerto Principe, and then sailed to Puerto Bello, Panama, which he captured after a brilliant attack. After levying a heavy ransom Morgan sailed for Jamaica. Later in the year he led an expedition which ravaged the entire Cuban coast, and in January, 1669, with a fleet of eight ships, he started on his famous expedition against Maracaibo. The capture and sack of the town was followed by the greatest excesses on the part of the buccaneers, who were surprised in their orgies by the arrival of three Spanish ships of war. Morgan assembled his half-drunk comrades, manned his ships, and after parleying with the Spanish commander suddenly attacked him, totally defeated him, and escaped. Returning to Jamaica, he was lightly reproved by Modyford, and was at once commissioned "commander in chief of all the ships of war in Jamaica." In August, 1670, he ravaged the Cuban and mainland coasts, and in January, 1671, he captured and plundered the city of Panama, one of the richest in Spanish America. On February 14 Morgan withdrew and embarked for Jamaica. The attack had been made after a peace had been arranged between England and Spain, and in April, 1672, Morgan was sent to England on a British frigate; but he took enough gold along with him to secure his vindication, eventually receiving knighthood and high favors from the King, and in December, 1674, was sent back to Jamaica with Lord Vaughan, the new Governor, as Lieutenant Governor and commander in chief of his Majesty's forces in the colony. There he spent the remainder of his life in comparative quiet, and at two different periods served as acting Governor.

Consult: A. O. Exquemeling, *Buccaneers of America* (1684), an interesting contemporary account by one of Morgan's lieutenants, reprinted in the "Adventure Series" (London, 1891); Philip Ayres, *The Voyages and Adventures of Capt Barth, Sharp, and Others to the South Sea . . . to which is added The True Relation of Sir Henry Morgan, his Expedition against the Spaniards in the West Indies, and his Taking Panama . . .* (London, 1684); James Burney, *History of Buccaneers in America* (ib., 1816; reprinted 1902); F. R. Stockton, *Buccaneers and Pirates of our Coast* (New York, 1898); Appleton Morgan, *Genealogical History of the Family of Morgan* (ib., 1897-1902).

MORGAN, HENRY JAMES (1842-1913). A Canadian biographer and historian, born in Quebec. He was educated at Morrin College in his native city and in 1860 entered the public service. In 1873 he became chief clerk in the Department of State and in 1895 retired on a pension. Among his publications are the *Canadian Parliamentary Companion*, established in 1862 and issued until 1876; the *Dominion An-*

nual Register and Review (1878-86); *Tour of H. R. H. the Prince of Wales in Canada and the United States* (1860); *Sketches of Celebrated Canadians* (1862); *The Industrial Politics of America* (1864); *The Place British Americans have Won in History* (1866); *Bibliotheca Canadensis, or A Manual of Canadian Literature* (1867); *The Bench and Bar of Canada* (1878); *Canadian Men and Women of the Time* (1898; new ed., 1912); *Ad Multos Annos: A Tribute to Sir Charles Tupper* (1900); *Types of Canadian Women* (1903); *Canadian Life in Town and Country* (1905), with Lawrence J. Burpee.

MORGAN, môr'gan', JACQUES JEAN MARIE (1857-). A French archaeologist, born at Huisseau-sur-Cosson, Loir-et-Cher. He was educated at the Paris Ecole des Mines and, after a trip in the Indies (1882) and an expedition through the peninsula of Malacca (1884), he spent five years in southern Russia, the Caucasus, and Turkey. In 1892 he was sent to Egypt as director general of the French antiquarian service. There he made valuable discoveries at Ombos and Karnak. Transferred to Persia in 1897, he explored the Pushti Kuh Range and Mesopotamia, discovering the Ham-murapi stele. He was in Persia during the troubles of 1905-06. His works include. *Géologie de la Bohême* (1882), *Mission scientifique au Caucase* (1890); *Mission scientifique en Perse* (1894-97), *Recherches sur les origines de l'Egypte* (1896-97), *Compte rendu sommaire des travaux archéologiques, etc.* (1898); *Mémoires de la délégation en Perse* (10 vols., 1901-08), *Les premières civilisations* (1909), *Etude sur la décadence de l'écriture grecque dans l'empire perse sous la dynastie des Arsacides, etc.* (1913).

MORGAN, JOHN (1735-89). An American physician, born in Philadelphia. He graduated from the College of Philadelphia (now University of Pennsylvania) in 1757 and later studied medicine with Dr. John Redman and in London and Edinburgh (M.D., 1763). After visiting Paris, Holland, and Italy, he returned in 1765 to Philadelphia, where he established himself. He was one of the founders of the medical department of the College of Philadelphia and served as professor of the theory and practice of medicine till 1783. Appointed by Congress (1775) physician in chief to the American army and director general of the military hospitals, he joined General Washington in Cambridge. There he found the army without medical supplies and appliances and the medical staff itself of the lowest quality. His endeavor to reorganize the department by making the passing of examinations necessary before entering the army as surgeon made him many enemies and in 1777 he was dismissed by Congress without reason. In 1779, however, upon investigation of a committee, the same body honorably discharged him. He returned to Philadelphia. Dr. Morgan was the first in America to advocate the separation of medicine and pharmacy. His writings include: *A Discourse upon the Introduction of Medical Schools in America* (1765); *Four Dissertations on the Reciprocal Advantages of a Perpetual Union between Great Britain and the American Colonies* (1766); *A Recommendation of Inoculation according to Baron Dmardale's Method* (1776); *A Vindication of his Public Character in the Station of Director General of the Military Hospitals, etc.* (1777).

MORGAN, JOHN HARTMAN (1876-).

A British publicist and educator, son of a Welsh Congregational minister. He studied at the University College of South Wales, at Balliol College, Oxford, and at Berlin, was a journalist, writing leaders for the *Manchester Guardian* in 1904-05; in 1905 became a London University extension lecturer and lecturer at the London School of Economics; and after two years as lecturer, in 1908 became professor of constitutional law at University College, London. He was Liberal candidate for Parliament for Birmingham in January, 1910, and for West Edinburgh in December of the same year. Besides contributions to the reviews he edited Hallam's *Constitutional History* and wrote: *The House of Lords and the Constitution* (1910); *The Place of a Second Chamber in the Constitution* (1910), *The New Irish Constitution* (1912). In 1915 appeared his translation, with critical introduction and notes, of *The War Book of the German General Staff*.

MORGAN, JOHN HUNT (1825-64). An American soldier, prominent on the Confederate side in the Civil War. He was born at Huntsville, Ala. About five years later his father removed to a farm near Lexington, Ky. During the Mexican War Morgan became first lieutenant of Colonel Marshall's Kentucky regiment of cavalry, but saw little active service. Though he had a prosperous manufacturing business, in 1861 he abandoned it and escaped to the Confederate lines with about 200 men and the guns of the militia company of which he was captain. At first he did irregular duty, chiefly scouting, but was later made captain and placed in command of three companies of cavalry called Morgan's Squadron. With these he did duty in Kentucky and Tennessee, and to some extent in Alabama. He organized the Second Cavalry at Chattanooga in April, 1862, becoming colonel. During the summer he served with General Biagg in Tennessee and captured Lexington, Ky. His success in daring and unexpected raids was so great that he was placed in charge of a cavalry brigade, and after promotion to brigadier general made the "Christmas Raid" into Kentucky, for which he was thanked by the Confederate Congress. In June, 1863, he was ordered to attempt to draw off Rosecrans from Tennessee by an expedition into Kentucky. He exceeded his orders, and, breaking through the Union line in Kentucky, he marched north and northwest to the Ohio River and crossed to the Indiana side. He had with him about 3000 cavalry or mounted infantry and four field-pieces of artillery. He swept around Cincinnati, closely pursued by Generals Hobson and Shackelford and opposed everywhere by the militia. A sudden rise in the Ohio River allowed gunboats to reach Buffington Island and prevented him from recrossing the river. Here about 700 of his men were taken prisoners, two companies succeeded in crossing the river, and he with the remainder set out towards the Pennsylvania border to join General Lee. After an exciting chase he was captured at a place 3 miles south of New Lisbon, Ohio, and was afterward confined in the Ohio State Prison at Columbus. On November 27, with a few companions, he escaped and reached the Confederate lines in safety. In January, 1864, he was authorized to reorganize his cavalry and was assigned to the Department of Southwest Virginia. When relieved he resumed his independent command and captured Mount Sterling and Cynthiana in

Kentucky in June, but was badly defeated by General Burbridge. On September 4, in Greenville, Tenn., he was betrayed by an inmate of the house in which he was sleeping and was shot while attempting to escape. General Morgan cared little for formal military tactics, but in ability to strike silently and unexpectedly and escape before an alarm could be raised he has been excelled by few leaders of cavalry. While he destroyed public property, burned bridges, and usually took the best horses in the country, the outrages committed by him have been much exaggerated. Consult Johnson and Buel (eds.), *The Battles and Leaders of the Civil War* (New York, 1887), and B. W. Duke, *Morgan's Cavalry* (new ed., ib., 1906).

MORGAN, JOHN LIVINGSTON (1872-). An American chemist. Born at New Brunswick, N. J., he graduated from Rutgers College in 1892 and from the University of Munich (Ph D.) in 1895. He taught chemistry at Stevens Institute in 1895-96 and at the Brooklyn Polytechnic in 1896-97. At Columbia University he served as tutor from 1897 to 1901, as adjunct professor of physical chemistry in 1901-05, and thereafter as professor. He translated from the German of G. Helm *The Principles of Mathematical Chemistry* (1897), and is author of *The Theory of Solution and its Results* (1897); *The Elements of Physical Chemistry* (1899; 5th ed., revised, 1914); *Physical Chemistry for Electrical Engineers* (1906, 2d ed., 1909), and contributions to chemical journals.

MORGAN, JOHN PIERPONT (1837-1913). An American financier and art collector, the son of Junius Spencer Morgan and the grandson of John Pierpont (qqv). He was born at Hartford, Conn., April 17, 1837, and died at Rome, March 31, 1913, while abroad for his health. Educated at the English High School, Boston, and at the University of Göttingen, Germany, in 1857 he entered the banking house of Duncan, Sherman & Co. in New York City. In 1860 he became American agent for George Peabody & Co. of London, in 1864 a partner in the firm of Dabney, Morgan & Co., dealers in investment securities, and in 1871 a member of Drexel, Morgan & Co., afterward J. P. Morgan & Co. In the field of international banking and investment he early became a prominent figure, but it was to his leadership in the movement for controlling enterprise in the interest of finance that he owed his later financial primacy. The panic of 1893 greatly disturbed American railway finance, and since the Morgan house had been largely engaged in dealing in railway securities, it was natural that Mr. Morgan should be drawn into the work of reorganizing the embarrassed corporations. In this period Mr. Morgan gained still greater prominence through his organization of a syndicate to take up the issue of bonds negotiated by President Cleveland for the protection of the gold reserve. A second phase of Mr. Morgan's activity consisted in the reorganization of industrial corporations under the form of holding companies. The United States Steel Corporation was the most successful of the industrial organizations created through his efforts. Against his success here must be set the practical failure of the shipping combination and, in the same period, his failure in the Northern Securities Company. In the last decade of his life Mr. Morgan exerted a large influence in the direction of consolidat-

ing banking interests through the organization of communities of interest, etc. His work as a financier was characterized by a breadth of vision beyond that of any other American financier, and at times by a large public spirit, as in his work to restore financial stability after the panic of 1893 and his successful efforts to avert widespread disaster in 1907. At the same time it must be admitted that he subordinated other interests unduly to the financial interest. Because of the financial advantages of the mammoth corporation, he exerted his influence to create such corporations even where the legality of the proceeding was very doubtful, as in the Northern Securities case, or where technical conditions did not favor the attempt, as in the case of the shipping combination and the extension of the control of the New York, New Haven, and Hartford Railroad over all competing or cooperating transportation concerns in southern New England. On account of the heavy outlays involved in many of his consolidations and the minor technical advantages offered by them, the effect of much of his activity was to increase financial instability, although the contrary was his aim. The subordination of industry to finance through the placing of bankers upon the directorates of railway and industrial corporations, while calculated to insure financial stability, carried with it incidental disadvantages which led to a powerful popular movement against "interlocking directorates" (qv). Several years before his death he gained control of the Equitable Life Assurance Society. In 1912 Mr. Morgan testified before the Pujo Banking and Currency Committee of the House of Representatives, appointed to investigate an alleged "money trust" in Wall Street. It was thought by many that the strain he was under at this time had a permanently harmful effect on his health. The testimony was published in the same year (New York).

During his life Mr. Morgan gave liberally: to Harvard Medical School (more than \$1,000,000); to Yale; to various institutions in Hartford, especially the Morgan Memorial Building (which he built) and Trinity College; to the cathedral of St. John the Divine, New York, in connection with which he built a Synod Hall; to his church (St. George's, Stuyvesant Square) for buildings and institutional work; to the Lying-in Hospital, New York (site, buildings, and funds—a total of about \$1,500,000), and probably millions in unannounced gifts. His will, however, was not notable for benefactions. The great bulk of his estate, including his art collections, was left to his son J. Pierpont Morgan, Jr. (qv). Mr. Morgan owned one of the finest of steam yachts and in 1897-99 was commodore of the New York Yacht Club. The *Columbia*, which twice successfully defended the *America's* cup, was built, equipped, and maintained by him. A trustee of Columbia University, treasurer of the Peabody Educational Fund, and identified with numerous public enterprises, Mr. Morgan received the degree of LL.D. from Yale in 1908 and from Harvard in 1910, and in 1911 was decorated with the grand cross of the Red Eagle of Germany.

Mr. Morgan was the greatest art collector of his day, his collections being the largest, most varied, and many of them individually the most important, owned by a single individual. Indeed, the *London Times* once said of him: "J.

Pierpont Morgan is probably the greatest collector of things splendid and beautiful and rare who has ever lived. There is no one with whom we can compare him, except, perhaps, Lorenzo de' Medici, and he surpasses even that prince in the catholicity of his taste." It should be said that it was the historic and romantic aspects of art rather than the aesthetic that claimed his attention. Among the treasures which he reserved for private enjoyment were a unique collection of important manuscripts and rare and handsomely bound editions of books, for which he built a very beautiful library adjoining his home in New York. In 1913 most of his other collections were placed on exhibition, as a loan, in the Metropolitan Museum of Art (q v), of which he was president and to which he gave much of his personal attention. Thirteen galleries had been arranged to house the many rare specimens of Byzantine and Gothic enamels and ivories, small bronzes and marbles of the Italian Renaissance, ecclesiastical metal work, rock crystals, a large collection of Flemish tapestries, one of the finest collections of miniatures in the world, and many paintings by masters of the first rank, particularly old English masters. The important wing of decorative arts in the Museum was made possible by Mr. Morgan's loans and generous donations. His vast collection of porcelains, probably the finest in America, as well as the French furniture and objects of decorative art and the paintings of the celebrated Fragonard room, were sold by his son, early in 1915, the paintings to H. C. Frick (q v). Elaborate catalogues of most of his collections were published at the expense of the elder Morgan. For a brief description, consult the catalogue published by the Metropolitan Museum of Art (New York, 1914). For much valuable material on Mr. Morgan's life and his importance in various fields, consult the *New York Evening Post* for March 31, 1913.

MORGAN, JOHN PIERPONT (1867- -). An American banker, son of John Pierpont Morgan (1837-1913). He was born in New York City and graduated from Harvard University in 1889. He became a member of J. P. Morgan & Co., New York, and of Morgan, Grenfell & Co., London, and a director or officer in many corporations. Upon his father's death he inherited the major portion of his great fortune, including his art collections, and succeeded him as director of the New York Central and Hudson River Railroad. He became a trustee of the New York Trade School and governor of the Peabody Donation Fund of London. In 1913 he was elected a director of the New York, New Haven, and Hartford, but he resigned the next year, when the financial methods of that railroad became generally known and criticized. His house was responsible for very large loans to foreign governments during the European War (1914 et seq.) and also served as chief agent for Belgian relief funds. In 1915 Mr. Morgan sold control of the Equitable Life Assurance Society to Gen. T. Coleman Du Pont, of the powder-manufacturing family. In July of the same year, while at his country place on Long Island, he was shot (but not seriously injured) by a war-crazed fanatic.

His sister, ANNE MORGAN, devoted herself to philanthropic and social work, especially in connection with the woman's department of the National Civic Federation. Her activity in a variety of good causes brought her a medal from

the National Institute of Social Science in 1915. She published *The American Girl* (1915).

MORGAN, JOHN TYLER (1824-1907). An American statesman, born at Athens, Tenn. He was educated in Alabama, whither he removed with his parents in 1833. There he studied law and in 1845 was admitted to the bar. He early won wide repute as a lawyer and campaign speaker, and in 1861 was a delegate from Dallas County to the Alabama State Convention which passed the ordinance of secession, and in May of the same year he enlisted as a private in the Fifth Alabama Infantry, of which he ultimately became lieutenant colonel. In 1862 he recruited the Fifty-first Alabama Regiment and became its colonel. In the next year he was promoted to be brigadier general and in this capacity served with considerable distinction under General Johnston. After the war he resumed his law practice at Selma, Ala., and again entered politics in 1876 as an elector at large on the Tilden ticket. In 1877 he was elected to the United States Senate, of which body he remained a member, receiving his sixth election in 1907. He was one of the foremost leaders of the Democratic party in debate, and, as such, showed himself interested in a great variety of subjects. In 1892 he was appointed a member of the Board of Arbitration to settle the Bering Sea fisheries dispute; and in 1898 he served on the commission to prepare a system of laws for the Hawaiian Islands. For a number of years he was chairman of the committee on foreign relations. During the agitation concerning Cuba, he was an eloquent and popular champion of Cuban freedom. As chairman of the committee on interoceanic canals he strongly favored the Nicaraguan route in preference to that across Panama—a position which caused his removal from the chairmanship.

MORGAN, JUNIUS SPENCER (1813-90). An American financier, born at West Springfield (now Holyoke), Mass. He was the father of John Pierpont Morgan. From about 1836 to 1853 J. S. Morgan was in the dry-goods business, for the last two years of this period as member of the firm of J. M. Beebe, Morgan & Co. of Boston, a large house. In 1854 he became a partner in the English banking house of George Peabody & Co. Ten years later he succeeded Peabody as head of the firm and changed its name to J. S. Morgan & Co. Under his direction it became one of the leading private concerns of its kind in the world. Morgan left about \$10,000,000. He gave largely to Trinity College, Hartford. In 1836 he married Juliet, the daughter of John Pierpont (q v.).

MORGAN, LADY (SYDNEY OWENSON) (?1783-1859). A novelist, daughter of Robert Owen-son, a theatrical manager. She was born in Dublin on Christmas Day, 1785, if we are to believe her. Croker mischievously alleged that she was born on the Dublin packet in 1775. For a while she mingled with theatrical people or with the mixed society frequented by her father in Dublin. Her father's affairs becoming involved, the clever girl resolved to support the family, first as governess and then as author. In 1812 she married Sir Thomas Charles Morgan, a distinguished surgeon. Though the Morgans lived for the most part in Dublin, they made two continental tours, and often visited London, where they settled in 1839. For her services to literature a government pension was granted to Lady Morgan in 1837. She died

April 14, 1859. Throughout her life Lady Morgan was widely known in society for her wit and her affectations. Her works, comprising novels, travels, and biographies, were savagely attacked by the reviewers, but they brought her a considerable fortune. They were indeed ephemeral, the novels gushing and sentimental or perfervidly patriotic and satirical. Among her novels are: *St. Clair, or the Heiress of Desmond* (1801), a sorry imitation of Goethe's *Sorrows of Werther*; *The Wild Irish Girl*, a silly rhapsodical book not without descriptive power (1806); *O'Donnell* (1814), Lady Morgan's protest, in the way of fiction, against the penal laws; *Florence McCarthy* (1816); *The O'Briens and the O'Flahertys* (1827). Of her travels, *France* (1817) was much read and criticized. Her main right to consideration is that she wrote English words for Irish melodies, an example soon followed to their great advantage by Thomas Moore and Stevenson. Consult Fitzpatrick, *Lady Morgan* (London, 1860); *Memoirs of Lady Morgan* (an autobiography), edited by Dixon (ib, 1862); H. S. Krans, *Irish Life in Irish Fiction* (New York, 1903).

MORGAN, LEWIS HENRY (1818-81). An American ethnologist, born near Aurora, N. Y., Nov. 21, 1818. He graduated from Union College in 1840, and after a course in law, completed in 1844, he formed a successful partnership with his classmate, afterward Judge George F. Danforth, in the city of Rochester. Upon leaving college, he organized a society of young men in Aurora styled the Grand Order of the Iroquois. The limits of the Grand Order were to be the territory anciently occupied by the Iroquois, and branch societies were to be established wherever an Iroquois tribe was known to have lived, with chapters standing for the Indian gentes. To show his profound interest in the organization, young Morgan went and lived among the existing tribes, in order to master their social organizations and forms of government. Morgan's scientific interests assumed a more substantial form in the now celebrated work, *The League of the Ho-dé-no-san-nee or Iroquois* (1851, new ed. by H. M. Lloyd, 1904), in which the author, unconscious of the immense diffusion of the system, traced the social organization, government, daily occupations, and customs of this wonderful league. During this early period Morgan also studied and described the Iroquois art products and implements of daily life in the cabinet of natural history in Albany.

In 1856 Morgan made the acquaintance of Henry and Agassiz, who warmly urged him to continue his studies. In 1858, during a visit to Marquette on business, Morgan discovered, in visiting a camp of Ojibwa, that their system of kinship was essentially the same as among the Iroquois. This was the revelation that determined Morgan's enduring fame. In 1868 the Smithsonian Institution published the result of eight years' uninterrupted research, travel, and correspondence, his *Systems of Consanguinity and Affinity of the Human Family*, a work essential to all studies on primitive sociology. His *Ancient Society* (1877) was a comprehensive and philosophical work, the result of 20 years' pursuit of a unique and engrossing inquiry. This book has exerted a well-nigh unparalleled influence on the conceptions of historians, sociologists, and students of kindred branches of knowledge, while through the cham-

pionship of such men as Bebel and Engels it has likewise become a popular classic in Socialistic circles. Morgan was not wholly absorbed in ethnological work, but also engaged in political life, serving twice as a member of the New York Legislature. In 1880 he was elected president of the American Association for the Advancement of Science. Besides the works already mentioned he published *The American Beaver and his Works* (1868) and *Houses and House Life of the American Aborigines* (1881). He left \$80,000 to help establish a woman's college at the University of Rochester. His death occurred Dec. 17, 1881.

Estimates of Morgan's work have ranged from servile adulation to withering contempt. He was certainly an accurate, painstaking recorder of facts, with a Darwinian faculty for collating related data, and an undoubted sense for the importance of phenomena others neglected. It has been truly said by Dr. Rivers that in the range of science hardly any discovery can be put down more certainly to the credit of one man than Morgan's discovery of the classificatory system of relationship. On the other hand, Morgan fell under the influence of the earlier evolutionists and thus came to sketch a unilinear scheme of cultural development, with a fixed sequence of stages, which is not in accord with the results of later inquiry. Deficient in logical rigor, he failed to realize the inconsistencies in his schemes of evolution and lacked a sense for form, so that his greatest work, *Systems of Consanguinity and Affinity*, is most unattractive, because of its diffuseness, irrelevancy, and clumsy arrangement. Nevertheless, his place in the history of anthropology will ever remain a high one since his labors have been the point of departure for most modern speculation and concrete research on social evolution.

MORGAN, MATTHEW SOMERVILLE (1839-90). An Anglo-American graphic artist and scene painter, born in London. He was first a scene painter alone, but afterward became artist and correspondent for the *Illustrated London News* and subsequently editor and proprietor of the *Tomahawk*. Many of his best comic drawings were done for this journal. Morgan, Burnand, Gilbert, and others founded *Fun*, to which Morgan contributed a number of cartoons on the American Civil War. He came to America in 1870 as special artist for Frank Leslie, the publisher, and was a theatrical manager in New York City for several years. He also managed a lithograph concern in Cincinnati (1880-85), and while there established the Matt Morgan Pottery Company and formed the Art Students' League. His influence in America was greatest in the domain of the poster and of scene painting, in which he showed great skill and originality.

MORGAN, MAUD (1864-). An American harpist. She was born in New York City and studied music under her father, George Washbourne Morgan, Alfred Toulmin, and the Belgian harpist, Chevalier Charles Oberthur. She made her debut as a harpist in a concert with Ole Bull in 1875; thereafter appeared in all the important American cities; was conductor of the Lenox Choral Society for seven years; and after 1895 served as harpist in Grace Church, New York.

MORGAN, MORRIS HICKY (1859-1910). An American classical scholar, born at Providence, R. I. At Harvard, where he graduated in 1881

and took the degree of Ph.D. in 1887, he became tutor, then assistant professor, and in 1899 succeeded F. D. Allen in the chair of classical philology. He devoted himself especially to the study of the Roman satirist Persius, Vitruvius, the Roman engineer and architect of the time of Augustus, and to various phases of Roman life. Evidence of his interest in Persius is seen in his *A Bibliography of Persius* (1909). He published papers on Vitruvius in various periodicals and in his *Addresses and Essays* (1910), and his translation of this author, nearly complete at his death, was published, with illustrations and original designs by H. L. Warren, in 1914. He edited also *Eight Orations of Lysias* (1895), and was editor, with W. W. Goodwin and J. W. White, of a school edition of Xenophon, *Anabasis* i-iv, which contains an admirable *Dictionary to the Anabasis*, by Morgan and White (1891, 1896). Consult H. W. Prescott, *Classical Philology*, vol ii, p 357 (Chicago, 1910), and B. L. Gildersleeve, *American Journal of Philology*, vol xxxi, pp. 243-244 (Baltimore, 1910).

MORGAN, TALI ESEN (1858-). An American choral conductor. He was born at Llangynwyd, Wales, but came to the United States in 1876. In 1879 he was publisher of the *Cambro-American* at Scranton, Pa., and for six years he edited a prohibition organ, *The People*. He began as a musical conductor in 1874, was engaged by Walter Damrosch in 1887, and after 1888 had charge of the Ocean Grove (N. J.) Festival under Anton Seidl. In 1898 he became manager and director of the Ocean Grove Summer Music Festivals, and later served as conductor of the New York Festival Chorus. He became editor and publisher of the *American Musical Times* and president of the International Correspondence School of Music.

MORGAN, THOMAS HUNT (1866-). An American zoologist, born at Lexington, Ky. He graduated at the State College of Kentucky in 1886 and received his Ph.D. degree at Johns Hopkins in 1891. He was professor of biology at Bryn Mawr College from 1891 to 1904 and thereafter professor of experimental zoology at Columbia University. He served as president of the American Society of Naturalists in 1909. His work includes highly important researches in the fields of embryology, regeneration, and heredity, published in various monographs and in such books as *The Development of the Frog's Egg* (1897), *Regeneration* (1901), *Evolution and Adaptation* (1903); *Experimental Zoology* (1907); *Heredity and Sex* (1913; new ed., 1915).

MORGAN, WILLIAM (c.1775-c.1826). An American Mason, whose disappearance under peculiar circumstances in 1826 caused the organization of the Antimasonic party. He was born probably in Culpeper Co., Va., and is said to have served under General Jackson in the defense of New Orleans, and afterward settled in York, Upper Canada, removing thence to Batavia, N. Y. In 1826, shortly after news had spread abroad that he intended, in conjunction with one David C. Miller, to publish a book exposing the secrets of Freemasonry, he suddenly disappeared and, despite much search, was never seen again. It was charged that he had been kidnaped and murdered by Masons, but whether this was true is not known certainly to this day. He was traced with some degree of certainty to Fort Niagara, whither he was said to have been conveyed by Masons in a closed carriage and

where he was said to have been imprisoned for a time. It was alleged that, refusing to withdraw his book or to give an oath of secrecy, Morgan was finally drowned by his abductors in Lake Ontario. A body found near Fort Niagara was for some time supposed to be his, but was later shown to be that of another man. It was in reference to this body that Thurlow Weed, recognizing the political value of the Antimasonic excitement, remarked that it was "a good enough Morgan until after election"—a phrase which has since been frequently used in American politics. Concerning Morgan's disappearance, which caused profound excitement throughout the North, much has been written. His book, *Illustrations of Freemasonry, by One of the Fraternity who has Devoted Thirty Years to the Subject*, was published in 1826, and was republished at various times thereafter, sometimes under the title *Freemasonry Exposed and Explained* (new ed., 1912). Consult Robert Morris, *History of the Morgan Affair* (New York, 1852); S. D. Greene, *The Broken Seal, or Morgan's Abduction and Murder* (Boston, 1870); Mackey and Singleton, *History of Freemasonry*, vol vi (New York, 1898). See ANTIMASONS.

MORGAN, SIR WILLIAM (1829-83). An Australian statesman, born in Wiltshampstead, England. He went to South Australia in 1848, made some money in the Bendigo gold diggings in 1851, and then settled at Adelaide as a merchant. An independent politician, he was elected to the Legislative Council in 1869 and in 1875 represented the cabinet in that body. After the defeat of the Colton ministry in 1877, which was largely due to Morgan's efforts, he was Chief Secretary under Boucaut, and from 1878 to 1881 was Premier, showing much ability and honesty. He was styled the "Colbden of South Australia."

MORGANATIC MARRIAGE (ML. *morganaticus*, relating to the morning, from Olig. *morgan*, Ger. *Morgen*, AS *morgen*, morning, perhaps connected with Ochurch Slav. *mirknati*, to become dark, *mirkā*, darkness, or with Lith. *meikti*, to blink, Gk. *μαρμαίπειν*, *marmarein*, to shine). When a member of a reigning house, who by law can contract a perfect marriage only with a woman of equal rank, wishes to marry a woman of inferior rank, he may contract what is called a morganatic marriage. In Germany those families that were reigning families at the close of the eighteenth century and that have retained their rank in spite of the loss of political power—the so-called "mediatized houses" or "high nobility"—are similarly restricted in the matter of marriage; and members of these families may also contract morganatic marriages.

A morganatic marriage is not a mere concubinage, nor may it exist simultaneously with a perfect marriage. From the ecclesiastical point of view and from certain legal points of view it is a perfect marriage. It is defective chiefly in public law. The morganatic wife does not acquire and the children do not inherit the rank of the husband and father, although, when the husband is a reigning prince, it is usual to give to the morganatic wife and her children titles of nobility. The children do not succeed to the father's public position, or to the property which goes with that position, or to family property (entailed estates). In some states neither the morganatic wife

nor her children have rights of succession even in the private property of the husband and father, except by testamentary provision or by antenuptial settlements.

The roots of the morganatic marriage go back to early German law. A perfect marriage was concluded only when the husband bought the *mundum*, or marital authority, over his wife, at first by a payment to the father or guardian, later by a settlement upon the wife, which was frequently described as "widowhood." A further gift or settlement upon the wife might be made in the form of a "morning gift" (*Morgengabe, dos morganatica*). In the case of an imperfect marriage without *mundum* only the morning gift was made. The Church, however, treated the imperfect marriage as a marriage, although it was unable to determine the civil results. When an ecclesiastical ceremony took place it was not unusual for the man to give the bride his left hand, whence the name "left-hand marriage." For the history of the morganatic marriage, consult Schröder, *Deutsche Rechtsgeschichte* (1889), pp. 293, 294, and works there cited. For modern law, Niebelschütz, *De Matrimonius ad Morganaticam* (1851).

MORGAN CITY. A city and port of entry in St. Mary Parish, La., 70 miles west by south of New Orleans, on Morgan's Louisiana and Texas Railroad (Map Louisiana, G 7). It is on the Intercoastal Canal, on Berwick Bay, and on the Atchafalaya River, which extends from Grand Lake to the Gulf of Mexico, 20 miles distant; has regular steamship connection with important Gulf ports, and has extensive sugar, lumber, fish and oyster, and truck-gardening interests. A trade is also carried on in live stock, fur and hides, moss, canned goods, and sirup. Among the city's noteworthy features are the city hall, courthouse, and high-school buildings, Elks Home, Lawrence Park, and Forts Star and Buchanan. The water works and sewage system are owned by the municipality. Here, on June 23, 1863, Richard Taylor, with about 3000 Confederates, captured the Federal garrison of about 1000, secured property worth \$2,000,000, and recaptured a large number of refugee blacks. The city was soon afterward abandoned by the Confederates and reoccupied by Federals. Pop., 1900, 2332; 1910, 5477.

MOR'GANFIELD. A city and the county seat of Union Co., Ky., 23 miles southwest of Henderson, on the Illinois Central and the Louisville and Nashville railroads (Map: Kentucky, C 4). It has tobacco stemmeries and manufacturing of carriages and wagons, gates, furniture, tile, brick, flour, etc. St. Vincent's Academy (Roman Catholic) is here, and there is a fine high-school building. The water works are owned and operated by the city. Pop., 1900, 2046; 1910, 2725.

MOR'GANITE. A rose-red variety of beryl (q.v.).

MORGANNWG, mōr'gān-nōōg, lolo. See WILLIAMS, EDWARD.

MORGAN PARK. Formerly a village in Cook Co., Ill., and a residential and educational suburb of Chicago, from the centre of which it was 14 miles distant. Morgan Park was first incorporated in 1884 and became a part of the city of Chicago in April, 1914.

MORGANTE MAGGIORE, mōr-gūn'tā mā-jō'rā, ll. A metrical romance by Luigi Pulci (q.v.).

MOR'GAN THE FAY. An important figure in mediæval romance, whose origin is probably to be traced to Celtic mythology. In the *Vita Merlini*, ascribed to Geoffrey of Monmouth, she is mentioned as the eldest of nine sisters who inhabit the fortunate "Insula Pomorum." She is said to be very learned in the art of healing and to be endowed besides with the mysterious powers of changing shape and of flying like a bird. To her, according to the same account, the wounded Arthur was borne after the battle of Camlan. Morgan played a similar part in romances of other cycles. Thus, in the story of "Ogier le Danois" she receives the aged Ogier in the island of Avalon and restores him to youth, and in the "Orlando Innamorato" of Boiardo there is a long account of her splendid abode at the bottom of a lake. In Italy her name has been popularly applied to a form of mirage. (See FATA MORGANA.) In the Celtic romances she is said to be a sister of King Arthur. The origin of her name and character is uncertain. It has been proposed to identify the nine sisters of the "Insula Pomorum" with the nine priestesses of Sena described in the ancient account of Pomponius Mela. From a different point of view Morgan has been connected with the Irish *Muirgen*, better known by the name *Liban Morgan*, like *Muirgen*, may mean "sea-born," and both persons have something to do with the world beneath the waves. But this theory (proposed by Professor Rhys) will not account for all the features of the story. The whole subject has been investigated in a study by Dr. L. A. Paton, who holds that Morgan's name and part, at least, of her characteristics are derived from the Irish *Morrighu*, a kind of battle goddess. Consult Miss Paton's dissertation, *Studies in the Fairy Mythology of Arthurian Romance* (Boston, 1903). For Rhys's view consult his *Arthurian Legend* (London, 1887).

MOR'GANTON. A city and the county seat of Burke Co., N. C., 60 miles by rail east of Asheville, on the Southern Railroad (Map: North Carolina, A 2). It has the State Hospital for the Insane and the North Carolina School for the Deaf and Dumb. It has considerable reputation as a health resort, and contains a private sanitarium. Among the principal manufacturing are cotton mills, tanneries, lumber mills, canning and furniture factories, and machine shops. In the vicinity there are deposits of gold and silver. Morganton has adopted the Commission form of government. The water works and electric-light plant are owned by the city. Pop., 1900, 1938; 1910, 2712.

MOR'GANTOWN. A city and the county seat of Monongalia Co., W. Va., 101 miles by rail south of Pittsburgh, Pa., on the Monongahela River and on the Baltimore and Ohio and the Morgantown and Kingwood railroads (Map: West Virginia, D 2). It has a fine courthouse and the West Virginia University (q.v.), established in 1868. There are extensive glassworks, furniture factories, tin-plate, planing, and flour mills, and brick and tile works. The city is in a rich agricultural, timber, natural-gas, and mineral country, coal, iron, limestone, timber, clay, and glass sand being found in large quantities. Cheat River, near here, is a resort of great scenic beauty. Morgantown was incorporated in 1783 by the Legislature of Virginia. Its growth has been rapid. Pop., 1900, 1895; 1910, 9150. 1914 (U. S. est.), 12,239.

MORGARTEN, mör'gär-ten. A mountain slope on the boundary of the cantons of Schwyz and Zug, Switzerland, celebrated as the scene of a victory won by the Swiss forest cantons over a numerically superior force of Austrians, Nov. 15, 1315. The cantons had formed a league in 1291 and took the side of the Emperor Lewis the Bavarian in his struggle against Frederick, the Hapsburg claimant. The latter's brother, Duke Leopold, determined to punish the Swiss who had been subject to the Hapsburg. Little is known of the events of the battle.

MORGEN, mör'gen, CURT VON (1858-). A German soldier and explorer, born at Neisse (Silesia), Prussia. He was educated for the army at Wahlstatt and Berlin and in 1889 took charge of an expedition for the exploration of Kamerun. On November 5 he left Kribi on the coast of Batanga. He discovered the Mham River, the principal tributary of the Sanaga, and proceeded along the Sanaga as far as Malimba. On June 2, 1890, he again set out from Kribi. During this second expedition he penetrated to Tibati, and thence to Ibi on the Benue, from which point he descended the river to Akassa, on the coast. He returned to Europe, but went again to Africa in 1894 and in 1896-97 fought with the English army against the Mahdi, and in the latter year witnessed the Græco-Turkish War from the headquarters of the Ottoman army. From 1897 to 1901 he acted as military attaché of the German embassy at Constantinople. In 1904 he was raised to the nobility and in 1912 became major general and commander of the Eighty-first Infantry Brigade.

MORGENSTERN, mör'gen-störn, CHRISTIAN (1805-67). A German landscape painter and etcher, born in Hamburg. He studied in his native city under Bendixen, and, after visiting Norway and studying for a time at the Academy of Copenhagen, settled in 1830 at Munich. His early work, in its simplicity and intimate feeling, was unique for that day in Germany and exercised a strong influence over the Munich landscape school. His best paintings are quiet, homely scenes, in sunshine or moonlight, of the Bavarian plateau, the beauties of which he was the first to discover. His mountain landscapes are less noteworthy. He also painted Alsatian views and marines. Among his works in public galleries are: "Mill in Sainte Marie Valley, Alsace" (1836, Hamburg Gallery); "April Day on Lake Starnberg" (1853, Leipzig Museum); "Norwegian Marine" and "Moonlight in Patenkirchen" (both in New Pinakothek, Munich).

MORGENSTERN, LINA (BAUER) (1830-1909). A German social reformer, born at Breslau. At 18 she had organized a league to aid poor school children of Breslau and shortly after her marriage to Dr. Theodor Morgenstern in 1854 a league to aid workmen, and in 1859 she founded the Berlin Kindergarten Association, of which she was president in 1860-66. The Berlin Public Kitchens established by her in 1866 to relieve economic distress were imitated in other large German cities and constitute her most notable achievement. Frau Morgenstern founded also a society for the protection of illegitimate children, an academy for the instruction of young women in useful arts (1869), the Berlin Workingwomen's Union, and the Berlin Housekeepers' Union (1873). She is author of *Die kleinen Menschen—101 Geschichten* (2d ed., 1864); *Der Kindergarten und die Schule* (1874), *Die Frauen des 19. Jahrhunderts* (3 vols., 1888-

91); *Frauenarbeit in Deutschland* (2 vols., 1893); *Das Paradies der Kindheit* (5th ed., 1889); *Universalkochbuch* (7th ed., 1898), *Hilfsbuch zur Gründung, Leitung, und Kontrolle von Volkskuchen* (3d ed., 1900); *Der hausliche Beruf* (6th ed., 1902).

MORGENTHAU, HENRY (1856-). An American lawyer, business man, and diplomat, born at Mannheim, Germany. He came to the United States in 1865, studied at the College of the City of New York, and graduated from Columbia Law School in 1877. He was a member of the law firm of Lachman, Morgenthau, & Goldsmith, New York, from 1879 to 1899; served as president of the Central Realty Bond and Trust Company from 1899 to 1905 and of the Henry Morgenthau Company (a realty firm) in 1905-13, and became president of the Herald Square Realty Company and director of the Underwood Typewriter Company. He was president of Mount Sinai Hospital, of the Bronx House settlement, and of the Free Synagogue in New York. An active and prominent member of the Democratic party, a liberal contributor to its funds, and an enthusiastic supporter of Woodrow Wilson, he was made chairman of the finance committee of the Democratic National Committee in the campaign of 1912, and in the following year he was appointed Ambassador to Turkey. After that country had entered the European War in support of Germany and Austria, Morgenthau assumed charge of the British interests in Turkey and won commendation for his vigorous insistence on the observance by the Turkish government of the rights of British refugees.

MORGES, mörzh. A town in the Canton of Vaud, Switzerland, 6 miles west of Lausanne, on Lake Geneva and on a branch of the Jura-Simplon Railway (Map. Switzerland, A 2). There are Reformed and Catholic churches, a college with a Realschule, a casino with a library and a museum of natural history, an industrial school, and a high school for girls. The town contains an old château (twelfth century), once the seat of the Bernese governors and now used as an arsenal, and near by is the château of Vufflens, said to have been erected by Queen Bertha of Swabia. The chief industry is wine making. Pop., 1900, 4438, 1910, 4594, about 500 of whom are Roman Catholics.

MORGHEN, mör'gen, RAFFAELLO (1758-1833). An Italian line engraver. He was born at Florence, June 19, 1758, the son of Filippo Morghen, who was his first teacher. He also studied at Rome under Volpato, whose daughter he married in 1781. Morghen worked in conjunction with his father-in-law, assisting him in his engravings of Raphael's paintings, among which "The Miracle of Bolsena" is entirely by Morghen. He was appointed professor at the Academy in Florence in 1793, became a member of the French Institute in 1803, and visited Paris in 1812, at the invitation of Napoleon, who conferred many honors upon him. His best-known works include Francis de Moncade, after Van Dyck, the "Aurora," after Guido Reni, "Madonna della Sedia" and "Transfiguration," after Raphael; "Diana Hunting," after Domenichino, the "Last Supper," after Leonardo. Of special interest also are his portraits of Dante, Petrarch, Boccaccio, Ariosto, Tasso, Alfieri, Raphael, etc. Though possessing great suavity and purity of line and high finish, his work is lacking in color and in spirit, and his great reputation has now

somewhat declined. His life and all his works, comprising 252 plates, are fully described by his pupil Palmerini in *Catalogo delle opere d'intaglio di Raffaello Morghen* (Florence, 1824). See Plate of PETRARCH.

MORGIANA, mōr'gi-ā'nā. A female slave, belonging to Cassius and then to his brother, in "Ali Baba and the Forty Thieves," a story in the *Arabian Nights Entertainments*.

MORGUE (Fr., originally the inner wicket of a prison, where prisoners were kept for some time, that the jailers and turnkeys might view them at their leisure, so as to be able to recognize them when occasion required, from *morguer*, to look at solemnly or sourly, to defy). The name designates a building, erected for this purpose, where the unknown dead found in the territory of a city are kept for a certain period for identification. There is no general rule for the preservation of such bodies, but usually they are placed on ice while the clothes and other property are exposed for view also, together with a short history of the circumstances of finding the body. If there are no legal complications, the body, upon proper identification, is turned over to the claimant. Unclaimed bodies are given to medical institutions or buried at the expense of the city. The name was first given to a building in Paris which in the middle of the fifth century was part of the Châtelet and was used for the keeping and identification of unknown corpses. In 1804 the morgue, after the prisons in the Châtelet had been closed in 1792, was removed to an old, two-story building on the Quai du Marché Neuf, and in 1864 to a building erected for this purpose and situated on the extreme point of the Île de la Cité. Morgues have been established in all large cities—in Boston, in 1851, in New York, in 1866, in Brooklyn, in 1870, in Chicago, in 1872; in St. Louis, in 1874; etc.

MORHOF, mōr'hōf, DANIEL GEORG (1639–91). A German literary historian, born at Wismar. He studied law and the humanities at Rostock, where in 1660 he became professor of poetry. In 1665 he was called to the chair of oratory and poetry at Kiel and in 1673 became also professor of history and in 1680 librarian. His *Opera Poetica* (1677) and *Deutsche Gedichte* (1682) are valueless, but his two prose works, *Unterricht von der Deutschen Sprache und Poesie* (1682) and *Polyhistor* (1688) are of considerable interest in the history of literature. The former contains perhaps the first historical treatment of German grammar and a review of what was then modern European literature. The *Polyhistor*, which deals with general literature and is encyclopædic in scope, marks the first systematic study in Germany of the history of literature. Consult article by Lihencron in the *Allgemeine deutsche Biographie*, vol. xxii, pp. 236 et seq.; also Eymér, *Morhof und sein Polyhistor* (Vienna, 1893).

MORI, mō'rē. The surname of the lords of Chosu in Japan. The chief of the clan was foremost in the antforeign agitation which sought to close Japan again to the world (1858–67), after the demand for admission made by Commodore Perry, and in 1863 became known through his action in firing upon Dutch and American merchantmen passing through the Straits of Shimonoseki. In consequence, a squadron was formed and the town of Shimonoseki was bombarded. This helped to convince the Japanese that resistance was impossible and

that the ancient policy of seclusion must be reversed. Mori continued the agitation, however, directing it against the government of the Shogun, and was one of the chief factors in the restoration of the Emperor to supreme power. Since the revolution of 1868 the clansmen of Chosu have been highly influential in the government, and as active in the adoption of Western civilization as they had been previously in opposition to its introduction.

MORI, ARINORI, or YUREI (1848–89). A native of Satsuma, Japan, and one of the group of young samurai who were prominent in advocating the thorough modernization of the Empire after the restoration of the Emperor. Educated in England, he adopted modern manners in life and thought and broke completely with the past. He held various high positions in the diplomatic and civil services and became finally Minister of Education. He was raised to the peerage in 1889, with the title viscount. When the constitution of Japan was promulgated, giving the Empire its place among progressive peoples, he was assassinated in his own house by a Shinto fanatic, who charged him with violating the sanctity of the shrine in Ise by lifting the curtain before the holy place with his cane.

MORI'AH. The name of the land whither Abraham was commanded to go to sacrifice his son Isaac upon a mountain, according to the Masoretic text of Gen. xxii. 2, and of the mountain upon which Solomon built the temple, according to 2 Chron. iii. 1. It is possible that the Chronicler understood the passage in Genesis as affirming that Abraham's sacrifice was made in Jerusalem. He no doubt found "the mountain of Moriah" as a designation of Zion, and it may already in his time have been popularly interpreted to mean "the mountain of vision," as it was by the Samaritan translator, Symmachus, and by Jerome. At an earlier time it may have been pronounced *moreh Yah* and signified "Yah is an oracle giver," or "the Moriah" may have meant "the oracle." How old this name of the temple mountain is cannot be determined. If the Masoretic text is sound, Gen. xxii. 2 refers to one of the mountains "in the land of Moriah." This particular shrine seems to be called *Yahwe yireh* (Yahwe sees) or *Yahwe yereh* (Yahwe gives oracles). The divine name, however, is not certain, and it may have been *Yereh El* or *Yereh El*. Cheyne looks for this sanctuary in the Negeb (q.v.), and Gunkel thinks that it is identical with the Jeruel near Tekoa mentioned in 2 Chron. xx. 16, though he admits that the distance from Beersheba does not preclude the identification with Jerusalem, and regards Ariel, a name of Jerusalem, as a corruption of Jeruel. It is possible that *Yahwe yereh* is an explanation of the meaning of Moriah, or that "the Moriah," "the oracle," is an appellative designation of a sanctuary also known by the kindred name Jeruel. But it is not certain that the original text in Gen. xxii. 2 had "the land of Moriah." The Syriac version suggests that the original reading was "the land of the Amorites." "Amorites" corresponds to the Assyrian Amurru or Martu, and the dropping of the prosthetic aleph can be easily accounted for. This explanation has the advantage of being based on very excellent ancient testimony to the pre-Masoretic text. Consult: August Dillmann, *Die Genesis* (6th ed., Leipzig, 1892); H. Gunkel, *Genesis* (Göttingen, 1901; 3d ed., 1910); T. K. Cheyne, article "Moriah," in *Encyclopædia Biblica*, vol. iii (New

York, 1902); S. R. Driver, *Genesis* (7th ed., London, 1909); John Skinner, *Genesis* (ib., 1911).

MORIALE, FRA. See MONTREAL D' ALBANO.

MORIER, mō'ri-ēr, JAMES JUSTINIAN (c.1780-1849). A British diplomat, author, and traveler, born at Smyrna. He was educated at Harrow and in 1807 became private secretary in Sir Harford Jones's mission to the Persian court. On May 7, 1809, three months after his arrival at Teheran, he was sent home with dispatches and performed a famous journey; of this he afterward published an account under the title *A Journey through Persia, Armenia, and Asia Minor to Constantinople in the Years 1808 and 1809* (1812). This book enjoyed a great vogue in Great Britain and was translated into French (1813) and German (1815). In 1818 he wrote also *A Second Journey through Persia*. In 1810 he went back to Teheran as Secretary of Legation under Sir Gore Ouseley, and after the latter's return to England in 1814 Morier acted for a time as British representative at the court of Persia. He was recalled in 1815. In 1817 he was pensioned by the government and devoted most of his time thenceforth to literature, in which pursuit he attained such success that Sir Walter Scott styled him the best novelist of the day. His best novels are *The Adventures of Hajji Baba of Ispahan* (1824; new ed., 1914); *Zohrab the Hostage* (1832); *Ayasha, the Maid of Kars* (1834).

MORIER, SIR ROBERT BURNETT DAVID (1826-93). An English diplomatist, born in Paris (where his father was Consul General) and educated at Balliol College, Oxford. After holding several other diplomatic offices, he was appointed chargé d'affaires at Stuttgart in 1871 and at Munich in 1872, whence he was transferred to Lisbon as English Minister (1876) and later to Madrid (1881-84). By close observation, which included not only diplomatic life but the character and opinions of the unofficial classes, he acquired an exceptional knowledge of and insight into German politics. He was often consulted by British statesmen in regard to foreign affairs. When he was Ambassador to St Petersburg (1884-91) he and Bismarck were bitter enemies, and in 1888 Count Herbert Bismarck charged Morier with furnishing information to Bazaine at the outbreak of the Franco-Prussian War. Time showed that Morier had been innocent and that French spies had gained the information in question. Bismarck's dislike of him sprang from his strong belief that Morier held political secrets which might impede or nullify his (Bismarck's) plans. For this there was some basis in a series of able political letters in the London *Times*, which were attributed to Morier. In 1891 he was transferred to Rome, but was forced by urgent business to remain in Russia, where he did much to smooth relations between that country and England. His health broke down and he died in Montreux, Switzerland.

MORIGI DA CARAVAGGIO, mō'rè-gē da kī'rā-vūd'jō. See CARAVAGGIO, M. A.

MÖRIKE, mē'ri-ke, EDUARD (1804-75). A German poet. He was born at Ludwigsburg, studied theology at Tübingen, and served as clergyman in many small parishes from 1826 to 1851. From 1851 to 1866 he was professor of German literature in a seminary at Stuttgart. One of the most prominent members of the Swabian school, he first appeared in 1832 with the fantastic tale *Maler Nolten* (revised 1853-75;

finished by Julius Klaiber in 1877; 3d ed., 1890), which revealed his imaginative power. His collected *Gedichte* (1838; 11th ed., 1894) are marked not only by the idyllic cast common to the Swabian group, but also by a delicate humor and a classical finish peculiarly their own. His fame now rests on his lyrics and ballads. The exquisitely wrought novelette *Mozart auf der Reise nach Prag* (1856) is one of his finest achievements. His further work includes the *Idylle vom Bodensee* (1846) and the caprice *Das stuttgarter Hützelmannlein* (1855). Many of the poems are to-day established folk songs. Among the best known are "Frühling lässt sein blaues Band," "Fragst du mich, woher die bange Liebe," and the ballad "Schön Rotraut." Consult the biographies by Notter (Stuttgart, 1875), Klaiber (ib., 1876), Mayne (ib., 1901), Fischer (Berlin, 1901), and Windegg (Stuttgart, 1904), also H. Ilgenstein, *Goethe und Morike* (Berlin, 1903).

MÖRIKOFER, mē'ri-kō'fēr, JOHANN KASPAR (1799-1877). A Swiss literary and ecclesiastical historian, born at Frauenfeld. He studied at Zurich, taught in his birthplace, and was pastor at Gottlieben from 1851 to 1869. His historical works have scientific value and literary charm; they include *Die schweizerische Mundart im Verhältnis zur hochdeutschen Schriftsprache* (1838). *Klopstock in Zurich* (1851). *Die schweizerische Literatur des achtzehnten Jahrhunderts* (1861). *Ulrich Zwingli nach den urkundlichen Quellen* (1867-69); *Geschichte der evangelischen Flüchtlinge in der Schweiz* (1876). Consult *Allgemeine deutsche Biographie*, vol. xxii, pp. 258 et seq., and vol. xxiv, pp. 787 et seq.

MORILLO, mō-rē'lyō, PABLO, COUNT OF CARTAGENA and MARQUIS DE LA PUERTA (1778-1837). A Spanish general. He was born in Fuentesecas in the Province of Toro and entered the Spanish navy in 1791. During the war against Napoleon he raised a guerrilla corps, at the head of which he soon acquired fame and became lieutenant general. In 1815 he was placed in command of 10,000 men and sent to South America to conquer the insurgent provinces of Venezuela and New Granada. He captured Caracas, Cartagena, and Bogotá, but met reverses later and was compelled to sign the armistice of Truxillo with Bolívar (1820). He returned to Spain, joined the court party, and was believed to be one of the authors of an insurrection of the guards in 1822. After this he went over to the patriots, obtained command of an army corps, changed back again, and submitted to the French (1823). Exiled by Ferdinand, he was recalled in 1832 and led an army against the Carlists. He published his *Mémoires*, translated into French by Ernest de Blossville (Paris, 1826), and two other documents, *Manifiesto que hace á la nación española . . . Pablo Morillo . . . con motivo de las calumnias . . . publicadas . . . en la Gaceta de la Isla de León* (Madrid, 1821) and *Contestación . . . al dictamen que . . . ha presentado la mayoría de la comisión de medidas* (Madrid, 1823). The best biography is that by Antonio Rodríguez Villa, *Don Pablo de Morillo . . . estudio biográfico documentado* (Madrid, 1908-1910).

MORIN, mō'rān', ARTHUR JULES (1795-1880). A French soldier and mathematician, born in Paris. He studied at the Ecole Polytechnique and at the Ecole d'Application in Metz. Commissioned in 1819 lieutenant in an engineer battalion, Morin rose to the rank of general of

a division in 1855. He was professor at the Conservatoire des Arts et Métiers, and after 1852 its director. In 1843 he became a member of the Academy of Sciences. His researches and inventions contributed materially to the progress of mechanics. The results of his labors are embodied in memoirs published in the *Comptes rendus de l'Académie des sciences de Paris*, and in a number of separate publications, among which are: *Hydraulique* (1837, 3d ed, 1865), *Aide-mémoire de mécanique pratique* (1838, 6th ed, 1871); *Notions fondamentales de mécanique et données d'expérience* (1850, 3d ed, 1860; Eng. trans by J Bennet, *Fundamental Ideas of Mechanics and Experimental Data*, etc. New York, 1860), *Etudes sur la ventilation* (1863), *Salubrité des habitations* (1868; 2d ed, 1874).

MORIN, AUGUSTIN NORBERT (1803-65) A Canadian jurist and statesman, born at St. Michel, Quebec, and educated at Quebec Seminary. He studied law in Montreal and in 1828 was admitted to the bar. Elected to the Legislative Assembly of Quebec in 1830, he soon became conspicuous as a Liberal and in 1834 was deputed by the Assembly to go to England with Denis Benjamin Viger (qv) and inform the ministry in London as to the political condition of the province. After the union of Upper and Lower Canada in 1841 he was elected to the Canada Legislative Assembly and was Commissioner of Crownlands in the La Fontaine-Baldwin administration (1842-43). He was again a member of the Assembly (1844-48) and was Speaker thereof in 1848-51. His political probity and experience had made him one of the most respected men in Canadian public life and after La Fontaine's retirement he became the leader of the French-Canadian Liberals. As he agreed with the programme of the Upper Canada Liberals he joined with Mr (afterward Sir Francis) Hincks (qv) in forming the Hincks-Morin administration, Morin being Provincial Secretary for Lower Canada and head of the cabinet ministers from that province. Later he held the portfolio of Crownlands. In 1854 the ministry was defeated by reason of the delay in settling the questions of clergy reserves and seigniorial tenure (see CANADA, *History*) and also by the vigorous opposition of a section of the Upper Canada Liberals (Reformers) under the leadership of George Brown. Morin resigned, but as his influence in Lower Canada was still strong, he afterward joined Sir Allan MacNab in forming the MacNab-Morin administration, a coalition of Liberals and Conservatives formed to carry through the delayed measures, a purpose that was attained. In 1855 Morin was made a judge of the Superior Court of Quebec, which office he retained until a short time before his death. In 1859 he was appointed a commissioner for codifying the laws of Lower Canada. Consult J. C. Dent, *The Last Forty Years* (2 vols., Toronto, 1881), and Sir F. Hincks, *Reminiscences* (Montreal, 1884).

MORIN, mô-rén', ENRICO CONSTANTINO (1841-1910). An Italian naval officer and statesman, born in Genoa. He became vice admiral (1893). In 1886 he was elected to the Chamber of Deputies, from 1888 to 1891 was Undersecretary of State in the Ministry of Marine, and from 1893 to 1896 was Minister of Marine. In 1900 he became Senator and again Minister of Marine. In April, 1903, he assumed charge also of the Ministry of Foreign Affairs,

but retired with the rest of the Zanardelli cabinet in November of the same year.

MORIN, mô-rân', JEAN, or JOHANNES MORINUS (1591-1659). A French Catholic theologian and Orientalist, born at Blois of Protestant parents. He was educated at Leyden and at Paris, where he was converted to the Catholic church. In 1618 he joined the Oratorians. He was head of the College of Angers, and in 1640 was summoned to Rome by Urban VIII to assist in discussing the union of the Greek and Roman churches. He was suddenly recalled by Richelieu, who possibly feared that Morin would speak ill of him at Rome. Besides his works on Church history, and more important, Morin wrote on textual criticism. *Exercitationes Biblicæ de Hebræi Græcique Textus Sinceritate* (vol. 1, Paris, 1633; vols 1, 11, 1b, 1669), a work that proved to be of epoch-making significance, urging the priority and superiority of the Samaritan Pentateuch and the Greek version. *Opuscula Hebræo-Samaritica* (1657), with grammar and lexicon; and in the Paris polyglot, the first edition of the Samaritan Pentateuch and Targum. Consult E. Ruyters, "Jean Morin" in *Annuaire de l'université catholique de Louvain* (Louvain, 1910).

MORINE, ALFRED BISHOP (1857-). A Canadian journalist and statesman. He was born at Port Medway, Nova Scotia, and was educated at Dalhousie University. After a few years' experience as the Ottawa correspondent for Nova Scotia and New Brunswick newspapers he went to Newfoundland and edited the *St John's Mercury* (1883-85) and *Herald* (1889-91). He was an Independent member for Bonavista in the Newfoundland Assembly in 1886-1906. During that period he had an important share in presenting the views of Newfoundland to the British government respecting the French rights on the west shore of the island. For this purpose he was a delegate to England in 1891, and in 1898 successfully represented the Newfoundland administration in London in the attempt to have British commissioners inquire and report upon French rights in the island. The negotiations thus set on foot resulted in the treaty between Britain and France in 1904, by which the difficulties which had existed in regard to Newfoundland since the Treaty of Utrecht (1713) were amicably settled. Morine was Colonial Secretary of Newfoundland in 1894, Receiver-General in 1897, and later Minister of Marine and Fisheries. In 1906 he removed to Toronto. In 1911 he was appointed chairman of the royal commission to investigate the Canadian civil service. He published *The Mining Law of Canada* and *Canadian Notes to Russell on Crimes*.

MORIOKA, mô-rê-ô'kâ The capital of the Prefecture of Iwate, Japan, situated in a mountainous district in the northern part of Honshu, about 40 miles from the coast (Map Japan, G 4). It is celebrated for its kettles, silk goods, fruits, and vegetables. Pop, 1898, 32,989; 1903, 31,861. 1908, 36,012.

MORIORI, mô-rê-ô'rê. The aborigines of the Chatham Islands, linguistically and somatically close kinsmen of the Maori (qv.) Their crania are distinctly more Polynesian than Melanesian, and some authorities see traces of race mixture in certain osteological peculiarities. Some anthropologists regard the Moriori as only a branch of the Maori, who reached the Chatham Islands before tattooing had come into general use or the carving and ornamentation of the New

Zealand Maori had taken on their characteristic development. Tradition, supported by other indications, suggests two migrations to these islands, one before and the other after Maori art had become matured. The flat stone clubs of the Chatham Islanders are supposed to go back to the dark people who preceded them. The best stone axes of the Moriori exceed in fineness of polish those of the Maori. The general conclusion is that the culture of the Chatham Islanders is an outspur of that of New Zealand. Such marked peculiarities as exist are due to the poverty and limitations of the group. The influence of the antecedent "dark race" is more marked there than in New Zealand itself. In 1831 they are said to have numbered 1200 to 1500; but the inroads of Maori from the Taranaki district of New Zealand in 1832-35 led almost to their extermination and there were but 200 left in 1868. The Moriori were large, powerful men, darker in color than the New Zealanders, and distinguished by broader and more hooked noses and almond-shaped eyes. In 1911 the islands were reported to contain but one pure-blooded Moriori, 218 Maori, and 234 Europeans. Consult E. Tregear, *The Maori Race* (Wanganui, 1904).

MORISCOOS, mò-ré'skòs (Sp., Moorish men). The name given in Spain after 1492 to those Moors who through intimidation or force were brought over to Christianity. See MOORS, SPAIN.

MORTSON, JAMES (1816-93). A Scottish clergyman. He was born at Bathgate, Linlithgowshire, was educated at Edinburgh, and in 1839 was licensed by the United Secession Church. Two years later, however, he was deposed for preaching "universal atonement." With three other ministers of like beliefs, and their followers, Morison founded (1843) the Evangelical Union (qv). At the same time he established a theological academy, of which he continued principal until his death. He also served as minister at Kilmarnock, and from 1853 to 1884 in Glasgow, where he died. Consult his *Life* by A. Adamson (London, 1898).

MORTSON, JAMES AUGUSTUS COTTER (1832-88). An English author, born in London. His childhood was spent in Paris (1834-40) and he gained an intimate knowledge of French. An Oxford graduate (1859), he wrote frequently for the *Saturday Review*, and in 1863 brought out a *Life of St. Bernard*, followed by sketches of *Gibbon* (1878), *Macaulay* (1882), and *Madame de Maintenon* (1885), while his last work, *The Service of Man: An Essay towards the Religion of the Future* (1887, 5th ed., 1892), was the outcome of his Positivist beliefs.

MORISON, ROBERT (1620-83). A British botanist, born at Aberdeen. He graduated at the university of his native city in 1638, but the next year, having espoused and fought for the Royalist cause, he was compelled to flee to France. There he studied anatomy, zoology, botany, mineralogy, and chemistry, and in 1648 graduated in medicine at Angers. A year or two later Gaston, Duke of Orléans, appointed him one of his physicians, a position which he held until the Duke's death in 1660, and in which he made such a reputation that after the Restoration Charles II appointed him his senior physician, King's botanist, and superintendent of all the royal gardens. In 1669 he became professor of botany at Oxford. His great service to botany was in reviving the study of systematic botany

upon an extensive scale, a study which had lapsed since the days of Cesalpino and Bauhin. Among his works are: *Praeludia Botanica* (1669); *Plantarum Umbelliferarum Distributio Nova* (1672); *Plantarum Historie Universalis Oronensis, Pars Secunda* (1680). Consult: Pulteney, *Sketches of the Progress of Botany* (London, 1790); Tournefort, *Éléments de botanique* (Lyons, 1797; in Latin, Paris, 1700); Franchet, *Flore de Loure-et-Cher*; Sachs, *History of Botany* (Oxford, 1906).

MORITZ, mò-rít's, KARL PHILIPP (1756-93). A German author, prominent in the Sturm-und-Drang period. He was born at Hameln, of poor parents. He taught for a short time at Dessau (1777), then at a military orphanage at Potsdam (1778), and soon after in Berlin. In 1786 he went to Italy, and in Rome became acquainted with Goethe, who recommended him to Duke Karl August, by whose influence Moritz was elected to the Berlin Academy, and in 1789 became professor of antiquities in the Academy of Art in Berlin. His adventurous life can to a great degree be reconstructed from the semi-biographical novels, *Anton Reiser* (1785-90) and *Andreas Harknopf* (1786). He wrote, besides *Versuch einer deutschen Prosodie* (1786), *Ueber die bildende Nachahmung des Schönen* (1788), *Gotteslehre* (1791); *Reisen eines Deutschen in England* (1783), *Reisen eines Deutschen in Italien* (1792-93). Consult: Dessior, *Moritz als Aesthetiker* (Berlin, 1889). Hans Glogau, *Anton Reiser* (Marburg, 1903), Hugo Eibisch, *Anton Reisers kritische Autobiographie* (Leipzig, 1909).

MORLAIX, mòr-lá'. A seaport in the Département of Finistère, France, on the estuary of the Dossen, 4 miles from the sea and 33 miles east-northeast of Brest (Map: France, N, B 4). The estuary is spanned by a fine railway viaduct 934 feet long and 190 feet high. The town has a mediæval aspect, with its sixteenth-century church of St. Mélaire, narrow winding streets, and quaintly gabled timbered houses. The port is accessible to ships of 400 tons' burden. A considerable coastwise trade is carried on in leather, paper, grain, and horses. The industrial establishments include paper mills, an important government tobacco factory, and manufactures of candles, kegs, and wooden shoes. Pop., 1901, 16,086. 1911, 15,262. Morlaix dates from the Roman occupation. In 1187 it was besieged and captured by Henry II of England. In 1522 it was taken by the troops of Henry VIII of England, but recaptured by the French in a night attack, when 600 Englishmen were killed.

MORLAKS. A Slavonic people belonging to the southern branch and living along the coast of Dalmatia, Austria-Hungary. They settled in this locality during the great southern migration of the Serbs from the Carpathian region in the sixth and seventh centuries. They are a hardy, seafaring people, who furnish the best material for the Austrian navy, and are prominent in the commerce of the Adriatic. They are generally classed with the Dalmatians. See DALMATIA.

MORLAND, GEORGE (1763-1804). An English genre, animal, and landscape painter. He was born in London, the son of Henry Morland (c.1730-97), painter, engraver, and picture dealer, from whom he inherited his talent and received his artistic training. At the age of 10 he exhibited sketches at the Royal Academy, and at 17 he had attained a reputation

as a copyist, especially of the Dutch and Flemish masters, at the same time producing original compositions, such as the "Angler's Repast." After a rupture with his father he set up on his own account in 1784 or 1785 and dashed into a career of dissipation and prodigality, supporting himself by the sale of his pictures, painted with marvelous rapidity and cleverness. He lived with a picture dealer and became the companion of hostlers, potboys, jockeys, pawnbrokers, and similar worthies. In 1786, after his return from a short visit to France, he married the sister of the engraver William Ward, and for a time reformed. At this period he painted moralities in the style of Hogarth, notably the "Lætitia" series, but he soon returned to his profligate life and in 1791 produced his masterpiece, the "Interior of a Stable," now in the National Gallery, London. He became popular and dealers flocked to him. Sometimes he painted two pictures a day, and once a large landscape with six figures in six hours. Every demand for money, tavern score, or bill was paid by a picture worth many times the charge. His subjects were scenes in humble life in town and country—cottages, stables, inn yards, pastoral scenes, and domestic animals, especially pigs. In this last-named subject no painter has equaled him, as witness the examples in the galleries of the New York Public Library and of Budapest. Altogether he painted 4000 pictures, 250 of which were engraved. He was imprisoned for debt from 1799 to 1802 and died in a sponging house in Holborn, Oct. 27, 1804. His epitaph on himself was, "Here lies a drunken dog." He was generous, good-natured, and industrious despite his faults.

After a period of neglect Morland is now ranked among the best masters of genre and animals, rivaling in his best work the Dutch artists on whom he modeled his style. He was a very facile brushman, his composition is remarkably good, his color is rich and harmonious, and his treatment, if light, is delicate and skillful. His presentation is realistic and truthful. The National Gallery possesses altogether eight paintings by Morland, including, besides the "Interior of a Stable," "Cowherd and Milkmaid," "The Fortune Teller," and "Roadside Inn"; in the South Kensington Museum are ten, the best known being "The Reckoning." The Museum of Glasgow has a "River Scene" and three seacoast landscapes. In the New York Historical Society are his "Old English Sportsman" and "Dogs Fighting"; in the New York Public Library, "Midday Meal"; and in the Corcoran Gallery, Washington, "The Farmhouse." The Louvre possesses "The Halt." His self-portrait is in the National Portrait Gallery, London.

Bibliography. William Collins, *Memoirs of a Picture* (London, 1803). Blagden and Hassell, *Memoirs of George Morland* (ib., 1806); and the monographs by Ralph Richardson (ib., 1895) and J. T. Nettlehip (ib., 1898); also G. C. Williamson, *George Morland* (ib., 1904); D. H. Wilson, *George Morland* (New York, 1907). Gilbey and Cuming, *George Morland* (ib., 1907).

MORLAND, SIR SAMUEL (1625-95). An English diplomat, mathematician, and inventor. He was born in Sulhampstead, Berkshire, and studied at Winchester School and at Magdalene College, Cambridge. His first political affilia-

tions were with the Parliamentary party. Morland's first mission of importance was to the Duke of Savoy in 1655 to protest against the massacre of the Waldensians. In this he was successful. Morland brought back with him materials, mostly clumsy forgeries, for a history of this sect, which he published in 1658. His discovery of a political plot in which Cromwell and some of his chief supporters were alleged to be concerned alienated his sympathies from the Parliamentary party and he afterward favored the restoration of Charles II. After the Restoration in 1660 Morland received the title of Baronet and many promises from the King which were only partly fulfilled. He devoted himself more and more to the study of mathematics and mechanics and invented a speaking trumpet, a capstan, and some calculating machines. The King furnished money to aid him in his experiments. Towards the close of his life Morland devoted himself specially to experiments in hydrostatics and hydraulics. He invented and improved pumps and water engines, notably the plunger pump, and improved the fire engine then in use. Familiar with the power of steam, as well as its other properties, he undoubtedly proved that it could be usefully employed. In some ways he anticipated the discoveries of James Watt (q.v.). He received medals for his researches and inventions, and published several scientific works. In one of the latter is a virtual description of the steam engine, the date, 1682, being considered by some authorities as that of the invention of this engine, though it was not patented by Savery (q.v.) until 1698.

MORLEY. A municipal borough in the West Riding of Yorkshire, England, 4 miles south-southwest of Leeds. The new town hall is a handsome building, opened in 1895, and the municipality owns its water works, gas and electric-lighting plants, maintains public baths, parks, and recreation grounds. It has important manufactures of woollens and mill machinery. There are coal mines and stone quarries. Morley is mentioned in *Domesday*. It was incorporated in 1885. Pop., 1901, 23,636; 1911, 24,282. Consult Smith, *Morley, Ancient and Modern* (London, 1886).

MORLEY, BARON. See MONTEAGLE, BARON.

MORLEY, EDWARD WILLIAMS (1838-). An American chemist, born at Newark, N. J. He graduated from Williams College in 1860 and from 1869 to his retirement in 1906 was professor of chemistry at Adelbert College, Western Reserve University. With this post he also held (1873-88) a chair of chemistry at the Cleveland Medical College. He was associated with A. A. Michelson (q.v.) in researches on the relative motion of ether and matter and also in the determination of the meter in terms of the wave length of light. His determination of the ratio of the atomic weights of oxygen and hydrogen was a classic contribution to scientific knowledge. He was president of the American Association for the Advancement of Science (1895) and of the American Chemical Society (1899); became a member of the National Academy of Sciences and a Fellow of the American Academy of Arts and Sciences; in 1912 he was honorary president of the eighth International Congress of Applied Chemistry; and received honorary degrees from various institutions, including Williams, Lafayette, Yale, and Pittsburgh.

MORLEY, FRANK (1860–). An American mathematician. He was born at Woodbridge, Suffolk, England, and graduated M.A. from King's College, Cambridge, in 1886. He served as master of Bath College in 1884–87, and then, coming to the United States, he taught mathematics at Haverford College, Pa., from 1887 to 1900, when he became professor of mathematics at Johns Hopkins University. He became editor of the *American Journal of Mathematics*. His publications include *Elementary Treatise on the Theory of Functions*, (1893), with James Harkness; and *Introduction to the Theory of Analytic Functions* (1898).

MORLEY, HENRY (1822–94). An English author, born in London, Sept. 15, 1822. He was educated at a Moravian school at Neuwied on the Rhine and at King's College, London (1838–43); practiced medicine at Madeley in Shropshire (1844–48); and, having been fleeced by a colleague, he started a school on Moravian methods at Manchester, but after two years he started it afresh at Liverpool. A series of ironical essays entitled *How to Make Home Unhealthy* attracted the attention of Dickens and eventually led to Morley's settling in London and taking a hand in *Household Words* and *All the Year Round* (1850–65). He also became connected with the *Examiner* as subeditor and then as editor (1856–64). Meanwhile he was appointed lecturer in English at King's College (1857–65) and then professor of English at University College, London (1865–89). He died May 14, 1894. Chief among Morley's works are *A Defense of Ignorance* (1851), a bit of irony; *Laes of Palissy* the Potter (1852), Jerome Cardan (1854), Cornelius Agrippa (1856), and Clement Marot (1870); *Memoirs of Bartholomew Fau* (1857), two volumes of fairy tales (1859–60); *English Writers*, to Dunbar (1864–67), rewritten and brought down to the seventeenth century (11 vols., 1887–95); *A First Sketch of English Literature* (1873, revised, 1886), *English Literature in the Reign of Victoria* (1881). His editorial work includes the *Library of English Literature* (5 vols., 1875–81); *Universal Library* (63 vols., 1883–88); *Cassell's National Library* (214 vols., 1886–90); the *Carisbrooke Library*, a series of reprints (14 vols., 1889–91); *Companion Poets* (9 vols., 1891–92). Though Morley was not a critic and editor of the first rank, he had scholarship, catholic tastes, and a talent for finding the best in things, and he performed a most valuable service in making easily accessible the treasures of English literature.

MORLEY, JOHN. See MORLEY OF BLACKBURN.

MORLEY, MRS. The name adopted by Queen Anne in her correspondence with the Duchess of Marlborough. See FREEMAN, MRS.

MORLEY, SAMUEL (1809–86). An English politician and hosiery manufacturer, born at Homerton (now part of London). He became manager in 1840 and sole owner in 1855 of his father's hosiery warehouse in London, and in 1860 he took over the Nottingham hosiery business established by his father and uncle. He erected several modern knitting mills and accumulated a great fortune. His home at Stamford Hill became a frequent meeting place of radical politicians and of dissenting ministers. He was a Liberal member of Parliament for Nottingham in 1865–66 and for Bristol in

1868–85, giving his enthusiastic support to Gladstone, who offered him a peerage in 1885. He became one of the proprietors of the chief Liberal newspaper, the *London Daily News*, whose price he caused to be reduced to a penny.

MORLEY, THOMAS (1557–1603). An English musician and composer. The place of his birth cannot be definitely fixed, but it is supposed that he was born in London and educated at St Paul's Cathedral. According to his own statement he also studied under Bird. In 1588 he became bachelor of music at Oxford and in 1591 was deputy chorister at St Paul's, taking his regular turn of duty as organist. In 1592 he was made epistler of the Chapel Royal. He strove hard during his entire career for the advancement of English music, and devoted himself exclusively to the development of vocal music. His principal work and that upon which his reputation is chiefly based was *A Plaine and Easie Introduction to Practicall Musicke*, published in 1597. It was the first practical work on music issued in England, was translated into German and published throughout the German states by Trost of Halberstadt about 1660. In England it remained an authority up to so late a period as 1770. He wrote many compositions for the Church, none of them, however, being printed in his lifetime. Tallis's monopoly of music printing expired in 1596, and two years later Morley obtained a similar one, and under his license "William Barley, Thomas Est, alias Snodham, Peter Short, John Windet, and others" printed several books as the "assigne of Thomas Morley." He resigned from the Chapel Royal in 1602. That he was an excellent musician his ballets and madrigals prove. He was also superior in melodic invention to any of his predecessors.

MORLEY OF BLACKBURN, JOHN, first Viscount (1838–). An English statesman and author, born at Blackburn, Lancashire, Dec. 24, 1838. Having taken his degree at Lincoln College, Oxford (1859), he went to London to devote himself to literature. He soon became editor of the *Literary Gazette*; at that time in such a state of decrepitude that Morley, with all his energy and talent, could not quicken it to new life. Morley's writings early showed the influence of Auguste Comte, and he became known as an agnostic philosopher. From 1868 to 1870 he edited for a short period the daily *Morning Star*. In 1867 he succeeded Lewes as editor of the *Fortnightly Review*, which he conducted brilliantly till 1883, becoming, in that year, editor of *Macmillan's Magazine*. In 1873 he was called to the bar at Lincoln's Inn. Under his guidance the *Macmillan* issued after 1878 the "English Men of Letters Series," to which Morley contributed a short but excellent *Life of Edmund Burke* (1879). His *Burke*, an historical study, had appeared in 1867. In 1880 he began ably to edit the *Pall Mall Gazette*; in 1881 published his *Life of Cobden*; and in 1883, after two failures, was at a by-election returned to Parliament for Newcastle-upon-Tyne. He soon became prominent, and in 1886 was Chief Secretary for Ireland under Gladstone, thus getting an insight into Gladstonian politics and character to be shown later in his monumental *Life of Gladstone* (1903). Morley sympathized with the Irish Nationalists, but, unlike Gladstone, he was unhampered by pledges and opinions. After the defeat of the Liberals in 1886 he was half in politics, half in

letters, till Gladstone's return to power restored him to his secretaryship (1892-95). Morley's anti-imperialistic views helped to lose him his seat in 1895, but he was elected from the Montrose Burghs in February, 1896, and this constituency he continued to represent until his elevation to the peerage in 1908. In 1898 and afterward he upheld the Boers. From 1905 to 1910 he was Secretary of State for India and then for four years Lord President of the Council. He resigned from the cabinet in August, 1914, because, with convictions opposed to war, he desired no part in the responsibility for British action against Germany after the invasion of Belgium. Numerous honors came to Morley—the Order of Merit, the chancellorship of Victoria University, degrees from Oxford, Cambridge, Edinburgh, Glasgow, and St. Andrews, etc. The rich historical library of Lord Acton, which Andrew Carnegie presented in 1902 to Morley, the latter gave, a few months afterward, to Cambridge. His place as a leading English writer and a philosophical radical with the full and frank courage of his convictions was firmly established by the works above mentioned and also by his *Critical Miscellanies* (two series, 1871 and 1877), *Voltaire* (1871); *Rousseau* (1873); *The Struggle for National Education* (1873); *On Compromise* (1874); *Diderot and the Encyclopædists* (1878); *Walpole* (1889), *Studies in Literature* (1891); *Cromwell* (1900); *Literary Essays* (1906); *Notes on Politics* (1914).

MORMOLUCOIDES (Neo-Lat. nom. pl., from *mormoluea*, glowworm, from Gk. *μормολύκειον*, *mormolykeion*, *μормολύκιον*, *mormolykion*, hobgoblin, from *μормολύττεσθαι*, *mormolyttesthai*, to frighten, from *μормώ*, *mormō*, bugbear + *είδος*, *eidos*, form). The oldest known fossil insect larva, found in the shale of the Newark formation of the Jura-Triassic system in New Jersey, Connecticut, and Massachusetts. In general appearance it resembles the larva of the modern firefly, though it is considerably larger, being quite three-quarters of an inch in length. It is considered to be the young of a neuropteran insect allied to the modern dobsons (*Sialidæ*).

MORMON, BOOK OF. A book issued at Palmyra, N. Y., 1829, by Joseph Smith, Jr., who professed to have been led to its discovery by an angel. He claimed it was written on gold plates in reformed Egyptian characters, and accompanied by the Urim and Thummim by means of which he translated it. It purports to be the sacred writings of a series of prophets and a sacred history of two nations occupying this continent from the time of the Tower of Babel till about four hundred years after Christ. It is considered equally sacred with the Bible by Latter-Day Saints. See **MORMONS**.

MORMON CRICKET. Either of the wingless migratory crickets, *Anabrus simplex* and *Anabrus purpureus*. These are large, peculiarly shaped crickets, which occasionally multiply so greatly in their native home in the foothills of the Rocky Mountains that they migrate to the plains below and destroy all cultivated crops. As they are wingless, they move but slowly, and may often be checked by ditches. A plowed field in their course forms a difficult barrier, and an approaching army may be destroyed by means of heavy rollers. They are pugnacious and will fight among themselves, and are to a certain extent carnivorous, devouring their injured comrades. For many years

they have been especially abundant and injurious in portions of Montana and Idaho.

MORMONS, or more properly **THE CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS**. A religious sect which originated in the United States. Its early history is that of its founder, Joseph Smith, Jr., who was born in the town of Sharon, Windsor Co., Vt., Dec. 23, 1805. His father engaged in several occupations, including those of farmer and well digger. Some writers assert that he was a "water witch," i.e., had the ability to locate with a forked wand hidden streams of water. Belief in this form of divination was then common, and still persists in some localities. Joseph's mother displayed great interest in religious matters, and it is said that she early announced the coming of a prophet in her own family. In 1816 the Smiths migrated to the semiwilderness of western New York and after a short residence in the village of Palmyra, Wayne County, settled upon a piece of land 6 miles south of that place on the border of Manchester, Ontario County. There they seem to have led a hand-to-mouth existence. Their neighbors were poor, plain, but generally religious folk of the frontier type.

It appears that Joseph Smith, Jr., had no special preparation for the calling of prophet. He received little education, but was taught to read, write, and cipher. He himself later testified that he was "a rough stone" and desired "the learning of heaven alone." From time to time he journeyed into Pennsylvania, where in 1827 he became engaged to the daughter of a respectable farmer and married her.

According to his own account, Smith had already begun to have visions. The first of these occurred in the spring of 1820 when the boy prophet was only 14 years old. It was a time of great religious excitement, and Joseph, with others of the Smith family, was more or less affected by revival meetings. His attention was attracted strongly to the text, "If any of you lack wisdom, let him ask of God, that giveth to all men liberally, and upbraideth not, and it shall be given him" (Jas. i. 5). He determined to ask of God "which of all the sects was right—and which I should join." He retired to a place in the woods, knelt in fervent prayer, and presently beheld "a pillar of light exactly over my head, above the brightness of the sun, which descended gradually until it fell upon me. . . . When the light rested upon me I saw two personages, whose brightness and glory defy all description, standing above me in the air. One of them spake unto me, calling me by name, and said, pointing to the other, 'This is my Beloved Son. Hear Him!'" When Joseph got sufficient command of himself, he asked concerning the various sects and was told that all were wrong, that he must join none, for all their creeds were an abomination in His sight.

Book of Mormon. One night three and a half years later (Sept. 21, 1823) Joseph experienced a second vision. An angel named Moroni thrice appeared to him and revealed the hiding place of certain golden plates containing the history of the ancient peoples of America. Next day Moroni again appeared to Smith; and the boy made a journey to the hill Cumorah, near Manchester, where he found the wondrous plates, but was not permitted by the angel to carry them away. On each twenty-second of September for three years thereafter Smith visited the hill and saw the plates, but was each time informed

by Moroni that the time was not ripe for their removal. On Sept. 22, 1827, however, some months after Smith's marriage, the custodian angel delivered the records into Smith's keeping with permission to reveal what was not "sealed." The message was written in a strange language upon golden plates, bound in a volume and closed with three clasps.

The years 1828-29 were devoted mainly to the translation of the graven characters on the golden plates. According to Smith, he used in this work two transparent crystals, set in rims of silver and fastened to a breastplate, constituting the Urim and Thummim of the ancient Hebrews. Smith was aided in the work by his wife, Emma Hale Smith, and by Martin Harris and Oliver Cowdery. Cowdery was a schoolmaster, and Harris was a farmer, who had been, in turn, Quaker, Universalist, Baptist, and Presbyterian. Harris's wife temporarily interrupted the work by destroying a portion of the manuscript, but the task was at last completed, and the book was published at Palmyra early in 1830. The necessary money was obtained by Harris's mortgaging his farm. The title given the work was *Book of Mormon*. The price was fixed at \$1 25 a volume, and Joseph Smith, Sr., for a time went about the country selling it. The golden plates were safely kept till the day the heavenly messenger called for them, when they were delivered into his hands.

The *Book of Mormon* purports to unfold in biblical language the history of ancient America from about the time of the dispersion from the Tower of Babel to the beginning of the fifth century of the Christian era. The first inhabitants were called Jaredites and came directly from Babel. The second race were principally Israelites and came from Jerusalem about 600 B.C. and supplanted the Jaredites. The Saviour made his appearance after his resurrection and gave the gospel to these people. Generations later the Nephites, the principal nation of the second race, were cut off on account of their wickedness, the remnant are the Indians who now inhabit the country. Mormon, a prophet and the last of the Nephite leaders, having written an abridgment of the history, prophecies, and revelations of these various peoples, the abridgment, as completed by his son Moroni, was hidden in the earth, whence it should come forth in the last days and be united with the Bible and thus accomplish the purpose of God. The last days were here, and the prophet had been found in the person of Joseph Smith.

Various theories have been advanced by Gentile writers in attempting to explain the genesis of the *Book of Mormon*. Some writers have conjectured that Sidney Rigdon, an eccentric Disciple minister, was the real deus ex machina and that perhaps he took as a basis a manuscript historical romance written some years before by one Solomon Spaulding, a graduate of Dartmouth, who had been, in turn, preacher, teacher, iron founder, and amateur archaeologist. These skeptics assume that Smith could hardly read or write, and think it probable that Rigdon furnished him a manuscript from which Smith read while pretending, behind a screen, to decipher the "reformed Egyptian" hieroglyphics of the Golden Book by the aid of the Urim and Thummim. But no evidence has ever been found that Smith and Rigdon had ever met or had communication prior to the publication of the *Book of Mormon*. The recovery in 1885 of the

alleged original of Spaulding's manuscript in Hawaii (now in the library at Oberlin College) has been to Mormons, however, conclusive proof of its nonconnection with their sacred book, for there is no real resemblance between the two.

Critics of the *Book of Mormon* itself declare that, in addition to private affairs inadvertently incorporated, they detect, in scriptural paraphrase, descriptions of the current agitations against Romanism, Freemasonry, infidelity, and even references to the so-called Washingtonian movement for total abstinence. The then widely prevalent theory that the Indians were the lost ten tribes of Israel is also embodied. The Nephites were not merely the modern Indians in disguise, but in their mental habits they are said to resemble local sectarians.

Organization of the Church. According to the Mormon narrative, while Smith and Cowdery were still engaged in the work of translating the *Book of Mormon*, a heavenly visitant, who was none other than John the Baptist, appeared (May 15, 1829) to them and conferred upon them the priesthood after the order of Aaron, and less than a year later the Apostles Peter, James, and John appeared and conferred upon Joseph and Oliver the priesthood after the order of Melchizedek. Thus empowered Smith and Cowdery presently began to preach and baptize. Six members were required by the laws of New York to effect a legal organization. The two elders associated with themselves Hyrum Smith, Samuel H. Smith, Peter Whitmer, Jr., and David Whitmer, and, April 6, 1830, organized at Fayette, N. Y., the religious body that was subsequently (1834) called the Church of Jesus Christ of Latter-Day Saints. (See also REORGANIZED CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS.) Several other persons had been baptized, but only these six were included in the original organization. "Thus was founded," writes the church historian, Orson F. Whitney, "the Church of Jesus Christ of Latter-Day Saints. Thus arose, as a system, what the world terms Mormonism—universally regarded as the most remarkable religious movement of modern times, detested and denounced throughout Christendom as a dangerous and soul-destroying imposture, but revered and defended by its disciples as the wonderful work of the Almighty, the veritable 'marvelous work and a wonder,' foretold by Isaiah and other ancient seers, which was to prepare the world, by the preaching of the restored gospel and the founding of the Latter-Day Zion, for the Messiah's second coming and the advent of the millennium."

The times were favorable for the new church. The land was still filled with doctrinal disputes; denomination set itself against denomination and creed made war on creed. Belief in ghosts and witches still lingered; there was much talk of signs and seasons, God's ways and Satan's ways, stories of visions and miracles were accepted with credulity, the second advent and the millennium were confidently expected by many. In 1831 the fanatic William Miller unlocked the prophetic numbers and with illustrative charts on which were depicted Nebuchadnezzar's image and apocalyptic beasts proclaimed to a doomed world that at some time between March 21, 1843, and March 21, 1844, Christ would appear and summon all on earth to judgment. In 1832 John Jay Shipperd and Philo Penfield Stewart founded the Oberlin colony in

northern Ohio to serve God and to hold property only in His interests. Jemima Wilkinson prophesied at Crooked Lake; the Fox Sisters started spiritualism only 10 miles from Joseph Smith's house; the return of apostolic gifts, of apostolic church organization, of divine recognition, was fervently hoped for by the local Quakers, Primitive Baptists, and Restorationists. It was an American era of revivals, of mental feverishness, of discontent with the hard realities of social existence, of readiness to embrace new ideals and new experiments.

Kirtland-Missouri Period. The Mormon faith soon won converts. Missionaries were sent to neighboring States and to Indian tribes. Locally, however, the new faith aroused little but hostility and derision, but, early in 1831, in obedience to a "revelation," the church removed to Kirtland, Ohio, where Sidney Rigdon had already gathered a communistic congregation. These people proved athirst for the new religion and adopted it with avidity. Converts came from all directions, and the church soon numbered nearly 2000 members. Kirtland soon presented the appearance of a modern Mecca. The prophet, with Sidney Rigdon and others, continued preaching the gospel in the face of all kinds of difficulties. In spite of numerous apostasies, especially in 1836, the faith still spread and revelation followed revelation. In 1833 the presidency of the church, consisting of Joseph Smith, Jr., Sidney Rigdon, and Frederick G. Williams, was organized, and in 1835 the apostolate of 12 was established. In 1837 the first foreign missionaries were sent to England. A temple costing about \$40,000 was built at Kirtland, and the people prided themselves in building up a clean and wholesome civic and economic community.

But Kirtland was to be a "stake" only. By revelation it was decided at some time to build a temple at Independence, Jackson Co., Mo., and the place was blessed to this end. But Missourians disliked the religious teachings of the Saints, moreover, they were rendered suspicious by their antislavery notions and by the printing of the *Book of Commandments*, in which Missouri was called "the land of your inheritance, which is now the land of your enemies." "The Mormons must go!" became the general cry. Late in 1833 the Saints were forcibly driven from their Zion and took refuge in Clay, Lafayette, and Van Buren counties. But there, also, they suffered new persecutions, and finally petitioned the State Legislature to assign them a place of residence. The thinly settled region that became Caldwell County was designated, and there the Saints founded the town of Far West. Meanwhile affairs at Kirtland had gone badly. The financial panic of 1837 involved some of the leaders in legal difficulties. Rebellion broke out and, early in 1838, Smith and Rigdon fled to Far West, where, in July, the corner stone of a new temple was laid. Here the tithing system was adopted. New troubles soon arose, however. Gentile mobs attacked the faithful, and the faithful retaliated in kind. The militia were called out. Governor Boggs, long a Mormon hater, issued an order that the "Mormons must be treated as enemies, and must be exterminated or driven from the State, if necessary for the public peace." Throwing law to the winds, the Missourians fell upon the Mormons and forced them (1838) to leave the State. Smith, Rigdon, and other leaders were arrested

on a charge of treason and other offenses, but some months later managed to escape. The Mormons vainly appealed to Congress to redress their wrongs.

Nauvoo Period. Upon the rich eastern bank of the Mississippi, in Hancock Co., Ill., a few miles above Warsaw, the oft-harried Saints pitched their tents and solemnly consecrated a place of residence. Here, as by magic, arose Nauvoo, the "Place Beautiful." Saw mills, flour mills, factories, and foundries were soon in busy operation, and for the fourth time a temple was begun. The city grew apace. By 1840, when the Harrison campaign was in full tide, Smith had too many votes at his disposal to be ignored, and Abraham Lincoln, one of the Whig electors, thought it worth his while to see that the prophet and his people had the right kind of political literature. The Saints threw their votes to the Whigs, though, to show their power and keep the Democrats in good humor, they scratched the last name on the Whig electoral ticket and substituted that of a Democrat. The Whig Legislature recognized the substantial and thus rendered by granting to Nauvoo a charter that clothed the council with almost unlimited power. The bidding for the political support of the Saints was so keen that not a single vote was recorded against the grant of the charter, Stephen A. Douglas lending his dexterous management of the Democratic members. The mayor was both executive and judiciary. Hancock County and its perquisites were ignored, and the Nauvoo Legion was organized and officered, a military force subject to no State authority but the Governor.

It was at Nauvoo, according to the Utah church, that by revelation the institution of polygamy was revived. The *Book of Mormon* had declared, "Behold, David and Solomon truly had many wives and concubines, which thing was abominable before me, saith the Lord," and had forbidden the faithful to have more than one wife. At Kirtland and in Missouri some of the Saints had tried to take a liberal view of the marriage relation, but such tendencies were restrained by the church authorities. At Nauvoo, however, Joseph Smith had a "revelation" (July 12, 1843) in favor of the practice of polygamy, and he and other leaders practiced the doctrine of "celestial marriage" and largely increased their households. Aware, however, that the announcement of such a doctrine to the world would cause a great uproar, the leaders of the church endeavored to keep it secret, and it was not formally promulgated until 1852, when the Mormons were safely ensconced in their desert stronghold beyond the Rockies. Polygamy was not merely permissible, but was urged upon those able to support more than one wife. It was a part of the doctrine that no woman can enter heaven unless sealed "for time and eternity" to some devout member of the Mormon church, and that space is filled with spirits seeking some "tabernacle of clay" by means of which they may attain salvation. Mormons justified polygamy not only because authorized by their prophets, but because it was sanctioned by the Old Testament.

At one time during the Nauvoo period as many as seven of the twelve apostles were engaged in preaching and publishing in England, and in 1842 eight ships were chartered to transport converts to America. By this time the prophet's followers were numbered by the thousands. He

was at the height of his fame. In both secular and spiritual affairs he was looked to as a leader, and, as the culmination of his interest in civic, political, and economic questions, he announced himself (February, 1844) a candidate for the presidency of the United States. His position, however, was not without danger, and the seeds that were to result in his destruction were already germinating. In the spring of 1842 Governor Boggs was shot and wounded, and suspicion turned against Smith as the instigator of the crime. He was arrested, but was freed by the municipal court on a writ of habeas corpus, and all attempts to take him to Missouri for trial failed. John C. Bennett, whom the people had made mayor of Nauvoo and major general of the legion, withdrew from the church and began a vindictive attack upon its members. The Gentile neighbors felt that the legion menaced the peace of Illinois, and it was said that the Saints expected to conquer Missouri and ultimately the whole country. Newspapers took up the anti-Mormon movement; Democrats and Whigs, who in turn had secured the votes of the Saints; looked upon them as uncertain allies and dangerous enemies; the orthodox churches stood in solid phalanx against the new doctrine.

The plural-wife doctrine stirred up considerable opposition among the Mormons themselves, and a number of prominent members, including Dr. R. D. Foster, William and Wilson Law, and Sylvester Emmons, decided to establish a newspaper in Nauvoo to combat the new order of things. In its first and only number the *Expositor*, as the paper was called, denounced (June 7, 1844) polygamy openly, condemned Smith's political aspirations as preposterous, and demanded reforms. The paper was suppressed by Mayor Smith and the city council as a public nuisance, the press was broken up, the type was pried, and all that was combustible was burned. This act precipitated a Mormon catastrophe. The owners of the *Expositor* obtained a writ at Carthage, Ill., for the removal to that place of Smith and the Nauvoo council on a charge of riot. When the writ was presented the Nauvoo municipal court granted a writ of habeas corpus, and a Mormon justice of the peace heard the case and discharged (June 17) the accused. But public indignation ran high among the Gentiles about Nauvoo, and a movement began to drive out the Saints. Both sides took up arms. The prophet started to flee to the West, but decided to return, and with his brother Hyrum was lodged in Carthage jail on a charge of treason. About 1200 militia gathered in Carthage, while another large force assembled at Warsaw. Governor Ford, who had pledged the prophet protection, ordered the militia to disband, with the exception of three companies, two of which were to guard the jail, while the third accompanied the Governor on a trip of investigation to Nauvoo. When Ford left Carthage a mob composed of militiamen and a few Missourians easily overpowered the not unwilling prison guard of nine men and battered down the door behind which the prophet and his brother were confined with two friends, Taylor and Richards, who were voluntarily bearing them company. Hyrum Smith was instantly killed; Taylor was disabled; the prophet, seeing that the end had come, defended himself valiantly with a six-barreled pistol. After wounding three of his assailants and being

severely wounded himself, he ran to the open window and leaped into the yard below. There the mob completed their bloody work.

Brigham Young and the Migration to Utah. Most of the Mormons accepted the leadership of Brigham Young. Young was a native of Whitingham, Windham Co., Vt., and at the time of the prophet's death was 43 years old. In his youth he had worked as a farmer, carpenter, painter, and glazier, and received little education. He embraced the Mormon faith in 1832 and gradually rose in authority, until, in 1839, he became president of the quorum of 12 apostles, to whom Smith is said to have given his "keys" of presidency. Young conducted the driven Saints successfully from Missouri to Illinois, and in the crisis following the prophet's death was hailed as head of the church by the people and later was sustained as president of the church according to the practice that the head of the 12 apostles should become president of the church on the death of the former president. Possessed of exuberant vitality, confident in himself and his cause, Young was gifted with great wisdom. It was well for the Saints that it was so, for their church had fallen upon perilous times. In January, 1845, the Nauvoo charter was repealed, and popular hostility continued so bitter that the Mormons agreed to leave the State the following spring. The property that could not be carried away was sold for what it would bring, or abandoned entirely; great numbers of wagons were built, tents and wagon covers made; wheelwrights, carpenters, and blacksmiths were busy day and night. Early in 1846, harried by their enemies, driven almost at the point of the sword, the Saints turned their backs upon the just completed temple, crossed the Father of Waters, and went their way westward "in pursuit of the ever-mocking phantom of home." The emigration of so many people was necessarily a slow one. The following winter found them scattered from the Mississippi to the Missouri, their main encampment being on the eastern bank of the latter river at the winter quarters now called Florence. On the way the men had hunted, had worked for the Iowa people, and at some of the camps had raised crops of corn. Naturally there was much suffering, especially from hunger and ague, but the march was well regulated, and the leaders did all in their power to keep up the spirits of their people. Dances were frequently held, and "the visiting Iowans looked on in amazement, to see these exiles from comfortable homes enjoying themselves on the open prairie, the highest dignitaries leading in Virginia reels and Copenhagen jigs." The Mexican War had begun that year, and over 500 of the Mormons volunteered and accompanied Col. Stephen W. Kearny (q.v.) to Santa Fe and California. The bounty money paid these men was mostly turned over to their brethren and proved of great assistance.

In April, 1847, a pioneer band composed of 143 men, three women, and two children set out under the leadership of Young to select a place for new homes. On June 26 they reached South Pass. On July 21 Erastus Snow and Orson Pratt, who were in advance, caught sight of Great Salt Lake and broke into loud hosannas. Next day an advance party camped on the site of the present Salt Lake City and sent back word of their discovery to Brigham Young. "We found the land so dry," says Snow, "that

to plough it was impossible, and in attempting to do so some of the ploughs were broken. We therefore had to distribute the water over the land before it could be worked." To many of the Saints the aspect of their Promised Land was discouraging, for it was a desolate, treeless plain, with sagebrush almost the only vegetation. Nevertheless, when the Mormon leader reached a point on Big Mountain whence he could survey the valley, he recognized its possibilities and said: "It is enough. This is the place."

Crops were planted, a town that was named Great Salt Lake City was laid out, a temple site was selected, and a fort was built. Members of the Mormon battalion who had followed Kearny rejoined their brethren from time to time. A party that had gone from New York by way of Cape Horn and California journeyed thither across the Sierras. The Saints who had been left behind by the pioneer expedition came to Utah in well-organized companies, and before the end of 1848 the population of the valley numbered more than 5000. At first there was much suffering from lack of food, clothing, and shelter, plagues of crickets and locusts threatened the crops, but soon there was an abundance for all. The discovery of gold in California and the wild rush across the plains that followed enabled the thrifty Saints to sell their surplus produce at high prices, while some of them grew rich as carriers of the gold seekers and their goods. Missionary work was continued abroad, and a fund was established for assisting poor converts to Utah. Some hundreds of the immigrants made the long journey from the Missouri, pulling handcarts containing their young children and worldly possessions. Many died on the way. By 1852 the population was variously estimated at from 25,000 to 30,000.

On March 10, 1849, a convention adopted a constitution for a State to be called Deseret (the honeybee). Two days later a provisional government was organized with Brigham Young as Governor. The general assembly met in July and sent a memorial to Congress asking for admission to the Union. The plea was refused, the Territory of Utah was organized instead, and Young was appointed Governor. Some feeling of ill will grew up between the non-Mormon members of the government and the Mormons. Outside of Utah opposition to Mormonism was greatly increased by Young's publication in 1852 of Smith's "revelation" on the eternity of the marriage covenant, including plurality of wives. The Republican National Convention of 1856 proclaimed it "the duty of Congress to prohibit in the Territories those twin relics of barbarism—polygamy and slavery." Soon after his inauguration President Buchanan directed the organization of a military force to march to Utah and uphold the Federal authority, and appointed Alfred Cumming of Georgia to succeed Young. In his message to Congress he declared (Dec. 8, 1857) it "sufficient to say that all the officers of the United States, with the single exception of two Indian agents, have found it necessary for their own safety to withdraw from the Territory, and there no longer remained any government in Utah but the despotism of Brigham Young." But the information on which President Buchanan based his message was found by government officials themselves to be incorrect. By many in the East it was believed the

Mormon issue was brought up to take attention from the slavery question. The military expedition, led by Col. Albert Sidney Johnston (q.v.), reached the borders of Utah in the fall of 1857 and spent the winter encamped among the mountains. On September 11 occurred, about 300 miles south of Salt Lake City, the famous Mountain Meadows Massacre (q.v.), news of which was a long time in reaching the East. A conflict between the Mormons and the troops seemed probable, and the Mormons did, in fact, destroy some supply trains, but in the spring of 1858 Cumming was peaceably installed as Governor and the so-called Mormon War came to an end.

Brigham Young was never again Governor, yet such was his influence as head of the church that he usually managed to dominate the affairs of the Territory. Young died in 1877, leaving a fortune valued at about one million dollars. Some observers had prophesied that after his death Mormonism would decline, but it caused no more change "than does the death of a pope in the Church of Rome." Young's character has been variously interpreted. Mormon writers represent him as a wise and able patriarch, steadfast in adversity, who led his people out of the Valley of Despair into the Promised Land and there acted as their faithful guide and counselor. Whatever may be the differences of opinion concerning his private life or his religious beliefs, historians are united in considering him as the greatest colonizer of modern times.

Crusade against Polygamy. Agitation against polygamy resulted in the passage by Congress in 1862 of the Morrill Act, directed against the practice, but nothing practical was accomplished by this legislation. The Cullom Bill of 1869 was opposed by Delegate Hooper of Utah on the ground that the Mormon views of the marriage relation were an essential part of their religious faith and therefore secured by constitutional guarantee against infringement. In 1871 indictments were found against Young and others for lascivious cohabitation, but only an Englishman named Thomas Hawkins was convicted. The Poland Act of 1874 declared the common law in force in Utah, placed all civil, chancery, and criminal cases under the jurisdiction of the Federal courts, empowered the United States marshals to draw the grand and petit juries, and provided that in cases of adultery, bigamy, or polygamy, a juror could be challenged if he practiced polygamy or believed in its righteousness. By the aid of this law George Reynolds, private secretary to Brigham Young, was convicted of bigamy, and when the case was appealed to the Supreme Court, that body ruled that religious belief cannot be accepted as justification for an overt act made criminal by the law of the land. In 1882 the stringent Edmunds Law forbade polygamy under heavy penalties and provided that no polygamist should be allowed to vote in any Territory or to hold office under the United States. An amendment to this law (1887) strengthened it in several particulars and dissolved the corporation known as the Church of Jesus Christ of Latter-Day Saints. Within two years after the passage of the Edmunds act about 12,000 voters were disfranchised; and within eight years 468 persons, mostly in the rural districts, were convicted of polygamy or unlawful cohabitation. Many Mormon leaders went into hiding or fled from the Territory. At first the

church vigorously opposed the enforcement of the law, one argument much used being that the law broke up existing families. But in 1890, when the Supreme Court had affirmed the decision of the lower court confiscating the property of the church and declaring the church to be an organized rebellion, the fourth president, Wilford Woodruff, issued a manifesto advising Mormons "to refrain from contracting any marriage forbidden by the law of the land." In 1893 President Harrison issued a proclamation granting amnesty and pardon to all persons liable to the penalty of the Edmunds Law who had abstained from violating it since Nov. 1, 1890, but on condition that they should in future obey the laws of the United States. Three years later, after having repeatedly applied for admission for nearly half a century, Utah was admitted to statehood, but the enabling act stipulated that "polygamous or plural marriages are forever prohibited." Whether this restriction would be adjudged constitutional is doubtful, but the prohibition was incorporated into the State constitution as well. Congress passed an act restoring the confiscated property to the church.

In 1898 Brigham H. Roberts, who was known to be a polygamist, was elected to the national House of Representatives, but was refused a seat. When in 1903 the Utah Legislature elected Reed Smoot to the United States Senate, a determined effort was made to deprive him of his seat. Smoot was a monogamist, but he was an apostle of the church, and charges were filed against him on the ground that the first presidency of the 12 apostles, as a body, "has not abandoned belief in polygamy. . . on the contrary, as the ruling authorities of the church promulgate in the most solemn manner the doctrine of polygamy, etc." The inquiry developed some interesting facts concerning polygamy, and the sixth president of the church, Joseph F. Smith, admitted on the witness stand that he had continued to live with his four wives since the manifesto of 1890 and that they had borne him children since that date. Smoot himself emphatically denied that he had taken any obligation as a Mormon apostle that was inconsistent with his oath as Senator, and submitted figures to show that polygamy was on the decline. After a long investigation the Senate voted (Feb. 20, 1907) not to unseat him, and constitutional lawyers are generally agreed that the decision was a correct one. According to the census of religious bodies made in 1906 by the United States government and published in final form in 1910 the number of communicants embraced in the body of Latter-Day Saints in 1906 was 256,647. In 1890 the number of communicants was 166,125, showing an increase from 1890 to 1906 of 90,522, or 54.5 per cent.

The Mormon church had in 1915 a following of about 500,000 souls. Of these the majority are in Utah, but there are many in Idaho, Arizona, Wyoming, Colorado, and other States. There are also colonies in Mexico and Canada, besides members in every civilized country of the world. Many converts to the faith are made every year in foreign lands and in the United States. The Mormon church as an organization does not enter into politics. Its members, however, take an interest in political and civic problems. It may appear to the outside world that the hierarchy of the church dominates in political affairs because of the

fact that every man holds some office in the priesthood which he bears. However, every man is free to take part in politics and to join any national political party that he wishes. The great national parties, Democratic and Republican, have at different times been successful at the polls in Utah.

In November, 1911, an election was held in Salt Lake City under a new commission form of government. In this election the American party's candidate for mayor was defeated by the candidate supported by the Citizens' ticket. It may be inferred, therefore, that the charge often made that Mormons invariably control political matters in Utah is not sustained by the results of these elections.

The Mormons in Utah. The notable industrial and social developments which have accompanied the upbuilding of the Mormon body politic have, perhaps, been too little noticed by non-Mormon writers. Prof. Levi Edgar Young, of the University of Utah, contributes the following account of the industrial, educational, and economic progress of the Mormon people from their beginnings to the present time.

The Mormon people arrived in the valley of the Great Salt Lake July 24, 1847. Here was begun the building up of a united social, economic, and political organization, which in time produced a splendid type of intellectual society and a solid foundation for a prosperous State. The settlers of Utah were a distinct type of authoritative society, accepting as right a prophet and leader who to them has divine authority. It is a demo-theocratic government, for all its people have perfect freedom, politically, socially, and intellectually.

Agriculture became the principal pursuit, and the desert waste was transformed into beautiful private gardens. Agriculture became from the first the keynote to Utah's history and development. Then came manufactures, such as iron foundries, leather, starch, cotton, woolen, shoe, and sugar factories, but those engaged in manufacturing did not lessen the number of hands engaged in the raising of wheat, corn, alfalfa, and potatoes. The modern system of irrigation was used, the first in American history.

In 1850 Millard Fillmore signed the act creating the Territory of Utah, and appointed Brigham Young Governor. Every village in Utah was the distinct Teutonic type of town government. Every town was systematically laid out, with broad streets and walks. This system implied an abundance of land, and the head of each family owned his own home. In the town meeting all the people met to discuss the affairs pertaining to the entire community—the moral, economic, political, and religious. These towns have grown into beautiful cities.

The Mormon people established in Utah the first university west of the Missouri River, as well as the first newspaper, and as early as 1851 established a public-school system. In 1852 they built a theatre, and in 1862 the Salt Lake Theatre was opened, which was the first of its kind in the West. The Mormons built edifices, now world-famed, such as the famous temple and tabernacle at Salt Lake City. They have maintained with the State school system splendid denominational schools, and in every ward, about 700 in number, there are to be found literary societies for the youth that have a wide influence in creating a high educational standard. In 1850 a library of books, worth \$5000,

was brought across the plains by ox teams. From that day to the present there have been libraries in the towns and cities of Utah.

In 1862 the overland telegraph was completed to Salt Lake City, and the first message flashed over the wires from Utah was to Hon. J. H. Wade, president of the Pacific Telegraph Company, and was signed by Brigham Young. It read: "Utah has not seceded, but is firm for the Constitution and laws of our country."

In 1850 the first territorial legislature met in Salt Lake City, and during the session a memorial was drawn up asking Congress to construct a transcontinental railroad. A few years afterward, 1869, the Union Pacific and Central Pacific roads were completed, a work in which the people of Utah took an active part.

To-day the economic, social, and intellectual condition of the State is up to the standard demanded by the best of Americanism.

Doctrines and Hierarchy. According to the present official handbook, the religion of the Latter-Day Saints consists of doctrines, commandments, ordinances, and rites revealed from God to the present age. The first principle is faith in God and in Jesus Christ; the next is repentance from all sin; then follows baptism for the remission of sin, as a preparation for the Holy Ghost, bestowed by the laying on of hands. Obedience to these principles is necessary to membership in the church. There having been no communication with heaven for hundreds of years, the world was without divine authority to administer gospel ordinances until Joseph Smith, who was ordained to the lesser or Aaronic priesthood and to the higher or Melchizedek priesthood, received the holy apostleship and the keys of the kingdom with power to seal on earth so that it might be sealed in heaven. Revelations for the whole church are given through its president, who is its earthly head and holds the keys of the kingdom.

Among the later revelations of the church are the doctrines of baptism for the dead and celestial marriage. As there was no authority among men to administer the ordinances of the gospel from the days of the early apostles or shortly after to the time of the restoration of the priesthood to Joseph Smith the prophet, all the baptisms during the intervening period were void. Friends of the dead, however, are permitted to take their names and be baptized in their stead. Other ordinances may also be admitted by proxy, the living in behalf of the dead. According to the revelation on celestial marriage, all unions entered into without divine authority are dissolved by death. Celestial marriage is marriage unto all eternity and is entered into by those who have obeyed the gospel and become the sons and daughters of God by adoption. The woman is given to the man, and they become one flesh. That which is thus sealed on earth is sealed in heaven, and is as valid as though performed in person by the Deity. Wives thus sealed to a man, and their children by him, are his in heaven after the resurrection.

The Mormon hierarchy is as follows: Joseph Smith and Oliver Cowdery were the first two elders and apostles in the church. Smith, who bore the title of prophet, seer, and revelator, stood at the head of the Melchizedek priesthood, of which three presiding high priests, chosen by the body, form a quorum of the presidency of the church. The president of the church and his two counselors form the first

presidency. The twelve apostles form a quorum equal in authority and power to the three presidents. The twelve are a traveling presiding high council, under the direction of the presidency of the church, to build up the church and regulate its affairs in all nations. The seventies are also called to preach the gospel and form a quorum equal in authority to that of the twelve. The seventy elders have seven presidents to preside over them, chosen out of the seventy. There are now 192 of these quorums of seventies. In addition to these officers of the Melchizedek priesthood are high priests and elders. The officers of the Aaronic or lesser priesthood are priests, teachers, and deacons. In 1915 there were 71 "stakes" of Zion in the church. Over each stake there is a presidency consisting of a president and two counselors, who are high priests. This presidency bears the same relation to the stake that the first presidency bears to the whole church. A high council in each stake, consisting of twelve members, who are also high priests, acts for the stake as the traveling presiding high council acts for the church in all the world. It is the province of the high priests to preside, while the special calling of the seventy is to travel and preach the gospel and build up the church. See REORGANIZED CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS.

Bibliography. The four chief collections of Mormoniana in America are the church archives in Salt Lake City, government publications at Washington, the Berrian collection, New York Public Library, rich in first editions and rare publications of the early church; the collection of the State Historical Society of Wisconsin, at Madison, which includes the unique private collection of A. T. Schroeder, late of Salt Lake City. Mormon periodicals: *Evening and Morning Star* (Independence, Mo., and Kirtland, Ohio, 1832-34); *Latter-Day Saints' Messenger and Advocate* (Kirtland, Ohio, 1834-37); *Elders' Journal* (Kirtland, Ohio, and Far West, Mo., 1837-39); *Times and Seasons* (Nauvoo, 1839-45), vol. iii et seq. containing the history of Joseph Smith, being extracts from his *Journal*, *Latter Day Saints' Millennial Star* (Manchester, 1841; Liverpool, 1842 et seq.); *Deseret News* (Salt Lake City, 1850-87); *Journal of Discourses* by Brigham Young and other church leaders (Liverpool, 1854-86). Pro-Mormon works: *Book of Mormon* (1st ed., Palmyra, N. Y., 1830, 2d ed., equally rare, Kirtland, Ohio, 1835); Joseph Smith, Jr., *Book of Commandments* (Zion, Jackson County, Mo., 1833, exceedingly rare; Salt Lake Tribune reprint, 1884); Lucy Smith, mother of the prophet, *Biographical Sketches of Joseph Smith and his Progenitors* (Liverpool, 1853, and Plano, Ill., 1880); E. W. Tullidge, *History of Salt Lake City* (Salt Lake City, 1886); H. H. Bancroft, *History of Utah* (San Francisco, 1889), containing a valuable bibliography; *The Pearl of Great Price* (Salt Lake City, 1891), selections from the writings of Smith; Joseph Smith, 3d, and H. C. Smith, *History of the Church of Jesus Christ of Latter-Day Saints*, from the standpoint of the Reorganized Church (Lamoni, Iowa, 1901); B. H. Roberts, *Joseph Smith, the Prophet-Teacher* (Salt Lake City, 1908); J. E. Talmage, *The Story of Mormonism* (ib., 1901); J. F. Gibbs, *Lights and Shadows of Mormonism* (ib., 1914); C. A. Shook, *True Origin of Mormon Polygamy* (2d ed., Cincinnati, 1914).

Anti-Mormon works: Howe, *Mormonism Unveiled*, the earliest first-hand information against Smith, very rare (Painesville, Ohio, 1834); Ferris, *Utah and the Mormons* (New York, 1854); Gunnison, *The Mormons* (Philadelphia, 1856), description of early life in Utah by an army officer; Hyde, *Mormonism: Its Leaders and Designs*, the confessions of an apostate (New York, 1857); T. B. H. Stenhouse, *The Rocky Mountain Saints* (London, 1870), a vivid portrayal by an ex-Mormon; W. A. Linn, *The Story of the Mormons*, the most complete and exhaustive Gentile history of Mormonism (New York, 1902); I. W. Riley, *The Founder of Mormonism: A Psychological Study of Joseph Smith, Jr.* (ib., 1902). Consult also *Testimony before Senate Committee* (Washington, 1903-05); M. T. Lamb, *The Mormons and their Bible* (Philadelphia, 1901); Nelson, *Scientific Aspects of Mormonism* (New York, 1904); L. A. Wilson, *Outlines of Mormon Philosophy* (Salt Lake City, 1905); Fohlin, *Salt Lake City, Past and Present: A Narrative of its History and Romance, its People and Cultures, its Industry and Commerce* (ib., 1909).

MORMYRIDÆ (Neo-Lat nom. pl., from *Mormyrus*, from Gk. *μορμύρος*, *mormyros*, sort of sea fish) A family of malacopterous fishes, allied to the pike family, but according to Cope forming a separate group, Seyphophori, having rather long, compressed bodies and a slender tail, swelling out at the origin of the caudal fin. The skin of the head is naked, envelops the gill covers and gill rays, and leaves only a slit for gill opening, and the color is dark. The mouth is small. All the dozen or more species inhabit the rivers of northern Africa and are nocturnal in their activities. The beaked or sharp-nosed *mormyrus* (*Mormyrus petersi*) is regarded as one of the best fishes of the Nile and is distinguished by the production of the lower jaw into an elongated fleshy appendage. It is caught by lines baited with worms, and is represented on many Egyptian monuments.

MORNAY, môr'nâ', PHILIPPE DE A Huguenot statesman. See DU PLESSIS-MORNAY, PHILIPPE

MORNING-GLORY. Various species of *Ipomœa*, especially *Ipomœa purpurea*, cultivated for their large funnel-shaped, diversely colored flowers, which open in the early morning and close during the heat of the day. The garden varieties are propagated from seeds sown in sunny situations in ordinary garden soil. Their large and abundant, roundish heart-shaped leaves make an excellent screen, the vines often attaining a height of 10 feet or more by midsummer. See CONVULVUS; IPOMŒA, and Plate of DICOTYLEDONS.

MORNY, môr'nê', CHARLES AUGUSTE LOUIS JOSEPH DE, DUKE (1811-65). A noted French politician of the Second Empire. He was the illegitimate son of Queen Hortense and of the Comte de Flahault, and consequently half brother to Louis Napoleon (later Napoleon III). He was born in Paris, Oct. 23, 1811. The secret of his parentage was well kept for a time and the Comte de Morny received 800,000 francs to adopt him; but he was educated by his grandmother, Madame de Souza-Flahault, and Queen Hortense left him at her death, in 1837, an annuity of 40,000 francs. Morny took a nominal part in the revolution of July, 1830, and entered the army in 1832 as a sublieutenant. He served with some distinction in Algeria, be-

ing made a Chevalier of the Legion of Honor; but he soon abandoned military life and in 1838 made his appearance as a manufacturer of beetroot sugar and published a pamphlet on the subject. From that time he was involved in all sorts of commercial and financial speculations. Chosen a deputy in 1842, he became the leader of fashion at Paris, but his financial schemes began to go wrong, and after the revolution of 1848 he attached himself to the cause of his half brother and was one of the prime instigators of the subtle and treasonable policy which culminated in the *coup d'état* of 1851. The morning after the deed was done Morny was made Minister of the Interior. This office he soon resigned, however, and in 1854 he became President of the Corps Législatif, and was Ambassador to Russia during 1856-57, where he married the rich and handsome Princess Troubetzkoï. Morny was created Duke in 1862, and continued his gay and extravagant life up to the time of his death on March 10, 1865. His character was sketched by Alphonse Daudet, who was his secretary, as the Duc de Mora in *Le nabab*. An extract from his memoirs appeared under the title *Une ambassade en Russie* (1856). Consult De la Guéronnière, *Etudes et portraits politiques* (Paris, 1856); Castille, *M. de Morny* (Paris, 1859); A. L. Imbert de Saint-Amand, *The Court of the Second Empire* (Eng trans. by E. G. Martin, New York, 1898); F. A. Lolié, *Le duc de Morny, the Brother of an Emperor and the Maker of an Empire* (Eng trans., ib., 1910).

MORO, mō'rō. All the inhabitants of the Philippine Islands who profess the Mohammedan faith are known as Moro. In reality they constitute several tribes with wide variation in dialects and lesser differences in customs and degree of civilization. Some of these people live in settled villages on or near the coast, along rivers or about the shores of lakes, where, in addition to their universal industry of fishing, they carry on a little farming and some manufacture in cloth, brass, and steel. From these, who form the highest type, they grade down to the so-called sea gypsies, who wander from place to place, often living for months in their rude outrigger boats. The Moro is essentially a warrior and makes war on slight provocation. He is not an open, fair fighter, but resorts to cowardly means of attack, and often exhibits great cruelty towards his captives.

Their homes are raised high on poles, often near or above the water. The timbers are lashed together with rattan, and the sides and roof are made of palm leaves sewed together. The furnishings of the average home are very scant, but the *datos*, or men of wealth, often have quantities of brass and other valuable objects on display.

Polygamy is sanctioned by their religion and is universal. Slavery is also a recognized institution and the desire for slaves is one of the chief incentives for raids against neighboring tribes. Since these captives soon became merged into the population, a large element of foreign blood has thus been introduced. Chinese and Arabian traders who have settled on the coasts have also influenced the physical type, as well as culture.

The government is patriarchal, the most prominent member of the order being called a *dato*, *sultan*, or *rajah*. He has extensive powers over his followers, who may vary from a

few dozen to several thousand. Nominally the Sultan of Sulu is the supreme ruler of this people, but his actual power outside his personal following is very small.

The greater part of this people are now found in the island of the Sulu Archipelago, southern Palawan, and the districts bordering on Lakes Lanao and Baluan, the banks of the Cottabato River, and the northwestern and western coasts of Mindanao.

Consult N. M. Saleeby, *History of Sulu* (Manila, 1908). See PHILIPPINE ISLANDS.

MOROCCO. See HONEY GUIDE.

MOROCCO, mō-rōk'ō, or **MAROC**, called by the natives *Maghrib el Aksa* (the extreme west) or briefly *Maghrib*. An empire or sultanate in the northwest of Africa, under French protection, bounded on the east by Algeria and on the north and west by the Mediterranean Sea, the Strait of Gibraltar, and the Atlantic Ocean. It extends southward into the Sahara, but the boundary in that direction is not exactly determined (Map: Africa, D 1). The Treaty of 1912 gave the French protection over 95 per cent of the country, the Spanish over about 5 per cent, and left about 140 square miles about Tangier as an international zone. Recent estimates give Morocco 219,000 square miles.

Topography. The country is generally mountainous, the Atlas (q.v.) Range, which attains an elevation of nearly 15,000 feet, traversing it in several parallel chains from southwest to northeast, separating the Saharan waste from the more arable land along the Mediterranean, and sending out numerous spurs to both the coast country and the desert. There are, however, many level tracts, especially at the western and eastern extremities and on the borders of the desert. Through the heart of north Morocco extending east and west is a depression, passing just north of Fez, the northern capital, to Oran, Algeria. The central range of the Atlas forms the water parting, separating the streams which flow into the Atlantic and Mediterranean from those which run southward to the desert. The former rivers have the shorter course and less volume, but they are perennial, while the latter become dry in summer, and even when running are lost in the sands of the Sahara. The chief river is the Muluya, with its tributary the Sharf, which drains the northeast of the country and falls into the Mediterranean after a course of 400 miles. The Muluya is of much commercial importance. The Sebu was found in 1905 to be navigable for light boats from the Atlantic to near Fez, 125 miles. The Kus, Bu-Regreg, Um-er-Rabia, Tensift, Sus, and Assaka drain the central and western districts and fall into the Atlantic, the Dra, Ziz, Ghir, and other streams irrigate the dry plains of Taflelt, the first mentioned emptying into the Atlantic Ocean. The other rivers are lost in the desert. All the rivers flowing to the sea are obstructed at their mouths by sand bars, some of which, the French found in 1905, may easily be removed.

Climate. The climate between the central range of the Atlas and the sea, under the influence of marine winds, is temperate, the thermometer seldom falling lower than 40° F., or rising above 90° F., and during the winter months the westerlies bring to this area 20 to 30 inches of rain; but in the southeastern districts extremes of heat and cold prevail and rain is there unknown. The entire country is very healthful

and has been recommended and used as a health resort. Malaria, the pest of the other Atlas lands, is almost unknown. Good pasturage is found as far south as Cape Juby, along the Atlantic coast, but dryness prevails throughout the Atlas region, though the winter precipitation covers the mountain tops with snow. This fact, together with the infrequency of wide valleys, makes the mountain region unfavorable for a large population. The settlement among the mountains is confined to the valleys where irrigation is possible and to the lower slopes. In the Saharan steppes cultivation is impossible, excepting in the many small oases where streams, fed by the mountain snows, bring surface or underground supplies of water.

Flora. The flora is richer in flowers and shrubs than in trees. The forests that once covered western Barbary have disappeared and Morocco is largely a treeless country, though some well-wooded valleys are found among the northern ranges. The cedar, mimosa, cypress, and cork oak have commercial value. The date and oil palms, the fig tree, pomegranate, oranges and lemons, apricots, peaches, the almond, and other varieties of fruit and nut trees are all important.

Fauna. The wild animals include the leopard, bear, hyena, and wild hog. The bustard, partridge, and waterfowl abound. The domestic animals comprise the dromedary and the horse, both bred extensively, and mules, asses, cattle, fat-tailed sheep, and goats.

Mineral Resources. The country is rich in iron ore, antimony, and rock salt (north of Fez), and gold and silver, as well as other minerals, are reported. Native hostility has hitherto prevented European enterprise from developing these resources to any considerable extent.

Agriculture. Agriculture and stock raising are almost the only industries. The alluvial soil of the wide plains of the west and east is especially adapted to the cultivation of cereals, and could be brought to a high degree of productivity by the application of modern agricultural methods. In 1904-05 the French sent several expeditions inland from the Atlantic to study resources, and their reports emphasize earlier ideas as to the value of agricultural and grazing prospects. The chief agricultural products, besides wheat, barley, and other cereals, are olives, dates, oranges, figs, and other kinds of southern fruit, as well as numerous varieties of vegetables. Cotton and sugar cane, once extensively cultivated, have now entirely disappeared, and the cultivation of tobacco is greatly hindered by the adverse sentiment towards its use. The manufacturing industries of Morocco are chiefly devoted to the production of leather, pottery, textiles, including carpets, metal goods of copper and brass, and silver filigree. Fezes are chiefly imported from Austria.

Commerce. The chief exports are hides and skins, barley, wheat, eggs, wool, almonds, cattle, etc. Imports include cotton goods, sugar, tea, provisions, hardware, etc. Purchases of clothing stuffs and metal wares from Europe are constantly increasing. The commerce with Europe is carried on through the ports of Tangier, Tetuan, Larache, Rabat, Mogador, Mazagan, Casablanca, and Safi, all of them, with the exception of Tetuan, situated on the Atlantic. Fez in the north and the city of Morocco in the south are the centres of the interior caravan trade. The commercial statistics of the country are very

incomplete, but the value of the trade passing through the ports in 1911 was: imports 94,279,000 francs, exports 83,600,000 francs, in 1912, imports 152,497,000 francs and exports 75,047,000 francs. In recent years the foreign trade has shown a tendency to increase. In 1912 imports from and exports to the United Kingdom were valued at 50,725,000 and 15,817,000 francs respectively; France, 49,953,000 and 15,540,000, Germany, 13,209,000 and 17,839,000. As wagon roads and bridges are unknown, commodities can be moved only at large expense.

Government. By the Franco-Moroccan Treaty of March 30, 1912, the Empire of Morocco became a French protectorate, excepting Tangier with surrounding territory, which, nominally Moroccan, became an "international sphere," and excepting the "Spanish zone" in the north, which, together with Ifni, on the coast at the south, was recognized by France in the Franco-Spanish Treaty of Nov. 27, 1912. The shereefian government continues, subject to the control of the French and Spaniards in their respective territories. The French administration, whose seat is at Fez and whose head is the resident commissioner general, may veto any loan or concession, control the relations of natives with foreigners, etc. It is under the Foreign Office at Paris. The Spanish zone is administered, under the control of a Spanish high commissioner, by a khalifa chosen by the Moorish Sultan from two candidates named by the Spanish government.

Prior to the establishment of the French and Spanish protectorates Morocco was an absolute despotism, under a sultan supreme alike in temporal and spiritual affairs. For some years, however, the Sultan and his officials had been subjected to strong external influence, and in 1906 an agreement was concluded between the interested European powers, together with the United States, and the Sultan, which provided for a Moorish police force under command of provincial governors assisted by French and Spanish officers, for a state bank, for tax reform, for purchase of land by foreigners, for certain modern methods of government, etc. The revenue (for which no reliable statistics were available) was derived from monopolies, taxes, customs, and gifts. Taxes were collected with little system, each taxgatherer being obliged to deliver a certain sum regardless of the amount collected. Refusal or reluctance to pay taxes was often followed by harsh measures—reprisals or punitive expeditions. An impartial and well-regulated system of administration of justice was naturally out of the question. The evidence of a Jew or a Christian against a Mohammedan was considered invalid by the native judges. The army of the Sultan in the French protectorate is under French control.

Army. The army was being reorganized in 1915 by the French and was under the command of a French general. Service was to be compulsory, substitution being permitted, and for a period of four years. The garrison at Fez was to consist of two battalions of infantry, two squadrons of cavalry, and a mountain battery. In addition to this garrison, there are nine battalions of infantry, five squadrons, four mountain batteries, one engineer battalion, and certain staff or administrative troops. Companies, squadrons, and batteries are commanded by French officers, a certain proportion of the noncommissioned officers also being French. In 1915 the compulsory feature of service had not become an ac-

complished fact but was being gradually introduced among the many different tribes composing the population.

Population. Estimates of the number of inhabitants vary widely, the population is often stated at 5,000,000 to 10,000,000, though undoubtedly the latter figure is much too large. One of the most recent estimates is as follows: in the French protectorate, 3,000,000; in the Spanish protectorate, 404,000. In the territory of Tangier, 60,000; total, 3,464,000. The aboriginal Berbers, who dwell in the mountainous districts but whose blood is more or less intermixed in the population as a whole, form the most numerous and important race. Arabs inhabit the plains; here also, as well as in the towns, dwell the "Moors," a mixture of Berber, Arabic, and often other elements, and Arabic in culture. There are probably about 150,000 Jews, the Spanish-speaking Jews are the most progressive and prosperous element in the population. There is a considerable negro and mulatto population. Europeans number about 20,000. Education is in a very backward condition, though most males have an opportunity of learning to read the Koran. Excepting the Jews, the natives are among the strictest of Mohammedans. The native capitals are Fez (with over 100,000 inhabitants), Morocco (about 80,000), and Mekinez (about 24,000).

History. Morocco was a Roman province, called Mauretania, and shared in the vicissitudes of the other Roman provinces of northern Africa during the decline of the Empire. It was reached by the tide of Arabian Mohammedan invasion, in 682, but was reduced to submission and to Mohammedanism only after a spirited resistance. Its people participated in the conquest of Spain. For a number of centuries its history is the rise and fall of successive dynasties, of which the most celebrated were the Almoravides and the Almohades (q.v.), who passed over into Spain and established their power in that country. In fact, during the later Middle Ages Morocco was the source whence new reinforcements were constantly drawn for the declining power of the Moors in Spain. Moorish dominion in Spain came to an end in 1492 with the surrender of Granada to Ferdinand and Isabella by Sultan Boabdil el Chico, and Morocco began to gain strength as an empire through the accession of the Spanish Moors and Jews. Since 1213 the country had been under the reign of the Beni Marin Berbers, who retained their hold until 1524. Then followed the unimportant Saadi period, lasting to 1550, in which year began the dynasty of the Hassani Shereefs, who reigned until 1649. The most important event of this period was the "Battle of the Three Kings" at El Kasar el Kebir in 1578. The deposed Sultan, Mohammed XI, had called upon the Portuguese for aid against the reigning Sultan, Abd el Malek. With 17,000 troops Dom Sebastian, of Portugal, marched upon El Kasar, accompanied by Mohammed XI. The forces of Dom Sebastian and Mohammed XI were annihilated, and all three rulers lost their lives. This battle ended Portuguese influence in Morocco and greatly strengthened the Empire. In 1577 the first foreign ambassador appointed to Morocco was accredited by the English Queen to the "King of Marucos and Fesse." In the same year Henry III of France created a consulate of Morocco and Fez. The Filali period began in 1649 and still continues in the present Sultan. In 1662 the

English occupied Tangier. The city was abandoned in 1684 because of the continuous assaults of the Moors and the interference of home politicians. This evacuation was considered by the Moors to be the most glorious victory of the Sultan, Mulai Ismail, who was one of the most notable of Moorish sultans. His death threw the country into a state of anarchy which lasted for several decades. In 1787 was signed the first treaty between the United States and Morocco, Washington and Mohammed XVIII being the signatories. In 1781 the first United States Consul to Morocco was appointed. War was declared by Morocco upon the United States in 1802 because of the war of the United States with Tripoli. Peace was declared by the Sultan before the news of this declaration reached America. In the seventeenth century the Moorish Empire included most of what is now Algeria and extended south to Guinea. The continuous breaking off of pieces of territory by European nations has reduced it to its present area of about 250,000 square miles, with the southern boundary undefined. Stimulated by the success of Abd el Khader in Algeria the Sultan Abd er Rahman in 1830 entered into negotiations with him and made an unsuccessful attempt to seize the city of Tlemcen, on the Morocco-Algerian border. The resultant treaty with France, which Abd er Rahman signed in 1832, included a clause promising that he would in no way support or communicate with Abd el Khader. When Abd el Khader sought refuge in Morocco in 1844 the French used this act as a reason to occupy the town of Oujdah. Tangier and Mogador were bombarded by the French, and finally the Moors were defeated at the battle of Isly. A treaty of peace followed. A few years later, owing to the differences which had arisen as a result of the loose provisions of the treaty, the French bombarded the port of Sallee. Thereupon their demands were granted. In 1880 a conference of the European powers took place in Madrid for the purpose of establishing the status of foreign residents and the rights and duties of foreign diplomatic and consular representatives in the Empire of the Moors. The code drawn up by this conference was a wise one, and its provisions operated for peace and prosperity up to the time of the Algeiras Conference in 1906. Unlike the Act of Algeiras, it was designed for this purpose. The rapid development of Algeria and the gaining of Tunisia stimulated French interest and gave rise to the dream of a vast North African empire. The development of trade routes in Algeria, which extended into Morocco, had shown France the desirability of this western empire of Islam. Coupled with this was added confidence in her diplomatic ability and in the possibility of coming to an understanding with England concerning African colonial affairs. Undoubtedly the contact between the English and French statesmen brought about by the Egyptian affair made France the gainer by at least a hint concerning what England would permit in Morocco. In 1894 Mulai el Hassan III died, and his son, Mulai Abd ul Aziz, came to the throne. The new Sultan had certain marked leanings towards European standards. These were held in check by Bu Hamed, his Grand Vizier, who had been the chief adviser of his father. But in 1900 Bu Hamed died, and the young ruler was free to attempt to introduce European standards into the administration of the country. A certain

portion of the populace objected to this procedure, realizing that it placed their country more at the mercy of European exploiters and took it farther away from Islamic standards. By supporting the Sultan, France permitted the opposition against him to become overwhelming. In the latter part of 1893 trouble broke out between the Riff tribesmen and the Spanish forces, as a result of which the Moorish government was forced to pay Spain an indemnity of 20,000,000 pesetas, giving a lien upon certain customs duties. In 1901 the oases of Timmimum and Tuat were occupied by the French. In 1902 an uprising under the leadership of Bu Hamara, who improperly claimed to be an older brother of the Sultan and therefore the rightful ruler, gained serious proportions. By 1903 native authority in Morocco had become so weakened by European intrigue that the Sultan asserted himself and dismissed the foreign advisers at his court. Thus two steps had been taken: the revolutionary element had been enabled to continue its opposition; the Sultan had been placed in a position where his return to native standards could not redeem him in the eyes of the Moors, and would condemn him in the eyes of Europe. Under European stimulus a situation more or less comparable to anarchy had thus been created. The seriousness of the situation reached its climax in 1904 with the capture by Raisuli of Ion Perdicaris, a naturalized American citizen. The kidnaping was perpetrated by Raisuli purely as a political move to protect himself from his enemies who had gained the upper hand and were about to have him disgraced and imprisoned. Although a large ransom was paid for the release of Perdicaris, Raisuli's real profit in the transaction was that he was given the governorship of Tangier, and his enemies were degraded or imprisoned. On April 8, 1904, an agreement of vital importance to Morocco was entered into by France and England. The generally disturbed condition of the country was recognized by France as her opportunity to intervene. Intervention resulted in an agreement whereby England, in exchange for a free hand in Egypt, granted the same right to France in Morocco. This agreement was the precursor of the Algeiras convention. The French government promised to make no effort to change the political status of the country, and to maintain British commerce on a footing of absolute equality with its own. France in 1904 faced an alliance with Germany or an alliance with England. That with England meant acceptance of British control of Egypt, that with Germany meant the giving up of all thought of the recovery of Alsace and Lorraine. It was finally decided to treat with England, and under Delcassé the agreement was concluded. The outbreak of the Russo-Japanese war seriously disturbed the balance of power in Europe. Emperor William took advantage of the fact. The war had freed him of anxiety concerning his eastern frontiers, and in the first part of 1905 the Russian disasters in Manchuria led him to a more or less open demonstration of his intentions concerning imperialism in the East and his desire to gain the friendship of Islam. Germany had declared, relative to the Anglo-French convention of April, 1904, that Germany's interests in Morocco were purely commercial and that consequently she had no pressing interests there.

On Oct. 3, 1904, agreement was reached between France and Spain confirmatory of the

Anglo-French agreement and, further, providing for the establishment of a Spanish zone of influence in the country north of El Kasar el Kebir. The hypothetical line drawn at this time as the line of demarcation between the French and Spanish zones later became the line of penetration of the French military forces.

The ground having been cleared for French domination of Morocco and the ultimate establishment of a protectorate, a French diplomatic mission to the Sultan was arranged. It arrived in Fez in January, 1905, and presented to the Sultan a comprehensive programme of reforms. This programme, which took away practically every independent power from the Sultan, clearly demonstrated France's intentions.

Germany immediately executed a coup d'état. On March 31 the German Emperor arrived unexpectedly in Tangier and during his visit gave voice to the determination that German interests in Morocco would be protected. This announcement not only again threw Morocco into the European tangle, but struck directly at the Anglo-French agreement of 1904. War was imminent. In May Count Von Tattenbach, German Minister at Lisbon, visited the Sultan to take advantage of the favorable impression made by the Emperor's words and to gain special privileges for Germany. He was successful to the extent that on May 28 the French programme of reform was rejected in toto on the ground that any reforms proposed for Morocco must emanate from a conference of the signatories of the Treaty of Madrid. By German influence the Sultan was induced to request the holding of such a conference. The French foreign Minister, Delcassé, having thus failed in his Moroccan plans, and having brought the country to the verge of warfare with Germany, resigned (June 6). Rouvier, his successor, in order to avert war, reached an agreement with Prince Rodalín, the German delegate, on June 8, concerning the conference requested by the Sultan. Subsequent German activities in Morocco urged the French to haste, and on September 28 the plans of the conference were agreed upon and it was called to open Jan. 16, 1906, at Algieras, Spain.

The delegates to this conference were from France, Germany, Austria-Hungary, Belgium, Spain, Great Britain, Italy, the Netherlands, Portugal, Russia, Sweden, the United States, and Morocco. The Act was signed at Algieras on April 7, 1906, and was proclaimed Jan. 22, 1907. According to the Act, as published, the conference was "inspired by the interest attaching itself to the reign of order, peace, and prosperity in Morocco, and recognizing that the attainment thereof can only be effected by means of the introduction of reforms based upon the simple principle of the sovereignty and independence of his Majesty the Sultan, the integrity of his domains, and economic liberty without any inequality." Briefly the programme outlined by the Act covered: (i) a declaration relative to the organization of the police; (ii) a regulation concerning the detection and repression of the contraband of arms, (iii) an act of concession for a Moroccan state bank; (iv) a declaration concerning a better return of the taxes and the creation of new revenues, (v) a regulation concerning the customs of the Empire and the repression of fraud and smuggling; (vi) a declaration relative to public services and public works. In this conference Austria alone supported the German claims, and German diplo-

macy was outmanœuvred, inasmuch as the Act opened the way to French control of Morocco. The French agreements with England and with Spain were partially nullified, but on the other hand France was given powers which, by a liberal interpretation of the Act, might be, and eventually were, developed into the right to regulate practically all Moorish affairs. To Spain the policing of the ports of Tetuan and Larache was given; to France the ports of Mogador, Saffi, Mazagan, and Rabat; Tangier and Casablanca to a joint French and Spanish police. It was arranged that in the Imperial Bank France should own three shares of capital as against one share for each of the other countries. A committee of customs to revise the customs duties was provided for; a committee on public works to expend a sum equal to 2½ per cent of the customs duties, and such other committees as were needed were arranged for. The United States Senate ratified the Act on Dec. 12, 1906, and the President on December 14. The United States, however, added an additional protocol declining to assume any responsibility for the enforcement of the provisions of the Act.

In 1907 a French agent, Dr. Mauchamp, was killed by natives in Marakesh. Demand was immediately made by France upon the Moorish government for the punishment of the guilty persons, and until this demand was complied with Algerian troops who had seized and occupied the city of Oujdah on the Morocco-Algerian border were to remain there. The latter part of July the French construction company engaged in the harbor works at Casablanca insisted upon running a construction railroad through a Moorish cemetery, as a result of which natives attacked the French and Spanish workmen and killed a number of them. On August 5 the town was shelled by French warships. Several thousand native Jews and Moors were killed. The occupation of Casablanca followed, and soon the entire Shawia district was under French control. This was in pursuance of the right granted France by the Act of Algieras to keep order in Morocco. In the summer of 1907 Mulai el Hafid, half brother of Sultan Abd ul Aziz, and the latter's Viceroy in Marakesh, proclaimed himself Sultan and defeated the troops of Abd ul Aziz near Settát. Abd ul Aziz left Fez and sought the protection of the French warships at Rabat, later going to Tangier to retire into private life. Mulai el Hafid, having been supported by the French, was amenable to their suggestions, and under one pretext or another their military operations were extended inland from Casablanca until in 1911 an uprising in Fez, in which a number of French officers lost their lives, resulted in the sending of a strong body of troops to the capital. In 1910 two of the Mannesman brothers, German capitalists and diplomatic agents, personal friends of the Kaiser, succeeded in buying from the Sultan concessions covering about one-fifth of the area of the country.

In 1908 Spain had found itself involved in a "little war" with the natives in the Melilla district, where Spanish capitalists had extensive iron interests. In 1911, following the example of France, Spain sent troops to the town of Larache. This aroused the French, and Spain was forced to abandon the stand she had taken. In mid-summer of this year another Moroccan crisis threatened when the German warship *Panther* was sent to Agadir in southern Morocco, where the Mannesman interests had become so impor-

tant. The officers of the *Panther* entertained the most powerful kaida of south Morocco on board ship and promised them Germany's support in resisting French control. War in Europe was again imminent. France and Germany both massed troops on the border; Belgian troops were rushed to the forts of Namur, Liège, and Derviers, and England became active as an ally of France. At the same time Spain sent 3000 troops to Melilla. On September 10 Germany replied to the French proposals concerning Morocco and asked that every claim of German subjects to concessions in that country should be recognized by France, that no new enterprises should be started under the French protectorate without being internationalized equally, and for a free hand in Morocco. The second provision concerned the Mannesman concessions. On November 3 a Franco-German accord was published in which Germany recognized the right of France to establish a protectorate in Morocco, both nations engaged to obtain the adhesion to this accord of the other signatories of the Act of Algeiras; France ceded to Germany, as compensation, about 250,000 square kilometers in the northern French Congo, touching the German Kameruns. France retained the right to run railroad lines across German territory to connect different parts of French Central Africa. France and Germany agreed to submit to The Hague tribunal all difficulties resulting from the accord, France agreed to safeguard the economic equality and commercial liberty for which provision was made in existing treaties, and it was mutually agreed to take over the rights and obligations in connection with the companies holding commercial concessions in Morocco. In April, 1912, a Franco-Spanish agreement was consummated concerning the administration of the country—in the Spanish zone under a Spanish high commissioner to act in conjunction with the French Governor-General at Fez. On March 12 the Franco-German agreement was ratified, confirming the French right to establish a protectorate which was formally established in 1913. This was a great diplomatic defeat for Germany and caused bitter feeling in German official and industrial circles. Soon after that the German army was increased, which was followed by the passing of the three-years military law in France; this prepared the way for the Great European War of 1914. On May 30 Fez was attacked by native tribes and additional French troops were sent to that point. In 1913 Mulai Abd el Hafid abdicated and Mulai Yusef became Sultan at the dictation of French statesmen. In 1914 the line separating the French and Spanish zones had been extended from Casablanca to Fez and eastward therefrom to Taza. From Oujdah French troops had progressed westward to Taza and in the latter part of the year Taza surrendered. The dividing line was complete. The breaking out of the European War brought disturbances in Morocco, as Germany had come to be looked upon as a friend of Islam.

MOROCCO, MAROCCO, or MARAKESH, mi'ra-kesh'. One of the capitals of the Sultanate of Morocco. It is situated on the north slope of the Great Atlas Range, 90 miles from the Atlantic coast and 250 miles southwest of Fez (Map Africa, D 1). Its location in a large plain near the foot of the Atlas is very favorable, the elevation being estimated at from about 1400 to over 1600 feet. The city has a healthful though hot climate, but is in a very backward and dilapidated condition. It covers a large area, surrounded by a wall, now more or less in ruins, with a height of 25 to 30 feet and a length of about 7½ miles. A large part of the space within is occupied by gardens, open areas, and market places, but in the built-up portions the streets are narrow, crooked, and dirty, and the houses are ill-kept, mostly one-storied, lime-and-earth buildings, with unglazed window openings. There are 19 mosques. A notable feature is the tower of the Kutubia Mosque, 230 feet high and of the type of the Giralda at Seville; this is almost the only stone edifice in the city. The Imperial Palace comprises an irregular conglomeration of buildings and gardens in the southern part of the city, covering 180 acres and surrounded by a wall. Of late years it is but seldom visited by the Sultan. The only industry of note is the manufacture of morocco leather. There is still considerable local trade carried on with the surrounding country and with the port of Mogador (q.v.). Traffic is largely in the hands of the Jews, who live under repressive conditions in a separate quarter of the city. The number of inhabitants is not known with certainty, but is commonly estimated at 50,000 to 75,000; however, the *Annuaire du Maroc* (Algiers) states the population at 80,000, of whom about 17,000 are Jews and 500 Europeans. The people are turbulent in disposition, and crimes of violence are common. Morocco was founded about 1070. It reached the height of its prosperity in the thirteenth and fourteenth centuries, when its population is said to have been 700,000. It was then a famous Mohammedan seat of learning. Its decline was brought about by several centuries of civil wars and rebellions.

MOROCCO GUM. See GUMS.

MOROCCO LEATHER. See LEATHER.

MORÓN, or **MORÓN DE LA FRONTERA**, mór'ón' dá là frón-ta'rá. A town of south Spain,

in the Province of Seville, 32 miles southeast of the city of that name, on the Guadaira (Map: Spain, C 4). On one of the high and steep hills surrounding the town are the remains of a once almost impregnable castle erected by the Moors on Roman foundations and surrounded by triple walls and towers. The castle was occupied by the French in 1810 and was blown up by them on their departure. The inhabitants are engaged in the production of olive oil and in the vicinity are marble quarries and mines of red hematite. Pop., 1900, 14,459; 1910, 17,099.

MOR'ON. See MENTAL DEFECTIVES.

MORONG, mō'rōng. A town of central Luzon, Philippines, capital of the Province of Rizal. It is situated on the north shore of the Laguna de Bay, 19 miles east-southeast of Manila. Pop., 1903, 5276. It is a busy industrial town.

MORONG, THOMAS (1827-94). An American botanist, born at Cahaba, Ala. The family removed to Massachusetts while he was a boy, and he graduated at Amherst in 1848. He studied law, but later entered Andover Theological Seminary, and completed his studies in 1853. During his early life he was devoted to botany as an amateur, and in 1888 he undertook an extended voyage of exploration and botanical collection in South America and visited Argentina, Paraguay, and Chile. Upon his return, in 1890, he was made curator of the herbarium of Columbia College, in New York City. In conjunction with Dr. N. L. Britton he published *An Enumeration of the Plants Collected by Dr. Thomas Morong in Paraguay, 1888-90*. He was one of the contributors to the *International Encyclopædia*.

MORONI, mō-rō'nē, or **MORONE**, GIAMBRATISTA (c.1525-78). An Italian portrait painter of the Brescian school, born at Albino, near Bergamo. He was a pupil of Moretto and was also influenced by Lotto. Moroni is the only painter produced by the Italian Renaissance who painted solely portraits. He is an excellent draftsman, and his portraits are direct and characteristic likenesses. In his best works, like the portraits of a "Tailor" (National Gallery, London) and "Bartolommeo Bonga" (Metropolitan Museum, New York), he is likewise a colorist of the first rank. Though it is always vital, much of his work, like the double portrait of a "Gentleman and his Wife" (Metropolitan Museum, New York), is hard and dry in effect. Other good examples of his work are "Widower with Two Children" (Dublin Gallery); "Old Man and Boy" (Boston Museum), portrait of a "Lady" (Walters Gallery, Baltimore); full-length portrait of a "Man" (Gardner collection, Boston); portrait of a "Man" (Wilstach collection, Philadelphia). A large number of his works are in the Brescia, and he is also well represented in the galleries of Milan, Florence, Vienna, and Berlin. His art is too literal for success in religious painting, in which he is a follower of Moretto.

MOROSINI, mō-rō-zē'nē, originally MOROSI. A family of Venetian nobles, dating from the eighth century. Four of the family became doges, three of its women wives of doges and two others queens (Tommasina of Hungary and Constance of Serbia), and many of them occupied other public positions. The first celebrated member of the family was DOMENICO MOROSINI, Doge from 1148 to 1156.—MARINO MOROSINI was Doge from 1249 to 1252.—MICHELE MOROSINI, Doge for less than a year (1382), was cele-

brated as a financier.—ANDREA MOROSINI (1558-1618) became historiographer of the Republic (1598) and held several public offices, besides being one of the Council of Ten. He wrote a history of Venice from 1521 to 1615, first published in 1623, and *Imprese ed spedizioni di Terra Santa e l'acquisto fatto dell'imperio di Constantinopoli dalla repubblica di Venezia* (1627), a history of the Fourth Crusade.—FRANCESCO MOROSINI (1618-94) gallantly but unsuccessfully defended the fortress of Candia against the Turks in 1667-69. About 20 years later he conquered nearly all of the Morea, which gained him the surname of Il Peloponnesiaco. He was elected Doge in 1688. Consult: Morosini, *Francesco Morosini il Peloponnesiaco* (Venice, 1885); Bruzzo, *F. Morosini nella guerra di Candia e nella conquista di Morea* (Forlì, 1890); Cicognasoranzo, *Bibliografia veneziana* (Venice, 1857, 1885).

MOROT, mō'rō', AIMÉ NICOLAS (1850-1913). A French historical and portrait painter, born at Nancy. He studied under Cabanel and at the Ecole des Beaux-Arts, where he was awarded the Prix de Rome in 1873. He is best known for his portraits of members of the fashionable and artistic world of Paris, including Prince d'Arenberg, Edouard Dumont, and E. Hébert (1905, Luxembourg). They are excellent likenesses, correctly painted, and cool in color. His battle pieces display great action and force. One of his earliest works, "The Battle of Aquæ Sextimæ," is in the Nancy Museum; "Rezonville, Aug. 16, 1870" is in the Luxembourg, and "Charge at Reichsoffen" is at Versailles. He became Officer of the Legion of Honor and member of the Institute.

MOROTOCO, mō'rō-tō'kō. One of a group of sedentary agricultural tribes residing about the Oxuquis River, on the border of the Chaco region, in southeastern Bolivia. The entire group constitutes a distinct linguistic stock, the Samucan. The Morotoco are remarkable in being apparently ruled by the women. The men do the household drudgery, although they are tall and robust and daring hunters. The women refuse to have more than two children, strangling any born above that number. Consult Keisten, in *International Archiv für Ethnographie* (Leyden, 1904).

MORO VAN DASHORST. See MOR.

MORPETH. A market town and a parliamentary and municipal borough in Northumberland, England, on the Wansbeck, 17 miles north of Newcastle (Map: England, E 1). The principal buildings are the fourteenth-century parish church of St. Mary, the old clock tower, the free grammar school of Edward VI, founded in 1552, and the town hall, erected by Sir John Vanbrugh. The town owns remunerative property, the markets, and provides a free water supply. It has flannel manufactures, iron foundries, collieries, quarries, machine shops, brick kilns, tanneries, and malt works. It is an important market for cattle. There are remains of a castle and gateway. Morpeth was a Saxon town of importance before the Conquest and was granted corporate privileges by Charles II. Pop., 1901, 6158; 1911, 7433.

MORPHEA (Neo-Lat., from Gk. μορφή, *morphē*, form). A chronic skin disease, sometimes called circumscribed scleroderma or Addison's keloid, consisting of patches, rounded or irregular in outline, pale yellow or brown in color, and sometimes following the course of a

superficial nerve. It occurs usually in young adult women, on the breasts, face, and neck.

MORPHEUS, mŏr'fŭs (Lat., from Gk. *Μορφεύς*, shaper, fashioner; cf. Gk. *μορφή*, *morphē*, form, shape). In classic mythology, the son of Somnus (Sleep), called the Shaper because he shapes or molds the dreams that visit the sleeper. He is first mentioned by Ovid, *Metamorphoses*, xi, 633 ff., and is represented as an old man with wings, pouring somniferous vapor out of a horn. Consult C. M. Gayley, *The Classic Myths in English Literature and in Art* (2d ed., Boston, 1911).

MORPHINE, mŏr'fīn or -fēn, or **MORPHIA**, mŏr'fī-ā (from Lat. *Morpheus*, god of dreams), $C_{17}H_{19}NO_3 + H_2O$. The most important of the 20 or more alkaloids existing in opium, of which it constitutes one-eighth to one-sixteenth by weight. Good opium should contain at least 9 per cent of morphine when assayed. In physiological activity one-fourth of a grain of morphine equals one grain of opium. It was first isolated in 1816 by Serturner, a chemist of Hanover. It occurs in combination with meconic and sometimes sulphuric acid, as colorless, shining, prismatic crystals, odorless, and having a bitter taste. It is soluble in 1040 parts of water at 176° F and in 6 of alcohol at 140° F, less soluble in ether and chloroform, and insoluble in benzene. The following are the common tests for morphine. Concentrated nitric acid when applied to morphine or its salt gives an orange color, changing to yellow; when it is mixed with iodic acid iodine is liberated, which may be recognized by the well-known starch test, a neutral solution of a morphine salt produces a blue color with a neutral solution of ferric chloride. Morphine combines with acids to form crystallizable salts, which are readily soluble in water and alcohol. Of these the sulphate, hydrochlorate (or muriate), and acetate are used in medicine. Apomorphine (q.v.), a powerful emetic, is prepared by heating morphine for some hours with an excess of hydrochloric acid.

The therapeutic uses of morphine and its salts are similar to those of opium (q.v.), but morphine acts more certainly and quickly and is more readily absorbed than opium, is more suitable for hypodermic use and is less apt to constipate and cause gastric disturbances.

The habitual taking of morphine is not uncommon. Those addicted to this habit become dependent for a comfortable existence on the drug and gradually increase the dose until enormous amounts are taken. The habit can be effectually treated only in institutions where the patient can be kept under constant surveillance. See ALKALOIDS, DRUG ADDICTIONS.

MORPHOGENESIS (Neo-Lat., from Gk. *μορφή*, *morphē*, form + *γένεσις*, *genesis*, origin, from *γίγνεσθαι*, *gignesthai*, to become). A term proposed by Haeckel, who divides morphology (q.v.) into the two coordinated branches of anatomy and morphogenesis or morphogenv. Morphogenesis is the equivalent of embryology or developmental history. It takes into account the gradual development and building up of the form of the adult, i.e., the series of changes and the mode by which the body and its organs become shaped. Haeckel further subdivides morphogenesis into ontogeny (q.v.) and phylogeny (q.v.). Consult Ernst Haeckel, *Generelle Morphologie der Organismen* (2 vols., Berlin, 1866), new edition under title of *Prinzipien der allgemeinen Morphologie der Organismen* (ib., 1906).

MORPHOLOGY (from Gk. *μορφή*, *morphē*, form + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). In zoology, the science of form and structure of animals. It is based on comparative anatomy and embryology and lays the foundation for physiology. We cannot well understand the structure or anatomy of the fully grown animal unless we have the history of the development of the organism as a whole and of the separate organs. The morphologist, whose methods of study are based on observation and comparison, must not only be a comparative anatomist, but also an embryologist. He should not only be acquainted with the individual development (ontogeny, q.v.), but also that of the class or phylum to which the organism belongs (phylogeny, q.v.). Moreover, as the existing living beings are the descendants of long lines of ancestry, the morphologist should have at his command all the available facts as to the fossil relatives of existing forms. Though we owe the word "morphology" to Goethe, it was first brought into its present extended use by the zoologists J. Müller and Leuckart. But long before the middle of the last century the general morphology of organisms was in part discussed by Oken, Carus, Goethe, Geoffroy Saint-Hilaire, Lamarck, Cuvier, Savigny, Owen, and Agassiz. For example, Goethe compared the flowering plant to an axis bearing modified or metamorphosed parts or leaves, Savigny discovered that the mouth parts or appendages of the heads of insects were modified legs, and Carus, Audouin, and Strauss-Durckheim perceived that their head was composed of a number of segments. Goethe, and also Oken, described a segmental structure in the vertebrate skull—a theory entirely abandoned by modern morphologists. That portion of the history of zoology called the Period of Morphology was signalized by the brilliant results in developmental work of Von Baer, Pander, J. Müller, Rathke, followed by the later researches of Schwann, Schleiden, Koeliker, Huxley, Vogt, Gegenbaur, Haeckel, and their followers. As the result we see numerous morphological problems either solved or in a fair way of solution.

MORPHOLOGY OF PLANTS. The study which treats of the structure of plants. Morphology began as a study of the gross structures of mature plants, but to this there have been added the minute structures, the development of tissues and of organs, the ontogeny of individuals (often called embryology), and finally the evolution of the plant kingdom (See BOTANY). That part of morphology which deals with tissues is usually called anatomy, the term "morphology" being reserved for the reproductive

structures in general. This distinction, however, is artificial, especially since vascular anatomy is joined with the reproductive structures in elucidating the evolution of plants. An outline of morphology, therefore, is an outline of the evolution of plants.

Thallophytes. The two principal groups, algae (q.v.) and fungi (q.v.), must be considered separately, since they hold very different relations to the evolution of plants.

Algae.—The algae are the primitive plants, in the sense that they preceded the other groups historically. All of their structures are related to water as a medium, so that the plant kingdom, so far as the present flora is concerned, began in water. The simplest body is a single cell, but in the group the body advances from the single cell, through cell colonies of various kinds, to many-celled individuals. The prevailing forms of the many-celled bodies among the algae are simple or branching filaments, usually anchored. Among the higher algae the body often becomes differentiated into different regions, notably among the marine forms. Among the brown seaweeds, e.g., the body of the kelps is differentiated into holdfast, stipe, and leaf-like expansions. The simplest form of reproduction is vegetative multiplication, in which new individuals are formed by ordinary cell division. In addition to this, algae developed reproduction by means of spores, which in most cases are swimming cells (zoospores). Among the algae there appears also sexual reproduction, at first the gametes seeming to be alike, then differentiating in appearance, so that they are recognized as sperms and eggs. The two kinds of gametes at first are produced by ordinary vegetative cells, but later special cells produce them, known as oogonia and antheridia.

Fungi.—The fungi are notably dependent plants, in the sense that they depend upon other plants and upon animals for their food supply, the lack of chlorophyll forbidding food manufacture. Fungi secure food in two ways as parasites they obtain it from living bodies, while as saprophytes they obtain it from material that has been produced by a living body and is no longer connected with it. For example, when the rust fungus attacks wheat, it is obtaining food from living plants; but when a mold fungus attacks bread, it is obtaining food from material produced by living plants, but no longer connected with them. It is evident that fungi may be very useful, as are the soil fungi, or they may be very injurious, as are the disease-producing fungi. The bodies of fungi range from single cells (as the bacteria) to filamentous bodies (the mycelia of true fungi), and many of the higher forms become quite complex. The reproductive methods are also the same as those of algae, viz., vegetative multiplication, spore reproduction, and sexual reproduction with its differentiations. Among the higher fungi, however, the sexual reproduction becomes less and less obvious, and in some cases it may have disappeared. While the algae may be said to represent the foundation upon which the plant kingdom has been built, the fungi hold no relation to the higher groups, but in general are regarded simply as degenerate algae.

Bryophytes. The bryophytes represent the first land plants, having been derived from algae that acquired the land habit, which means exposure to air as a medium. The danger of this exposure is the loss of water by the plant, and

the structures and habits of land plants are explained by this fact. Among the bryophytes the liverworts (Hepaticeæ, q.v.) are the important genetic group, having been derived from the algae and having given rise to the higher plants. The mosses (Musci, q.v.), on the other hand, represent a specialized branch from the liverworts, distinguished from the latter by the leaf shoot and the much more complex spore case. The establishment of the land habit made possible the further development of plants on the land surface. In consequence of this change in the conditions of living, the plant bodies of liverworts are much more compact and possess protective structures against excessive loss of water by evaporation. Not only are the working bodies protected, but the sexual cells are jacketed, so that the sex organs (antheridia and archegonia) are many-celled. The most significant result of the land habit was the establishment of an alternation of generations (q.v.), so that sporophyte and gametophyte alternate regularly in the life history. Among bryophytes the gametophyte is the conspicuous generation, because it manufactures food in addition to producing sex organs, and the sporophyte is dependent upon it. In one group of bryophytes (*Anthoceros*) the sporophyte is green, so that the possibility of an independent sporophyte is evident. The further progress of the plant kingdom is dependent upon independent sporophytes, because the free display of green tissue by a gametophyte means conditions unfavorable for the swimming of sperms necessary to fertilization, while the free display of green tissue by a sporophyte means conditions favorable also for the dispersal of spores.

Pteridophytes. The pteridophytes represent the first vascular plants, the vascular system having been developed in connection with an independent sporophyte. The so-called vessels are thick-walled, tubular cells that extend through the sporophyte and are equipped to conduct water. Associated with the vascular system are the first roots among plants—organs for the intake of water—and also the first sporophyte leaves. The vascular system, roots, and leaves represent one mechanism, each part of which is necessarily related to the other parts. Among the pteridophytes, the chief living representatives of which are the club mosses (*Lycopodiales*, q.v.), the horsetails (*Equisetales*, see *EQUISETUM*), and the ferns (*Filicales*, see *FERN*), the conspicuous and independent sporophyte is in sharp contrast with the very inconspicuous gametophyte. Among ferns, e.g., the gametophyte (prothallium) is a very small, liverwort-like body, often not larger than the head of a pin. It is among the pteridophytes that the structure called the strobilus (q.v.) appears, a structure that is the precursor of the flower. The strobilus is not a feature of all pteridophytes, not appearing among ferns, but it is a structure begun by the group. Another important fact associated with the pteridophytes is the appearance of heterospory (q.v.), for this is the precursor of the seed. This means a differentiation of spores into two kinds, one kind (microspores) producing the male gametophytes, and the other kind (megaspores) producing the female gametophytes. Another accompaniment of heterospory is that the gametophytes are dependent and so small that they remain within the spores that produce them, thus disappearing from ordinary observation.

Spermatophytes. The seed plants are the most conspicuous plants of the present flora, for they make up nearly all the vegetation commonly observed. They have developed as two great groups: the gymnosperms, in which the seeds are exposed, and the angiosperms, in which the seeds are inclosed. The gymnosperms are the ancient seed plants that are now much less numerous than the more modern angiosperms.

Gymnosperms.—The gymnosperms represent the first seed plants, continuing and advancing the structures of the ferns, from which they differ chiefly in the presence of seeds. The vascular system is notably developed, resulting in larger sporophyte bodies and in a larger display of foliage. The early gymnosperms did not have strobili (cones), resembling the ferns in this feature, but all other gymnosperms have strobili as a very conspicuous structure. The important fact about gymnosperms is the existence of seeds. A seed is derived from an ovule, and an ovule is a megasporangium. The difference between an ovule and other megasporangia is that the ovule retains its megaspores instead of shedding them. This retention of the megaspore means that the female gametophyte develops within the ovule, that fertilization occurs there, and that the embryo sporophyte develops there. When all of these structures within the ovule become incased by a hard coat (testa), the total structure is a seed. Among gymnosperms the transportation of pollen (pollination) is effected by the wind, and after fertilization the egg develops an embryo, which then passes into a dormant stage. Activity is resumed when the conditions for seed germination are present.

Angiosperms.—The angiosperms are far more varied and abundant than are the gymnosperms and constitute the conspicuous vegetation of the land surface. Three features of the group stand out conspicuously in contrast with the gymnosperms. The first feature is the inclosed ovule, the inclosing structure being the carpel. This means that the pollen grains containing the male gametophytes cannot reach the ovule, but are received by a special region of the surface of the carpel (stigma). This means further that the pollen tube must traverse the style, enter the cavity of the ovary, reach the tip of an ovule, and then penetrate the tip of the ovule until the egg is reached. The second feature is the appearance of the flower, which differs from a strobilus in having another set of members added to the sporophylls, and this set (perianth) is usually differentiated into sepals (calyx) and petals (corolla). The third feature is related closely to the second, for it is the development of insect pollination. Many angiosperms retain the old method of wind pollination, but insect pollination is a conspicuous feature of the group, and it is associated with the remarkably diversified development of the flowers. It should also be stated that among angiosperms the male and female gametophytes are reduced to their lowest terms, the former being represented by three nuclei within the pollen grain, and the latter at the fertilization stage by seven free cells within the ovule, one of which is the egg.

Vascular System. The use of the vascular system in interpreting the evolution of vascular plants demands that its important features should be indicated. In a cross section of a vascular stem two very distinct regions are observed, viz., the cortex and a central cylinder called the stele. It is in the stele that the vas-

cular cylinder of the stem develops. This cylinder always comprises two regions, known as xylem (wood) and phloëm (bast), the former being the water-conducting region. Each of these regions is characterized by its vessels, the vessels of the xylem being tracheids or tracheæ, while those of the phloëm are sieve vessels. In general, the xylem of pteridophytes and gymnosperms consists of tracheids, while that of angiosperms is characterized by tracheæ.

There are three types of vascular cylinder which represent different stages in the evolution of vascular plants. The most primitive type of cylinder is called the protostele, which is a solid cylinder, in which the phloëm completely surrounds the xylem. This type of cylinder is characteristic of all roots and of the stems of the most primitive pteridophytes, such as the club mosses. A second type of vascular cylinder is the amphiphloic siphonostele (solenostele), which is a hollow cylinder (i.e., incloses a pith region) in which the phloëm occurs on both sides of the xylem. This type of cylinder is characteristic of the stems of ferns, among which a modification of it is found, called the polystele. The polystele simply means an amphiphloic siphonostele which in the adult plant breaks up into separate and more or less scattered strands, thus breaking up the appearance of a hollow cylinder. The maidenhair fern is an excellent illustration of the amphiphloic siphonostele, while the common bracken illustrates the polystele. A third type of vascular cylinder is the ectophloic siphonostele, which is a hollow cylinder in which all the phloëm is external to the xylem, i.e., the xylem is in contact with the pith. This type of cylinder is characteristic of all the seed plants, and for this reason is regarded as the most advanced type. It also has its polystelic modification among the monocotyledons, in which the hollow cylinder is broken up into separate and scattered bundles as the plant matures. For this reason the monocotyledons are described as having scattered bundles, but all young monocotyledons have vascular cylinders. One of the characteristic features of the ectophloic siphonostele is the development of a cambium layer between xylem and phloëm which makes possible an increase of the stem in diameter.

In most cylinders the vascular tissues are not continuous, but occur in separate strands or bundles, separated from one another by undifferentiated tissue, called pith rays, which extend from the pith to the cortex. In this way the pith rays seem to differentiate the cylinder into vascular units, which have been called vascular bundles. The character of these bundles varies in the evolution of vascular plants, according to the relation between xylem and phloëm. There are four such arrangements. (1) radial, in which xylem and phloëm occur in alternating radii, an arrangement characteristic of roots; (2) concentric, in which the phloëm completely surrounds the xylem, an arrangement characteristic of the stems of pteridophytes. (3) collateral, in which xylem and phloëm occur side by side upon the same radius, the xylem being towards the pith and the phloëm towards the cortex, an arrangement characteristic of the stems of gymnosperms and dicotyledons, (4) amphivasal, in which the xylem completely incloses the phloëm, an arrangement characteristic of the stems of monocotyledons.

Another feature of the vascular system which

has proved to be significant in the evolution of vascular plants is the relation of the first-formed xylem to that which develops later. At their first appearance in the stele, the vascular elements are laid down at certain definite points, these first elements being called the protoxylem. From these protoxylem strands the later xylem (metaxylem) extends. The three situations developed in the evolution of the vascular system are as follows. (1) exarch, in which the protoxylem occurs at the periphery of the stele, and consequently all the metaxylem is centripetal, (2) mesarch, in which the protoxylem occurs more or less within the stele, so that the metaxylem develops both centripetally and centrifugally, (3) endarch, in which the protoxylem develops only centrifugally. The exarch condition is characteristic of all roots and of most protosteles; the mesarch condition is characteristic of ferns; while the endarch condition is characteristic of all seed plants.

The various combinations of cylinder type, bundle type, and protoxylem position indicate the relative advancement of any group of vascular plants. Many other features of the vascular system are being used for the same general purpose, and since the vascular tissue is the most persistent of all plant tissues, it is through vascular anatomy that we have become acquainted definitely with the history of vascular plants.

The best conception of the present condition of plant morphology may be obtained by reading the general articles on BRYOPHYTES; PTERIDOPHYTES; SPERMATOPHYTES; THALLOPHYTES; and the more special articles on ALGÆ, ANGIOSPERMS; Equisetum; Fern; Fungi, Gymnosperms; Hepaticæ, Lycopodiales, and Musci. A still more detailed account of plant structures may be obtained from the separate titles which deal with the prominent phenomena and organs, such as ALTERNATION OF GENERATIONS; ANTHERIDIUM; ARCHEGONIUM; HETEROSPORY, LEAF, ROOT; SEED; SPORE; STEM.

Bibliography. Among elementary works that treat of the modern aspects of morphology are the following: D. H. Campbell, *Structural and Systematic Botany* (Boston, 1890); C. R. Barnes, *Plant Life* (New York, 1898); Coulter and Chamberlain, *Morphology of Angiosperms* (ib., 1903); J. M. Coulter, *Plant Structures* (2d ed., ib., 1904). More advanced works are as follows: K. E. Goebel, *Outlines of Classification and Special Morphology*, translated by Garnsey (Oxford, 1887); S. H. Vines, *Student's Text-Book of Botany* (New York, 1895); Eugen Warming, *Handbook of Systematic Botany*, translated and edited by M. C. Potter (ib., 1895); O. W. Caldwell, *Handbook of Plant Morphology* (ib., 1904); G. F. Atkinson, *Elementary Botany* (3d ed., ib., 1905); J. M. Coulter, *A Text-Book in Botany* (ib., 1906); C. E. Bessey, *Botany* (7th ed., ib., 1908); Strasburger and others, *Text-Book of Botany*, translated by Porter (3d ed., ib., 1908); Coulter, Barnes, and Cowles, *A Text-Book of Botany* (ib., 1910); Coulter and Chamberlain, *Morphology of Gymnosperms* (Chicago, 1910); J. M. Coulter, *Elementary Studies in Botany* (New York, 1913).

MORPHOTROPISM (from Gk. *μορφή*, *morphē*, form + *τροπή*, *trōpē*, a turning, from *τρέπω*, *trepein*, to turn). The study of the phenomenon of the small but distinct change in crystalline form produced by the replacement

of a chemical element or radical group in a substance by another closely related to it. By comparing the crystal forms of a series of closely related substances the part played by each constituent substance may be inferred, especially when the substitution methods of organic chemistry are applied to substances having very large chemical molecules. See CRYSTALLOGRAPHY.

MORPHY, PAUL CHARLES (1837-84). An American chess player, born in New Orleans, La. He was remarkably precocious, especially as a chess player, and before he was 13 had defeated many well-known amateurs. He studied law for several years at the College of South Carolina, playing chess only occasionally. At the first American Chess Congress, which assembled in New York in 1857, Morphy defeated with ease the best players that could be brought to meet him. He visited Europe in 1858, and in England beat Lowenthal, Boden, and Bird, and performed the most astonishing feats in simultaneous games without the board. In Paris he won five out of eight games with Harrwitz, and continued his exhibitions of blindfold playing. After his return to the United States, in 1859, he won seven out of eleven games with the visiting German expert Anderssen. He was admitted to the bar and began the practice of law in New Orleans. The strain occasioned by his blindfold contests, however, had been too great for his mental faculties, and, though he abandoned chess altogether, he was soon forced to relinquish all mental occupation and died in retirement. During the comparatively short period of his activity Morphy displayed a skill that was inexplicable. He was at no time a close student of chess and he played without preparation and with little hesitation, but an analysis of his games reveals combinations remarkable for finesse, depth, elegance, and soundness. These qualities, combined with a wonderful memory, made him perhaps the most remarkable chess player in modern times. Consult Lowenthal, *Morphy's Games of Chess* (London, 1860).

MORRA. An Italian game. See LA MORRA.

MORRILL, JUSTIN SMITH (1810-98). An American legislator and political leader. He was born at Strafford, Vt., and after an elementary education was engaged in business and farming until 1855, though he gave much time to study. As an antislavery Whig he was elected to Congress in 1854, was five times re-elected, in 1867 took a seat in the Senate and served continuously until his death, a record up to that time. During the latter part of his service in the House he was the leading member of the Committee on Ways and Means, of which he was chairman from 1865 to 1867, and chairman of the Subcommittee on Tariff and Taxation. In the Senate he was a member after 1867, and chairman for many years, of the Committee on Finance. He will be remembered chiefly for his connection with two important measures. In 1857 he introduced a bill for the establishment, through the aid of public land grants, of State colleges throughout the country primarily for the purpose of teaching agriculture and the mechanic arts, other subjects, however, not to be excluded. This bill was vetoed by President Buchanan, but became a law in 1862 through the signature of President Lincoln. By virtue of this act and the supplementary Second Morrill Act, so called (1890), there had been established, by 1915, 67 institutions

giving instruction to 69,000 students. Morrill also framed and introduced in the House the Morrill Tariff Act of 1861. (See **TARIFF**.) He opposed government paper money (and especially the Legal Tender Act of 1861-62), and the annexation to the United States of outlying territory. He published *The Self-Consciousness of Noted Persons* (1886). Consult: F. W. Taussig, *Tariff History of the United States* (New York, 1888; 5th ed., 1910); G. W. Atherton, *Legislative Career of Justin S. Morrill* (Washington, 1901); E. J. James, *Origin of the Land Grant Act of 1862* (Urbana, Ill., 1910).

MORRILL, LOT MYRICK (1813-83). An American legislator and cabinet officer, born at Belgrade, Me. He became a student at Waterville (now Colby) College in 1833, but left before graduating to enter a law office at Readfield. In 1837 he was admitted to the bar, and for several years practiced in partnership with Timothy O. Howe. In 1841 he removed to Augusta, where he won wide distinction as a lawyer and public speaker. Although strongly opposed to the extension of slavery, he was in all other matters in perfect agreement with the Democratic party, and became one of the leaders of the Maine Democracy. In 1853 and 1854 he was elected to the Lower House of the State Legislature, and in 1856 was elected to the State Senate. After Buchanan's nomination, disapproving of his party's platform, he resigned from the Democratic State Committee and allied himself with the Republican party. He was elected Governor of the State by that party in 1857 and was reelected in 1858 and 1859. In 1861 he was chosen United States Senator to succeed Hannibal Hamlin. Reelected for a full term in 1863, he was defeated by a single vote in 1868 by Hamlin, but in the following year was elected to succeed William P. Fessenden for the remaining part of the latter's term. In 1871 he was again elected to the Senate, but in 1876 resigned to enter the cabinet of President Grant as Secretary of the Treasury. This portfolio he held until after the inauguration of President Hayes in 1877. Thereafter until his death he was collector of customs for the Portland (Me.) district.

MORRILLTON. A city and the county seat of Conway Co., Ark., 51 miles by rail northwest of Little Rock, on the Arkansas River and on a branch of the St. Louis, Iron Mountain, and Southern Railroad (Map: Arkansas, C 2). It has a trade in cotton and live stock and manufactures of cottonseed oil, woolens, machine-shop products, lumber, furniture, etc. The water works and electric-light plant are owned by the municipality. Pop., 1890, 1644; 1900, 1707; 1910, 2424.

MORRIS. A city and the county seat of Grundy Co., Ill., 62 miles southwest of Chicago, on the Illinois River, the Illinois and Michigan Canal, and the Chicago, Rock Island, and Pacific and the Chicago, Ottawa, and Peoria railroads (Map: Illinois, H 3). It has St. Angela's Academy, a Roman Catholic institution for women. The city is the centre of a considerable trade in grain and cattle, and there are mines of bituminous coal and manufactories of oatmeal, hardware, paper car wheels, leather, cut glass, fibre board, novelties, bricks, and tile. The water works are owned by the municipality. Morris was settled in 1834 and incorporated first in 1857. Pop., 1900, 4273; 1910, 4563.

MORRIS. A city and the county seat of Vol. XVI -19

Stevens Co., Minn., 157 miles west by north of St. Paul, on the Northern Pacific and the Great Northern railroads (Map: Minnesota, B 5). It is near the Pomme de Terre River, which furnishes good water power. Situated in a fertile agricultural region, Morris carries on a large trade in produce, and has several grain elevators and flour mills. It is the seat of the West Central School of Agriculture and the Assumption School (Roman Catholic), and contains a fine high school, general hospital, and a Carnegie library. The water works are owned by the city. Morris adopted the commission form of government in 1913. Pop., 1900, 1934; 1910, 1685.

MORRIS, ALEXANDER (1826-89). A Canadian statesman, born at Perth, Ontario. He was educated at the University of Glasgow and at McGill University, Montreal, and was called to the bar in 1851. Elected in 1861 a Conservative member of the Canada Legislative Assembly, he strongly supported the movement for the confederation of the British-American provinces (1862-66). In 1867 he was elected to the first Dominion Parliament and in 1869 was appointed Minister of Inland Revenue in the first administration of Sir John A. Macdonald. He was made Chief Justice of the Court of Queen's Bench of Manitoba in 1872, but in December of the same year he resigned and became Lieutenant Governor of Manitoba and the Northwest Territories (1872-76). He returned to Ontario in 1877 and was a member of the Ontario Legislature (1878-86). He published: *Canada and her Resources* (1855); *Treaties of Canada with the Indians of the North-West* (1880); *Nova Britannia* (1884), a volume of speeches and lectures on Confederation.

MORRIS, BENJAMIN WISTAR (1819-1906). An American Protestant Episcopal clergyman. He was born at Wellsboro, Pa., graduated from the General Theological Seminary in 1846, and in 1847 was ordained priest. He was stationed as rector at Sunbury, Manayunk, and Germantown, all in Pennsylvania. In 1868 he was consecrated Bishop of Oregon and Washington, his diocese subsequently being restricted to the former State. During his incumbency he actively advanced the educational and philanthropic interests of his diocese, being instrumental in establishing St. Helen's Hall, a boarding and day school for girls, the Bishop Scott Academy, and the Good Samaritan Hospital in Portland. He published *Presbyterian, Baptist, and Methodist Testimony to Confirmation* (1860).

MORRIS, CHARLES (1745-1838). An English song writer of Welsh origin. He was reared by his mother, went to America in the Seventeenth Foot in 1764, and on his return to England he was for many years punch maker and bard of the famous Beefsteak Society, a convivial club founded in 1735. He associated with the party of Fox, for which he wrote many political songs, as "Billy Pitt and the Farmer." Neglected by his Whig friends, he composed the lament, "The Old Whig Poet to his Buff Waistcoat." Morris met the Prince of Wales and was a frequent guest at Carlton House, where he was known as "the sun of the table." Among his best-known pieces are: "The Town and the Country," "A Reason Fair to Fill my Glass," "The Triumph of Venus," and "Ad Poculum." The Prince granted him an annuity of £200, and the Beefsteak Society gave him a villa near Dorking, where he passed his last years, living

to be 93. His songs were gathered under the title *Lyra Urbanua* (1840; 2d ed., 1844).

MORRIS, CHARLES (1784-1856). An American naval officer, born at Woodstock, Conn. He entered the United States navy as a midshipman in 1799 and took an active part in the operations against Tripoli. In the famous recapture and destruction of the *Philadelphia* young Morris was the first of the boarders to reach the deck of that vessel. In 1807 he was promoted lieutenant and in 1811 became first lieutenant of the *Constitution*. Morris was given great credit for his work in the escape of the *Constitution* from a British squadron, and a month later he particularly distinguished himself in the capture of the British frigate *Guerrère* and was dangerously wounded. Promoted captain, he was given command of the new sloop of war *Adams*, 28 guns. After a successful cruise in which he captured a number of merchantmen and boldly chased others into British ports, he was in turn chased by British frigates of superior force. Forced into the Penobscot, he was blockaded by a British squadron. While damages were being repaired the *Adams* was attacked by a strong British force and to save her from capture she was destroyed. In 1815 Morris commanded the frigate *Congress* in the second squadron sent against Algiers, but these vessels arrived too late to take part in active operations. In 1816 he was ordered to proceed to Oregon in the *Congress* and take possession of the country about the Columbia River; but before starting his destination was changed to the Gulf of Mexico, the Spanish colonies of Central and South America being then in a state of revolution. After Commodore Perry's death in 1819 Morris succeeded him in the command of the South American squadron. In 1825 he carried Lafayette back to France in the *Brandywine*. For 13 years he was one of the navy commissioners, and for a considerable time superintendent of the Naval Academy. At the time of his death in 1856 he was chief of the Bureau of Ordnance and Hydrography. Commodore Morris was a most distinguished, brave, able, and energetic officer and by his work and example did much to build up the navy and infuse into it an unconquerable spirit. Consult his *Autobiography* (Annapolis, 1880).

MORRIS, CHARLES D'URBAN (1827-86). An American classical scholar and educator, born at Charmouth, Dorset, England. His grandmother was Mary Philipse Morris (qv.). He was educated at Worcester College, Oxford, and, after three years as a scholar at Lincoln College, was a fellow of Oriel (1851-54). In 1853 he came to New York, was rector of Trinity School until 1856, and then founded the Mohegan School, near Peekskill. From the University of the City of New York he went in 1876 to Johns Hopkins as collegiate professor of Latin and Greek. His publications, which are marked by many original pedagogical methods, include: *A Compendious Grammar of Attic Greek* (1869; 4th ed., 1876); a *Latin Grammar* (1870; 4th ed., 1876); an edition of Thucydides, book i (completed by J. W. White, Boston, 1887); papers in learned periodicals; and several Latin and Greek primers and readers.

MORRIS, CLARA (1840-). An American actress, especially noted for her success in the interpretation of emotional roles. She was born in Toronto, Canada (her real name being Morrison), but was reared in Cleveland, Ohio, where

at the Academy of Music she became a member of the ballet and afterward leading actress. Later she played in Cincinnati. She went to New York in 1870 as a member of Daly's company. In 1872 she made a sensation in *L'artiste* 47. Conspicuous among her subsequent successes were those won in *Alire* (1873), *Camille* (1874), and *Miss Multon* (1876). Miss Morris became known as an actress distinguished for spontaneity and naturalness. She was married to F. C. Harriott in 1874. For some years after 1885 she devoted herself mainly to literary work, writing: *Little Jim Crow, and Other Stories of Children* (1899), *A Silent Singer* (1899), *Life on the Stage: My Personal Experiences and Recollections* (1901); *A Pasteboard Crown* (1902), *Stage Confidences* (1902); *The Trouble Woman* (1904), fiction, *The Life of a Star* (1906); *Left in Charge* (1907); *New East Lynne* (1908); *A Strange Surprise* (1910). *Dressing Room Receptions* (1911). Miss Morris's old age was embittered by poverty and the complete blindness which overtook her in 1910. In 1913, the house in which she had lived in Yonkers for 37 years having been sold, she moved to Whitestone, L. I. Consult McKay and Wingate, *Famous American Actors of To-Day* (New York, 1896). Matthews and Hutton, *Actors and Actresses of Great Britain and the United States* (1h, 1886).

MORRIS, SIR DANIEL (1844-). A British agriculturist, born at Loughor, Glamorgan, Wales, and educated at Cheltenham, the Royal College of Science, South Kensington, and Trinity College, Dublin. In 1877 he was appointed assistant director of the Royal Botanic Gardens, Ceylon, and in 1879 director of the Botanic Department of Jamaica. He was assistant director of the Royal Botanic Gardens, Kew, England, from 1886 to 1898, during which time he visited the West Indies and other colonies on several special missions connected with the improvement of their agriculture. While Imperial Commissioner of the West Indian Department of Agriculture (1898-1908) he was active in inaugurating agricultural reforms. Among the successful enterprises undertaken by him was the reestablishment of the cultivation of Sea Island cotton in the West Indies. After his retirement from active duty he served as scientific adviser in tropical agriculture to the Colonial Office. Morris published numerous papers on horticulture, economic botany, and agriculture, especially as related to the West Indies. From 1899 to 1908 he was editor of the *West Indian Bulletin*, the *Quarterly Journal of the Imperial Department of Agriculture*, and from 1902 to 1908 of the *Agricultural News*, Barbados. In 1893 he was made C.M.G. and in 1903 K.C.M.G., and he received the Victoria medal of horticulture.

MORRIS, DINAH. In George Eliot's *Adam Bede*, the character which really becomes the centre of interest for the novel.

MORRIS, EDWARD JOY (1815-81). An American legislator, diplomat, and author, born in Philadelphia. He graduated at Harvard in 1836 and began the practice of the law in Philadelphia. He was a member of the Pennsylvania State Assembly in 1841-43, and in November, 1842, was elected as a Whig to the Twenty-eighth Congress, serving from 1843 to 1845. From 1850 to 1854 he was chargé d'affaires for the United States at Naples. After his return, he took a leading part in the movement for the or-

ganization of the Republican party in Pennsylvania, and in 1856-58 was a Republican member of Congress. From 1858 to 1870 he was United States Minister to Turkey. He was a frequent contributor to American magazines for many years, and published *Notes of a Tour through Turkey, Greece, Egypt, and Arabia Petraea to the Holy Land* (2 vols., 1842). He translated, with copious notes and additions, *The Turkish Empire, Social and Political* (1854), from the German of Alfred de Bessé. He also translated Theodore Mügge's *Afraga, or Life and Love in Norway* (1854), and Ferdinand Gregorovius' *Corsica, Picturesque, Historical, and Social* (1856).

MORRIS, EDWARD PARMELEE (1853-). An American Latinist. He was born at Auburn, N. Y., graduated at Yale in 1874, and afterward studied at the universities of Leipzig and Jena. He was professor of Greek at Drury College (1879-84) and professor of Latin at Williams (1885-91), and after 1891 professor of Latin at Yale. He was editor of Plautus's *Mostellaria* (1880), *Pseudolus* (1890), and *Captives and Trinummus* (1898), and of Horace's *Satires* (1909) and *Epistles* (1911). He wrote also various philological monographs and reviews, especially in connection with Plautus and Latin syntax, and the important volume *On Principles and Methods in Latin Syntax* (1902).

MORRIS, SIR EDWARD PATRICK (1859-). A Newfoundland lawyer and statesman, born at St. John's, and educated at the University of Ottawa. He was called to the bar and entered politics in 1885, being elected a Liberal member of the Newfoundland Legislature. He became a member of the cabinet of Sir William Whiteway in 1889, and was acting Attorney-General during the greater part of 1890-95. During the popular agitation for a law ratifying the railway contract undertaken by Sir Robert Gillespie Reid (q.v.), Morris headed an Independent Liberal movement (1898-1900) favoring the contract. In 1903-07 he was Minister of Justice and Attorney-General in the cabinet of Sir Robert Bond (q.v.); in 1907-09 leader of the Liberal Opposition; and then became Premier of Newfoundland. He was a delegate to the conference at Ottawa to discuss the entrance of Newfoundland into the Dominion of Canada (1895); to the British Colonial Office respecting the French shore question (1897 and 1901), to the Imperial Defense Conference, London (1909), the Imperial Conference (1911), and The Hague Arbitration Tribunal (1910). In 1904 he was knighted and in 1911 was made a member of the Imperial Privy Council. He edited the *Newfoundland Law Reports, 1800-1904* (St. John's, 1905), known as *Morris' Reports*.

MORRIS, GEORGE POPE (1802-64). An American journalist and poet, born in Philadelphia. He founded with Samuel Woodworth (q.v.) in New York the *Mirror* (1823-42), a literary weekly, which became the *New Mirror*, and the *Evening Mirror*. In these journals appeared much early work of Bryant, Halleck, Poe, Paulding, Willis, Hoffman, and others, making these periodicals important elements in the literary development of the time. Morris also founded the *National Press* (1845), out of which was developed the *Home Journal* (1846), in which Willis, who had long been associated with Morris, again collaborated. His *Briarcliff* (1825), founded on Revolutionary incidents and

events, was a popular success. His *Poems*, collected for the last time in 1860, contained the familiar ballads, "Woodman, Spare that Tree" (founded on a real incident), "My Mother's Bible," "We Were Boys Together," and "A Long Time Ago." Morris died in New York, July 6, 1864. Consult J. G. Wilson, *Bryant and his Friends* (New York, 1886).

MORRIS, GEORGE SYLVESTER (1840-89). An American educator and philosophical writer, born at Norwich, Vt. He graduated in 1861 at Dartmouth College, served in the Federal army during the first two years of the Civil War, and was a tutor at Dartmouth in 1863-64. After spending several years in Germany in the study of philosophy and theology, he was appointed, in 1870, professor of modern languages and literature in the University of Michigan, and in 1881-89 was professor of logic, ethics, and the history of philosophy. From 1878 to 1885 he also lectured on ethics and the history of philosophy at Johns Hopkins University. He published a translation of Ueberweg's *History of Philosophy* (2 vols., 1872-74); an edition of Gregg's *Philosophical Classics* (1875); *British Thought and Thinkers* (1880); *Kant's Critique of Pure Reason: A Critical Exposition* (1882); *Philosophy and Christianity* (1883); *Hegel's Philosophy of the State and of History* (1887).

MORRIS, GEORGE UPHAM (1830-75). An American naval officer, born in Massachusetts. He entered the navy in 1846, was commissioned lieutenant in 1855, and still held that rank when Commander William Radford's absence on March 8, 1862, left him the senior officer on the *Cumberland* during its battle with the Confederate ram *Merrimac*. Lieutenant Morris's gallantry in fighting his ship until she sank with her flags still flying aroused the greatest enthusiasm in the North, and earned his promotion to the grade of lieutenant commander (1862). In May, 1862, when commanding the *Port Royal*, a steam gunboat, he participated in a battle with a nine-gun Confederate battery on the James River, and was afterward wounded in an attack on Fort Darling. He also took part in the attack on Fort Powell, Grant's Pass (1864). He was commissioned commander in 1866, and in 1874 retired from active service on account of ill health.

MORRIS, GOUVERNEUR (1752-1816). An American statesman and diplomat. He was born at Morrisania, N. Y., Jan. 31, 1752, and graduated at King's (now Columbia) College in 1768. He studied law and was admitted to the bar in 1771. In 1775 he was chosen to represent Westchester County in the first Provincial Congress of New York, and took a prominent part in the advocacy of the American cause. He served in two succeeding Congresses in the same and the following year. He was one of the recognized leaders of the congresses; served on nearly all the important committees, among them the committee that drafted the constitution of the State of New York; and with Jay and Livingston had much to do with framing the plan of government for the State. In 1777, when only 25 years of age, he was elected to the Continental Congress, in which he served until 1780. Immediately upon taking his seat he was appointed on a committee to investigate the condition of the army at Valley Forge, and afterward devoted his energies to securing the adoption by Congress of Washington's plans for the organization and pay of the army. His

ability won for him the chairmanship of the committee to confer with the British commissioners on reconciliation who arrived in 1778. As chairman of the committee to publish an address to the people of the Colonies on the existing condition of affairs he drew up a masterly account of the causes of the war, the efforts that had been made to achieve independence, and the transactions with the British commissioners. The address was entitled *Observations on the American Revolution*. In 1779 he was chairman of three other important committees and performed the whole duties of each. During his career in Congress Morris drew up several reports and papers on finance which showed marked ability. His services were recognized by his appointment as assistant superintendent of finance in 1781, a position which he held with great credit until 1785. It was in this capacity that he drew up a scheme for a system of coinage which, though not adopted at the time, ultimately became the basis of the present system. He represented Pennsylvania in the Constitutional Convention of 1787 at Philadelphia, took a leading part in the debates of that body, and the published proceedings showed that he made more speeches than any other member, always championing a strong national government. He urged the proportional representation of the States in the Senate, and favored a freehold suffrage, a good-behavior tenure for the executive, and representation in Congress apportioned according to the number of free inhabitants. In 1780 Morris went to France on private business, and was in Paris at the outbreak of the French Revolution. He kept a diary during his stay, and wrote letters which threw much light on the character of the events which he witnessed. In 1790 he went to London as private agent to the British government to conduct negotiations regarding the unfulfilled stipulations of the Treaty of 1783. His mission was not successful, and he again returned to the Continent. In 1792, while still in Europe, he was appointed Minister to France, and served in that capacity during the stormy scenes of the two ensuing years. In 1794 the French government requested and obtained his recall. He remained in Europe until 1798. In 1800 he was elected from New York to the United States Senate, where he acted with the Federalists. After his retirement from the Senate in 1803 he took great interest in the Erie Canal project, and served as chairman of the Canal Commission from 1810 to the time of his death, which occurred Nov. 6, 1816. His biography has been written for the "American Statesmen Series" by Theodore Roosevelt (Boston, 1900). An elaborate biography was prepared by Jared Sparks (3 vols., Boston, 1832). Morris's diary and letters have been published in two volumes (New York, 1888). Consult also H. C. Lodge, in *Historical and Political Essays* (Boston, 1892).

MORRIS, GOUVERNEUR (1876-) An American novelist and short-story writer, born in New York City and educated at Yale (B.A., 1898). He began as a contributor of fiction to magazines, and so continued, writing also: 1 *Bunch of Grapes* (1897); *Tom Beaulieu* (1901); *Aladdin O'Brien* (1902); *The Pagan's Progress* (1904); *Ellen and her Man* (1904); *The Footprint and Other Stories* (1908); *Putting on the Serecs* (1909); *Spread Eagle and Other Stories* (1910); *The Voice in the Rice* (1910); *It and Other Stories* (1912); *If You*

Touch them they Vanish (1913); *The Incandescent Lily and Other Stories* (1914).

MORRIS, SIR HENRY (1844-). An English physician, born at Petworth, Sussex. He was educated at Epsom College, University College, and Guy's Hospital and established himself in London. He served as surgeon and lecturer in anatomy and surgery at Middlesex Hospital Medical College, examiner in surgery, University of London, examiner in anatomy, University of Durham, chairman of the court of examiners, Royal College of Surgeons, president of the Royal College of Surgeons (1906-09), president of the Royal Society of Medicine (1910-12), etc. In 1909 he was made Baronet. Among his writings are *Anatomy of the Joints of Man* (1879); *Surgical Diseases of the Kidney* (1885); *Gynecology* (1891); *Injuries and Diseases of the Genital and Urinary Organs* (1895); *On the Origin and Progress of Renal Surgery* (1898); *Treatise on Human Anatomy* (1898, 4th ed., 1907), with others; *On Treatment of Inoperable Cancer* (1902); *Looking Back—Christian Science Refuted* (1909); *"Suggestion" in Relation to the Treatment of Disease* (1910).

MORRIS, HENRY W. (1806-63). An American naval officer. He was born in New York City, entered the United States navy in 1819, and became a captain in 1856. For some time after the outbreak of the Civil War he was in Washington superintending the construction of the *Pensacola*, which vessel, when completed in January, 1862, he took safely by the Confederate batteries on the Potomac. He then joined the Federal blockading squadron in the Gulf of Mexico, distinguishing himself in the attacks upon Forts Jackson and St. Philip, and after the capture of New Orleans was in command for a short time of the squadron stationed there. He was made commander in July, 1862. His health giving way, he went to New York, where soon afterward he died.

MORRIS, JAMES. See MORRIS, WILLIAM (1786-1858).

MORRIS, JOHN (1826-93). An English Jesuit, born at Ootacamund, Madras, India. He went to England, studied at Harrow and at Trinity College, Cambridge, but after a year (1845-46), having become a Catholic, he went to Rome to complete his training there in the English College. He was made canon of Northampton in 1852, and from that year to 1855 was vice rector of the English College at Rome. Again returning to England, he acted as private secretary to Cardinal Wiseman and his successor, Cardinal Manning. In 1867 he became a member of the Society of Jesus. Morris was rector of St. Ignatius' College, Malta (1877-78), professor of canon law and Church history in St. Bruno's College, near St. Asaph (1879), and from 1880 to 1886 rector and master of novices at Roehampton. His principal published works are: *Condition of Catholics under James I* (1871); *The Troubles of our Catholic Forefathers* (1875); *The Letter-Books of Sir Amias Paulet* (1874); *Cardinal Wiseman's Last Illness* (1871); *The Life of Father John Gerard* (3d ed., 1881); *The Life and Martyrdom of St. Thomas Becket* (2d ed., 1885). Consult J. H. Pollen, *Life and Letters of Father John Morris* (London, 1896).

MORRIS, JOHN GOTTLIEB (1803-95). An American clergyman, born at York, Pa. He graduated at Dickinson College in 1823, then

studied theology at Princeton and at Gettysburg Seminary, and in 1827 was licensed as a preacher. In the same year he went to Baltimore, where he founded the Trinity English Lutheran Church, of which he continued to be pastor until 1860, when he became librarian of the Peabody Institute. In 1860 to 1864 he was librarian of the Peabody Institute at Baltimore. In 1864 he became pastor of the Third English Lutheran Church, and in 1874 accepted a call to Lutherville, Md., where he was actively interested in the founding of the College for Women. He was president, in 1877, of the first Lutheran church diet at Philadelphia. He held a number of academic positions, founded the Lutheran Historical Society at Gettysburg, Pa., presided over the General Synod in 1843 and in 1883, contributed frequently to scientific and religious journals, edited the *Lutheran Observer* (1823-34), and wrote a number of books, among which may be mentioned *Life of John Arndt* (1853); *Life of Catherine de Bora* (1856); *Quant Sayings and Doings Concerning Luther* (1859); *Fifty Years in the Lutheran Ministry* (1878).

MORRIS, LEWIS (1671-1746). An American Colonial Governor. He was born at Morrisania, N. Y., the son of Richard Morris, a captain in Cromwell's army, who had emigrated to the West Indies after the Restoration and a few years later purchased a tract of 500 acres of land on the north bank of the Harlem River, in the region later named Morrisania, after his family. Although left an orphan in infancy Lewis was well educated under the direction of his uncle, by whom the Morrisania estate to which he fell sole heir in 1691 was increased to nearly 3000 acres. He also inherited a large estate in New Jersey, in which Colony he was appointed, in 1692, judge of the court of common right. After the union of East and West Jersey and the establishment of New Jersey as a royal colony, he was continually prominent in public affairs, serving for many years in both the Colonial Council and the Assembly. He served for a time as Chief Justice of both New Jersey and New York, was appointed acting Governor of New Jersey in 1731, and from 1738 until his death was Governor of the Colony. Consult W. W. Spooner, *Historic Families of America* (New York, 1907).

MORRIS, LEWIS (1726-98). An American patriot during the Revolutionary War and one of the signers of the Declaration of Independence. He was born at Morrisania, N. Y., graduated at Yale in 1746, and as early as 1767 became conspicuous as an opponent of the restrictive measures of the British ministry. He was elected to the Continental Congress in 1775, and at the close of the session was sent west to secure, if possible, the adherence of the Indians, remaining for some time at Pittsburgh and corresponding with Congress. In 1776 he again sat in Congress, did important work on committees, and was one of the signers of the Declaration of Independence. His disinterested support of the American cause and his sturdy independence brought upon him the destruction of much of his property by the British army. Giving up his seat in 1777 in favor of his half brother, Gouverneur Morris (q.v.), he returned to his estate, and subsequently served as a member of the New York Legislature and as major general of the State militia.

MORRIS, SIR LEWIS (1833-1907). An Eng-

lish poet, born at Carmarthen, Wales. After graduating from Jesus College, Oxford (B.A. 1855, M.A. 1858), he studied law, was called to the bar at Lincoln's Inn (1861), and practiced as a conveyancer till 1880. Especially interested in higher education in Wales, he served on the governing boards of three Welsh colleges. On several occasions he stood for Parliament in the Liberal interest, but without success. In 1895 he was knighted. His verse comprises *Songs of Two Worlds* (3 vols., 1871, 1874, 1875), sonorous and optimistic verse, the *Epic of Ilades* (1877), blank-verse monologues; *Gwen: A Drama in Monologue* (1879); the *Ode of Life* (1880). *Songs Unsung* (1883), the first volume to be issued under the author's own name, *Glycia: A Drama* (1886), *Songs of Britain* (1887). *A Vision of Saints* (1890). *Songs without Notes* (1894). *Idylls and Lyrics* (1896). *Harvest-Tide* (1901). *The New Rambler from Desk to Platform* (1905). To the critic Morris is a writer of slight and easy verse on pretentious themes.

MORRIS, MARY (PHILIPSE) (1730-1825). One of the celebrated Philipse family, born in the Philipse manor house on the Hudson. She possessed much personal beauty and charm, and, according to an insufficiently supported tradition, she received and declined an offer of marriage from Washington, whom she met in 1756 while visiting her brother-in-law Beverly Robinson in New York. Two years later she married Capt. Roger Morris, an English officer, and lived for many years in an elegant mansion—known as the Roger Morris House and later as the Jumel mansion—on the outskirts of New York. When the Revolution broke out she remained loyal to the crown, and as a result she was attainted of treason and in 1776 her property was confiscated. In 1809 her children sold their reversionary rights in the confiscated property to John Jacob Astor for \$100,000. In recognition of her loyalty, the English government made her a grant of \$85,000. Mrs. Morris accompanied her husband to England and died at York. Her mansion was Washington's headquarters from Sept. 16 to Oct. 21, 1776. Here he made plans to defend the Heights and to block the passage of the Hudson River. The house was purchased in 1810 by Stephen Jumel, a French wine merchant, and for some time was the resort of French émigrés. Jumel's widow occupied the house until her death in 1865, and for many years thereafter Nelson Chase, the husband of Mme. Jumel's niece, lived there. In 1903 it was acquired by New York City to be used as a museum of historic relics.

MORRIS, MAY (?-). An English worker in arts and crafts, daughter of William Morris (1834-96). She was born at Upton, Kent, attended Notting Hill High School, and studied art with her father. She devoted herself to the designing of embroidery and jewelry and later lectured widely on these and similar subjects in England and America. Miss Morris was one of the founders and later became chairman of the Women's Guild of Arts. She edited, with introductions, her father's collected works (24 vols., 1910-14).

MORRIS, MICHAEL, BARON KILIANIN (1827-1901). An Irish jurist. He was born in Galway, studied at Trinity College, Dublin, and was called to the Irish bar in 1849. His great popularity made his advance in politics very rapid. He was elected to the House of Com-

mons in 1865 as a Conservative, was named Solicitor-General for Ireland in 1866, Attorney-General in the same year, a puisne judge of the Irish Court of Common Pleas in the following year; and after the abolition of his later post of Chief Justice of Common Pleas, he became Lord Chief Justice of Ireland in 1887. His great popularity was due to a kindly nature, a contempt for legal subtleties and technicalities, and an abounding wit whose expression was flavored with a rich Galway brogue. When asked once at a London dinner party to explain Irish disaffection, he replied that it was a case of "a quick-witted people ruled against its will by a stupid people"—an epigram that has become historic. In 1900 Morris retired from the bench, and the same year was made an hereditary baron in the peerage of the United Kingdom.

MORRIS, RICHARD (1833-94). An English philologist. He was born at Bermondsey, was educated at St. John's College, Battersea, in 1869 became lecturer on the English language and literature in King's College School, and in 1871 took holy orders. Four years later he was made headmaster of the Royal Masonic Institution for Boys at Wood Green, Middlesex, from which he retired in 1888 to become master of the grammar school of Dedham, Essex. He edited a number of publications for the Early English Text Society, the Chaucer Society (notably his *Chaucer* in six volumes, 2d ed., 1891), and the Philological Society; and in 1874 was elected president of the latter. Besides his editions of early English works, he published: *The Etymology of Local Names* (1857); *Specimens of Early English* (1867); *Historical Outlines of English Accidence* (1872, 2d ed. by Kellner and Bradley, 1895); *Elementary Lessons in Historical English Grammar* (1874); *Primer of English Grammar* (1874). From 1882 to 1888 he turned his attention to Pali and edited four of the extensive Buddhist texts for the Pali Text Society.

MORRIS, ROBERT (1734-1806). An eminent American financier and one of the signers of the Declaration of Independence. He was born at Liverpool, England, Jan. 31, 1734. At the age of 14 he was sent to America and placed in the counting house of Charles Willing, a rich Philadelphia merchant, whose partner he became in 1754, continuing as such until 1793. The firm of Willing & Morris became one of the leading mercantile establishments in America, and by the outbreak of the Revolutionary War Morris had already acquired a large fortune. Although naturally averse to a rupture with Great Britain, he sacrificed his personal interests, signed the nonimportation agreement of 1765, and served as a member of the citizens' committee that compelled the stamp distributor for Philadelphia practically to relinquish his office. In June, 1775, he became a member of the Pennsylvania Committee of Safety, in October of the same year he was elected to a seat in the Legislature of Pennsylvania (to which he was reelected in 1776), and in November he was appointed by that body a delegate to the Continental Congress. All three of these offices were held by him at the same time. As a member of Congress he served on several important committees and signed the Declaration of Independence, although he had opposed Lee's resolution of June 7 and absented himself from the congressional hall on July 4, when the final vote was taken. At the expiration of his term

in Congress, in 1778, he was elected again to the State Legislature, but on account of miscellaneous charges against him in connection with his mercantile operations, he failed of reelection in the following year. In October, 1780, however, he was returned to the Legislature for the fourth time. It was at this time that the fortunes of the Colonial army reached their lowest ebb. Charleston had fallen; Gates had been defeated by Cornwallis; Arnold's treachery cast gloom on the country. Munitions and supplies were sadly wanting, and Continental currency had depreciated until it was worth but little more than the paper on which it was printed. In this almost desperate situation, Congress resolved to supersede the old treasury board by a superintendent of finance. Morris was chosen to the position Feb. 20, 1781, at a salary of \$6000 a year, and received large powers over the finances of the Confederation. His chief programme was to relieve the situation by import duties, loans and subsidies from France, and to inaugurate a policy of retrenchment. He was unable, however, to carry out the first part of his scheme on account of the refusal of the States to confer the necessary power upon Congress for the laying of import duties. On several occasions he succeeded in borrowing large sums on his personal credit, without which some of the important campaigns of the war would have been impossible. Thus the means which enabled Washington and Greene to carry out the campaign of 1781 were raised mainly by his exertions. In 1781, with the approval of Congress, he founded the Bank of North America and became a large stockholder in it. This institution became of great service to the American cause and was, to a certain extent, under the control of Morris. He continued to hold the difficult and vexatious office of Superintendent of Finance until November, 1784, when he resigned it with a sense of relief. In the same year the Pennsylvania Legislature had annulled the charter of the bank, and in order to obtain its reestablishment Morris secured an election to the Legislature in 1785 and succeeded in having the charter renewed in 1786. In the latter year he was again elected to the Legislature, and in 1787 became a member of the Constitutional Convention at Philadelphia. He had the honor to nominate Washington for the presidency of the Convention, but did not take a prominent part in the proceedings of that body. Upon the organization of the new government, President Washington offered him the position of Secretary of the Treasury. He declined the offer and recommended Alexander Hamilton, who was appointed. At the same time, however, he accepted a seat in the United States Senate, where he served without special distinction until 1795. Unfortunate business speculations proved disastrous, and on Feb. 16, 1798, he entered a debtor's prison in Philadelphia, where he was confined until Aug. 26, 1801. He died May 8, 1806. Consult. A. S. Bolles, *The Financial Administration of Robert Morris* (New York, 1878); W. G. Sumner, *The Financier and the Finances of the American Revolution* (ib., 1891); id., *Robert Morris* (ib., 1892). The best biography is E. P. Oberholtzer, *Robert Morris, Patriot and Financier* (New York, 1903), which is based upon the Robert Morris papers in the Library of Congress.

MORRIS, THOMAS (1776-1844). An American antislavery leader, born in Augusta Co.,

Va. His father removed to Ohio in 1795. While working on a farm in Clermont County he studied law, and was admitted to the bar in 1804. From 1806 to 1830 he was a member of the Ohio State Legislature. In 1832 he was elected to the United States Senate as a Democrat. He very soon took ground on the slavery question, however, in radical opposition to that held by the majority of his party. He willingly presented antislavery petitions and ardently defended the right of petition in the Senate. He also spoke strongly against Texan annexation. In 1838, when Calhoun introduced a series of resolutions touching the constitutional status of slavery, Morris introduced a set of alternative resolutions embodying a rational and explicit statement of the views of the antislavery men. On the expiration of his term as Senator his constituents, to whom his views on the slavery question had been displeasing in the extreme, discarded him for Benjamin Tappan. In January, 1840, at the Democratic State Convention, he was read out of the party, and later in the year associated himself politically with the new Liberty party (q.v.) movement. In May, 1841, he was nominated for Vice President on the Liberty party ticket, on which James G. Birney had been named for President. These nominations, which were for the campaign of 1844, were confirmed at the Buffalo convention of the party in 1843. Consult B. F. Morris, *Life of Thomas Morris* (Cincinnati, 1856), and Smith, *The Liberty and Free-Soul Parties in the Northwest* (New York, 1897).

MORRIS, THOMAS ASBURY (1794-1874). An American Methodist Episcopal bishop, born near Charleston, W. Va. His educational advantages were limited. He was originally of Baptist training, but entered the Methodist ministry in 1816. From 1834 to 1836 he was editor of the *Western Christian Advocate*. Elected Bishop in 1836, for several years he was the senior Bishop of the church. He was a member of the General Conferences of 1824, 1828, 1832, and 1836. His writings include 1 *Discourse on Methodist Church Polity* (1859; later eds.), *Sermons on Various Subjects* (1841, 1859), *Miscellany, Essays, Sketches, etc.* (1854), 1 *Semi-Centennial Sermon* (1864). Consult J. F. Marlay, *The Life of Thomas A. Morris* (New York, 1875).

MORRIS, WILLIAM (1786-1858). A Canadian statesman. He was born at Paisley, Scotland, was brought by his parents to Lower Canada (Quebec) in 1801, and a few years later entered business in Montreal. During the War of 1812-15 he served both in the militia and in the navy, and shortly after peace was signed resumed business at Perth. He was a member of the Upper Canada Assembly (1820-36), and in the former year became prominent by moving and carrying a series of resolutions claiming for the clergy of the Church of Scotland a share in the lands reserved by law for the use of the Protestant clergy, but hitherto monopolized by the Church of England. His name thereafter was prominently identified with the struggle for the secularization of the clergy reserves. He was selected in that behalf to be the bearer of a petition to the British government, and in 1837 went to England for that purpose. Morris was appointed a member of the Legislative Council in 1836. During the rebellion of 1837-38 in Upper Canada he served the government as colonel of militia. In 1844 he was appointed Receiver General in the administra-

tion of which William Henry Draper (q.v.) was the chief figure. In 1846 he became President of the Executive Council, retaining that office in the succeeding Sherwood-Daly ministry (1847-48).

His brother, **JAMES MORRIS** (1798-1865), was elected to the Upper Canada Assembly in 1837 and to the Canada Legislative Assembly in 1841. He was appointed to the Legislative Council in 1844, was Postmaster-General in the Hincks-Morin administration (1851), Speaker of the Legislative Assembly (1853-54), Speaker of the Legislative Council (1858), and Receiver General in the Macdonald-Sicotte administration (1862-63).

MORRIS, WILLIAM (1834-96). An English poet, artist, and Socialist. He was born at Walthamstow near London, March 24, 1834. Morris's early boyhood was spent in the romantic region near Epping Forest, where he showed at the outset his love for nature. He was educated at Marlborough College, and at Exeter College, Oxford. Here he mingled little in the college life, but he read swiftly and widely, thus quickly storing in his strong memory a stock of knowledge which he put to use. In 1854 he was near turning to Roman Catholicism as an escape from religious perplexities, but the impulse passed. He mastered Church history and Anglican theology, but soon left them in a new enthusiasm for Carlyle, Ruskin, and Kingsley. It was in 1854 that Morris first visited France, whither he went again a year later with his friend Edward Burne-Jones (q.v.). On this tour he fell so wholly under the spell of French Gothic that he gave up his earlier purpose of founding a religious brotherhood and became an architect. In 1859 he married Jane Burden of Oxford, who had sat as his model and was a noted beauty. After trying his hand at architecture and painting, Morris with Rossetti, Burne-Jones, and other friends, established, in 1861, a firm in London for designing and manufacturing artistic furniture and household decorations. As time went on Morris took up the manufacture of tapestry and other textiles, dyeing, book illumination, and printing. The old firm of decorative art was dissolved in 1875, and in 1881 Morris transferred his works to Merton Abbey in Surrey. In 1890 he founded the famous Kelmscott Press at Hammersmith. There many beautiful books were printed, and thence, after 1893, he issued books of his own in verse and prose. For the practical advancement of the lesser arts, and of the doctrine that all things should be made beautiful, Morris did more than any other man of his time. At Oxford he showed his literary talent in several contributions in verse and prose to the *Oxford and Cambridge Magazine*, which he maintained (1856). Two years later he published the *Defense of Guenevere, and Other Poems*. This volume marks a date in later romanticism; and never again did Morris surpass it in force and concentration. Afterward he turned for his subjects to Roman, Greek, Norse, Old French, and other mediæval stories, which he clothed in verse with great facility. By the *Life and Death of Jason* (1867) and *The Earthly Paradise* (1868-70) he proved himself one of the best story-tellers since Chaucer, his avowed master. In the summer of 1871 he made a trip through Iceland. In 1876 appeared *Sigurd the Volsung and the Fall of the Niblungs*, a narrative poem approaching the dignity of an epic.

Morris wrote many romances in prose or in prose and verse combined; among these are the *House of the Wolfings* (1889), *The Roots of the Mountains* (1890), *The Story of the Glittering Plain* (1890), and *The Well at the World's End* (1896). In 1890 he published *News from Nowhere*, a romantic pastoral, picturing the England of a possible remote future, happy in a realized Socialism. As a translator he succeeded capably in his renderings from the sagas, and his English translations of the *Æneid* and the *Odyssey* have, with their defects, fine qualities. In 1885 he became an active Socialist, delivering lectures to workmen and contributing to the *Commonweal*, the organ of the Socialistic League. He died Oct. 3, 1896, leaving to the world a splendid example of the man who devotes his wealth and his genius to the bettering of visible things and to the spreading of fine and generous ideals. A collection of various of his papers, entitled *Architecture, Industry, and Wealth*, appeared posthumously in 1903.

Warwick, *William Morris: His Homes and Haunts* (London, 1912); Arthur Compton-Rickett, *William Morris: A Study in Personality* (New York, 1913); A. Clutton-Brock, *William Morris: His Life and Work* (ib., 1914), in the "Home University Library" Morris's *Collected Works* (24 vols., New York, 1910-15) were edited, with introductions, by his daughter, May Morris (q.v.).

MORRIS DANCE (from OF. *morisque*, *moresque*, Fr. *moresque*, from Sp. *morisco*, Moorish, from *moro*, Moor). An obsolete English dance of Moorish origin. It seems to have been introduced into England about the time of Edward III, but it did not become universally popular until the time of Henry VII. When danced in connection with May Day it was an elaborate costume dance, and the characters of Robin Hood, Friar Tuck, Maid Marian, Little John, a dragon, and hobbyhorse were introduced. The costumes of the performers were generally decorated with scores of small bells which were tuned in musical intervals. There were several variations of the morris dance, the two most notable being a sword dance, where the performers leaped over swords, and a ribbon dance, in which the girls danced back and forth between colored streamers. At the Restoration the morris dance was revived for a time, but soon died out. Several modern English composers have used it as an idealized dance form, generally in 4-4 time.

MORRIS ISLAND. An island at the southern entrance to the harbor of Charleston, S. C. (Map: South Carolina, E 4). Three small batteries on Cumming's Point, at the northern end of Morris Island, took part in the bombardment of Fort Sumter on April 12-13, 1861. Later

the works were strengthened and called Battery Gregg, and Battery Wagner was constructed to the south. In the spring of 1863 Admiral Du Pont and General Hunter made unsuccessful attempts to reduce these defenses. When these officers were succeeded by Admiral Dahlgren and General Gilmore, early in July, a landing was effected on the southern part of the island, but on the 11th and 18th desperate assaults failed. A regular siege was established and five parallels were constructed. The guns of Fort Sumter, which were trained to protect the island, were silenced by the Federal fleet, and on September 7 General Beauregard ordered the evacuation of the island.

MORRISON. A city and the county seat of Whiteside Co., Ill., 124 miles west of Chicago, on the Chicago and Northwestern Railroad (Map: Illinois, D 2). It is surrounded by a region interested largely in farming, stock raising, and dairying, and manufactures refrigerators, school furniture, flour, carriages, and condensed milk, and there are two greenhouses. It has a public museum and library. Pop., 1900, 2308; 1910, 2410.

MORRISON, ARTHUR (1863-). An English novelist, widely known for the realism with which he depicts London life, and known also as a collector of objects of art and as a writer on Oriental art. A collection of paintings by Chinese and Japanese old masters, made by him, is now in the British Museum. His writings comprise *Tales of Mean Streets* (1894), *Martin Hewitt, Investigator* (1894), *Chronicles of Martin Hewitt* (1895), *Adventures of Martin Hewitt* (1896), *The Dorrington Deed-Box* (1897), *To London Town* (1899), *Cunning Murrell* (1900), *The Hole in the Wall* (1902), *Divers Vanties* (1905), *Green Ginger* (1909), *The Painters of Japan* (1911); and the plays *That Brute Simmons* (1904), with H. C. Sargent, and *A Stroke of Business* (1907), with H. W. C. Newte.

MORRISON, FRANK (1859-) An American labor leader. He was born at Franktown, Ontario, was educated in the schools of Walkerton, Ontario, became a printer in 1873, and graduated in 1894 from the Lake Forest University Law School, where he also studied in 1895. In 1897 he became secretary of the American Federation of Labor. He was one of the three officials of the American Federation of Labor who were made defendants in the Buck Stove case. For a history of the case see MITCHELL, JOHN; and consult H. W. Laidler, *Boycotts and the Labor Struggle* (New York, 1914).

MORRISON, GEORGE ERNEST (1862-). A British journalist, born at Geelong, Victoria, Australia. He studied for some time at Melbourne University and completed his education at Edinburgh in 1887. In the meanwhile he had seen adventure in the South Sea islands, had crossed Australia on foot from north to south (1882-83), and had been seriously wounded in New Guinea. After further travels in America and in Morocco, where he was for some time court physician, and after a short sojourn in Australia, he went to China, walked from Shanghai to Rangoon (1894), traveled in Siam and southern China as correspondent to the *London Times* (1895-96), and in 1897 became correspondent of the *Times* at Peking, where he was present during the Boxer disturbances of 1900. His views on Chinese affairs,

gained by travel and study in every province of China, are authoritative. In 1912 he was appointed political adviser to the President of the Chinese Republic. He wrote *An Australian in China* (1895).

MORRISON, JAMES DOW (1844-). An American Protestant Episcopal bishop, born of Scottish parents in Waddington, N. Y. He received his early education in Canada, graduating from McGill University, Montreal, in 1865. He was minister at Hemmingford, Canada, in 1869-71, and later at Herkimer, N. Y., and Ogdensburg, where he was Archdeacon from 1881 until 1897. In the latter year he was consecrated first Protestant Episcopal Missionary Bishop of Duluth. In 1907 he organized the diocese of Duluth, of which he became Diocesan Bishop. In 1898 he was Paddock lecturer at the General Theological Seminary, New York. He published *Fundamental Church Principles* (1900).

MORRISON, ROBERT (1782-1834). The first Protestant missionary to China, born at Buller's Green, Morpeth, England. He learned the trade of boot-tree maker after leaving school. In 1797 he was converted, joined the Presbyterian church, and began to improve himself by study. In 1803 he was admitted to Illoxton Independent Academy, and in the following year entered the Mission College of Gosport. Morrison, having been ordained, was sent out in 1807 as the first missionary. Under the protection of some merchants from the United States settled at Canton, he assumed Chinese dress and began the study of Chinese. In 1809 he was appointed translator to the East India Company's factory here, and while in this position he prepared a *Grammar of the Chinese Language*, published in 1815. Between 1815 and 1823 appeared the six thick quarto volumes of his *Dictionary of the Chinese Language*. He also produced several vocabularies of Canton-English and English-Canton. His *New Testament* in Chinese was published in 1815, and the *Old Testament* appeared in 1818. In that year he founded the Anglo-Chinese College at Malacca. It was removed to Hongkong in 1845. Consult the *Memoir* by his widow (2 vols., London, 1839) and W. J. Townsend, *Robert Morrison, Pioneer of Chinese Missions* (New York, 1888).

MORRISON, WILLIAM (1785-1866). A Canadian explorer and fur trader, born at Montreal. He began trapping and trading at Fond du Lac in 1802, joined the Northwest Company in 1805, and made extensive explorations in the Northwest territories. After John Jacob Astor gained control in 1818 of fur trading in the United States, Morrison worked for him until 1826. He afterward returned to Lower Canada. Morrison claimed to have explored during the winter of 1803-04 Lac La Biche, or Elk Lake, which was in 1832 identified as the source of the Mississippi by Schoolcraft and renamed Itasca. Consult *Minnesota Historical Society Collections* (vol. i, St. Paul, 1872, vol. vii, Minneapolis, 1893; vol. viii, St. Paul, 1898).

MORRISON, WILLIAM RALLS (1824-1909). An American lawyer and legislator, born in Monroe Co., Ill. He was educated at McKendree College, but left before graduation to enlist as a private in an Illinois volunteer regiment for the Mexican War, and participated in most of the battles of Taylor's campaign. After his return he studied law, was admitted to the bar,

and from 1855 to 1859 was a Democratic member of the Lower House of the Illinois Legislature, serving as Speaker in the last year. At the outbreak of the Civil War he organized and became colonel of the Forty-ninth Illinois Infantry, fighting at Fort Donelson and serving until December, 1863, when he resigned to take his seat as a War Democrat in the Thirty-eighth Congress; he had been elected while at the front in the preceding year. He practiced law from 1865 until 1873, and from that year until 1887 was again a member of the House. During his congressional career he attained wide distinction as an advocate of a radical reduction in the tariff, but was never able to secure the support of enough members of his own party to assure the passage of bills which as chairman of the Ways and Means Committee he introduced in 1876, 1884, and 1886. The Morrison Bill of 1884, embodying the famous "horizontal" tariff scheme, which proposed a straight (or horizontal) reduction of 20 per cent from the tariff of 1883, was defeated by a slender majority formed of Republicans and protectionist Democrats led by Samuel J. Randall (q.v.). In 1885 Morrison was defeated for election to the United States Senate by John A. Logan by one vote, and in the following year failed of reelection to the House. He was appointed by President Cleveland a member of the Interstate Commerce Commission in 1887, and served until 1897, for the last six years as chairman.

MORRISTOWN. A town and the county seat of Morris Co., N. J., 22 miles by rail west of Newark, on the Delaware, Lackawanna, and Western, the Morristown and Erie, and the New Jersey and Pennsylvania railroads (Map: New Jersey, C 2). Among the features of the town are Memorial and All Souls' hospitals, Randolph Military Academy, the Young Men's Christian Association and Young Men's Catholic Association buildings, a public park with a soldiers monument, and a large public library and lyceum, occupying a handsome edifice. Here is the site of Fort Nonsense, erected by Washington and marked by a memorial monument. Four miles from the town, at Morris Plains, is the State Hospital for the Insane, which cost nearly \$3,000,000, has accommodations for 1500 patients, and is one of the largest institutions of its character in the United States. Morristown is in the rose and peach belt of the State, on a table-land surrounded by hills rising nearly 700 feet above sea level, and is chiefly a fashionable residential place with large villas. The only industrial establishments of any importance are hosiery mills and a high-pressure wire factory. Its comparatively dry and bracing winter climate attracts invalids. The government, as provided under the original charter of incorporation, is vested in a mayor and a municipal council, of which the executive is a member. The school commissioners are chosen by popular vote. Pop., 1900, 11,267; 1910, 12,507.

Settled about 1710, Morristown was known as West Hanover until in 1740 it received its present name in honor of Lewis Morris, then Governor of New Jersey. During the Revolution Washington made his headquarters here from January to May, 1777, and again from December, 1779, to June, 1780, occupying during the latter period the old Ford mansion, which now belongs to the Washington Association and in which numerous Revolutionary

relics are exhibited. At the old Speedwell Iron-works here the shaft of the *Savannah*, the first steamboat to cross the Atlantic, was cast, and here, from 1837 to 1843, Professor Morse and Alfred Vail perfected the electric telegraph. *Morristown* was incorporated in 1865. Consult Colles, *Authors and Writers Associated with Morristown*, etc. (Morristown, 1893), and Sherman, *Historic Morristown* (ib., 1906).

MORRISTOWN. A city and the county seat of Hamblen Co., Tenn., 42 miles northeast of Knoxville, on the Southern and the Knoxville and Bristol railroads (Map: Tennessee, G 2). It is the seat of the Morristown Normal and Industrial College, a Methodist Episcopal institution for negroes. Morristown is the commercial centre of a rich agricultural region, and is an important poultry and stock market, the value of the annual shipments being \$3,000,000. The manufactures include flour, stoves, threshing machines, hosiery, butter, hardwood tops and panels, furniture, gloves, vinegar, harness and saddles, tinware, acetylene-lighting plants, monuments, concrete building blocks, wagons, leather, brooms, and sash and blinds; and there are quarries of variegated marble and zinc, lead, and iron mines in the vicinity. The city owns and operates its water works and electric-light and sewage plants. Pop., 1900, 2973; 1910, 4007.

MORRISTOWN. A town, including the village of Morrisville, Lamoille Co., Vt., 50 miles by rail east by north of Burlington, on the Lamoille River and on the St. Johnsbury and Lake Champlain Railroad (Map: Vermont, C 3). It contains a Carnegie library and the People's Academy. Morristown is in a rich agricultural and dairying country, butter, eggs, cream, potatoes, and hay being the chief products. The water works and electric-light plant are owned by the village of Morrisville. Pop., 1900, 2583; 1910, 2652.

MORRO, EL. See NATIONAL MONUMENTS.

MORROW, PRINCE ALBERT (1846-1912). An American dermatologist, born at Mt. Vernon, Christian Co., Ky. He graduated as M.D. from University Medical College (later part of New York University) in 1874. Settling in New York City, he was clinical professor of venereal diseases (1884-90) and clinical professor of genito-urinary diseases (1886-90) at the university and at Bellevue Hospital Medical College. He took active part in the public-welfare movement and was president of the American Society for Sanitary and Moral Prophylaxis from its organization in 1905. He contributed many articles to the medical journals and was one of the editors of the *Journal of Cutaneous and Genito-Urinary Diseases*. Among his works may be mentioned: *Veneral Memoranda* (1885, 2d ed., 1905); *Drug Eruptions* (1887); *Atlas of Skin and Venereal Diseases* (1888-89); *System of Genito-Urinary Diseases, Syphilology, and Dermatology* (3 vols., 1892-94); *Leprosy* (1899); *Social Diseases and Marriage* (1904).

MORROW, WILLIAM W. (1843-). An American lawyer and jurist, born near Milton, Wayne Co., Ind., and educated in the public schools of Illinois and California. Admitted to the bar in 1869, he served as assistant United States attorney for California (1870-74), as attorney of the State Board of Harbor Commissioners (1880-83), and as special counsel for the United States before the French and

American Claims Commissions (1881-83) and before the Alabama Claims Commission (1882-85). From 1879 to 1882 he was chairman of the Republican State Central Committee, in 1884 chairman of the California delegation to the Republican National Convention, and a member of the Forty-ninth to the Fifty-first Congresses (1885-91). After serving as United States district judge for the northern district of California in 1891-97, Morrow became judge of the United States Circuit Court and then of the Circuit Court of Appeals for the ninth judicial circuit. In 1905 he was one of the incorporators of the American National Red Cross Society.

MORSE. The largest island in the Limfjord, in northwest Jutland, Denmark (Map: Denmark, B 2). Its area is 139 square miles. It is in marked contrast with the surrounding mainland, being much more fertile and having a somewhat elevated (250 feet) interior, with steep coasts. Pop., 1901, 22,237, 1911, 24,270. The chief town is Nykjobing, with 6918 inhabitants (1911).

MORSE (probably from Icel *mar*, sea + *ros*, horse, cf. Norw. *rosmar*, walrus; less plausibly from Russ. *moryu*, *moichu*, moose, from *more*, sea). An old name for the Atlantic walrus (q.v.).

MORSE. See COSTUME, ECCLESIASTICAL.

MORSE, CHARLES WYMAN (1856-) An American financier, born in Bath, Me. He graduated from Bowdoin College in 1877, having more than paid his way through college by sending ice to a New York brewery company. Later he engaged in the shipping business in Maine, moving in 1880 to Brooklyn and then to New York City. Here he established an ice business which finally, in 1899, under the name of the American Ice Company, expanded to include the areas of Philadelphia and Baltimore. This company practically secured a monopoly in New York. Through political affiliations it obtained exclusive wharfage rights, enabling it to raise prices until the public clamor caused an investigation. The scandalous condition then revealed was regarded as one of the causes of the overthrow of Tammany Hall in 1901. In the meanwhile Morse had sold his holdings, making a profit, it was claimed, of over \$12,000,000. He then turned to the shipping business. His efforts to secure a monopoly of the American coastwise transportation service resulted in the combination under one control of the Clyde Steamship Company, the Mallory line, the Metropolitan Steamship Company, the Hudson Navigation Company, the Ward line, and others. Morse also entered the publishing business and was influential in establishing the Butterick Company, of which he was first vice president. To finance his vast industrial undertakings, and especially to make possible a spectacular manipulation of American Ice, Consolidated Steamship, and United Copper stocks, he secured control of a chain of nine banks, using methods afterward considered questionable. Because of his connection with several of the banks which failed during the panic of 1907 and the general belief that in a measure Morse was responsible for the panic, his methods and transactions came up for review in the Federal courts. The National Bank of North America (New York), of which he was vice president, was closed in January, 1908. The indictment charged that he had criminally

misapplied the funds of this bank (and so of others also), that "he had entered upon a career of reckless and forbidden speculation," and that he had concealed his unlawful practices by making false entries in the books. Later in the same year he was convicted and sentenced to 15 years' penal servitude in Atlanta Penitentiary, higher courts sustained this decision. The case attracted general attention, but opinions regarding the outcome were various. Many, regarding it as a salutary lesson to those who were conducting big business illegally, rejoiced in the ability of the government to convict a rich man. Others thought that, while Morse was guilty, such actions as his were common in Wall Street and that his offense was more technical than real. The case was important in that it gave an impetus to the antitrust movement. After Morse had served a part of his sentence, his health was reported to have been undermined, and efforts were made, particularly by his wife, to obtain a pardon, which was granted by President Taft in 1912. A sojourn abroad enabled him to recuperate rapidly and he returned to the United States the next year. From then on he was involved in suits by persons who had lost on American Ice stock, etc., but he again acquired corporate interests, becoming president of the Hudson Navigation Company.

MORSE, EDWARD SYLVESTER (1838-). An American zoologist and Orientalist, born at Portland, Me. For three years he studied at the Lawrence Scientific School, Harvard, under Louis Agassiz. He was professor of comparative anatomy and zoology at Bowdoin College (1871-74), lecturer at Harvard (1872-73), and professor at the Imperial University, Tokyo, Japan (1877-80). Thereafter he served as director of the Peabody Museum at Salem, Mass., of which he had been a founder. Morse became known also as a popular lecturer on natural history and Oriental travel. His reputation as a zoologist was early established by his studies of brachiopods, which proved them not to be mollusks, and he was elected a member of the National Academy of Sciences, also corresponding or honorary member of many foreign scientific and Oriental societies, a fellow of the American Academy of Arts and Sciences, and president of the American Association for the Advancement of Science (1886). While in Japan Morse interested himself greatly in the art, antiquities, social customs, and folklore of the people and made a collection of pottery, etc., which was bought by the Museum of Fine Arts, Boston. A catalogue, prepared by Morse, who had been made keeper of the collection in 1892, appeared in 1901. In 1898 he was decorated with the Order of the Rising Sun, as an expert on Japanese ceramics, he served on the jury of awards at the Chicago, Buffalo, and St. Louis expositions; and in 1911 he was president of the American Association of Museums. His writings include: *First Book of Zoology* (1875), *Japanese Homes and their Surroundings* (1886); *On the Older Forms of Terra-Cotta Roofing Tiles* (1892); *Glimpses of China and Chinese Homes* (1902), *Mars and its Mystery* (1906); besides numerous articles contributed to scientific journals.

MORSE, HARMON NORTHROP (1848-). An American chemist, born at Cambridge, Vt. He graduated from Amherst College in 1873 and from the University of Göttingen (Ph.D.) in

1875. He was an assistant in chemistry at Amherst in 1875-76, and at Johns Hopkins University served as associate professor of chemistry in 1876-91, as professor of analytical chemistry from 1891 to 1908, and thereafter as professor of inorganic analytical chemistry and director of the chemistry laboratory. His researches in osmotic pressure are of importance. He published *Exercises in Quantitative Chemistry* (1905) and *The Osmotic Pressure of Aqueous Solutions* (1914).

MORSE, HARRY WHEELER (1873-). An American physicist, born at San Diego, Cal. He graduated at Leland Stanford Junior University in 1897 and at Leipzig (Ph.D.) in 1901. He was instructor (1902-10) and assistant professor (1910-12) in physics at Harvard University and served as professor of chemistry (1912-13) at the University of California. In 1913 he was placed in charge of the scientific work of the Western Precipitation Company at Los Angeles, Cal. He is translator of Ostwald's *Letters to a Painter on the Theory and Practice of Painting* (1906) and *Fundamental Principles of Chemistry* (1907), coauthor of *Ostwald and Morse's Elementary Modern Chemistry* (1907); and author of *Chemistry and Physics of the Lead Accumulator* (1912) and monographs on spectroscopy.

MORSE, HOSEA BALLOU (1855-). An American author and authority on Chinese affairs, born at Brookfield, Nova Scotia. His ancestors had settled at Dedham, Mass., as early as 1636. Graduating from Harvard in 1874, Morse entered the Chinese Imperial Customs Service as an assistant. He was made Deputy Commissioner in 1887 and Commissioner in 1896, and from 1903 till his retirement in 1907 was Statistical Secretary (Commissioner of Customs) to the Inspector General of Customs (Chief of the Department of Statistics, Printing, and Supplies). In 1885 he was sent by Imperial decree on a special mission regarding the peace settlement between China and France. From 1885 to 1887 he was also concerned with the reorganization of the China Merchants' Steam Navigation Company. In 1889, again by special Imperial decree, he was appointed Commissioner in connection with the opening of Hunan Province to foreign trade. He was highly honored by the Manchu government; became president of the American Association of China, vice president of the China branch of the Royal Asiatic Society, and chairman of the board of directors of the Y. M. C. A. at Shanghai, and received the degree of LL.D. from Western Reserve University in 1913. His writings include: *Currency of China* (1906), *Trade and Administration of the Chinese Empire* (1908, rev. ed., 1913), *Guilds of China* (1909), *International Relations of the Chinese Empire, 1834-1860* (1910).

MORSE, JOHN TORREY (1840-). An American biographer. He graduated at Harvard College in 1860, lectured there on history (1876-79), was coeditor with Henry Cabot Lodge of the *International Review*, and practiced law in Boston. From 1879 to 1891 he was an overseer of Harvard. He was honored with membership in the National Institute of Arts and Letters. His books include: *Treatise on the Law Relating to Banks and Banking* (1870); *Law of Arbitration and Award* (1872); *Famous Trials* (1874); *Life of Alexander Hamilton* (2 vols., 1876); *Life and Letters of Oliver Wendell*

Holmes (2 vols., 1896); in "American Statesmen Series" (which was edited by him) the lives of *John Quincy Adams* (1882), *Thomas Jefferson* (1883), *John Adams* (1884), *Benjamin Franklin* (1889), and *Abraham Lincoln* (2 vols., 1893), *Life and Letters of Colonel Henry Lee* (1906).

MORSE, RICHARD CARY (1841-) An American leader in the Young Men's Christian Association. He was born at Hudson, N Y, and was educated at Yale (A B, 1862), and at Princeton and Union theological seminaries. He was assistant editor of the New York *Observer* in 1867-69, and was then ordained to the Presbyterian ministry. As general secretary of the international committee of the Y. M. C. A. after 1869, he became prominently identified with the extension and supervision of the work in North America, and after 1872, in its interest, made several trips to England, the Continent, Australia, China, Japan, Korea, and India. He was chosen one of the two American members of the World's Student Christian Federation. His writings include *Robert R. McBurney: A Memorial* (1899); *Polity of Young Men's Christian Associations* (1904); *Fifty Years of Federation of the Young Men's Christian Associations of North America* (1905); *History of the North American Young Men's Christian Associations* (1913).

MORSE, SAMUEL FINLEY BREESE (1791-1872). An American artist and inventor. He was born at Charlestown, Mass., April 27, 1791, and graduated at Yale College in 1810. While in college he painted "miniatures on ivory at \$5 and profiles at \$1." Later, with the American painter Washington Allston, he visited England and studied there with Allston and with Benjamin West. In 1813 he received the gold medal of the Adelphi Society of Arts for a plaster model of the "Dying Hercules," which he had used in painting a large picture exhibited the same year at the Royal Academy. Returning to New York in 1815, he became in 1826 the first president of the National Academy of Design and was appointed in 1835 professor of the arts of design in the University of the City of New York. During this period he was constantly working on commissions, among his sitters being James Monroe, Chancellor Kent, Fitz-Greene Halleck, and Lafayette. He did not give his entire attention to art, but was interested in chemistry and especially in electrical and galvanic experiments, his interest doubtless being awakened in the subject of electro-magnetism through conversations with Prof. J. Freeman Dana, who lectured in New York on that subject in 1826-27 and exhibited an electro-magnet. Morse first conceived the idea of the telegraph while on board the packet ship *Sully* on his way from Europe to America in 1832, while discussing the then recent discovery in France of a method for obtaining the electric spark from the magnet. Before the close of that year a portion of the apparatus which he had devised had been constructed in New York, but it was not until three years later that, in a room at the University, he showed the telegraph operating with half a mile of wire. In September, 1837, he made a public exhibition of his discovery and in that year filed his caveat at Washington. No result followed his appeal to Congress for aid during that session, and Professor Morse visited Europe with the hope of enlisting the interests of foreign governments

in his invention. In this attempt he was unsuccessful, and he returned to New York, where, as well as in Washington, he struggled under serious privations during the four years which elapsed before he obtained (1843) congressional aid. In that year, after he had almost yielded to despair, Congress at midnight, in the last moments of the session, appropriated \$30,000 for an experimental line between Washington and Baltimore. After this aid had been granted, Morse succeeded after many difficulties in establishing a working telegraph line, and the first message, "What hath God wrought?" was sent from the rooms of the United States Supreme Court in the capitol at Washington to Baltimore on May 24, 1844. From this time the telegraph was an assured success, but Professor Morse was frequently involved in litigation to maintain his rights under his patents. He also was engaged in numerous controversies. But the number and character of the honors heaped upon Professor Morse on account of his invaluable invention have probably never been equaled in the case of any other American. See TELEGRAPH.

Professor Morse set up the first daguerreotype apparatus and with Prof. John W. Draper was associated in taking the first daguerreotypes in America, he also laid the first submarine telegraph line (in New York harbor in 1842), and from him, in a letter to the Secretary of the Treasury of the United States in 1843, seems to have come the first suggestion of an Atlantic telegraph. His last public act was the unveiling of a statue of Benjamin Franklin in Printing House Square, New York. He died in New York, April 2, 1872. Consult Prime, *Life of S. F. B. Morse* (New York, 1875), and E. L. Morse (ed.), his son, *Samuel Finley Breese Morse, his Letters and Journals* (2 vols., Boston, 1914).

MORSE, SIDNEY EDWARDS (1794-1871). An American journalist, geographer, and inventor, a brother of Samuel F. B. Morse. He was born in Charlestown, Mass., graduated at Yale in 1811, studied theology at Andover and law at Litchfield, Conn., and in 1815 established the Boston *Recorder*, a weekly religious newspaper, which he edited for more than a year. In 1820 he published a small geography and in 1823 a larger one called *A New System of Modern Geography*, of which more than 500,000 copies were ultimately sold. The success of the book was partly due to the later use in it of superior map prints in color produced by a new process called cerography, which he, with the assistance of Henry A. Munson, developed in 1839. In 1823, with his brother Richard, he established the New York *Observer*, another religious weekly, and he continued to be its chief editor and proprietor until 1858. He afterward invented an instrument called a bathyometer, for ascertaining sea depths, exhibited at the Paris Exposition of 1869 and in New York City in 1870. Besides his works on geography he published *Premium Questions on Slavery* (1860).

MORSELLI, mòr-sèl'lè, ENRICO AGOSTINO (1852-). An Italian alienist and neurologist, born at Modena. He graduated at the university of that city in 1874, studied psychiatry at Reggio under Livi and anthropology at Florence under Mantegazza, and subsequently became professor of psychiatry in the Turin medical school and physician in charge of the insane asylum in the same city. In 1889 he

was called to Genoa to fill the chair of mental and nervous diseases; in 1910 he became also professor of experimental psychology. Among his many works are: *Il trasfusione de sangue* (1876, 2d ed., 1886), *Il suicidio* (1879, Eng. trans., *Suicide*, 1882); *Critica e riforma del metodo in antropologia* (1880); *Il magnetismo animale* (1886); *Antropologia generale* (1887-1911); *Carlo Darwin e il darwinismo*, etc (1892); *Manuale di semiotica delle malattie mentali* (1898); *Lynda e Tullio Murri* (1905); *Psicologia e spiritismo* (1908). Morselli became coeditor of the *Rivista sperimentale di Freniatria e di Medicina Legale* in 1875 and of the *Archivo di Psichiatria* in 1885.

MORSHANSK, môr-shânsk'. An important commercial town in the Government of Tambov, Russia, situated near the river Tsna, about 60 miles north-northeast of the city of Tambov (Map: Russia, F 4). It produces tallow, soap, and spirits on a large scale and is the seat of an extensive trade in agricultural products and live stock. Pop. 1897, 27,756. 1911, 31,802.

MORTALITY, STATISTICS OF. See LIFE INSURANCE. VITAL STATISTICS.

MORTAL SIN. In Roman Catholic theology, the name given to the graver class of sins, in distinction from venial sins (qv). For a sin to be mortal it must be a conscious violation of a known divine law, decided upon deliberately by a free will, a deliberate choice of an end of action apart from God, and it must usually be in a matter of importance, because trivial matters do not usually determine supreme choices. Mortal sin, as its name implies, is believed to destroy absolutely the divine life of grace in the soul and render it deserving of eternal punishment, unless remitted by perfect contrition or by attrition in conjunction with the sacrament of penance (qv).

MORTAR (OF, Fr *mortier*, from Lat. *mortarium*, mortar, connected with *marcus*, hammer, Skt. *mar*, to crush). A mixture or paste of cement or lime and sand. Mortars may be classified, according to the nature of the cementing substance used, into common lime mortar and cement mortar.

Lime Mortar. Mortar made of common lime is extensively used because of its intrinsic cheapness and the ease with which it can be prepared. It sets or becomes hard only in air, however, and should consequently not be used under water, in wet places, or in freezing weather. Its small strength compared with cement mortar, however, limits its use to structures in which great strength is not required. In making lime mortar the proportions of the mixture are usually about one volume of lime to from two and one-half to three volumes of sand, with four parts of sand as a maximum, the rule being to add sand until the mortar works well with a trowel. The lime is placed in a layer in a shallow box or in a depression scooped out of the sand and then sprinkled with a quantity of water from two and one-half to three times the volume of the lime. This being done, the lime should be left to slack undisturbed. It is generally held by engineers that the lime should be slacked at least 24 hours before it is mixed with the sand. This is frequently not done, through haste or carelessness, in common building operations. It is also important that all the water required for slacking should be added to the lime at one time, since the addition of water after slacking has begun

retards that process and results in the production of a lumpy mortar. After the lime has been slacked the sand is spread in a layer over its top and the two materials are mixed and remixed by means of a hoe or shovel until a uniform paste is secured. The mortar is then ready for use. Formerly all brick was laid in lime mortar, but now, except for small buildings, it has been largely supplanted either by a cement mortar or a cement mortar with lime paste.

Cement Mortar. The most valuable of all mortars are those made with natural or Portland cements, the latter being preferable (see CEMENT), as a binding material. The proportions of the ingredients that are most commonly used are one part cement and two or three parts sand. To make the mixture, about half the sand is spread in a layer over the bottom of the mixing box, the cement is then spread in a layer over this sand bed and is in turn covered with the remainder of the sand. The mass of cement and sand is then turned and returned with a shovel until the two ingredients are thoroughly intermingled. Water is then added to the mixture, which is again turned by the shovel. To cause the mortar to be handled on a trowel more easily and to make it more plastic and smooth lime paste may be added to cement mortar in moderate proportions. Where cement mortar is used for bricklaying with all the voids filled, there results a monolithic mass which will break through the bricks themselves as readily as through the joints. To make colored cement mortars various substances are added, but the effect is to make the mortar weaker, and often the color is not permanent.

Pointing Mortar. A special mortar for protecting the joints in masonry, either a rich mixture of Portland cement and sand or neat cement.

Grout. A thin or liquid mixture of lime or cement is called grout. It is used to fill up small interstices by pouring it upon the masonry, into the voids of which it is expected to find its way.

Water-Tight Mortar is made of varying proportions of Portland cement, sand, and lime.

Consult: Heath, *A Manual of Lime and Cement* (New York, 1893); I. O. Baker, *A Treatise on Masonry Construction* (10th ed., 1b, 1909), M. A. Howe, *Masonry* (1b, 1915). See BRICKWORK, BUILDING, CEMENT, MASONRY.

MORTAR. A cannon designed to reach its target from above by employing a very steep angle of fall of projectile. For instance, as a coast-defense weapon the mortar is used to attack the deck instead of the armored sides of a ship. In the field it may be used to attack the overhead cover of land fortifications, to search trenches, or to reach the personnel protected by very steep cover. Relatively to calibre the mortar is shorter than the howitzer or gun, uses angles of elevation as great as 70 degrees, secures change in range by varying both the projectile charge of powder and the angle of elevation. In the United States service, mortars are used only in the coast-defense service; calibre 12-inch, range about 12,000 yards, weight of projectile 1000 pounds. In Europe mortars of various calibres, from 3-inch up to 16.5-inch, were used in the field during the European War of 1914. The ordnance surprise of this war was the great German 42-centimeter (16.5-inch) mortar used in the reduction of the Liège forts.

The length of this powerful weapon was about 24 feet, diameter of bore 16½ inches, weight of shell 1760 pounds, bursting charge 400 pounds high explosive, ranges used from 8300 to 15,000 meters. The gun and carriage were drawn by large tractors. At Namur the great Austrian 12-inch Skoda mortars were used, also German 8 3-inch and smaller. See HOWITZER. COAST ARTILLERY. HEAVY FIELD ARTILLERY; ORDANCE, ARTILLERY.

MORTARA, môr-ta'ra. A town in the Province of Pavia, Italy, situated on the Arbogna, 25 miles southwest of Milan (Map Italy, B 2). Its Gothic church of San Lorenzo contains paintings by Lanini and Ferrari. There is a technical school and a theatre. Manufactures of machines and hats are carried on. Cheese is produced. At the battle of Mortara, March 21, 1849, the Austrians defeated the Sardinians. Pop. (commune), 1901, 8631; 1911, 10,468.

MORTARA, EDGAR. A Jewish boy whose alleged abduction excited much interest in Europe in 1858 and following years. He was the son of Momolo Mortara, a resident of Bologna, and was forcibly taken from his father's house on June 23, 1858, by the authorities on the ground that he had been baptized into Christianity by a Roman Catholic maidservant. The efforts of the parents to recover the boy aroused much sympathy, even from some Catholic rulers in Europe, but were unsuccessful. Apparently of his own choice he remained with the church authorities, was educated for the priesthood, became an Augustinian monk, and has preached as a missionary in the German cities and in New York. A drama by Moos, *Mortara, or the Pope and his Inquisitors* (Cincinnati, 1860), was founded on the case. Consult *The True Story of the Jewish Boy Edgar Mortara* (London, 1860).

MORTAR VESSEL. A vessel fitted for carrying and operating a mortar. Such a vessel requires good beam and a strong deck to resist the recoil of the mortar. During the Civil War schooners were used as mortar vessels. In Europe ketch-built vessels were largely used for this purpose, the so-called bomb ketch being a frequent adjunct to a fleet in conducting operations against land defenses. Mortars are no longer used, high-angle fire being obtained from longer guns, so that mortar vessels are obsolete.

MORTE D'ARTHUR, môt dir'tur' (OF, the death of Arthur). The name applied, in slightly varying forms, to several versions of the Arthurian legend and cognate stories. (See ARTHUR.) There are two English metrical romances of the name, each existing in a single manuscript and probably based on French originals. But in more than one way the most important work bearing this name is the celebrated redaction or blending by Sir Thomas Malory of French and English romances. It was completed in 1469 and first printed, by Caxton, in 1485. Of this edition but two copies exist, the only perfect one in New York; a scholarly reprint of it, with valuable editorial matter, was made by Sommer (London, 1889). The book probably did more than any other influence to nationalize the Arthurian legend, and the poets, from Spenser to Tennyson (in the *Idylls of the King*), have drawn abundantly on its treasures. The best modern editions, besides that mentioned above, are by Israel Gollancz, "*Temple Classics*" (4 vols., New York, 1900); Edward Strachey (ib., 1907); the Everyman edition (2

vols., ib., 1908); Ernest Rhys (ib., 1909). Consult J. L. Weston, *Survey of Arthurian Romance* (1905); G. H. Maynard, *Arthur of the English Poets* (Boston, 1907); H. O. Sommer (ed.), *Vulgate Version Arthurian Romances*, published by the Carnegie Institution (Washington, 1909-12).

MORTEMART, môt'mar', FRANÇOIS ATHÉNAIS DE ROCHECHOUART DE See MONTESPAN, MARQUISE DE.

MORTGAGE, môr'gāj (OF *mortgage*, *mortgage*, Fr *mortgage*, from *mort*, from Lat. *mortuus*, dead, from *mori*, Skt. *mar*, to die + *gage*, ML. *vadium*, *vadium*, from Goth *vadi*, OHG. *uetti*, Ger *Wette*, AS *wedd*, archaic Eng *wed*, Lat *vas*, pledge, Lith *vaduti*, to redeem a pledge). In English and American law, the conveyance or transfer of property, either real or personal, as security for the payment of a debt or the performance of a legal obligation.

The debtor or obligor may, and usually does, retain possession of the property mortgaged—the validity of the security not depending upon possession as in the case of pledge (q.v.) and common-law lien (q.v.). This method of securing performance of an obligation was known to the ancient law, and under the civil law the distinction was well settled between *hypotheca*, in which the property given as security remained in the possession of the debtor, and *pignus*, in which the property given as security was surrendered to the creditor.

The giving of security by mortgage first became of importance at common law after the passage of the Statute *Quia Emptores* (18 Edw. I.), by which the restraints on alienation of lands held in fee were removed. Mortgages were then in form conditional grants, a form of gift or limitation peculiarly adapted to the giving of security without necessarily changing the possession of the security. At common law the owner of real estate might grant to another any estate in fee with the right on the part of the grantor or his heirs to reënter upon the property and revest the title in the grantor or his heirs upon the happening of a specified condition.

By making the condition of reentry the payment of money or the performance of an obligation due from the grantor to the grantee, all the essentials of a common-law mortgage were created. Upon payment of the sum due when due, the condition of the grant or conveyance was satisfied, and title was thereby revested in the grantor or mortgagor. But if the mortgagor failed to pay the mortgage debt when due, performance of the condition thereafter became impossible, and the mortgagor thereby lost all claim upon the mortgaged property.

Equity early exercised its jurisdiction to mitigate the harsh operation of this common-law rule by allowing the mortgagor who had failed to perform his obligation upon the due date (or the law day, as it was called) to redeem the mortgaged property upon payment of the sum due with interest. This right of the mortgagor was known as his equity of redemption and was unlimited in point of time. But as this unlimited right of redemption of the mortgage rendered it impossible for the mortgagee to realize on his security, equity also gave to the mortgagee the right to cut off the right of redemption by foreclosure, which was an equitable suit asking a judicial declaration that the right to redeem had been forfeited.

The modern law of mortgages, then, combines both legal and equitable doctrines, and many of its peculiarities, both of form and substance, will be explained by reference to the historical development of the law. While the mortgage in modern practice may, for most purposes, be regarded only as a lien created in favor of the mortgagee, it is still in form a conveyance vesting the title of the property in the mortgagee, and, in the absence of statute, it is generally the rule that no mortgage valid at law can be created without a conveyance.

It is usual to incorporate in the mortgage a clause providing for the defeasance of the title upon payment of the mortgage indebtedness, but, as will appear, even that is not essential. In some States statutes have been passed authorizing a mortgage which is not a conveyance in form, but which for all practical purposes has the same effect as the common-law mortgage as modified by equity. One important consequence arising from the fact that at common law the mortgagee acquired a title was that his mortgage was valid against an innocent purchaser of the property for value without notice of the mortgage, which could not have been the result had the mortgage been a mere lien or right in personam against the mortgagor. See *EQUITY*.

This rule has been modified in the United States by statutes universally adopted requiring mortgages and purchasers of property generally to record their documents of title in order to protect them against claims of purchasers without notice.

When the intention of an agreement is to create a mortgage, although it is not in effect a conveyance and consequently not a legal mortgage, equity will enforce the agreement against the mortgagor or third parties having notice of the agreement as though it were a valid mortgage.

Thus, where the owner of real estate deposited his title deeds of the property with another for the purpose of securing a debt or obligation, the English courts of equity have recognized in the transaction a valid mortgage. This doctrine of creating a mortgage by pledge of title deeds has not been recognized in the United States, except, perhaps, in the State of New York. When a conveyance is absolute on its face, equity will inquire into all the circumstances of the transfer of title and, if it appear that the transfer was made only for the purpose of giving security, will treat the transaction as a mortgage and allow the grantor to redeem the property upon payment of the mortgage indebtedness. All mortgages, however, whether express or implied from the circumstances, are to be distinguished from conditional sales, which are agreements to sell and transfer title to the property upon the happening of a certain event. It will be observed that the position of a mortgagor is closely analogous to that of a conditional vendor who has agreed to sell property upon payment of a certain sum. There is, however, one important distinction between the two relations. In the case of conditional sales there is no existing indebtedness. The vendee is under no obligation to pay money to the vendor before electing to purchase, while the mortgagor is so bound. In determining in any given case whether the transaction is a conditional sale or a mortgage, courts will scrutinize the evidence with great care and in case of doubt will hold the transaction to be a mortgage. From the nature of

the mortgage it seems probable that a legal liability independent of the mortgage itself is not essential to its validity, but in general all mortgages are accompanied by some form of legal obligation for the performance of which the mortgage is given as security. This is usually a promissory note or bond payable to the mortgagee, and, where the purpose is to issue numerous bonds secured by one mortgage, the practice is to make the mortgage or conveyance to a trustee, who holds the property as security for all the bondholders. Railroad mortgages are usually of this kind. If the note or bond is illegal or if there is any illegality in the mortgage transaction, the mortgage is invalid.

Mortgages are sometimes given to secure future advances to be made by the mortgagee. Such mortgages are everywhere valid and enforceable as between the mortgagor and mortgagee, but in some States they are held not to be valid against third parties, except as to advances actually made, of which the third party has actual or constructive notice at the time of acquiring an interest in the property. In a number of States, statutes provide that mortgages for future advances shall have no validity against third persons.

Any legal property, either real or personal, may be mortgaged, even including future or inchoate property, as crops planted but not yet grown, which the common law regards as being capable of present ownership. But a mortgage of property not yet acquired by the mortgagor could have no validity at common law on the principle that "a man cannot grant that which he hath not." Mortgages of this character as well as mortgages of equitable interests are, however, recognized and enforced by the courts of equity when the rights of innocent third parties are not involved. Such mortgages are now generally regarded as valid between mortgagor and mortgagee, but there is a variety of views held in the several States as to their validity against third parties—some courts, as those of Massachusetts, holding that they can have no validity even against creditors of the mortgagor unless the mortgaged property is delivered to the mortgagee, and some, as those of New Jersey, holding that they are valid against all parties having notice of the mortgage.

The mortgage, besides a description of the mortgaged property and the mortgage indebtedness, may, and usually does, contain clauses providing that the whole debt shall become due and payable upon failure to pay interest or taxes and assessments upon the mortgaged property. The mortgage may also include a power of sale enabling the mortgagee to sell the mortgaged property without foreclosure upon the mortgagor's failure to pay the debt. In some States such a provision is made inoperative by statutes which require foreclosure of the mortgage exclusively by judicial proceedings, and in others the power of sale is regulated by requiring due notice by public advertisement or by requiring that the sale itself shall be public. A stipulation that the mortgagor shall have no right to redeem will be disregarded by the courts upon the same principle that courts of equity disregard the condition of forfeiture of the common-law mortgage, viz., that equity will relieve a mortgagor from an oppressive condition or stipulation.

The estate of the mortgagor in possession has been likened to a tenancy at will or by suffer-

ance, and as between himself and the mortgagee, the analogy is very close. At common law the mortgagee having the title could take possession at will, the sole right of the mortgagor, if the mortgagee exercised this right, being to redeem by payment of the mortgage indebtedness on the due date. But as to all others, the mortgagee in possession is clothed with substantial ownership. He is entitled to the rents, issues, and profits of the mortgaged property; he may sell or encumber it subject to the mortgage, and upon his death the property goes to his heirs at law.

In many States the mortgagee's common-law right to take possession of the mortgaged property by ejectment or other appropriate action has been cut off by statute, and he can only secure possession of the mortgaged property after default and through foreclosure.

Although the mortgagee holds the title to the mortgaged property, the law recognizes that he holds it as an incident to his claim against the debtor, which is personal property. The mortgagee's estate, therefore, in both real and personal property, is regarded as personal property only and passes, upon his death, to his personal representative and not to his heirs.

In general, the mortgagee out of possession is in the position of one having a mere lien or personal claim against the mortgagor. But the mortgagee in possession of the mortgaged property, who was at common law substantially in the position of owner of the property, is compelled by equity to account for the rents, issues, and profits and to apply them upon the mortgage indebtedness.

Both the mortgagor and the mortgagee may freely assign their interests. It is not unusual for the assignee of the mortgagor to assume the mortgage indebtedness by the instrument of assignment, and it is the general rule that the mortgagee may enforce this undertaking either upon the theory of subrogation or that the mortgagee may sue upon a contract made for his benefit.

When several mortgages are given upon the same property they have priority in the order of their creation unless otherwise provided. This rule may be varied by the operation of recording acts, which usually give priority to mortgages in the order in which they were recorded.

A mortgage is extinguished by payment of the mortgage indebtedness or by a legal tender of the amount due on the day when due. Tender after that time has no effect at common law, and in equity the only effect is to prevent interest accruing. A mortgage may also be terminated by a release thereof by the mortgagor or by a merger resulting from the union of the mortgage estate and the equity of redemption in the same person. If the merger is accomplished by a conveyance of the mortgaged property by the mortgagor to the mortgagee, the courts will scrutinize the transaction with the greatest care and, if there appear to have been any oppression or undue influence on the part of the mortgagee, will allow the mortgagor to redeem. See **MERGER**.

A mortgage is extinguished by the final judgment or decree in an action to foreclose the mortgaged property or in an action to redeem it from the mortgagee. See **FORECLOSURE**; **EQUITY OF REDEMPTION**.

Courts have always favored the mortgagor's

right to redeem, and at any time before the extinction of the mortgage will allow him to compel a cancellation and surrender of the mortgage upon payment of the mortgage indebtedness with interest and, as an incident to the redemption, will compel the mortgagee to account for rents or profits which he has received. Consult: D. H. Pingrey, *Treatise on the Law of Chattel Mortgages* (Newark, N. J., 1891), id., *On the Law of Mortgages of Real Property* (2 vols., Philadelphia, 1893); Coote, *Treatise on the Law of Mortgages* (7th ed., London, 1904); L. A. Jones, *Treatise on the Law of Mortgages of Real Property* (6th ed., Indianapolis, 1904); id., *Personal Property* (5th ed., ib., 1908); and the authorities referred to under **REAL PROPERTY**. See also **CHATTEL MORTGAGE**.

MORTGAGE BANKS. Institutions designed to furnish long-term credit on real security. In 1686 a plan for a bank to issue bills on real-estate security was approved by the Governor and Council of Massachusetts Bay. The plan fell through, but a number of similar schemes were launched in Colonial America, such as the Public Loan Office of Pennsylvania (1722), the New London Society of Connecticut (1732), the Land Bank scheme of Massachusetts Bay Province (1740). These and similar schemes all failed, on account of improper financial methods. The first really successful enterprise of the kind was the Silesian Landschaft, created by Frederick the Great in 1769. The plan of operation involved the organization of all the noble landholders of the province into essentially a mutual-credit association. All lands were appraised by the association, and the amount that each landowner might borrow was fixed. Upon application any member might obtain debentures, secured by the collective property of the association, through the sale of which he might obtain the funds required. The King granted to the association a subsidy of \$216,000, later increased to \$432,000. This association is still in existence and in 1912 had loans outstanding to an aggregate of \$97,919,605. Similar associations were founded in a number of the Prussian provinces during the eighteenth century: Kür and Neumark, 1774, Pomerania, 1781, West Prussia, 1787; East Prussia, 1788, Lunenburg, 1790. The general principles of mutual credit, the issue of debentures based on the collective property of the association, etc., were the same. The effect of the plan was to mobilize real credits. The debentures, unlike mortgages on specific tracts of land, enjoy a national market. This feature was further emphasized by the creation in 1873 of the Central Landschaft of Prussia, which correlates the activities of seven Landschafts and one communal credit association. Besides the Landschafts there are found in Germany a large number of other land-credit banks.

In France the most important mortgage-credit institution is the *Crédit Foncier*, founded in 1852, with a capital now amounting to \$45,000,000. The *Crédit Foncier* lends on mortgages, either repayable at long term by annuities or at short term with or without amortization. Loanable funds it raises through the sale of debentures secured by its collective assets.

Mortgage banks of a character similar to the German and French banks have been established in most European and several non-European countries. They enable the borrower on real

security to secure loans at low interest, repayable usually at his option, and with maximum term of 30 years in Finland, 33 in Chile, 36½ in New Zealand, 42 in Australia, 50 in Italy and Japan, 54½ in Austria, 55½ in Russia, 56½ in Germany and Sweden, 57 in Switzerland, 60 in Denmark, 63 in Hungary, and 75 in France. For the most part such institutions are primarily designed for the aid of agriculture, but they are extensively employed for financing the purchase and improvement of urban property as well. See RURAL CREDIT.

MORTGAGES, TACKING OF. See TACKING OF MORTGAGES

MORTIER, mór'tyá', EDOUARD ADOLPHE CASIMIR JOSEPH, Duke of Treviso (1768-1835). A French marshal. He was born at Cateau-Cambrésis, Feb. 13, 1768. His father was a deputy to the States-General in 1789, and though Mortier was educated for a business career, he entered the service of the Republic as a sublieutenant of carbiniers in 1791. He rose rapidly and in 1793 became adjutant general. After greatly distinguishing himself under Moreau and Kléber, he was made a general of division in 1799. In 1803 he was in command in Hanover and in the administration of that country showed the utmost probity and sagacity. Created a marshal of the Empire in 1804 and placed in charge of an army corps in 1805, Mortier showed his military genius by holding in check a superior force of Russians at Leoben. In 1806 he occupied Hanover, Hesse-Cassel, and Hamburg and defeated the Swedes in several encounters. He commanded the left wing of the French army at Friedland and after the Peace of Tilsit was intrusted with the government of Silesia and created Duke of Treviso. Sent to Spain in 1808, he took part in the siege of Saragossa and defeated the Spaniards at Ocaña (Nov. 19, 1809). After sharing in the Russian campaign of 1812 Mortier took a decisive part in the battle of Lutzen (May 2, 1813) and in all the subsequent military events of 1813-14. When Napoleon's cause was lost, Mortier at last gave in his adhesion to the government of Louis XVIII. During the period of the Hundred Days, Mortier first saw the King safely out of France and then joined his old leader. After the Second Bourbon Restoration he was crossed off the list of peers for refusing to sit on the court-martial of Ney. He became a member of the Chamber of Deputies in 1816 and was restored to the Chamber of Peers in 1819. After the revolution of 1830 he was made Ambassador at St. Petersburg, became Grand Chancellor of the Legion of Honor in 1833 and Minister of War and President of the Council in 1834-35. He was killed on the Boulevard du Temple, July 28, 1835, by a missile from the infernal machine of Fieschi (q.v.)

MORTILLET, mór'té'yá', LOUIS LAURENT GABRIEL DE (1821-98). A French anthropologist, born at Meylaur, Isère. His interest in prehistoric archaeology dates from a trip to Italy in 1858, and he began to study the Swiss lake dwellings. In 1864, after his return to France, he founded a review, *Matériaux pour l'Histoire Positive et Philosophique de l'Homme*, and in 1868 became an assistant, and later conservator, at the Museum of Saint-Germain. In 1876, with Broca, he planned the Ecole d'Anthropologie. He also was active in politics, mayor of Saint-Germain-en-Laye, and in 1885 deputy from Seine-et-Oise, as a strong anti-

clerical. His published works include: *Le signe de la croix avant le christianisme* (1866); *Les habitations lacustres du lac du Bourget* (1867); *Origine du bronze* (1876); *Le préhistorique* (1882); *Origines de la chasse, de la pêche et de l'agriculture* (1890); *Formation de la nation française* (1897).

MORTIMER, EARL OF OXFORD AND. See HABLEY, ROBERT

MORTIMER, JAMES (1832-1911). An American diplomat and playwright. After leaving Annapolis he served in the navy for a time and then entered journalism at Philadelphia. In 1850 he started the *Frankford Journal*, but shortly afterward became an attaché of the American Legation at Paris. He spent some years as secretary to the United States Minister at St. Petersburg and finally became Paris correspondent of American newspapers. Mortimer contributed also to the Paris press, and some of his articles brought him to the favorable notice of Napoleon III. He served as a messenger between the Emperor and the Empress Eugénie, and the Emperor provided the funds with which he started the *London Figaro* in 1870. He produced about 35 plays in London, including *Joy is Dangerous*, an adaptation, *Heartsease*, in which Madame Modjeska made her first London appearance in 1880, his best-known comedy, *Gloriana*, first played in 1891 and revived under the title *The Artful Valet*; and *My Bachelor Past*.

MORTIMER, ROGER DE (†1287-1330). First Earl of March and eighth Baron of Wigmore. For some years he was a faithful adherent of Edward II of England and from 1316 to 1321 his representative in Ireland to oppose Edward Bruce; but soon after he was recalled in 1321 Mortimer joined the insurgent barons who were hostile to the Despencers. In 1322 Mortimer submitted to Edward and was imprisoned in the Tower of London, but escaped to France two years later. There he met and fascinated Queen Isabella, wife of Edward, became her paramour, and determined upon the overthrow of the King. With a small force the two landed on the English coast in 1326 and were soon joined by large numbers of the discontented nobles and common people. The King was defeated, taken prisoner, and probably murdered in his prison in 1327. Mortimer took the title of Earl of March in 1328 and received confiscated estates and offices of immense value, while his creatures controlled the administration. Edward III was a minor, and, though a council held the regency, Mortimer's influence was supreme. Mortimer became very unpopular when he made the Shameful Peace with the Scots in 1328. Finally Edward III resolved to be King in fact as well as in name, had the Earl of March seized at Nottingham Castle, and summoned a new Parliament. Mortimer was tried on charges of treason, condemned, and in 1330 hanged, drawn, and quartered. (See Edward III.) Consult William Longman, *Edward III*, vol. i (London, 1869), and William Stubbs, *Constitutional History*, vol. ii (6th ed., Oxford, 1897).

MORTIMER'S CROSS, BATTLE OF. See EDWARD IV; ROSES, WARS OF THE.

MORT'MAIN (OF. *mortemain*, from ML. *mortua manus*, dead hand), STATUTES OF. In England, the acts of Parliament prohibiting or restricting the alienation of lands to corporations. The term "mortmain" is applied to the perpetual tenure of lands by corporations, par-

ticularly religious corporations, whose members and officers, being ecclesiastics, were by the common law deemed civilly dead, *civiliter mortuus*, and hence the derivation of the term as signifying land held by the dead hand of the Church. In later times the term has been applied to the tenure of lands by corporations generally, whether ecclesiastical or lay.

Mortmain first became a matter for the serious attention of English legislators and lawyers as early as the reign of Edward I. The policy of the various ecclesiastical corporations of acquiring large holdings of land and retaining them became a menace to the well-being of the state, partly because it afforded a ready means of accumulating wealth and power which were held in strict allegiance to the Church, whose interests were often in conflict with those of the civil authority, but primarily because the ownership of land by ecclesiastical corporations was inconsistent with feudal tenure. The feudal system presupposed the holding of land by a tenant who could render to his overlord certain fixed services, military or other, and certain dues, known as incidents, under certain circumstances. The most important of these incidents were: (a) *Aids*.—Assessments levied by the lord on his freehold tenants for knighting the lord's eldest son, marrying off his eldest daughter, and ransoming his body from captivity. (b) *Relief*.—The sum which an heir was required to pay to the lord upon coming into his ancestor's tenancy. (c) *Wardship*.—The right of the lord to become the guardian of the infant heir of his tenant and take the profits of the estate during the heir's minority. (d) *Marriage*.—The right of the lord to dispose of the tenant's daughter in marriage. (e) *Escheat*.—The right of the lord to the freehold upon the death of the tenant without heirs.

It is apparent that the acquisition of land by an ecclesiastical corporation, which could not die or contract marriage and which had none of the other attributes of a natural person, struck at the very basis of the feudal system and was regarded with jealousy by the great lords and the civil officers of the crown. The result was a series of legislative enactments, extending over a period of nearly 600 years, having for their purpose the restraint of alienation in mortmain. No sooner did the will of the state find expression in appropriate legislation for this purpose than the powerful influence of the Church was exerted to evade or nullify it by judicial interpretation or by resort to legal fictions invented by skillful lawyers and urged by them upon the courts with such success that ultimately new legislation became necessary. To this historic struggle between the Church and the landed aristocracy are attributable many of the peculiarities of the law of real property to this day.

The earliest statute relating to the subject after the fall of the Western Empire was an edict of the Emperor Frederick Barbarossa in 1158 prohibiting conveyances to Church corporations. In England there have been enacted in all 21 statutes affecting the power to alienate in mortmain. The earliest of these (a provision contained in Magna Charta, c. 43, that there should be no transfer of land to Church corporations by a tenant without the consent of his lord) seems to have fallen into disuse or to have been evaded by conveyances direct to the officers of the religious houses, who held the property

"to the use," i.e., for the benefit, of such houses.

The next statute of importance, and the first to curb effectively the acquisition of land by the ecclesiastical corporations, was the Statute *De Religiosis* (7 Edw. I, St. ii, c. 13), passed in 1279.

This statute made all alienations in mortmain unlawful and made the provision effective by enacting that all such conveyances should work a forfeiture to the lord of the land attempted to be conveyed. The lawyers of the time, however, soon devised a method for evading the statute by the invention of the common recovery (q.v.), a fictitious suit brought against the would-be grantor, to which the courts gave the effect of a conveyance. This development in the common law was met by a new legislative enactment (13 Edw. I, c. 32) in 1285, which forbade alienation of lands in mortmain by common recovery and attached the same penalty to such alienation as in case of the conveyances forbidden by the Statute *De Religiosis*. The Statute *Quia Emptores* (18 Edw. I, c. 1), which removed some of the common-law restraints upon alienation, expressly excluded from its operation all alienation in mortmain.

These statutes in time were evaded by the practice of conveying lands to a layman, to be by him held for the use or benefit of an ecclesiastical corporation, which obligation came to be enforced by the Chancellor. The use was the forerunner of the modern trust and the basis of equity jurisdiction over trusts. In 1391 this practice was forbidden on pain of forfeiture, unless such conveyance to uses was licensed by the King (15 Rich. II, c. 5).
